KEY TO PRONUNCIATION.

ā as in ale, fate.
“ “ senate, chaotic.
á “ “ glare, care.
“ “ am, at.
â “ “ arm, father.
“ “ ant, and final *a* in America, armada, etc.
 In rapid speech this vowel readily becomes more or less obscured and like the neutral vowel or a short *u* (*ü*).
a “ “ final, regal, where it is of a neutral or obscure quality.
“ “ all, fall.
“ “ eve.
“ “ elate, evade.
“ “ end, pet. Also for *ä* in German, as in Gräfe, to which it is the nearest English vowel sound.
ä “ “ fern, her, and as *i* in sir. Also for *ö*, *oe*, in German, as in Göthe, Goethe, Örtel, Oertel, and for *eu* and *oeu* in French, as in Neufchâtel, Crèvecoeur; to which it is the nearest English vowel sound.
e “ “ agency, judgment, where it is of a neutral or obscure quality.
i “ “ ice, quiet.
i “ “ quiescent.
i “ “ ill, fit.
ï “ “ old, sober.
ö “ “ obey, sobriety.
ö “ “ orb, nor.
ô “ “ odd, forest, not.
o “ “ atom, carol, where it has a neutral or obscure quality.
oi “ “ oil, boil, and for *eu* in German, as in Feuerbach.
oo “ “ food, fool, and as *u* in rude, rule.
ou “ “ house, mouse.
û “ “ use, mule.
ü “ “ unite.
ü “ “ cut, but.
u “ “ full, put, or as *oo* in foot, book. Also for *ü* in German, as in München, Müller, and *u* in French, as in Buchez, Budé; to which it is the nearest English vowel sound.
û “ “ urn, burn.
y “ “ yet, yield.
z “ “ the Spanish Habana, Cordoba, where it is like a *v* made with the lips alone, instead of with the teeth and lips.
ch “ “ chair, cheese.

D as in the Spanish Almodovar, pulgada, where it is nearly like *th* in English then, this.
g “ “ go, get.
G “ “ the German Landtag, and *ch* in Feuerbach, buch; where it is a guttural sound made with the back part of the tongue raised toward the soft palate, as in the sound made in clearing the throat.
H “ “ *j* in the Spanish Jijona, *g* in the Spanish gila; where it is a fricative somewhat resembling the sound of *h* in English hue or *y* in yet, but stronger.
hw “ “ *wh* in which.
K “ “ *ch* in the German ich, Albrecht, and *g* in the German Arensburg, Mecklenburg; where it is a fricative sound made between the tongue and the hard palate towards which the tongue is raised. It resembles the sound of *h* in hue, or *y* in yet; or the sound made by beginning to pronounce a *k*, but not completing the stoppage of the breath. The character *k* is also used to indicate the rough aspirates or fricatives of some of the Oriental languages, as of *kh* in the word Khan.
n “ “ sinker, longer.
ng “ “ sing, long.
N “ “ the French bon, Bourbon, and *m* in the French Étampes; where it is equivalent to a nasalizing of the preceding vowel. This effect is approximately produced by attempting to pronounce “onion” without touching the tip of the tongue to the roof of the mouth.
sh “ “ shine, shut.
th “ “ thrust, thin.
TH “ “ then, this.
zh “ “ *z* in azure, and *s* in pleasure.
 An apostrophe, or superior comma, ['] is sometimes used to denote a glide or neutral connecting vowel, as in tā'b'l (table), kǎz'm (chasm).
 Otherwise than as noted above, the letters used in the respellings for pronunciation are to receive their ordinary English sounds.
 When the pronunciation is sufficiently shown by indicating the accented syllables, this is done without respelling; as in the case of very common English words, and words which are so spelled as to ensure their correct pronunciation if they are correctly accented. See the article on PRONUNCIATION.

THE NEW INTERNATIONAL ENCYCLOPÆDIA

HALL, hä'l. A small and very old town in the Austrian Crownland of Tyrol, situated on the Inn, which is here navigable, six miles east of Innsbruck (Map: Austria, B 3). The parish church, built in 1271, with a monument that marks the grave of Speckbacher, leader of the Tyrolese in their struggle for independence, the gymnasium, the fifteenth-century Rathaus, the Franciscan convent, and the Münzthurm, are the chief buildings. About nine miles north of the town is the Salzberg, with salt-mines, from which salt in the form of brine is conveyed in wooden pipes to the pans of Hall. Besides salt, Hall manufactures chemicals, felt hats, buttons, fire-engines, paper, cloth, and chicory. The town is growing in favor as a summer resort. Population, in 1890, 5800; in 1900, 6200. Hall was a flourishing town in the Middle Ages, but has declined greatly on account of wars and earthquakes.

HALL, or **SCHWÄBISCH** (shvā'bīsh) **HALL**. An old town of the Kingdom of Württemberg, Germany, situated on the Kocher, 48 miles north-east of Stuttgart (Map: Germany, C 4). It is poorly built, but has some interesting ancient buildings. The Church of Saint Michael, constructed in 1427-1525, contains a fine altarpiece. The Church of Saint Catharine, on the left bank of the Kocher, dates from the fourteenth century, and is noted for its fine high altar. The Rathaus is a stately eighteenth-century edifice. Hall has salt-works and saline baths, and carries on a trade in grain and cattle. The manufactures include iron articles, machinery, cotton yarn, leather, etc. Hall, mentioned as early as 887, owed its importance in ancient times to its saline springs. It was raised to the rank of an Imperial town in 1276, and it was in its mint that the first coins known as *Hellers* were struck. It came into the possession of Württemberg in 1802. Population, in 1890, 9000; in 1900, 9225.

HALL (AS. *heall*, *heal*, Icel. *höllr*, OHG. *halla*, Ger. *Halle*; probably connected with AS. *helan*, obsolete Eng. *heal*, OHG. *helan*, Ger. *hehlen*, Lat. *celare*, Gk. *καλύπτειν*, *kalyptein*, to hide, OIr. *celim*, I hide). A name given to a large inclosed space in the form of a single apartment,

whether it stands alone in a separate structure or is in a larger building of which it is merely a part. The term is even used, by extension, of the feudal mansions or manor houses of which such a large room was the main part. Finally, in modern architecture, by a misuse of the term it has come to be applied to the common room out of which the others open, whether it is large or small.

In the history of architecture the term hall is applied to such interiors as the hypostyle hall of an Egyptian temple, the *apadans* of a Persian palace, or the *tepidarium* of the Roman thermæ, and we call mediæval churches with a single nave, or with several naves of equal height, hall churches. But the origin of the term is both secular and northern. The earliest Saxon buildings we have any record of are the palaces of the kings, and these seem to have consisted of one large hall, in which the king, his courtiers, and all his retainers dwelt together, and one other chamber, in which the king and his hearthmen slept, while his retainers slept in the hall. The same custom prevailed among other early Norse and Germanic tribes. The Normans built their houses on the same plane, with the hall and one solar (q.v.) or sleeping apartment. The same arrangement prevailed with slight modifications during the twelfth and thirteenth centuries. Then and later the hall, while part of the group of manor buildings, was often a separate structure, with its independent roof, as at Stokesay and Oakham castles. In the fourteenth and fifteenth centuries, when the country was more settled and prosperous and manners had become more refined, more numerous rooms were necessary. The hall, however, still retained its place as the chief apartment. In it the King or the lord of the manor gave audience, administered justice, received and entertained his retainers and guests, and performed all the acts of feudal life. Often he used it, also, as his sleeping apartment. At one end of the hall was a raised platform or dais, on which the table of the lord of the manor was placed, and where his more honored guests sat. The retainers sat at a table in the lower part of the room. The halls were more frequently roofed than vaulted, and these roofs were very carefully and elegantly constructed, as many still

remaining show. The hall of the King's palace, now called 'Westminster Hall,' built by William Rufus and restored by Richard II., is the finest example in England, being 300 feet long and 100 feet broad. Those in the Imperial and royal palaces of Germany, as at Goslar, are the earliest and best preserved of their class.

The use of such halls spread from feudal society to other branches of life, especially corporate life in the Gothic and Renaissance periods. There are three principal classes of such halls—the communal halls, the guild halls, and the college halls. The political organization of the free mediæval cities required large meeting-places for their governing bodies; they sometimes occupied the entire ground floor, as at Udine, either open or inclosed; sometimes the second floor above a basement, as at Padua (the largest in existence). The entire structure was often most imposing, as at Siena, Perugia, Gubbio, Florence, Cremona. (See PALACE.) They fell into disuse with the fall of liberty in the Renaissance. The second class, the guild halls, without being generally as imposing in Italy (except, for instance, that at Florence), attained great importance in Flanders and Northern France. Here the 'Halles' were the heirs of the great Roman markets. Each great corporation possessed one, and where the city was governed by them the communal belfry often rose from its summit, as in the halls of Ypres, Bruges, and Arras. Many of these great structures remain: the Butchers' Hall (*Halle à la Viande*) at Ghent, Ypres, and Antwerp; the Bakers' Hall (*Halle au Pain*) at Brussels; the Fishmongers' Hall (*Halle aux Poissons*) in many towns; the Cloth Hall (*Halle aux Draps*) at Ghent, Bruges, Louvain, and Brussels; the Bankers' Hall (*Bourse*) at Antwerp. The finest of all is the hall at Ypres, built between 1201 and 1304. Some are open, on piers, especially in the south of France, as at Figeac and Cordes; others, in France also, are built entirely of wood, as at Villeneuve and Evron. Sometimes they are built around a court, as at Antwerp; but the usual type is an oblong stone structure with wooden timbered roof or vault, in one, two, or three aisles, often with a second-story gallery. The various colleges at Oxford and Cambridge and other universities had common halls, which were often of great architectural dignity and beauty, several of which remain almost unchanged. The history of the term, therefore, shows that it applies to a large meeting-place, whether of a feudal family, a corporation, or an entire community.

In more recent times it has been logically applied to large places where any audience is gathered together, especially for musical and other entertainments, such as Saint George's Hall in Liverpool, or Carnegie Hall in New York. Some of the meeting-places notable in our own history bear this name, such as Faneuil Hall in Boston, and Nassau Hall in Princeton. The large buildings at American universities, whether dormitories or recitation buildings, even when they contain no large main apartment, are generally called halls.

HALL, or HOSTEL. An institution in English universities fast dying out, chiefly by absorption into colleges. It was the earliest, and for a long time the only organization for the support of students outside the foundations

of the religious orders. For the establishment of a hall, a few students by mutual agreement rented a house, chose a principal, at first generally one of their number, later a master, and applied to the university for recognition. The halls were held on lease, the rent being fixed at intervals, generally, of five years by four taxers, two masters and two citizens, and houses once occupied by students could not be let to a layman, so long as a clerk would take it. The halls were under the supervision of the university, which had the right of visitation, and gradually acquired considerable authority over them. For centuries the halls greatly outnumbered the colleges, and even after the rise of colleges many halls remained as independent establishments, largely as the residences of wealthier students. Some received endowments and became not unlike small colleges; but most kept to the original idea of a hall, that of an independent self-governing community of students living at their own expense. The rise of colleges where support was given students was the death-blow to the hall idea, and many colleges owed their origin to the absorption of older halls. This process of absorption is still going on, and the halls are now almost extinct, even those now remaining being destined to union with neighboring colleges after a longer or shorter period. See SAINT MARY HALL; SAINT EDMUND HALL.

HALL, ANNA MARIA (*née* Fielding) (1800-81). An English novelist, born in Dublin. Her mother, left a widow, took her to London, where she was educated. In 1824 she married Samuel Carter Hall, editor and author. She became known by *Sketches of Irish Character* (1829), which was followed during the next fifty years by about fifty distinct publications, consisting mostly of short stories and novels. Many of them first appeared in magazines. A good specimen of her delineation of Irish character—almost equaling Maria Edgeworth's—is *Marian* (1840). Another side of her talent is represented by *Midsummer Eve, a Fairy Tale of Love* (1848). She also succeeded in gaining popular favor by several plays. *The French Refugee* (1836), for example, ran ninety nights at Saint James's Theatre. She was an active and practical philanthropist. Consult Hall, *Retrospect of a Long Life* (London, 1883).

HALL, ARTHUR CRAWSHAY ALLISTON (1847—). An American bishop, born at Binfield, in Berkshire, England. He was educated at Christ Church College, Oxford, and entered the Cowley Fathers, or Society of Mission Priests of Saint John the Evangelist, a community bound to poverty, chastity, and obedience. In 1872 he became assistant pastor of the Church of the Advent in Boston, and, in 1882, minister to the Mission Church of Saint John the Evangelist in the same city. He was recalled to England in 1891, was elected Bishop of Vermont in 1893, and after much ecclesiastical discussion was consecrated in February, 1894, after being released from the Cowley Order. He wrote: *Confession and the Lambeth Conference* (1879); *Meditations on the Creed* (1880); *Meditations on the Collects* (1887); *The Example of the Passion* (1882); *The Virgin Mother; Christ's Temptation and Ours; A Charge on Marriage and Divorce; Confirmation; and Marriage with Relatives* (1901).

HALL, ASAPH (1829—). An American astronomer, born of Revolutionary stock in Goshen, Conn. At sixteen he became a carpenter, but spent his spare time in study. In 1854 he went to Central College, McGrawville, N. Y., and in spite of poor teaching, learned some mathematics in the year and a half he spent there. He studied under Brünnow at Ann Arbor, where he made his first acquaintance with astronomy, and in 1857 went to Cambridge as assistant to Professor Bond at the pitiful salary of three dollars a week. He studied mathematics and German by himself, and gradually advanced until he earned \$600 a year at the Cambridge Observatory. In 1862 he took a civil-service examination and became an aid, and a year afterwards professor of mathematics in the United States Naval Observatory. This position he held until 1891 and was sent on several expeditions: in 1869 to Bering Strait, in 1870 to Sicily to observe eclipses; in 1874 to Vladivostok to observe the transit of Venus; to Texas in 1882 for the same purpose; and to Colorado in 1878 on a solar-eclipse expedition. His greatest fame came from his discovery in 1877 of the two satellites of Mars, which he called Deimos and Phobos. In recognition of this discovery he received a gold medal from the Royal Astronomical Society, and the award of the Lalande prize from the Paris Academy. In 1875 he was elected a member of the National Academy of Sciences, and afterwards was elected its president. He retired from the Government employ in 1891, and four years later went to Harvard as professor of astronomy, where he remained until 1901. In 1902 he was president of the American Association for the Advancement of Science.

HALL, BASIL (1788-1844). A British naval officer, author, and traveler, born and educated in Edinburgh. He entered the navy in 1802, saw service on the coasts of China, India, and South America, was made post-captain in 1817, and left the navy in 1823. The rest of his life was spent in travel, and scientific pursuits at home. The descriptions of his various voyages while in the navy, and of his subsequent travels, show a broad and keen observation and were well received, though his *Travels in North America* caused great indignation and met with much hostile criticism in the United States, because of his outspoken remarks upon American customs. His scientific work was mostly confined to personal experimentation, and was of little permanent value, though he was a member of many scientific societies and contributed widely to their journals. In 1842 his mental powers failed, and he died in confinement two years later. His most important writings are: *A Voyage to the West Coast of Corea and the Great Loo-Choo Island* (1818); *Extracts from a Journal Written on the Coasts of Chili, Peru, and Mexico* (1824); *Travels in North America* (1829); *Fragments of Voyages and Travels* (1831); *Schloss Hainfeld, or a Winter in Lower Styria* (1836); *Spain and the Seat of War in Spain* (1837); and *Patchwork* (1841).

HALL, CHARLES CUTHBERT (1852—). An American clergyman of the Presbyterian Church, born in New York City. He was educated at Williams College, the Union Theological Seminary, the Presbyterian College in London, and the Edinburgh Free Church College; was ordained in 1875, and succeeded Wendell Prime as pastor

of the Union Presbyterian Church of Newburg, N. Y. Two years afterwards he became pastor of the First Presbyterian Church of Brooklyn, N. Y. *Qualifications for Ministerial Power* (1894) was Dr. Hall's Carew lectures at Hartford Theological Seminary. A trustee of Atlanta University and of Williams College, and long a director of Union Theological Seminary, he was chosen president of the last-named institution in 1897. Dr. Hall compiled with Lasar *The Evangelical Hymnal*.

HALL, CHARLES FRANCIS (1821-71). An American Arctic explorer. He was born at Rochester, N. H., and was for a time a blacksmith, and later became a stationer and journalist. In 1860 he sailed from New London in the *George Henry*, to discover the remains of the Franklin party, the expense of the expedition being borne largely by Henry Grinnell (q.v.). His ship was blocked by ice, and for two years he lived among the Eskimos near Frobisher Bay, returning in 1862. In 1864 he published an account of the expedition in *Arctic Researches* and in *Life Among the Esquimaux*. In the same year Hall returned to the Arctic to renew his search for evidences of the fate of the Franklin expedition. It was not till the spring of 1866 that he met Eskimos at Cape Weyton, south of Boothia Felix, who had seen Franklin and visited the deserted ships. He obtained from them silver bearing the crest of Franklin and other officers of the party. While searching for further evidence he did some interesting geographical work by filling in the gap between Rae's farthest (1846) and Parry's farthest, in Fury Strait (1825), thus completing the mapping of the north coast of the continent. At last, after five years of toil, he met natives near the south shore of King William Land, in the summer of 1869, who gave him personal or traditional information of the fate of 79 of the 105 men who died of starvation in King William Land. It is now believed that the remaining 26 reached the coast of the mainland and perished. It was thus McClintock, Hall, and Schwatka and Gilder who solved the fate of the Franklin party. His last expedition was undertaken in 1871, at the expense of the United States Government, in the small naval vessel *Polaris*, which proved to be unfitted for Arctic work. He ascended the Smith Sound channels into the Polar Sea to 82° 11' N., the most northern point attained up to that time by a vessel. Unable to proceed farther, the expedition spent the winter of 1871-72 at Thank God Harbor, on the Greenland coast. In the fall Hall made a sledge journey north to Cape Brevoort, and was the first to see the land on the west side of Robeson Channel and to determine approximately its extension to the north. Upon returning from this journey he was taken violently ill, and died on November 8, 1871. In the fall of 1872 the *Polaris* pushed into an impassable ice pack and drifted south for two months, when a terrible gale broke up the pack and nearly destroyed the vessel. A part of the supplies had been removed to the ice, on which 19 of the crew had taken refuge, and they were carried away from the vessel in the darkness. After experiencing all the horrors of a five months' winter drift on an ice-floe, they were picked up, off Labrador, 1300 miles from the point of separation, with 20 in the party, the Eskimo Hannah having given birth to a girl.

The ship had drifted to the Greenland shore a little south of Smith Sound, whence, in the spring of 1873, the remainder of the party retreated south in boats, and were rescued at Cape York on June 22d by a Scottish whaler. Though the expedition was unfortunate, its geographical results were very important. Hall completed the exploration of Kennedy Channel, discovered Hall Basin and Robeson Channel, extended both Greenland and Grinnell Land northward nearly two degrees of latitude, and visited the unknown Polar Sea. He was not competent to take charge of scientific work, but he was a genuine Arctic pioneer, full of resources, and undaunted by obstacles, many of which he overcame by patient and untiring effort. The scientific results of the *Polaris* expedition were important, and were published by the Government in 1879. Consult also: Davis's *Polaris North Pole Expedition* (Washington, 1876); Tyson's *Drift* (New York, 1874); Bessel's *Die amerikanische Nordpola Expedition* (Leipzig, 1879).

HALL, CHESTER MOOR (1703-71). An English scientist, inventor of the achromatic telescope. He was born at Leigh, in Essex; was a student of the Inner Temple in 1724 and a bencher in 1763. He lived at New Hall, Sutton, and was often called 'Moor of Moor Hall.' From study of the structure of the human eye he arrived at the conclusion that achromatic lenses were possible; discovered two kinds of glass in 1729, of enough variation of dispersion; and in 1733 had made several telescopes. But though there seems no doubt of the priority of his invention, he took no pains to appear in the suit of *Dollond vs. Champness* (1766). See TELESCOPE; DOLLOND, JOHN.

HALL, CHRISTOPHER NEWMAN (1816-1902). An English Congregational minister, born at Maidstone, Kent, and educated at Totteridge, at Highbury College, and at the University of London. For twelve years he was pastor of the Albion Congregational Church at Hull. In 1854 he succeeded Rowland Hill and James Sherman at Surrey Chapel, and in 1876 he went to Christ Church, Lambeth, a charge which he resigned in 1892. He became widely known in England as a total-abstinence agitator and as an evangelist. He was a friend of the North during the Civil War, and in 1867 toured America with the intention of quieting differences between Great Britain and the United States. Dr. Hall's tracts were his best-known works, especially: *Come to Jesus* (1846); *It is I* (1848); *Follow Jesus*; and many others, of which hundreds of thousands have been distributed. He wrote besides: *The Land of the Forum and the Vatican* (2d ed. 1859); a biography of his father, under the title *Conflict and Victory* (2d ed. 1874); *Lyrics of a Long Life*; and an *Autobiography* (1865).

HALL, EDWARD (c.1499-1547). An English historian, son of John and Catharine Hall, who seem to have been prominent in the Reformation, and may have been the "John Hall and his wife," prisoners in Newgate, "for the testimony of the Gospel" (1555), mentioned by John Fox. Edward Hall was educated at Eton and at King's College, Cambridge, and studied law. He was a strong defender of the Tudors, and carried his ideas of reform no further than the King, but supported the royal supremacy in Parliament,

spoke in behalf of the Bill of Six Articles (1539), and was appointed (1541) a member of the commission to deal with all transgressors of that law. His *Union of the Noble and Illustre Families of Lancaster and York* (1542; and, the most complete edition, from the press of Richard Grafton, and with a preface by him, 1550) is especially valuable for the reign of Henry VII. and the early years of Henry VIII. It was largely used by Shakespeare in his historical plays, and was borrowed from by Grafton, Holinshed, and Stow.

HALL, FITZEDWARD (1825-1901). An American philologist, who was born at Troy, N. Y., but spent his mature years in England. He was educated at Walpole, N. H., Poughkeepsie, the Rensselaer Polytechnic Institute, and at Harvard, where he did not finish his course, as he was sent to India to look for a runaway brother. At Benares, in 1850, he was appointed to a post in the Government College, which became in 1853 an Anglo-Sanskrit professorship. In 1855 he was appointed inspector of public instruction for Ajmere and Mairwara, and a year later for the Central Provinces. In 1860 he received the degree of D.C.L. at Oxford, and two years later left India for London, where he became professor of Sanskrit, Hindustani, and Indian jurisprudence at King's College, received the post of librarian at the India Office, and in 1864 was made examiner in Hindustani and Hindi on the Civil-Service Commission. In 1880 he succeeded Max Müller as examiner in Sanskrit, and from 1887 to his death was examiner in English also. His edition of the *Vishnupurāna* is marked by wide reading and by many quotations from unpublished manuscripts in his own possession. About 1870 he turned his attention to English philology, and published: *Recent Exemplifications of False Philology*, an attack on Richard Grant White (1872); *Modern English* (1873); *On English Adjectives in -able, with Special Reference to 'Reliable'* (1877); *Doctor Indoctus* (1880); and other volumes. The most lasting monument to his activity in English philology is his work on the *Oxford Dictionary*, and on Wright's *English Dialect Dictionary*. A valuable library of a thousand Oriental manuscripts and many books he gave to Harvard University. From 1869 until his death he lived at Marlesford, in Suffolk. His principal works in Sanskrit are: *Atmabodha* (1852); *Sāṅkhyaprāvachana* (1856); *Sāryasiddhānta* (1859); *Vāsavadattā* (1859); *Sāṅkhyasāra* (1862); and *Dasarūpa* (1865); and in Hindi, a *Reader* (1870), and Ballantyne's *Hindī Grammar* (1868).

HALL, GEORGE HENRY (1825—). An American painter, born in Boston. He studied at Düsseldorf and in Paris, and traveled in Spain, Italy, and Egypt. In 1868 he was elected an Academician. His works include: "Group of Spanish Children;" "Young Lady of Seville;" "The Seasons;" "Studies of Grapes;" "Bric-a-brac of Damascus;" "April Showers;" and some portraits.

HALL, GERTRUDE (1863—). An American author, born in Boston. She was educated in Florence, and published several volumes of verse, from *Verses* in 1890, including *Allegretto* (1894), *The Age of Fairy Gold* (1899), *April's Sowing* (1900), and a translation into English of Ros-tand's *Cyrano de Bergerac*.

HALL, GRANVILLE STANLEY (1845—). An American educator. He was born at Ashfield, Mass.; graduated at Williams College in 1867, and subsequently spent several years studying philosophy and psychology in Germany. He was professor of psychology at Antioch College, Ohio, from 1872 to 1876, and at various periods was lecturer on the same subject at Harvard and at Williams. In 1884 he was chosen professor of psychology at Johns Hopkins University, and in 1888 he became president of Clark University, Worcester, Mass. He became an important contributor to educational literature, and is a leading authority in that field. He was also appointed editor of the *American Journal of Psychology* and the *Pedagogical Seminary*. Among his books are: *Aspects of German Culture* (1881); *Hints Toward a Select and Descriptive Bibliography of Education* (1886), with John M. Mansfield; and *The Contents of Children's Minds on Entering School* (1894).

HALL, ISAAC HOLLISTER (1837-96). An American Orientalist, born at Norwalk, Conn., and educated at Hamilton College. After eleven years at the New York bar he was appointed professor at the Protestant College of Beirut, where in 1876 he discovered a Syriac manuscript of the Philoxenian version of the Gospels, Acts, and, in part, the Epistles. This he published in 1884. He returned to America in 1877; distinguished himself by his studies of epigraphy, especially as the first to decipher the Cypriote inscriptions; in 1885 was appointed curator of the Metropolitan Museum of New York City, and later lectured on New Testament Greek at Johns Hopkins University. In 1884 he deciphered "Antilegomena Epistles" from the Syriac manuscript discovered by the Rev. W. F. Williams, which he published (1886) in facsimile. He also compiled a *Critical Bibliography of the Greek New Testament as Published in America* (1884).

HALL, Sir JAMES (1761-1832). A British geologist and chemist, noted for his application of chemical tests to geological hypotheses. He was born in Haddingtonshire, Scotland, the eldest son of Sir John Hall, Baronet, and succeeded to the baronetcy in 1776. Having become interested in geology during the early part of his career, he associated intimately with James Hutton, then the most eminent name in that science, and was ultimately led to accept his uniformitarian theory of geology, which explains the phenomena of the earth's crust by steady and progressive natural changes. In testing the theory he traveled extensively, and studied the rocks in different parts of Scotland, as well as in the Alps, in Italy, and in Sicily. He also had recourse, for the same purpose, to experiments in his laboratory, but, owing to Hutton's disapproval of that method, did not publish the results until after the latter's death in 1797. These made good his contention in some respects against the opponents of Hutton's system. On some points, however, he differed from his master, explaining, for example, the boulders on the Jura and similar phenomena at Corstorphine by the supposed action of a sea flood instead of by the glacial theory which is now generally accepted. He was also deeply interested in the study of architecture, and in 1813 published an *Essay on the Origin, History, and Principles of Gothic Architecture*, whose ideas had already been presented in less

elaborate form before the Royal Society of Edinburgh in 1797. He aims to prove that Gothic architecture is an evolution begun by reproducing in stone crude wattle buildings, and he constructed a miniature wattle-work cathedral in Gothic style to illustrate his argument. Hall took part in Parliamentary life, representing the borough of Michael in Cornwall from 1807 to 1812. After his death, which occurred at Edinburgh in 1832, an account of a machine which he invented for the regulation of high temperatures was given before the Geological Society of London.

HALL, JAMES (1793-1868). An American journalist and author, born in Philadelphia. He studied law, but joined the army in 1812, and served at Lundy's Lane and Fort Erie. Meanwhile he continued his legal studies, and in 1820 he removed to Shawneetown, Ill., where he began practice at the bar, and edited the *Illinois Gazette*. Later he was judge of the Circuit Court and then State treasurer, meanwhile editing at Vandalia, Ill., the *Illinois Intelligencer*. At Cincinnati he conducted the *Western Monthly Magazine* (1833-37), and was engaged in banking. Among his publications are: *Letters from the West* (1829); *Legends of the West* (1832); *Tales of the Border* (1835); *Life of W. H. Harrison* (1836); *History of the Indian Tribes* (3 vols., 1838-44); and *The Romance of Western History* (1847). His collected works were published in four volumes in 1853-56.

HALL, JAMES (1811-98). An American geologist and paleontologist, born in Hingham, Mass. He studied under Amos Eaton at the Rensselaer Polytechnic Institute, where he subsequently occupied the chair of geology. In 1836 he was appointed to the Geological Survey of New York, and was soon placed in charge of the work in the western part of the State. The report of the survey which appeared in 1843 laid the foundation for the proper classification of the Paleozoic formations in America, and was the means of establishing the office of State Geologist, with Hall as its occupant. He now devoted himself to a comprehensive study of the older fossil-bearing rocks, and published his researches from time to time in various reports and monographs, which have come to be regarded as classics by students in this branch of geology. He was president of the American Association for the Advancement of Science in 1856, of the Geological Society of America in 1889, and was elected honorary president of the International Congress of Geologists at Washington in 1891. He received many honors from foreign scientific societies, including the Wollaston medal of the London Geological Society. Among his more important contributions to geology are the following: *Geology of New York*, part iv. (1843); *Palaontology of New York* (8 vols., 1847 et seq.); *Graptolites of the Quebec Group* (1865); and portions of the *Report of the Geological Survey of Iowa* (1858-59), and of the *Report on the Geological Survey of the State of Wisconsin* (1862).

HALL, JOHN (1829-98). An American clergyman, born of Scotch parentage at Market Hill, County Armagh, Ireland, and educated at Belfast College. He was licensed to preach by the Belfast Presbytery in 1849, was a missionary in West Ireland for three years, held a pastorate for an equal period at the First Presbyterian

Church in Armagh, and in 1858 accepted a call to Saint Mary's Abbey, Dublin, where he remained for nine years, actively occupied in Church work and in matters relating to popular education. In 1867 he came to America as a delegate from the General Assembly of the Presbyterian Church in Ireland, and shortly after his return was called to the pastorate of the Fifth Avenue Presbyterian Church in New York City, where he remained until his death. He was a member of the International Sunday-School Committee from 1872 to 1896, served as a trustee of Princeton University and a director of the Union Theological Seminary; delivered many lectures at Yale on the Lyman Beecher foundation; and from 1882 to 1891 was chancellor of the University of the City of New York (now New York University). Among his best-known writings are: *Family Prayers for Four Weeks* (1868); *Care Cast upon the Lord* (1869); *Papers for Home Reading* (1871); *Questions of the Day* (1873); *Preaching: Manner and Matter* (1874); *God's Word Through Preaching* (1875); *You and Your Children* (1877); *Foundation Stones for Young Builders* (1881); *A Christian Home and How to Maintain It* (1883); *Light unto My Path* (1895). Consult T. C. Hall, *John Hall, Pastor and Preacher* (New York, 1902).

HALL, JOHN VINE (1774-1860). An English religious writer and advocate of total abstinence. He was born at Diss, Norfolk. When a young man he fell into drunken habits, but after a hard struggle reformed, and became a teetotaler. From 1814 to 1850 he was a bookseller at Maidstone. From 1854 till his death (1860) he devoted himself to religious and temperance work. His *Sinner's Friend* (1821) is said to have been translated into thirty languages and circulated in millions of copies. Consult his autobiography, *Conflict and Victory*, edited by his son, the Rev. Newman Hall (London, 1874).

HALL, JOSEPH (1574-1656). An English bishop, remarkable for his learning, piety, and misfortunes. He was born July 1, 1574, at Ashby-de-la-Zouch, Leicestershire. He was educated at Emanuel College, Cambridge, of which he became a fellow (1595). Entering the Church, he became, in 1617, Dean of Worcester; was one of the English deputies to the Synod of Dort (1618-19); was consecrated Bishop of Exeter in 1627; and in 1641 was translated to Norwich. In the latter years of his life he was accused of Puritanism, and incurred the displeasure of Archbishop Laud. In 1641, having joined the prelates who protested against the validity of all laws passed during their forced absence from Parliament, he was committed to the Tower and threatened with prosecution for high treason; but was set at liberty at the end of seven months, on finding bail for £5000. On his return to Norwich he found his revenues sequestered and his property pillaged. He rented a small farm at Higham, near Norwich, to which he retired (1647), and died September 8, 1656. His works, mostly of a controversial character, have been published, with autobiography, notes, etc., by Pratt (London, 1808); Peter Hall, a descendant of Joseph (Oxford, 1837-39); and Philip Wynter (Oxford, 1863). Of his other works, the most read now are his devotional treatises (*Select Devotional Works*, 1830), in seven parts, of which a number have been separately reprinted. His

poetical *Satires*, written at college, were praised by Pope. For his life, consult John Jones (London, 1826).

HALL, LYMAN (1725-90). A signer of the Declaration of Independence. He was born in Connecticut, and remained there until his graduation from Yale College in 1747, after which he removed to the parish of Saint John, in Georgia. This parish was largely peopled by New Englanders, and to them is chiefly due Georgia's final decision to throw in her lot with the other colonies. The people of this parish, disgusted with the indecision of their fellow colonists, endeavored to ally themselves with the Committee of Correspondence in Charleston, S. C., and when this proved infeasible decided to refrain from trading with the other colonists of Georgia, and particularly with the people of Savannah. In 1775 they sent Hall as their delegate to Congress, where he was allowed to debate, but being the only representative of Georgia, could not vote when the voting was done by whole colonies. Soon afterwards Georgia joined her sister colonies and elected five delegates to the Congress, among them Hall. He was reelected in 1776, and again in 1780.

HALL, MARSHALL (1790-1857). An eminent English physiologist and physician, born at Basford, Notts. At the age of twenty (having been previously apprenticed to a chemist) he entered on the study of medicine at the University of Edinburgh, where, in 1812, he took his degree of M.D. After three years' subsequent attendance at the leading schools of medicine on the Continent, he commenced practice in Nottingham in 1815, and rapidly obtained a high provincial reputation. In 1826 he removed to London, where his career as a physician was eminently successful. His name is well known in connection with the doctrine of the reflex function of the nervous system. He admitted that the phenomena of which he treated had been long known to physiologists; but he believed himself to have been the first to show their independence of sensation, to bring them together under one generalization, to establish with precision the laws of their production, to assign them their just rank in physiology, and to apply the doctrine to the elucidation of disease. His last bequest to the science of medicine and the cause of humanity was the description of a simple and easily applied method of restoring suspended respiration, which has been the means of saving many from untimely death, and is known as 'the Marshall Hall method.' It is briefly as follows: The insensible person is laid on his back. His mouth is opened, and the tongue, grasped with a towel or handkerchief, is pulled forward. The lower part of the body is then elevated for a moment, to let water in the larynx and mouth run out by gravitation. The body is then laid on its back, with the left arm bent backward and upward, and placed under the head. The body is then gently rolled over on the face, the tongue being held forward, and then rolled back again. The object kept in view is to compress the thorax and empty the lungs by means of the weight of the body. The manœuvre must be repeated once every four seconds, deliberately, and preferably by the watch; for rescuers are apt to be too hasty and to perform the manipulation incompletely through nervousness. This method of resuscita-

tion has been largely superseded by the 'Sylvester method,' described under RESPIRATION.

HALL, OWEN (real name JAMES DAVIS). An English dramatic author. He was educated at University College, London, and practiced as a solicitor in London from 1874 to 1886. In the latter year he deserted the law for journalism. was editor of the *Bat* in 1885-87, and of *Galignani's Messenger* in 1888-90. In 1899 he founded and became editor of a weekly magazine known as the *Phoenix*. He is best known by his plays, such as: *A Gayety Girl*; *An Artist's Model*; *The Geisha*; *A Greek Slave*; *Florodora*; and *The Silver Slipper*.

HALL, ROBERT (1764-1831). A celebrated English Baptist preacher and writer. He was born at Arnesby, near Leicester, May 2, 1764, the son of a Baptist minister and the youngest of fourteen children. He was feeble in body and precocious in intellect. At the age of fifteen he was sent to a Baptist academy at Bristol. In 1781 he entered King's College, Aberdeen. Graduating M.A. in 1784, he became (1785) assistant Baptist minister and tutor in the academy at Bristol. He was a fluent, rapid, and impressive speaker, and was liberal, but not heterodox, in his religious views. In consequence of a disagreement with his colleague, he went, in 1790, to Cambridge, where, by his elaborate composition and vivid eloquence, he rose to the highest rank of British orators. He was not less distinguished for his writings and published discourses. His *Apology for the Freedom of the Press* (1793), and sermon on *Modern Infidelity* (1800), extended his reputation. In 1806 he resigned because of poor health, and in 1807 he settled in Leicester. He married in 1808, after a whimsical courtship; returned to Bristol in 1826, and died there February 21, 1831. He was an indefatigable student, learning Italian at sixty that he might enjoy Dante. Nearly all his life he suffered from ill health, and had at times attacks of insanity; yet few men have performed more intellectual labor. A complete edition of his works, with a memoir by Dr. O. Gregory, and observations on his character as a preacher by John Foster, was published in London, in six volumes (1831-33; 11th ed. 1853). His miscellaneous works are in Bohn's *Standard Library*, and an edition of his *Work of the Holy Spirit* appeared in London (1886). Consult his life, by Hood (London, 1881).

HALL, SAMUEL CARTER (1800-89). A British author and editor, born near Waterford, Ireland. He went to London in 1821, became a reporter of debates in the House of Lords in 1823, commenced a year later the study of law, though he never practiced, and had a varied experience as editor of magazines and books. In 1824 he married Anna Maria Fielding, who became well known as a skillful delineator of Irish life and customs. He edited the *London Art Journal* from 1839 to 1880; introduced during his period of supervision the engraving of sculpture and other innovations; and exposed the prevalent frauds in the sale of pictures alleged to be by the old masters. In 1880 he was granted a pension by Lord Beaconsfield. He frequently collaborated with his wife, rendered her valuable assistance in the preparation of her very popular *Ireland*, and edited, with extensive critical and explanatory annotations: *The Book of Gems* (1836-38); *The Book*

of British Ballads (1842); *Gems of European Art, the Best Pictures of the Best Schools* (1843-45); *The Beauties of the Poet Moore* (1844); *The Baronial Halls and Picturesque Edifices of England* (1848); *The Gallery of Modern Sculpture* (1849-54); and *Selected Pictures from the Galleries and Private Collections of Great Britain* (1862-68). The best known among his original works are: *The Trial of Sir Jasper: A Temperance Tale in Verse* (1873); *An Old Story: A Temperance Tale in Verse* (1875); *A Memoir of Thomas Moore* (1879); *Rhymes in Council*; *Aphorisms Versified* (1881); and *Retrospect of a Long Life, from 1815 to 1883* (1883).

HALL, WILLIAM EDWARD (1835-94). An English writer on international law, born at Leatherhead. He was educated at University College, Oxford, where he took the degree of A.B. in 1856 and A.M. in 1859, and in the latter year won the chancellor's prize for a notable essay on *The Effect Produced by the Precious Metals of America upon the Greatness and Prosperity of Spain*. He studied at Lincoln's Inn, and was called to the bar in 1861, but turned his energies toward a study of modern history and international law. He traveled widely, and became well known as an art collector, upon which subject he also wrote extensively. In 1867 he attracted public attention by the publication of an able treatise entitled *A Plan for the Reorganization of the Army*. In 1874 appeared his first work on international law, *The Rights and Duties of Neutrals*. This was followed in 1880 by his great work, *International Law*, the publication of which marked an epoch in the literature of the subject, and secured for its author at once recognition as one of the greatest living authorities in that branch of law. The book reached a fourth edition in 1895, and was accepted as a standard work in Europe and America as well as in England. He also wrote *A Treatise on the Foreign Powers and Jurisdiction of the British Crown* (1894). He was elected in 1882 a member of the Institut de Droit International, and in 1891 was appointed one of the English commissioners for the settlement of the Newfoundland fisheries question with France.

HALLAM, ARTHUR HENRY (1811-33). An English essayist, son of Henry Hallam. He was a young man of great promise, and was educated at Eton, and at Trinity College, Cambridge. On graduating in 1832, he began the study of law; but the next year went abroad with his father, and died suddenly at Vienna. At Cambridge he formed a close friendship with Alfred Tennyson, to whose sister he was engaged to be married. Hallam's name has been rendered memorable through its connection with Tennyson's "In Memoriam," in which the poet employs the premature death of his friend as the starting-point of the well-known elaboration of his views on life and death. Hallam's *Remains in Prose and Verse* were published in 1834.

HALLAM, HENRY (1777-1859). An English philosophical historian and critic. He was the only son of John Hallam, Dean of Bristol and Canon of Windsor, and was born in Windsor on July 9, 1777. He was educated at Eton, and at Christ Church, Oxford, where he graduated B.A. in 1799; studied law at the Inner Temple, of which society he became a bencher; and was in practice on the Oxford circuit until 1812, when

an inheritance, through his father's death, together with a Government sinecure, allowed him to follow his natural bent for historical study and literary work. His literary aptitude had been early exhibited by precocious productions in the *Musæ Etonenses* (1795), and his contributions to the *Edinburgh Review* and other periodicals soon brought him into prominence among the most noted writers of the day. His first extended work, *A View of the State of Europe During the Middle Ages* (1818), was the result of ten years' preparation, occasionally relieved by intervals of Continental travel. His other important works are: *The Constitutional History of England from the Accession of Henry VII. to the Death of George II.* (1827), and *Introduction of the Literature of Europe in the Fifteenth, Sixteenth, and Seventeenth Centuries* (4 vols., 1837-39). Marked by conscientious and extensive research in original sources, by impartial analysis and criticism, together with ease and lucidity of style, these works long remained standard authorities, unsurpassed in their accuracy of details by the more extended modern works which have replaced them in the estimation of scholars. They went through several editions, and were translated into the leading European languages. In politics Hallam was a Whig; his candor and general temperament, however, unsuited him for the conflicts of parties, and he took no active part in them, but he displayed a genuine interest in all questions of social improvement. He acted with the Wilberforce party for the abolition of slavery, as well as in other humane schemes, and was one of the original promoters of the Society for the Diffusion of Useful Knowledge. In 1830 he was one of the recipients of the two fifty-guinea gold medals instituted by George III. for historical pre-eminence. Washington Irving received the other medal. Other honors included a D.C.L. degree, fellowship of the Royal, Antiquarian, and other learned societies, and trusteeship of the British Museum. Hallam's life was saddened by much domestic affliction, ten out of his eleven children, and his wife, having died before him.

HALLAM, ROBERT, Bishop of Salisbury. (c.1360-1417). An English ecclesiastic. Educated at Oxford, he was a prebendary of Salisbury Cathedral by 1394, and six years afterwards was Archdeacon of Canterbury. After having been chancellor of Oxford University (1403-05), he was made Bishop of Salisbury in 1407 and a cardinal in 1411. He was a noted reformer, a leader of the party which tried to assert the supremacy of the Papal Council over the Pope himself, and he maintained so high a standard of independence throughout his investigation of abuses, while preserving the unity of his Church, that his death was considered responsible for the reactionary movement of Roman Catholicism in England.

HALLBERG-BROICH, hăl'berg-broik, THEODOR MARIE HUBERT, Reichsfreiherr von (1768-1862). A German soldier and author, known also by the pseudonym Eremit von Gautine, born in the Duchy of Jülich. He entered the military service of the Electorate of Bavaria, and subsequently, after extensive travels, became so active a patriot in the German cause that he was imprisoned by the French invaders for eight months

in Paris. In 1813 he organized the militia forces enrolled between the Rhine and the Maas, and on January 6, 1814, crossed the Rhine at Coblenz in command of 30,000 troops. His writings, marked by original viewpoints and a somewhat bizarre style, include: *Reise durch Skandinavien* (1818); *Reise durch Italien* (1830); *Reise durch England* (1841); and *Deutschland, Russland, Kaukasus, Persien* (2 vols., 1844). Consult Giffel, *Leber des preussischen Generals Freiherrn von Hallberg-Broich* (Berlin, 1863).

HALLE, or **HALLE AN DER SAALE**, hăl'le än dër zäl'e (Lat. *Hallæ Saxonum*). An important city in the Prussian Province of Saxony, situated on the right bank of the Saale, and on a number of islets, in latitude 51° 29' N., and longitude 11° 58' E., 21 miles by rail northwest of Leipzig (Map: Prussia, D 3). Halle has broad promenades on the site of its ancient fortifications, and abounds in mediæval buildings and monuments. Among the prominent churches are the splendid edifice of Saint Maurice, founded in the twelfth century and containing a fine choir and altar, and a pulpit with reliefs; the sixteenth-century Marktkirche, with its four towers; and the cathedral, consecrated in 1523. The chief secular edifices and monuments are the Rathaus, dating from the fifteenth century and recently renovated; the Rote Turm, a clock tower 276 feet high, dating from the fifteenth century; the neighboring statue of Roland, erected at a more recent date; a statue of Handel, who was born here; the new Ratskeller, built in 1893, in the Gothic style, and used partly for municipal offices; the remains of the Moritzburg, the former residence of the archbishops of Magdeburg; the Archbishop's residence, adjoining the cathedral and containing some valuable collections of the provincial museum; and, lastly, the buildings of the famous university. (See HALLE, UNIVERSITY OF.) The interesting cemetery is like an Italian campo santo, and has handsome arcades. Besides the university the educational institutions include two gymnasias, the Francke Institutions (comprising a Latin high school, a 'real' school, a seminary for teachers, etc.); also the provincial museum with prehistoric antiquities, the municipal museum devoted to art, and the municipal theatre. Halle has a zoological garden and important hospitals, and is the seat of numerous historical, scientific, and economic societies.

It is a very important industrial town. At the head of the local industries for centuries has been the production of salt, which is obtained on an islet of the Saale, the yearly output amounting now to nearly 9000 tons. The workmen who are engaged in the salt-works are known as Halloren, and differ from the rest of the population of Halle in the matter of dialect and certain customs. In olden times they formed a separate caste. The metal industries developed greatly during the second half of the nineteenth century, and Halle has now over fifty large establishments for the manufacture of machinery, besides numerous establishments for the production of other iron and copper articles. There are also many starch factories. Additional manufactures are of chemicals, chocolate, cocoa, chicory, malt, sugar, beer, spirits, etc. Sugar-beets are raised in the vicinity, and there are brown-coal mines. The commerce, mostly in grain, sugar,

and colonial goods, is quite extensive, a considerable part of the traffic being by river. The town has good railroad connections. There is an electric street railway.

Halle is administered by a chief burgomaster, a burgomaster, an executive board of 16, and a municipal council of 54 members. The city owns the water-works, two gas plants, an electric plant since 1900, and an abattoir. The budget of 1902 balanced at \$1,625,600, the most significantly large item of expenditure being for education. The municipal debt amounted to \$6,116,124. Halle began to grow only in the second half of the nineteenth century. From 52,620 in 1871 the population, almost wholly Protestant, increased to 71,484 in 1880, 101,401 in 1890, and 156,611 in 1900, the extraordinary increase during the last decade being due to the annexation of suburbs.

Halle, first mentioned about 800 as the Castle of Halla, and as a town in 1064, is of very ancient origin. It was presented by Otho I. to the Archbishopric of Magdeburg, and began to grow in importance with the foundation of the monastery of Neuwerk in 1116. As a member of the Hanseatic League it attained considerable commercial prominence, and succeeded in freeing itself from the rule of the Archbishops of Magdeburg. Its independence, however, was of short duration, owing to the internal conflicts between the common people and the patricians, which gave Archbishop Ernest an opportunity to regain the town in 1478. The Reformation became an issue in Halle in 1522, and in 1541 a Lutheran superintendent was appointed. By the Treaty of Westphalia the town came into the possession of Brandenburg. Taken by the French in 1806, it was annexed to Westphalia in the following year, and passed to Prussia in 1813. Consult: Hertzberg, *Geschichte der Stadt Halle*, vols. i.-iii. (Halle, 1889-92); Schrader, *Geschichte der Universität Halle* (Berlin, 1895).

HALLE, UNIVERSITY OF. A German university which came into existence through the rivalry between conservative Saxony and progressive Brandenburg, and because the Hohenzollerns desired to have a more centrally located Lutheran university than that at Königsberg. The new foundation was united with a Ritter academy already existing, and was formally opened in 1694, with over 700 students. Thomasius and A. H. Francke were the most influential in determining the progressive character of the institution, which has been called the first modern university. In the earlier half of the eighteenth century it was preëminently the chief resort for Protestant Germany, having 1500 students on the average; later on, Göttingen became a strong rival. From the beginning, Halle was one of the leading theological schools of Germany, a distinction it has never lost, though it changed from its original pietism to a bold rationalism in the latter half of the eighteenth century. In the period of the Napoleonic Wars the university was twice suspended for its strong Prussian utterances. In 1817 the old and honorable University of Wittenberg (founded 1502) was united with it. The main university building was erected in 1832-34; nearly all the others in the seventies and eighties. Much attention is given to instruction in agriculture. Halle had in 1901 about 2000 students. The library, founded in 1696, contains over 210,000 volumes and 800 manuscripts, besides the Poniekau collec-

tion of books on Saxony and Thuringia with 15,000 volumes and 1000 manuscripts. Among the great names of Halle are those of Chr. Wolf, F. A. Wolf, Schleiermacher, Gesenius, Tholuck, Leo, and Bergk. Halle was also the seat of the scientific society *Academia Naturæ Curiosorum*, founded by J. B. Bausch in 1652, and now known as the *Leopoldinisch-Karolinische Akademie*. See *ACADEMY, passim*.

HALLE, *âl*, ADAM DE LA. See ADAM DE LA HALLE.

HALLÉ, *hâMê*, Sir CHARLES (or KARL HALLE) (1819-95). A German-English pianist and conductor. He was born at Hagen in Westphalia, his father being the town kapellmeister, and was regarded when but a young child as a musical prodigy. After serious study with Rink at Darmstadt, he went to Paris (1836), where he laid the foundation of all his subsequent success. He earned for himself a solid reputation during the twelve years of his stay there, and was in friendly contact with Cherubini, Chopin, Liszt, and Kalkbrenner. The political disturbances of 1848 caused his removal to London, where he was enthusiastically received. It was in Manchester, however, that he gained his most enduring fame, and did his best and most important work. He had been appointed director in 1853 of the Gentlemen's Concerts, and in 1857 commenced a series of subscription concerts with his famous orchestra, which up to the time of his death was the greatest musical educational factor in the north of England. Although his greatest interests were in Manchester, he was closely connected with the musical life of London, in 1861 performing all Beethoven's sonatas in eight matinée concerts. In 1880 he also produced Berlioz's *Faust* in the same city. In 1888 he was made a knight by the Queen (Victoria), and the same year married Madame Norman Neruda, with whom in 1890 and 1891 he made a tour of Australia. His compositions were entirely instrumental, and included many orchestral arrangements, and a method for the pianoforte. He died in Manchester.

HALLÉ, WILMA MARIA FRANCISCA, Lady. See NERUDA, WILMA MARIA FRANCISCA.

HALLECK, FITZ-GREENE (1790-1867). An American poet, born at Guilford, Conn. He was educated in Guilford, and in 1811 became a clerk in a New York bank, where he remained for twenty years. He was afterwards the confidential agent of John Jacob Astor in his commercial affairs, and was appointed by him one of the original trustees of the Astor Library in New York. In 1849 he retired to his native place, where he spent the remainder of his life. Halleck wrote verses from his boyhood, but in his collected poems he included nothing juvenile. In 1819 he became associated with Joseph Rodman Drake (q.v.) in contributing the humorous series of "The Croaker Papers" to the *Evening Post*. The illness of Drake soon put an end to these papers, and Halleck commemorated his friend's death in the most beautiful and best-known of his poems, beginning "Green be the turf above thee" (1820). His longest poem, *Fanny* (1819), is a satire on the literature, fashions, and politics of the time. It obtained a factitious popularity, but hardly repays reading. In 1822-23 Halleck visited Europe, and in 1827 published an edition of his poems, among them the popular and good

verses on "Alnwick Castle," and on "Burns." These, with "Marco Bozzaris" (1825), constitute his chief claim to remembrance as a poet of a slight though genuine lyric vein, and of distinct capacity for society verse, who was yet artist enough to confine his production to a very moderate compass. Consult: Wilson, *The Life and Letters of Fitz-Greene Halleck* (New York, 1869); *The Poetical Writings of Fitz-Greene Halleck*, edited by Wilson (ib., 1869).

HALLECK, HENRY WAGER (1815-72). An American soldier, the general-in-chief of the United States Army from 1862 to 1864. He was born in Westerville, N. Y., on January 16, 1815, studied for a time at Union College, and graduated at West Point in 1839. He then served for a year as assistant professor of engineering at West Point; was assistant to the Board of Engineers at Washington in 1840 and 1841; and from 1841 to 1846, except for a few months in 1845, when he was in Europe for the purpose of examining various public works, was assistant engineer in repairing the fortifications of New York harbor. Soon after his return from Europe, he delivered a series of lectures before the Lowell Institute of Boston, which he published in 1846 as *Elements of Military Art and Science*, which in a new edition (1858) was much used during the Civil War as a training manual for volunteer officers. In 1847, during the Mexican War, he was sent to the Pacific Coast, and here served as aide-de-camp to Commander Shubrick from October, 1847, to June, 1848 (for part of this period serving as Lieutenant-Governor of Mazatlán); was chief of staff during Lieutenant-Colonel Burton's campaign in Lower California, and from August, 1847, to December, 1849, served as Secretary of State for California under the military governments of Generals Mason and Riley. In 1849 he was a member of the California Constitutional Convention, and of the committee which draughted the State Constitution. From December, 1852, to August, 1854, he was inspector and engineer of lighthouses, and from April, 1853, to August, 1854, was also a member of the board of engineers for fortifications on the Pacific Coast. He resigned from the army on August 1, 1854; became a successful lawyer in San Francisco; was elected president of the Pacific and Atlantic Railroad in 1855, and from 1850 until 1861 was director-general of the New Almaden quicksilver mines. Soon after the outbreak of the Civil War he reentered the army (August 19, 1861), with the rank of major-general, and from November 9, 1861, to March 11, 1862, commanded the Department of Missouri, which then embraced Missouri, Iowa, Minnesota, Illinois, Arkansas, and western Kentucky. In this capacity he quickly put a stop to the speculations of contractors, thoroughly trained the disorganized troops, dismissed hundreds of placemen, and in general substituted order and system for the chaos which had resulted from his predecessor's laxity and incapacity. He planned the western campaign of 1862, and on April 11th assumed command in person at Pittsburg Landing (Shiloh). On May 30th his forces entered Corinth. On July 11th he was appointed General-in-Chief of the Armies of the United States, and at once proceeded to Washington, where he served in this capacity until March 12, 1864, after which, until April, 1865, he was chief of staff of the Army. He then was in command

successively of the Military Division of the James, the Division of the Pacific, and the Division of the South until his death. As a soldier he was a strict disciplinarian, an excellent organizer, and a skillful strategist; but his genius was more adapted to the map than to the field, and on many occasions he is considered to have fallen far short of the requirements of a general-in-chief. He published: *Bitumen: Its Varieties, Properties, and Uses* (1841); *A Collection of Mining Laws of Spain and Mexico* (1859); *International Law, or Rules Regulating the Intercourse of States in Peace and War* (1861; abridged ed. for schools and colleges, 1886); and a translation of Jomini's *Vie politique et militaire de Napoléon* (1864).

HALL EFFECT. See ELECTRICITY.

HALLEIN, hăl'in. A town in Salzburg, Austria, 10 miles south of the city of Salzburg, on the right bank of the river Salza (Map: Austria, C 3). It is noted for its extensive salt-works and saline baths, and has also important cotton, needle, and button factories. The Dürnberg, a mountain 2388 feet above the level of the sea, contains the largest salt-mine in the Austrian Salzkammergut, from which the salt is conveyed in large wooden conduits to the works within the town. Good rock salt is also obtained from Dürnberg. Hallein dates from the tenth century. Population, in 1890, 5200; in 1900, 6600.

HAL'LEL (Heb., praise). A part of the Jewish hymnal service. The term usually signifies the Egyptian Hallel, so called because of its connection with the Passover festival. This Hallel comprises Psalms cxiii.-cxviii., and is chanted in synagogues on the festivals of the Passover, Pentecost, Tabernacles, and the eight days of the Hannucah festival or Feast of Lights, and also at the close of the meal on the first evening of the Passover. It was this Hallel, or at any rate part of it, that was sung by Christ and His disciples at the Passover meal (Matt. xxvi. 30; Mark xiv. 26). Another Hallel, called the 'great Hallel,' was a general thanksgiving chant. Jewish authorities dispute in the Talmud as to what Psalms it should include. Some identify it with the usual Hallel (Psalms cxiii.-cxviii.); others make it Psalms cxx.-cxxxvi., cxxxv. 4-cxxxvi., or cxxxvi. alone.

HALLELUJAH, hăl'lê-lôô'yâ, or **ALLE-LUIA** (Heb. *Halelu Yâh*, praise ye Yahweh). An ascription of praise to God derived from the Old Testament, where it appears at the end of certain psalms, and in general use as an expression of thankfulness. It is retained in the Greek and Latin liturgies in the original form, and was so also by the Church of England in the first Prayer-Book of Edward VI., though it is now translated by "Praise ye the Lord." Being an expression of gladness and triumph, it was reserved for seasons and festivals which expressed these emotions. Thus, in the Roman Catholic Church, it is never used from Septuagesima to Easter; and in some mediæval office books, the office of the Saturday before Septuagesima made a special mention of it, even personifying it, and taking a quaint and tender farewell of it: "Thou shalt go from us, O Alleluia; thou shalt return to us again in peace, O Alleluia." During the entire Easter season, on the contrary, and also in a

slightly less degree during the octaves of Christmas, Epiphany, and Corpus Christi, it is used continually at the end of antiphons, introits, communions, and other parts of the service. The three-fold repetition of it at the end of the mass, called the greater Alleluia, was in the Middle Ages sung by the deacon to a very prolonged melody or neuma. (See NEUMES.)

HALLELUJAH VICTORY. The name given to the victory of the Britons over the Picts, at Mold, Flintshire, Wales, March 30, 430, from the war-cry of the former, which had been suggested by Saint Germain, Bishop of Auxerre, on the eve of the battle.

HALLÉN, hál-lán', ANDERS (1846-). A Swedish dramatic composer, born at Göteborg. He was educated under Rheinberger, Reineke, and Rietz, and from 1872 to 1878 was conductor of the Göteborg Musical Union, although he had important interests in Berlin, and resided there most of the time. He composed several important operas, which received their first presentation at the Royal Opera, Stockholm, of which in 1892 he became musical conductor; and also published numerous German and Swedish songs. His music, not generally known outside of Sweden and Germany, is exceedingly popular among the Swedish singing societies of the United States. His compositions include the operas *Harald der Viking* (1881), *Hexfallen* (1896), the song-cycles *Vom Pagen und der Königstochter* and *Traumkönig und sein Lieb*, symphonic poems, and choral rhapsodies.

HALLER, hál-lér, ALBRECHT VON (1708-77). An eminent physiologist, anatomist, botanist, and poet, born at Bern, Switzerland. Two years after the death of his father, an able lawyer, he went, in 1723, to the University of Tübingen, where he became the pupil of the anatomist Duvernoy. In 1725 he removed to Leyden, where he obtained the degree of doctor of medicine in 1727. He then visited London, whence he proceeded to Oxford, and afterwards to Paris, where for six months he studied anatomy and botany; later he became the pupil of Johann Bernoulli, the celebrated mathematician, at Basel. He returned in his twenty-second year to his native city, and commenced practice as a physician. The professor of anatomy, Meig, having fallen ill, Haller undertook the duties of his class; he likewise devoted much of his time about this period to the botany of the Alps, and also published a descriptive poem, *Die Alpen*. In 1735 he was appointed physician to the hospital, and shortly afterwards principal librarian and curator of the cabinet of medals; but in 1736 he left Bern to become professor of medicine, anatomy, botany, and surgery in the new university at Göttingen. For the next eighteen years he devoted himself wholly to teaching and to original research. He took an active part in the formation of the Royal Academy of Sciences of Göttingen, and the memoirs of the society contain many of his papers. During the period from 1736 to 1753 he published 86 works on medical subjects. He was appointed physician to the King of England in 1739. In 1753 he returned to Bern. Among his most important writings are his *Elementa Physiologicæ Corporis Humani* (1757-66)—by far the most important of his works—and his four *Bibliothecæ*, or critical catalogues of

works on botany, surgery, anatomy, and medicine. Haller's eminence as a man of science was duly recognized in his own lifetime. He was ennobled by the Emperor of Germany in 1748, and the universities of Oxford and Utrecht in vain endeavored to obtain him as their professor. His name is especially connected with the doctrine of muscular irritability. (See MUSCLE.) While his name is indelibly recorded in the annals of science, it should also be remembered that by his work as a poet Haller greatly contributed to the movement which toward the end of the eighteenth century brought new life to German poetry. Others of his works were: *Icones Anatomicæ* (1743-50); *Opuscula Pathologica* (1755); and *Opuscula Botanica* (1749). For his *Life*, consult Frey (Leipzig, 1879).

HALLES, ál, LES. A large building on the Grande Place of Bruges, Belgium, erected in the thirteenth century, now used as offices of the city Government, and as a market. Its massive belfry, 350 feet in height, is the subject of Longfellow's poem "The Belfry of Bruges." It contains a remarkable set of chimes dating from 1748.

HALLES CENTRALES, ál sán'trá'l'. The great central market of Paris, an enormous group of metal structures consisting of a system of pavilions planned to cover 22 acres. Between the pavilions are covered streets 48 feet in width, with a roof about 48 feet above the ground, intersected by an avenue 105 feet wide. Each pavilion is divided into 250 small shops, rented for 20 centimes a day, and beneath are cellars 12 feet in height. The provisions sold in the market are brought during the night in wagons, the total number of which is estimated at 15,000. The early hours of the morning to 8 o'clock in summer and 9 in winter are devoted to auction sales, after which the retail trade commences.

HALLETT, BENJAMIN FRANKLIN (1797-1862). An American statesman and editor, born at Barnstable, Mass., son of Benjamin Hallett (1760-1849), the ship-master and founder of sailors' Bethels. He was educated at Brown University, studied law, worked on a paper in Providence, R. I., and in 1827 became editor of the *Boston Advocate*, from which he resigned in 1831, because his crusades against Masonry, against slavery, and in behalf of temperance were ruining the subscription list. He turned against Henry Clay when the latter refused to commit himself to the Anti-Masonic Party; and when Masonry no longer was an issue, Hallett joined the Democratic Party. Long chairman of its national committee, he did much to nominate Pierce and Buchanan. He was appointed district attorney by the former in 1853, and wrote the Democratic platform in 1856.

HALLETTE, á'let', A. (1788-1846). A French mechanic, born at Arras, where he founded a machine-shop. He improved the hydraulic press used for the extraction of oil, and invented a new system of propulsion tubes for atmospheric locomotives, the *tube propulseur Hallette*. Consult his monograph with that title (Paris, 1844).

HALLETTSVILLE. A city and the county-seat of Lavaca County, Tex., 101 miles west by south of Houston; on the San Antonio and Aransas Pass Railroad (Map: Texas, F 5). It carries on considerable trade in cotton, cottonseed

oil, and live-stock; and has several cotton-gins, a cottonseed-oil mill, etc. The water-works and electric light plant are owned by the municipality. Population, in 1890, 1011; in 1900, 1457.

HALLEVI, JUDAH. See HALEVI, JUDAH.

HALLEY, EDMUND (1656-1742). An English astronomer and mathematician, born at Haggerston, London, the son of a soap-manufacturer. He was educated at Saint Paul's School, and afterwards at Queen's College, Oxford, which he entered in 1673. In 1676 he published a paper on the orbits of the principal planets; also observations on a spot on the sun, from which he inferred its rotation round its axis. In November of the same year he went to Saint Helena, where for two years he applied himself to the formation of a catalogue of the stars in the Southern Hemisphere, which he published in 1678 (*Catalogus Stellarum Australium*). On his return he was chosen a Fellow of the Royal Society, and deputed by that body to go to Danzig to settle a controversy between Hooke and Hevelius as to whether it is profitable to use telescopic or plain sights for astronomical observations. In 1680 he made a tour of the Continent, during which he made observations with Cassini at Paris on the great comet which goes by his name, and the return of which he predicted. His observations on this comet formed part of the foundation of Newton's calculation of a comet's orbit. Halley returned to England in 1681, in 1683 published his theory of the variation of the magnet, and the next year made the acquaintance of Newton. In 1686 Halley published an account of the trade winds and monsoons on seas near and between the tropics, and in 1692 his hypothesis relative to the change in the variations of the magnetic needle. To test the truth of this by obtaining measures of the variations in different parts of the world, he was sent in 1698 in command of a ship to the Pacific; but his crew mutinied, and he was obliged to return. The next year, however, he sailed again, and the result of his observations was a chart for which he was rewarded by the rank of captain in the navy with half pay for life. Soon after he made a chart of the tides in the channel, and surveyed the coast of Dalmatia for the Emperor of Austria. On the death of Wallis, in 1703, he was appointed Savilian professor of geometry at Oxford. In 1705 he published his researches on the orbits of the comets. In 1713, on the resignation of Sir Hans Sloane, he became secretary of the Royal Society; in 1716 he made valuable experiments with the diving-bell, which were afterwards published; and in 1721, after the death of Flamsteed, he became astronomer royal. In this office, and engaged especially in studying the moon's motions, he passed the rest of his life. In 1729 he was chosen a foreign member of the Academy of Sciences, Paris. Halley was the author of numerous other researches of great importance besides those mentioned. His *Tabulæ Astronomicæ* did not appear till 1749. Among his principal discoveries may be mentioned the long inequality of Jupiter and Saturn, and that of the slow acceleration of the moon's mean motion. He was the first to predict the return of a comet, and also to recommend the observation of the transits of Venus with a view to determine the sun's parallax. See COMET.

HALLEY'S COMET. See COMET.

HALLIARDS, or HALYARDS (probably a variant of *hallier*, from OS. *halian*, OHG. *halōn*, *holōn*, Ger. *hollen*, Eng. *hale*, to haul; connected with Lat. *calare*, Gk. *καλεῖν*, *kalein*, to summon; explained by popular etymology as *haulyards*, or *haleyards*). Ropes used to hoist yards, gaffs, sails, etc. They usually take their name from the object hoisted; as, *topsail* halliards, *jib* halliards, *ensign* halliards, etc.; but in some instances they have other designations, the *crow-foot* halliards (so called because it is made fast to the awnings by several small lines spread out in fancied resemblance to a bird's foot), *throat* and *peak* halliards on gaffs, etc.

HALLIWELL-PHIL/LIPPS, JAMES ORCHARD (1820-89). An English antiquary and biographer of Shakespeare, born in Chelsea, London. His taste for original research was exhibited while yet a student at Cambridge, and he was made a fellow of the Royal Society and of the Society of Antiquaries when but eighteen years old. After the founding of the Shakespeare Society in London (1841), he gradually devoted more and more of his time to the study of the great dramatist. Rejecting the popular method of constructing the poet's biography from internal evidence, Halliwell discredited the personal application even of the sonnets, and set himself through years of investigation to collect and sift contemporary and traditional evidence to be found chiefly in Stratford-on-Avon and neighboring villages. The result of his labor was issued in his *Outlines of the Life of Shakespeare* (1st ed. 1881; 9th ed. 1890), but before he left the ranks of Shakespearean critics he had published a superb folio edition of the plays (16 vols., 1852-65). In 1863 he was largely instrumental in preventing the sale of Shakespeare's birthplace, and the foundations of New Place, where he died, and he aided generously in turning the one into a museum, and clearing the site of the other. Ever open to give and receive suggestions or criticisms from other Shakespearean students, his assistance was valuable, both directly and indirectly, through the collections of old literature and Shakespearean and other documents he presented or bequeathed to the Chetham Library, Manchester (1851), Smithsonian Institution, Washington (1852), the Penzance public library (1866-88), the Edinburgh University Library (1872), and the Birthplace Museum (1889). Many of his own numerous books were printed for private circulation only.

HALL MARKS. See PLATE MARKS.

HAL/LOCK, GERARD (1800-66). An American journalist, born at Plainfield, Mass. He graduated at Williams College in 1819, taught at Amherst Academy (1819-21), and after a short course at Andover, at Salem. In 1824 he started the *Boston Telegraph*, which was united with the *Recorder* a year later. He acquired a part interest in the *New York Observer* in 1827, and in 1828 joined David Hale in the management of the *Journal of Commerce*. He built a schooner, the *Evening Edition*, which met incoming vessels at Sandy Hook and brought back news; and in 1833 established a pony express between New York and Philadelphia, which gave the *Journal of Commerce* another great advantage. Hallock opposed abolition, but did much to further libera-

tion of the slaves. He was one of the founders of the Southern Aid Society (1854); and in 1861 the use of the mails was forbidden his paper, and he was indicted for 'encouraging rebels.' Unwilling to give up his principles, he retired from journalism, and lived at Hallock's Castle in New Haven, where he was known as a liberal and generous citizen. Hallock was one of the founders of the Associated Press of New York.

HALLOCK, WILLIAM ALLEN (1794-1880). An American editor, brother of Gerard Hallock. He was born at Plainfield, Mass., and was educated at Williams College and at Andover Theological Seminary. From the foundation of the American Tract Society (1825), he was its corresponding secretary until ten years before his death. He edited the *American Messenger*, and in addition to his labors as editor and reviser of the publications of the society, wrote several biographies and many tracts. Consult Knight, *Memorial of William Allen Hallock* (New York, 1882).

HALL OF FAME. See RUMESHALLE.

HALL OF FAME FOR GREAT AMERICANS. A structure on the grounds of the New York University, completed in 1900, and designed to commemorate the achievements of distinguished citizens of the United States. It consists of a colonnade, 500 feet in length, following the curve of a terrace which supports three of the university buildings, and resting on a granite corridor which contains a long hall and five rooms, intended for a museum for the preservation of portraits and mementos of those whose names are inscribed in the colonnade. The colonnade contains 150 panels seven feet long and one and one-quarter feet high, designed to be filled by bronze tablets bearing the name of the person commemorated, the dates of his birth and death, and a selection from his writings. The agreement between the university and the donor of the Hall of Fame provided that no name shall be inscribed except of a person born in what is now the territory of the United States, and of a person who has been dead at least ten years. Fifty names, if selected, were to be inscribed during 1900, and five additional names every five years thereafter, completing the full number by the year 2000. Nominations were received from the general public by the University Senate, who transmitted the names seconded by any member to a board of 100 electors selected from educators, writers, and others interested in American history, 51 votes being necessary to a choice, subject to the final approval of the University Senate. The first fifty names were required to include representatives of a majority of fifteen classes: authors and editors; business men; educators; inventors; missionaries and explorers; philanthropists and reformers; clergymen and theologians; scientists; engineers and architects; lawyers and judges; musicians, painters, and sculptors; physicians and surgeons; rulers and statesmen; soldiers and sailors; distinguished men and women outside these classes. Panels left vacant by these restrictions may be filled the ensuing year. The announcement of the new foundation created wide interest. It was favorably considered by the press, and some papers offered prizes for the lists of names which should approach most closely to the final choice of the

electors. The Senate received over 1000 names, of which 200 were submitted to the electors, who were themselves invited to add to the nominations. From the names suggested, the electors chose 29, as follows: George Washington, Abraham Lincoln, Daniel Webster, Benjamin Franklin, Ulysses S. Grant, John Marshall, Thomas Jefferson, Ralph Waldo Emerson, Robert Fulton, Henry Wadsworth Longfellow, Washington Irving, Jonathan Edwards, Samuel F. B. Morse, David G. Farragut, Henry Clay, George Peabody, Nathaniel Hawthorne, Peter Cooper, Eli Whitney, Robert E. Lee, Horace Mann, John James Anderson, James Kent, Henry Ward Beecher, Joseph Story, John Adams, William Ellery Channing, Gilbert C. Stuart, Asa Gray. Of the remaining names, those which received the votes of ten or more electors were by that fact placed in nomination for the next election.

HALLOPEAU, á'ló'pó', FRANÇOIS HENRI (1842—). A French physician, born in Paris and educated there. He was appointed hospital physician in 1877, and became a member of the Academy of Medicine in 1893. Besides special monographs on diseases of the skin, Hallopeau wrote a standard *Traité élémentaire de pathologie générale* (4th ed. 1893).

HAL/LORAN, LAWRENCE HAYNES (1766-1831). An English poet and author, born probably in Ireland. He was first a teacher in a private school near Exeter. Afterwards he took orders, and was chaplain in the English fleet during the battle of Trafalgar. He published a descriptive poem, "The Battle of Trafalgar," in 1806. He went to South Africa as chaplain to the forces there, but owing to his defense of two officers court-martialed for dueling in 1810, and his satirical pamphlet, *Cap-Abilities, or South African Characteristics* (1811), he was banished. On his return to England he led a wandering life, and was ultimately condemned to seven years' transportation for forgery. He opened a school in Sydney, Australia, where he died. His works include: *Odes, Poems, and Translations* (1790); *Lacrymæ Hibernicæ, or the Genius of Erin's Complaint* (1801); and *The Female Volunteer*, a drama (1801).

HALLOW-EVEN, or HALLOWE'EN. The name popularly given to the eve or vigil of All Hallows, or festival of All Saints, which being the 1st of November, Hallowe'en is the evening of the 31st of October. In England it was long customary to crack nuts, duck for apples in a tub of water, and perform other harmless fireside revelries. Sometimes there were ceremonies of a more superstitious character, as, for example, charms to discover who should be the husband or wife of the person inquiring. Consult Brand, *Popular Antiquities*, edited by Ellis (London, 1813).

HALLOW-FAIR. A market held in some places in Scotland during November, i.e. at Hallowtide.

HALLSTATT (hál'stát) **EPOCH.** The name applied to the last stage of bronze or the first stage of iron culture in Europe. It is so called from the necropolis of Hallstatt, Upper Austria, near the border of Salzburg. It is associated with the Celtic language group and the Alpine race of Ripley, who characterizes the

Hallstatt culture of the eastern Alpine highlands as more highly evolved than that of the Neolithic period in the West due to Oriental influences. It appeared a thousand years or more before the Christian Era. It flourished chiefly in Carinthia, Southern Germany, Switzerland, Bohemia, Silesia, Bosnia, Southeastern France, and Southern Italy. Consult Deniker, *Races of Man* (London, 1900).

HÄLLSTRÖM, häll'strēm, IVAR (1826—). A Swedish composer, born in Stockholm. He was educated for the legal profession, and was private librarian to the Crown Prince, who became Oscar II. of Sweden. In 1861 he was appointed the successor of Lindblad as director of the National School of Music at Stockholm. He is essentially a national composer, and all his writing is marked by the characteristics of Scandinavian music in general, and the Swedish folk-music in particular. He composed several operas, the most successful of which was *Den Bergtagna*, or the *Mountain King*. Other works include the operas, *Hertig Magnus*; *Den förtrolade katten*, or *The Enchanted Cat*; *Neaga*, or *Nyaga* (libretto by Carmen Sylva); *Idyl* for soli, chorus, and orchestra, which, in 1860, won the prize of the Musical Union of Stockholm.

HALLUCINATION (from Lat. *hallucinatio*, *alucinatio*, hallucination, from *alucinari*, to wander in mind). In the states of dreaming, hypnosis, and insanity (q.v.), we find a derangement, temporary or permanent, of the normal train of ideas (see ASSOCIATION) and their attendant affective processes; in hallucination and illusion (q.v.) we have an abnormal condition of single ideas or representations. (See IDEA.) An illusion may be defined here, provisionally, as a distorted perception; an hallucination is "an image of memory which differs in intensity from the normal" (Wundt), a centrally aroused idea which by its strength and vividness simulates the reality of an external object, and is, therefore, accepted as real by the perceiving subject. Hallucinations are characteristic of certain forms of insanity; the religious visionary holds intercourse with the Virgin Mary; the melancholic hears insulting or threatening voices (delirium of persecution). Sane persons, especially those engaged in intellectual pursuits, are also liable to hallucinations after a period of concentrated mental work. The commonest forms of hallucination are, perhaps, the 'hypnagogic,' visions or voices seen or heard in the drowsy interval preceding sleep. Hallucinations are ordinarily auditory or visual, though they may also arise within the spheres of taste, smell, and touch.

Hallucinations may be set up by hyperæmia of the brain, membranes, and cortex; by the action of drugs (morphium, ether, etc.); and by disturbances of brain nutrition, resulting in anæmia. The common factor in all these cases is a deposition, in the cerebral cortex, of products of decomposition, which at first enhance the irritability of the area affected, and presently serve themselves as stimuli to brain action.

BIBLIOGRAPHY. Wundt, *Grundzüge der physiologischen Psychologie*, vol. ii. (Leipzig, 1893); Mueller, *Ueber die phantastischen Gesichtserscheinungen* (Coblenz, 1826); Brière de Boismont, *Des hallucinations* (Paris, 1845); Sully, *Illusions* (New York, 1881); Parish, *Hallucinations and Illusions* (New York, 1897).

HALLUF. See WART-HOG.

HALLUIN, a'lwān'. A town in the Department of Nord, France, on the Belgian frontier (Map: France, K 1). It has extensive manufacturing establishments of cotton, linen, etc. Population, in 1901, 16,500.

HALLUX VAL'GUS (Lat., wry toe). The technical name of a deformity of the great toe, which is generally caused by wearing too small a shoe, the toe, for lack of room, being forced out of its normal position so that it sometimes overlaps the other toes. This malformation, which is most common among women, not unfrequently results in osseous changes which may necessitate amputation of the toe.

HALLWICH, häll'vik, HERMANN (1838—). An Austrian politician and historian, born at Teplitz, and educated at Prague. From 1871 to 1897 Hallwich was a member of the Austrian House of Deputies, allied with the German Left, and prominent as a speaker on questions dealing with commerce and tariff. As an historian he is best known as an ardent defender of Wallenstein. He wrote: *Wallensteins Ende. Ungedruckte Briefe und Akten* (1879); *Heinrich Matthias Thurn als Zeuge im Prozess Wallenstein* (1883); and *Gestalten aus Wallensteins Lager* (1885).

HALM, FRIEDRICH, the pseudonym of MÜNCH-BELLINGHAUSEN, E. F. J., Baron von (q.v.).

HALM, hällm, KARL (1809-82). A German philologist, born at Munich in 1809. From 1839 he taught at Speier and Hadamar; in 1849 he became rector of the newly founded Maximilians-gymnasium at Munich, and in 1856 professor in the university there and director of the royal library. His principal works are critical editions of *Cicero* (1845-56), *Quintilian* (1868-69), and *Cornelius Nepos* (1871); *Cicero's Orations with commentary* (1845-48); and *Select Orations of Cicero* (1854-66); in the Teubner series, *Æsop's Fables* (1852), *Florus* (1854), and *Tacitus* (4th ed. 1891). His shorter treatises comprise: *Lectiones Stobenses* (Speier, 1841-42); the *Catalogue of the Fathers of the Latin Church Library* (1865); and his rich *Catalogue of the Munich Library*, vol. i. (1865).

HALMA, a'l'má', NICOLAS (1755-1828). A French mathematician, born at Sedan, and educated there and in Paris. He took holy orders, and was principal of the college at Sedan (1791-93). Removed from this position by the suppression of the colleges, he went to Paris and was in quick succession engineer, surgeon, professor at the Prytanée and at the Military School of Fontainebleau, librarian and instructor of the Empress, and librarian of the Department of Bridges and Highways. Then he undertook, at the instance of Delambre, the translation of Ptolemaeus on astronomy, together with the commentaries of Theon on the first two books, and other material (1813-16). But the success and merits of his work were small, and an appointment as assistant curator of the Bibliothèque Sainte Geneviève and as canon of Notre Dame were much more remunerative. His further works include translations and criticisms of Greek mathematicians and chronologists, and text-books of geography, besides many miscellaneous writings.

HALMAHERA, häll'má-há'rá. An island of the Moluccas. See GILOLO.

HALMOTE, or **HALIMOTE** (from *hall* + *mote*, AS. *gemot*, assembly). An ancient English court, held by the lord of a manor for the purpose of administering the laws and customs of the manor. It was composed of the freeholders of the manor, and came later to be known as the *Court Baron* or manorial court. See **COURT BARON**.

HALMSTAD, hälm'städ. A town in Sweden, and capital of Halland Län, situated at the mouth of the Nissa on the east shore of the Cattegat, about 76 miles south-southeast of Göteborg (Map: Sweden, E 8). The town possesses a castle, now the residence of the Governor; a church dating from 1462, and a high school. It is an important railroad centre, and has regular steamship connection with most of the Swedish coast towns as well as with Copenhagen and Lübeck. It is the chief export town for a large part of Southern Sweden. The chief manufactures are cloth, beer, and machinery. The town exports lumber, fish (the river abounding in salmon), oats, butter, and woolen goods; the chief imports are food-stuffs, fertilizers, petroleum, and jute. Population, in 1901, 15,400. Halmstad received municipal privileges in 1307, and has been the scene of many important events in the history of Sweden, among them the defeat of the Danes by Charles XI. in 1676.

HALO (Lat. *halos*, from Gk. *ἅλως*, halo, disk, threshing-floor, from *ἀλείν*, *halein*, to grind). The general name given to a class of optical phenomena, described more specifically as **GLORY**, **CORONA**, **ANTHELIA**, **PARHELIA**, **MOCK SUNS**, **SUN-DOGS**, **PARASELENA**, **MOCK MOONS**, etc. When the light of the sun or moon or bright star shines through a delicate cloud, or layer of fog or mist, a variety of optical phenomena are produced which may be classified as (a) circular rings around the sun or moon or star as a centre; (b) horizontal rings around the zenith as a centre; (c) partial arcs around the sun or the zenith; (d) vertical columns of light either through the sun or moon, or through points around the horizon symmetrically placed with reference to the sun; (e) elliptical rings around the central luminary. If the observer is so located that his shadow is projected upon a cloud, a bank of fog, or a meadow covered with drops of dew, he may see similar circles of light around his shadow or his anti-solar point, which circles have been described under **ANTHELIA**. The circles around the sun really occur much more frequently than those around the moon, but are less frequently observed, owing to the brightness of the sun; they can, however, easily be seen by viewing the reflection of the sky in the surface of still water or an unsilvered glass plate.

Halo is the general term by which we designate a variety of optical phenomena whose study is a branch of physical optics. The circular rings of class (a), when they are quite near the sun, namely, within fifteen degrees, and, in fact, usually within five degrees, are the result of the interference of waves of light that have passed around the minute globules of water, or sometimes of dust, in the hazy atmosphere. This process was called diffraction by Sir Isaac Newton, who showed that in the rear of every small object there is a bright spot instead of a shadow, and surrounding this bright spot a series of concentric rings or bands of brilliant colors. If

one looks at the sun through a mass of small particles or fibres of rather uniform size, as those of wool, a similar series of concentric rings will be seen, the angular diameter of which increases as the diameters of the fibres diminish; on this principle Dr. Thomas Young based the construction of his eriometer for the determination of the diameter of small particles and the fibres of textile materials. The largest rings that have been seen about the sun are those known as Bishop's rings, observed after the eruption of Krakatoa. These are about ten, twelve, or fifteen degrees in radius, and must have resulted from the presence of a very delicate layer of the finest imaginable dust or aqueous globules whose diameters probably did not exceed 0.0002, or one five-thousandth of an inch. On the other hand, particles that have a diameter of 0.0013 may produce rings having a radius of one degree, which would, therefore, very closely encircle the sun or moon, whose radius is only one-quarter of one degree. All these circles are known as 'glories.'

For large globules of water, such as compose the lower clouds, the diffraction phenomena become inappreciable, and are replaced by more complicated phenomena of reflection and refraction. In the higher alto-stratus and alto-cumulus clouds formed of small globules of water the range of diameters is usually rather large, and a series of overlapping circles is seen when the sun or moon is behind them. In the highest cirrus clouds the particles of ice form more delicate circles. For particles of a much smaller size than those that usually occur in clouds, the phenomena of diffraction are replaced by the colors of thin plates. Brilliant illustrations of these clouds occurred in the green, blue, and red suns seen when the sun was examined through the clouds of vapor that were thrown off by the eruption of Krakatoa in 1883. The study of this subject led to the experiments by Kiessling, and more especially by Dr. Carl Barus, whose publications on cloudy condensation form the stepping-stones to our present limited knowledge of the growth of minute water-globules from a diameter somewhat less than the tenth of the length of the sodium-wave up to a diameter equal to that wave-length itself. Consult *Bulletin* No. 12, United States Weather Bureau, 1895.

In the small circles or glories referred to, the red circles are outermost, and the blue ones within; the term 'halo' is applied by meteorologists more especially to circles of larger radius formed by reflection and refraction within the drops of water, such as the rainbow and the halos of twenty-two and twenty-five degrees radius. In rainbows or halos formed by one reflection the red is innermost, namely, on the side toward the sun; and the blue is outermost, or away from the sun. Circles formed by two reflections have the red outside and the blue inside.

The complex and beautiful halo phenomena that are seen in the winter time result from the reflection and refraction of light by innumerable crystals of ice or simple snowflakes, which produce, in general, a hazy appearance in the air. When the sky is cloudless and of a pale blue near the zenith, these crystals of ice, settling down very slowly through the still air, may be sufficiently numerous to reflect enough sunlight to produce gorgeous effects. The simplest ice crystal is a regular hexagonal prism whose ends are either planes perpendicular to the axis or

more commonly hexagonal pyramids. When a ray of light within a prism strikes an inner surface at an angle of incidence of about 80.5° it is totally reflected. When a beam of light passes through the two sides of a prism whose angle is 60° , in such a way as to suffer the minimum deviation, the latter will amount to about $21^\circ 50'$. Bearing these principles in mind, as also the fact that in an ordinary cloud the prisms have every possible position, we see that the general result will be that crystals that are near the position of minimum deviation will conspire to refract the light in the same direction; some of the others will send the light in any direction, so the general result will be a bright circle of light surrounding the sun as a centre; its angular radius from the sun will be about $21^\circ 50'$, or the so-called halo of 22° , which has a dark interior, an inner reddish edge, and a bright exterior.

In still air the slender prisms of ice are likely to be suspended more nearly vertically. Therefore, their surfaces reflect a little sunlight as from a vertical mirror to the eye. When the observer is in the midst of a cloud or fog of such prisms, he sees a reflection of the sunlight forming a band of white light around the horizon at about half the apparent angular attitude of the sun. This is called the *parhelic circle*. When other combinations of reflections from snow crystals occur so as to double or treble the brightness of particular spots in this parhelic circle, these spots are called mock suns, sun-dogs, or parhelia. A vertical arc may be produced by the reflections from the horizontal surfaces of snowflakes, and this arc may extend for a very considerable distance above and below the sun.

The most brilliant attendant of a halo is the tangential arc, which is sometimes seen touching the halo of 46° at its summit; it can only be seen when the sun's altitude is between 12° and 30° , and is due to the reflection of the sunlight through ice needles whose refracting edges are horizontal. The geometrical study of halos was most thoroughly worked out by Bravais, in his memoir of 1847 in the *Journal de l'Ecole Polytechnique*, vol. xviii. (Paris); it is also quite fully presented by Mascart, *Traité de l'optique* (Paris, 1896). The complete application of the theory of interference to the explanation of the phenomena of the supernumerary rings that accompany halos, and especially rainbows, was given by Dr. Thomas Young in 1804, but has more recently been presented in both elementary and analytical methods by Dr. J. Pernter, of Vienna. The idea that cloudy particles are not solid small spheres of water, but hollow vessels like a soap-bubble, was abundantly disproved by Clausius, but still finds occasional mention in popular text-books. However, the arguments for and against this vesicular theory (consult Kober, in Poggenhorn's *Annalen*, Berlin, 1871) show that it can have no standing in science. An exhaustive work on optical meteorology was in course of preparation in 1903 by Prof. J. Pernter of Vienna.

HALOANDER, hä'ló-án'dér, GREGORIUS (1501-31). A German jurist whose family name was Meltzer. He was born at Zwickau, and was educated in Leipzig. He published, at Nuremberg, under the protection and with the help of Wilibald Pirckheimer: the *Pandectæ* (1529); *Institutiones* (1529); *Codex Justinianus* (1530);

and, in Greek with a Latin version, *Novellæ Constitutiones* (1531). He also edited Epictetus's *Enchiridion* (1529). Consult: Schmidt, *Symbolæ ad Vitam Gregorii Haloandri* (Leipzig, 1866), and Flechseg, *Gregor Haloander* (Zwickau, 1872).

HALOGENS (from Gk. ἅλς, *hals*, salt + -γενής, *-genēs*, producing, from γίγνεσθαι, *gignesthai*, to be born). The name given to the four non-metallic elements, fluorine, chlorine, bromine, and iodine. The term was originally used by Berzelius, on account of the ease with which these elements form salts. The halogens combine directly with many of the other elements, much heat being evolved in the process. With hydrogen, they form the well-known hydrofluoric, hydrochloric, hydrobromic, and hydriodic acids, respectively. The halogens exhibit an unmistakable gradation of physical properties. Thus, fluorine is a colorless gas; chlorine is a yellowish-green gas easily condensed to a liquid; bromine is a dark-red volatile liquid; iodine is a lustrous grayish-violet solid. See FLUORINE; BROMINE; CHLORINE; IODINE.

HALOPHYLOUS PLANT (from Gk. ἅλς, *hals*, salt + φίλος, *philos*, loving). See HALOPHYTE.

HALOPHYTE (from Gk. ἅλς, *hals*, salt + φυτόν, *phyton*, plant). Plants which grow naturally in soils or waters rich in various salts, especially those with alkaline reactions. Common salt is quantitatively much the most important of these substances, although in certain localities alum, saltpetre, and other salts are abundant.

HALOPHYTES.

Longitudinal section of the stem of samphire, showing obliquely arranged palisade cells, also isolated water tracheids.

enough to be of ecological importance. The vegetation of the oceans and salt seas and lakes, as well as that along their marshy shores, represents the greater part of the halophytic vegetation of the world; however, there are great interior halophytic areas in arid climates, where seas or salt lakes have formerly existed. Sometimes salt springs or small areas of salty soil disclose a halophytic vegetation. While a great many species have, perhaps, become perfectly adjusted to soils or waters rich in salt, it is, nevertheless, true that these conditions are unfavorable for the development of the great majority of plants; and experiments have shown that many halophytes may grow as well, if not better, in soils or waters

with a low salt content. This is not true, however, in the case of such extreme halophytes as the marine algae.

EFFECTS OF SALT ON THE GROWTH AND STRUCTURE. Almost all plants can take up limited quantities of ordinary salt without injury, although most plants probably do not need it in their normal life processes. All but natural halophytes and a few xerophytes soon perish if large quantities of salt are present in the soil. Probably the injurious effects of salt are due to the increased difficulty of osmotic absorption by the root, and to the inhibiting action of salt on the plant's normal life processes. Structures and conditions that have been experimentally shown to result from growth in salt solutions are reduction in leaf surface, increase of leaf thickness (due to richer development of palisades and water-storage cells), reduction of intercellular spaces. All of these are well-known xerophytic characters, so that halophytes, with the exception of submerged marine plants, are now regarded as a class of xerophytes whether the soil in which they grow be dry or wet. The structures noted, as well as others, doubtless serve to reduce transpiration, and it may be supposed that this is an advantage, because of the lessened osmotic absorption. See XEROPHYTES.

HALOPHYTES.

Cross-section of leaf of *Sonneratia acida*: 1, in ordinary soil condition; 2, when grown in salty soil, showing the great thickening of the cuticle in the latter.

Halophytes belong to a great number of families, some of which, as the Chenopodiaceæ, Frankeniaceæ, Plumbaginaceæ, are particularly rich in halophytic members. One of the most interesting features of halophytes is the wide distribution of their species. It is easy to see how coastal forms should be similar over wide areas, but why the same forms should also occur in many continental interiors is not so apparent. Perhaps the former interior seas had marine connections; in this case the interior halophytes form the best-known group of relict plants (q.v.). It must be remembered, however, that migrations are easier than has been generally supposed, and that given a congenial habitat in a congenial climate, a species or genus characteristic of such places is pretty likely to appear sooner or later. The various halophytic formations and societies are treated under BEACH PLANTS; BENTHOS; DESERT VEGETATION; DUNE VEGETATION; MANGROVE SWAMP; PLANKTON; and SWAMP.

HALPINE, or HALPIN, CHARLES GRAHAM (1829-68). An American soldier and poet, born in Oldeastle, County Meath, Ireland, and educated at Trinity College, Dublin. After a short journalistic experience in Dublin, he came to America in 1851. For a few months he was the associate editor of the *Boston Post*; served as the Washington correspondent of the *New York Times*, and after short connections with various metropolitan papers, was associate editor of the

New York Times until 1857, when he became editor-in-chief of the *New York Leader*. At the outbreak of the Civil War he enlisted in the Sixty-ninth Regiment, New York Volunteers. He served as assistant adjutant-general on General Hunter's staff and under General Halleck, accompanied the former on his Shenandoah expedition in 1864, resigned from the service soon afterwards on account of failing health, and was brevetted a brigadier-general of volunteers. His experiences and observations as a soldier found humorous expression in the popular poems and stories written over the pen-name of Miles O'Reilly. He became editor of the *New York Citizen* in 1864, and strongly advocated civil-service reform; was elected register of New York County in 1867, and died in the following year from his continued literary exertions. His best-known writings, apart from fugitive poems, are: *Lyrics by the Letter H* (1854); *Life and Adventures, Songs, Services, and Speeches of Private Miles O'Reilly* (1864); and *Baked Meats of the Funeral: A Collection of Essays, Poems, Speeches and Banquets of Private Miles O'Reilly* (1866). His complete *Poetical Works* appeared in 1869.

HALS, häls, FRANS (c.1584-1666). A Dutch portrait and genre painter, the greatest, next to Rembrandt. He was born at Antwerp, not at Mechlin, as is often stated, probably in 1584. He went to Haarlem before 1600, and studied there under Karel van Mander (q.v.). He led a careless and jovial life, but was held in high esteem by his fellow townsmen. Like his brother, Dirk, he was an honorary member of the chamber of rhetoric; he belonged to the civic guard, and was head of the painters' guild, and of an important school of painting. He was twice married. He was usually in debt; and in 1664 the municipality of Haarlem allowed him a yearly pension of two hundred florins, which he enjoyed until his death on September 7, 1666.

The artistic development of Hals may best be studied in his large *doelenstukken* (portrait groups of the city guard) in the Museum of Haarlem. The earliest of these, the "Banquet of the Officers of Arquebusiers of Saint George" (1616), is in his first manner. There are traces of the old Haarlem School, in particular of Van Mander, but Hals is already an independent master. His grouping is freer than that of the old school; his color, though still brown in tone, is more luminous, and applied in a broader manner; and his characterization far superior.

His second manner (1627-39) is represented by three *doelenstukken* in the Haarlem Gallery: the "Banquet of Officers of the Arquebusiers of Saint George and Saint Andrew" (1627); "Officers of Saint Andrew" (1633), the most serious and finest of the groups; and the "Officers and Sergeants of Saint George" (1639), nineteen figures, among which is that of the artist himself. To these may be added a similar piece, the so-called "Shooting Gallery" (1637), in the city hall of Amsterdam. During this period his pictures are characterized by a light gray tone, greater breadth of execution, and greater seriousness of character. Another portrait group of the Haarlem Museum, the "Governors of the Elizabeth Hospital" (1641), in the peculiar treatment of light and in its rich golden hue, shows the influence of Rembrandt—an influence, however, which was only temporary and experimental. Before 1635 his color began to grow deeper, and

a darker gray tone pervaded his pictures. His treatment continued to grow broader, attaining a breadth perhaps never achieved by another master. This last manner is represented in the Haarlem Museum by two fine portrait groups: "Governors of the Hospital for Old Men," and the "Lady Governors of the Hospital for Old Women," both of 1665.

Frans Hals was one of the greatest portrait painters of all times. All details are subordinate to the character and expression of the face; the colors, however bright, serve to emphasize the carnation of the face. No painter has exceeded him in expression. He left over one hundred and sixty works, most numerous in Dutch and German galleries, and in those of Paris, Saint Petersburg, and New York.

The most interesting example of the portraits of the first period is that of the "Artist and His Wife in a Park" (1624), at Amsterdam; others are those of an unknown "Nobleman and His Wife," at Cassel; of "Jacob Olycan and His Wife" (1625), in The Hague; and of a "Young Married Couple" (1627), in Berlin. The Louvre possesses three fine examples of his second manner: "Nicholas Berensteyn and His Wife" (1629); the "Berensteyn Family," an admirable group composed of father, mother, six children, and two nurses; and a "Girl of the Berensteyn Family," the most charming of Hals's feminine portraits. Other prominent examples are the "Nurse with Child," in the Berlin Museum; the life-size figure of William van Heythuysen, in the Liechtenstein Collection, Vienna, his masterpiece, according to Bode; another of the same subject in the Museum of Brussels.

The portraits of his last period show no decline. Among the best are those of an old man and his wife in private possession, Paris; of Descartes, in the Louvre; the "Young Man in a Soft Hat," at Gotha; and three well-known portraits of unknown men in the Hermitage at Saint Petersburg. The Metropolitan Museum of New York has portraits of an unknown man, and of Hals's wife, and one of two gentlemen, attributed to him.

Hals is the father of Dutch genre painting. In his genre pieces he found an amusement and freedom not possible in ordered portraits. They are painted in a broader style with more humor. Most of them date from his early period. Among the best are: the "Jolly Trio" (1616), in private possession in the United States, of which there is a replica by Dirk Hals in the Berlin Museum; the "Herring Vender" (1516), in the Baring Collection, London; "Junker Ramp and His Mistress," in private possession, Haarlem. To the same period belong a number of pictures of singing boys and flute-players in the galleries of Brussels, Berlin, Königsberg, Schwerin, etc.; and of jovial drinkers at Amsterdam, Cassel, etc. Especially fine examples of this genre are the "Fool Playing a Lute," at Amsterdam, and "La bohémienne," in the Louvre. The original of the famous "Hille Bobbe," an old woman with an owl upon her shoulder and a tankard of wine in her hand, is in the Berlin Museum. There are replicas at Dresden and in the Metropolitan Museum, New York, probably by Frans Hals the younger. The latter museum also possesses a genre piece of a "Smoker."

Hals was the head of a large school, and exercised a great influence upon Dutch painting.

Among his pupils were Verspronk, the portrait painter; his brother, Dirk Hals, and Adriaen Van Ostade, genre painters; the greatest genre painters of Holland—Metsu, Ter Borch, and Steen (q.v.)—were under his influence. Five of his sons were painters. Of these the most important was FRANS HALS THE YOUNGER (1620-c.1669), who copied his father's pictures. Examples of his independent works are in the Arenberg Gallery and in the Royal Palace at Brussels, in the Schwerin Gallery, and in the museums of Berlin and Königsberg.

Consult: Van der Willigen, *Les artistes de Haarlem* (Haarlem, 1870); Vosmaer and Unger, *Frans Hals Galerie* (Amsterdam, 1873); Knackfuss, *Frans Hals* (Leipzig, 1897). The chief authority on Hals is W. Bode; see his *Studien zur Geschichte der holländischen Malerei* (Braunschweig, 1883).

HÄLSCHNER, hēlsh'nēr, HUGO PHILIPP EGMONT (1817-89). A German criminalist. He was born at Hirschberg, Silesia, was educated at Breslau and Berlin, and in 1847 was made professor of law at Bonn, where he lectured on the history and nature of criminal law. In 1868 he was made a life member of the Prussian Upper House. His principal publications are: *System des preussischen Strafrechts* (2 parts, 1858 and 1868); *Das Recht Deutschlands im Streit mit Dänemark* (3d ed. 1863), an important work in which the disputes between Germany and Denmark are treated from the standpoint of the legal historian.

HALSTEAD, MURAT (1829-). An American journalist, born in Ross Township, Butler Co., Ohio. He was educated at Farmers' College, near Cincinnati, became a member of the staff of the Cincinnati *Commercial* in 1853, and in 1865 its chief owner. This journal was subsequently consolidated with the *Gazette* of Cincinnati, as the *Commercial-Gazette*, of which he became the editor-in-chief. He was afterwards editor of the Brooklyn *Standard-Union*, and then became a special newspaper correspondent and magazine writer, in which capacity he visited the Philippine Islands during the Spanish-American War. His books include a *Life of William McKinley*, a *Life of Admiral Dewey*, and *The Galveston Tragedy*.

HALSTED, BYRON DAVID (1852-). An American botanist, born at Venice, N. Y. He was educated at the Michigan Agricultural College, and, after two years' teaching in that institution, at Harvard. In 1879 he became editor of the *American Agriculturist*. He was elected professor of botany at Iowa Agricultural College (1885), and at Rutgers College (1889). Halsted gained most fame by his knowledge of weeds and fungi injurious to agriculture. He wrote: *The Vegetable Garden* (1882); *Farm Conveniences* (1883); and *Household Conveniences* (1883).

HALSTED, GEORGE BRUCE (1853-). An American mathematician, born at Newark, N. J. He graduated at Princeton in 1875, and studied at Johns Hopkins and in Berlin. He was instructor in Princeton until 1884, when he was appointed to the chair of mathematics in the University of Texas. Halsted wrote on mathematics, philosophy, and formal logic in the *Popular Science Monthly*, in *Mind*, and the *American Journal of Mathematics*; and published: *Mensuration* (1881); *Elements of Geometry* (1885);

FRANS HALS

"HILLE BOBBE," FROM THE PAINTING IN THE NATIONAL GALLERY, BERLIN

Elementary Synthetic Geometry (1892); *Pure Projective Geometry* (1895); and *Non-Euclidean Geometry* (1900).

HALS/WELLE, KEELEY (1832-91). An English painter, born in Richmond, Surrey. He first worked as an engraver, and afterwards studied at the Royal Scottish Academy in Edinburgh. He exhibited "Vino Veritas" in 1857, and "The Bridge of Sighs" in 1858. The best-known of his Roman pictures are "Roba di Roma" and "Non Angli, sed Angeli." His landscapes usually treat Surrey scenery. His work is marked by beautiful color and free, vigorous handling.

HALYS, hāl'is. The old name of the Kizil Irmak (q.v.), the largest river in Asia Minor.

HALYSITES, hāl'i-sī'tez (from Gk. ἄλωσις, *halysis*, chain). A fossil coral found in rocks of Ordovician and Silurian age in North America, Europe, and Australia, and distinguished by the chain-like figure produced by a cross-section of its mass upon the surface of a rock in which it is imbedded. Halysites is a very characteristic fossil of the Niagara series, and two species, namely, *Halysites catenularius* and *Halysites escharoides*, are common in the Silurian coral reefs of North America and England, where they are known as 'chain corals.'

HAM, äN. A town and fortress in the Department of Somme, France, on the Somme, 36 miles from Amiens by rail, and 70 miles north-northeast of Paris (Map: France, K 4). It is celebrated for its mediæval castle, strengthened by modern additions, which has frequently served as a prison for political offenders. Louis Napoleon, afterwards Emperor, was a prisoner here from 1840 to 1846. After the coup d'état of December 2, 1851, the Republican generals Cavaignac, Lamoricière, Changarnier, and others were kept here for some time. The donjon, a round tower, is 110 feet high, 110 feet broad, and has walls 36 feet thick. Other noteworthy features of the town are the twelfth-century Romanesque Church of Notre Dame, recently restored, a belfry, public library, and museum. Population, in 1901, 3300.

HAM (AS. *hamm*, OHG. *hamma*, dialectic Ger. *Hamme*, ham, haunch; connected with Gael. *cam*, Lat. *camur*, crooked). Properly, the hind part or angle of the knee; but usually applied to the cured thigh of the ox, sheep, or hog, more especially the last. Ham-curing and bacon-curing are performed in a variety of methods, each country or district having its own peculiar treatment. The essential operations are salting and smoking. The curing of pork-hams forms a large and important item in the industry of various countries. See **PACKING INDUSTRY**.

HAM (perhaps originally the name of a deity to be compared with the first element in the name Ammizaduka, an early Babylonian king). According to Gen. x. 6-20, the second son of Noah, and ancestor of a group of people which includes Cush (Ethiopia), Egypt, Put, Canaan, and Babylon, represented by Nimrod. The origin and meaning of the name are quite obscure. Older explanations connecting the word with a supposed name for Egypt, *Kemi* or *Chemi*, signifying 'black,' or rendering it as 'hot' with reference to the district from which the Hamites came, are now discarded. The critical view of the tenth chapter of Genesis is that it is a composite production which has undergone much manipulation

at the hands of editors. Ham has been substituted for Canaan, who, according to Gen. ix. 25, is in reality the 'younger son' of Noah, and who merited the curse of his father. According to an earlier version, the three sons of Noah were Shem, Canaan, and Japhet—representing three groups settled in Palestine. When the originally local tradition, through circumstances which cannot be considered here, was extended into one of general ethnic significance, Japhet, originally Phœnicia (as it seems), became a term for the distant outlying nations of the north and northeast, and the near and distant islands to the west in the Mediterranean; Shem became not only the ancestor of the Hebrews and their immediate relatives, but also of other nations like the Elamites (i.e. the Persians) who were favorable to the Hebrews; while Ham became the designation for all nations who, as enemies of the Hebrews at one time or the other, are 'accursed.' Hence, Egypt, Babylonia, Assyria, and the Canaanites with their offspring are put among the Hamites. Viewed in this light, the list of nations in the tenth chapter of Genesis, while not altogether lacking in historical value, is of interest chiefly as revealing the geographical horizon of Jewish writers in the sixth and fifth centuries B.C., and the principles guiding these writers in their grouping of the nations known to them. A problem that is still unsolved is to determine the source whence the writer or writers obtained the name Ham, which will also explain the substitution of Ham for Canaan. Consult the commentaries on Genesis (chapter x.) by Gunkel, Holzinger, Strack, Dillmann, Delitzsch, Ball, and others; also Knobel, *Die Völkertafel der Genesis* (Giessen, 1850); Glaser, *Geschichte und Geographie Arabiens*, vol. ii. (Berlin, 1890).

HAM, EAST AND WEST. Two English municipalities, east suburbs of London, from which they are separated by the river Lea (Map: London, D 9). Their growth and importance are due to their proximity to the metropolis, and to the numerous factories established in their midst to evade the prohibitive enactments of the Metropolitan Board of Works. Both city administrations are of a high order. West Ham owns a fine town hall, municipal buildings, a public hall, free libraries, a well-equipped technical institute, an electric-lighting plant, electric tramways, isolation hospitals, a lunatic asylum, public baths, and recreation grounds. East Ham is well provided with libraries, parks, and recreation grounds, electric lighting, and tramways, a new town hall, technical institute, and public baths. Population, East Ham, in 1891, 32,700; in 1901, 96,000; West Ham, in 1891, 204,900; in 1901, 267,300.

HAMA, hä-mä' (the *Hamath* of the Bible). A city of Syria, situated on both banks of the Orontes, about 120 miles north of Damascus (Map: Turkey in Asia, G 5). It is irregularly built with narrow, crooked, ill-paved streets, and houses built mostly of mud. It has a number of mosques and well-stocked bazaars. Its manufactures consist chiefly of rough woolen mantles, and cotton fabrics; trade is with the neighboring Bedouins. The population is estimated at 50,000. See **HAMATH**.

HAMADAN, hä'mä-dän'. A town of Western Persia, in Irak-Ajemi, situated in a very

fertile and picturesque region, about 180 miles southwest of Teheran (Map: Persia, C 4). It is unattractive in appearance, but has a number of fine well-stocked bazaars, several mosques, and two tombs of special interest, one claimed to be that of Mordecai and Esther, and the other of the Arabian philosopher Avicenna (q.v.). Hamadan is famous for its copper ware, leather trunks and saddlery, carpet, silver, and gold works. Commercially the town is of considerable importance, owing to its position on the route between Bagdad and Teheran. The population is estimated at 25,000, including about 1000 Jewish families. Hamadan is generally believed to occupy the site of the ancient Ecbatana (q.v.).

HAM'ADRY'AD (Lat. *hamadryas*, from Gk. *ἡμαδρύας*, *hamadryas*, from *ἡμα*, *hama*, with *δρύς*, *drys*, tree). A venomous serpent, the largest of Oriental cobras (*Naja* or *Ophiophagus bungarus*). It is nowhere numerous, but widely distributed, occurring in damp, forested regions from Ceylon to the Philippines, and is known as the 'giant cobra,' and in some parts of India as 'sunerkor.' It grows to a length of 13 feet, and probably more, and has a hood which it can expand; but differs from the common cobra by the presence of a pair of large shields on the head behind the parietals. It is variable in color, but usually, when adult, is some shade of brown, with broad dark cross-bands. It is fierce in disposition, rarely showing any fear of man (though exhibiting much intelligence in captivity), and often climbs trees and conceals itself in their hollows. It feeds altogether upon snakes, which it chases swiftly, seizes behind the head, and swallows head foremost. It is said that a man bitten by a vigorous snake of this species will die in three minutes, and an elephant in two hours. Were it not so rare it would be the most dangerous reptile in the world. See COBRA and KRAIT. Consult Fayrer, *Thanatophidia of India* (London, 1874).

HAMADRYAD. The mandrill. See BA-BOON.

HAMADRYADS. See NYMPHS.

HA'MAN. A character introduced into the Book of Esther as an 'Agagite' (Amalekite) chief minister of Ahasuerus, King of Persia. When Mordecai the Jew refused to obey the order to bow down before Haman, the latter made an attempt to destroy all the Jews in the kingdom; Queen Esther, however, foiled his design, and Haman was hanged on the very gibbet which he had prepared for Mordecai. See ESTHER, BOOK OF.

HAMANN, hä'mán, JOHANN GEORG (1730-88). A German writer and a very original thinker, sometimes called the 'Magician of the North.' He was born at Königsberg, in Prussia. His early life was somewhat checkered, and he frequently changed his dwelling-place. In 1759 he returned to his home in Königsberg, and devoted himself to the study of the ancient languages and Oriental literature. As an author Hamann was little esteemed by his contemporaries. His language was figurative and symbolical in the highest degree, and frequently concealed rather than revealed the depth of his thinking. Yet he had the friendship of many eminent authors, and the influence which he exercised upon Herder, Goethe, and Jacobi was

considerable. All his writings exhibit a deeply spiritual faith in the unseen and the eternal. Among them the *Sokratische Denkwürdigkeiten* (1759) and *Kreuzzüge des Philologen* (1762) are perhaps less oracular than the rest. His complete works were published by Roth (Berlin, 1821-43), in seven volumes; an eighth volume by Wiener (Berlin, 1843) contains additions and explanations and an indispensable index. His correspondence with Jacobi was published by Gilde-meister (Gotha, 1868), who also wrote his biography (4 vols., 1857-63). For his life, consult Poel (Hamburg, 1874-76).

HAMASA, or **HAMASAH**, há-mä'sá (Ar. *hamasah*, bravery, from *hamisa*, to be firm). The name of a famous anthology of Arabic poetry, collected by Habib ibn Aus et-Tai, surnamed Abu Temmam (c.807-846), and divided by him into ten books. The first book is the longest, and deals with the heroes of pre-Islamic times, illustrating the quality of *hamasah* (valor), which names the book, and also the whole collection. The remaining books deal with (2) Lamentations; (3) Manners; (4) Love; (5) Satires; (6) Hospitality; (7) Descriptions; (8) Travel; (9) Pleasantries; (10) Blame of Women. The collection is made with singularly good taste, and is taken from extempore works rather than from the standard poets. It is of great historical value, since it pictures very faithfully the life and the characteristics of the early Islamic era. There are three editions of the Arabic (1) by Freytag (2 vols., Bonn, 1828-47); (2) the Bulak edition (A. H. 1256); (3) the Calcutta edition (1856). The *Hamasah* has been translated into German by Friedrich Rückert (Stuttgart, 1846), and selections have been rendered into English by Lyall, *Ancient Arabic Poetry* (London, 1885). See ABU TEMMAM.

HAMATH, há'máth. A city in Northern Syria, situated on the banks of the Orontes (the modern el-Asi). The name signifies 'fortress' or 'sacred inclosure;' by the Greeks the city was called Epiphania, by the Christians Emath Epiphania; but the old name still maintains itself as Hama. Hamath is mentioned as early as the inscriptions of Thothmes III. (B.C. 1503-1449), and Seti I. (B.C. 1356-1347). King Tou (or Toi), of Hamath, sent to David a message of congratulation upon his victory over Rehob (after B.C. 1026; II. Sam. viii. 9). Hamath was evidently the capital of a State whose boundaries extended to the northern limits of Israel, 'the entrance of Hamath,' which probably was the opening between the Nasairiyeh Mountains above Tripoli and the north point of Lebanon. It is doubtful whether Solomon exercised any authority north of this point. Irchuleni of Hamath was one of the allied kings against whom Shalmanezar II. fought at Karkar in B.C. 854. In II. Kings xiv. 28, the text is too corrupt to permit any conclusion as to the author's thought, and the passage cannot be used to prove a conquest of Hamath by Jeroboam II. of Israel. Ini-ilu of Hamath paid tribute to Tiglath-pileser III. in B.C. 730, who annexed 19 districts of the land to Assyria. Sargon conquered Hamath in B.C. 720 and flayed King Ilu-bidi alive. According to II. Kings xvii. 24-30, Hamathites were transported to Samaria; a confusion with some other name is probable. Hamath belonged successively to the Assyrian, the Chaldean, the Persian, and the

Seleucid kingdoms. In the Asmonean period Jonathan, the Judean high priest, marched with an army into the country of Hamath for the defense of Demetrius. Hamath submitted peaceably to Abu Ubaida, the Moslem leader, in 639, and the Christian church was changed into a mosque. In the period of the Crusades the Ismailians took possession of Hamath. Tancred conquered the city in 1108 and massacred the Ismailians; but the Christians lost it to the Turk Togtekin in 1115. In 1178 the city passed into the hands of Saladin. A flourishing period for Hamath was the reign of Abulfeda (1310-31). In 1812 Burekhardt visited the city and saw the famous stones covered with Hittite inscriptions, which have not yet been deciphered. (See HITTITES.) For the modern town see HAMA. Consult: Burekhardt, *Travels in Syria and the Holy Land* (London, 1822); Delitzsch, *Wo lag das Paradies* (Leipzig, 1881); Winckler, *Alttestamentliche Untersuchungen* (Leipzig, 1892); Ed. Meyer, *Geschichte des Alterthums*, vol. i. (Stuttgart, 1884).

HAMBACH, hām'bäg. A village of Bavaria, situated in the Rhine Palatinate, 15 miles west of Speier. Population, in 1900, 2244. It has an old castle, and is famous chiefly on account of the Hambacher Fest, a revolutionary meeting which took place here on May 27, 1832, attended by about 30,000 persons. This gathering marked the beginning of an open republican movement in Germany, and was followed by a series of reactionary measures on the part of the Bavarian Government. Most of the leaders of the gathering were compelled to seek safety abroad, and some were imprisoned. The fortieth anniversary of the Hambacher Fest was celebrated on May 27, 1872, with the approval of the Bavarian King.

HAM-BEETLE. A cosmopolitan beetle (*Necrobia rufipes*) of the family Cleridæ, also called 'red-legged ham-beetle,' which is particularly abundant in the Southern and Western United States, and occasionally ruins many hams in the packing houses and storehouses. The injury is generally due to careless packing or to the accidental cutting or cracking, or even to a considerable stretching or fraying of the canvas covering of the hams. It is a small, rather slender beetle of dark-bluish color, with reddish legs. Its larva is a slender grub, white at first, with a dark head and two small hooks at the end of the body. When full-grown it is grayish-white with a series of brown patches above. It transforms to pupa within a paper-like cocoon. There are several generations each year, and the winter is passed both in the larval stage and as an adult.

HAM'BLET, PRINCE OF DENMARKE, HYSTORIE OF. The probable source of Shakespeare's *Hamlet*, an English translation of one of Belleforest's *Histoires tragiques*, which, in their turn, were copied from Bandello's tales. The French version was published in 1570, and was at once extremely popular in England; the translation was made before 1596, possibly by 1589. See AMLETH.

HAM'BLIN, JOSEPH ELDRIDGE (1828-70). An American soldier of the Civil War, born at Yarmouth, Mass. Long a member of the Seventh Regiment of the New York militia, he enlisted in 1861 as adjutant in Duryea's Zouaves, and served in Virginia under Butler, McClellan,

Meade, Grant, and Sheridan in the Sixty-fifth New York. He especially distinguished himself at Cedar Creek, where he was wounded. He was brevetted brigadier-general, and in 1865 promoted to full rank, with the brevet of major-general, for his gallantry at Sailor's Creek. After the war he was prominent in the New York National Guard.

HAMBLIN, THOMAS SOWERBY (1800-53). An American actor, born in Pentonville, near London. As a member of the Sadler's Wells Theatre Company he won some success in London, especially at Drury Lane (1820); but gained much more in New York City, whither he came (1825) with his wife, Elizabeth Blanchard. In 1830, after extended American tours, he and James H. Hackett leased the Bowery Theatre in New York City, and soon after gained entire control of it. He lost heavily when this theatre was burned (1836); was not very successful in an English tour; and later became manager of the second and of the third Bowery Theatre. The Park Theatre was burned during the first year of his management (1848). 'Handsome Tom Hamblin' was an excellent actor, though somewhat uneven; a liberal manager; an excellent business man; and a great favorite with the public. Hamblin's principal rôles were Hamlet, Macbeth, Othello, Rollo, and Pierre.

HAMBURG, hām'bōōrk. A city-State and a city of the German Empire, with a gross area of 159 square miles, of which the city occupies 30 square miles (Map: Germany, D 2). The city-State embraces, in addition to the city, four contiguous districts, one of which belongs also to Lubeck. It lies mostly in one body, around the city itself, on the north side of the Elbe, at the head of the river's estuary-like mouth. It is bordered by Schleswig-Holstein on the north and Hanover on the south. The city-State comprises also small scattered districts, including Ritzbüttel (with Cuxhaven) and the island of Neuwerk, both at the mouth of the Elbe. Nearly one-half of the total area is in farms and gardens, and a rather large percentage is in meadow. Grain, vegetables, and hay are the chief crops. The fruit output is considerable, and is excellent. The live-stock holdings are heavy.

The city of Hamburg is situated on the north bank of the Elbe, at the mouth of the Alster, in latitude 53° 33' N. and longitude 9° 59' E., and with its suburbs extends for over 5 miles along the river-front; it is the largest port on the Continent of Europe, and the third largest in the world. Its climate is damp, mild in winter and cool in the summer. The mean annual temperature is over 46° F.; rainfall, 28 inches. The city consists of two radically different parts. The central part—since the disastrous fire of 1842 reconstructed according to modern ideas—by its broad, well-lighted, well-drained streets, and fine, lofty houses, offers a striking contrast to the remaining part, much of which is devoted to wholesale business, and is intersected by canals, along which goods are conveyed in lighters to and from the warehouses. The ancient ramparts, converted into gardens and walks, now constitute an inner park-like girdle, separating the old city from the adjacent suburbs of St. Pauli, Altona (q.v.), Ottensen, Rotherbaum, St. Georg, Borgfelde,

Hohenfelde, and Uhlenhorst. In most of these suburbs attractive villas may be found. The beauty of the city is greatly enhanced by two large sheets of water formed by the Alster, and known as the Binnen-Alster, or Alsterbassin, and Aussen-Alster. They are surrounded by good hotels, handsome private houses, and fashionable promenades. Two splendid bridges span the Elbe, over sixty bridges span the canals in the city, and there are numerous steam ferries. The harbor, with its vast traffic, is one of the sights of the city, and splendid views of it are to be had from different elevations. Of the several fine public buildings, the most noteworthy are the Exchange, containing a commercial library, with over 100,000 volumes; the Rathaus, an elaborate structure in Roman Renaissance, completed in 1897; the Seewarte (the buildings of the German Meteorological Station); and the Deutsches Schauspielhaus, completed in 1900. The principal churches are: Saint Nicholas, built from designs by Sir Gilbert Scott, at a cost of \$1,000,000, as a memorial of the fire of 1842, a fine Gothic building, with one of the loftiest spires in Europe (485 feet high); Saint Michael's, built in the eighteenth century, in the Renaissance style, and also distinguished by a lofty spire (426 feet high); and Saint Catharine's, dating from the fifteenth century, and archaeologically interesting, being one of the few churches that escaped the fire.

Among the streets of Hamburg the Jungfernstieg is the most famous and the busiest thoroughfare. The Alter Jungfernstieg and the Neuer Jungfernstieg are handsome quays, which bound the Alsterbassin. The Neurwall and the Alterwall, near the Exchange, are the centre of commercial life, and the Rödings-Markt and the Katharinenstrasse contain fine residences of merchants of the seventeenth and eighteenth centuries. Of the new streets, the Kaiser-Wilhelm-Strasse, opened in 1892, is the most important. The Anlagen are a fine public promenade, laid out on the site of the old fortifications, and the Sandthor-Quai and the Kaiser-Quai, where the large steamships lie, are the most prominent quays along the Elbe. Hamburg is not rich in public monuments. The statue of Lessing, by Schaper, the monument to the sons of Hamburg who fell in the war of 1870-71, by Schilling, and the Hansa fountain, deserve mention.

Situated on a low plain, far from any mountains, the city derives its drinking-water from the Elbe. Formerly this was so polluted that Hamburg suffered from cholera epidemics more than any other city in Northern Europe; but since 1893, when a newly devised and enormous filtering plant was put into operation, there has been no recurrence of the epidemic. A well-constructed sewerage system drains the city perfectly, discharging the refuse into one sewer tunnel which empties into the river with the outgoing tide, and is automatically dammed by the incoming tide. Garbage is burned in municipal crematories erected in 1893. The streets are well paved with asphalt or smooth square stones, and are kept very clean, the principal ones being washed and swept every day, and the less frequented ones cleaned a few times a week. The struggle against cholera epidemics led the city authorities to revise also the building regulations. This was necessitated by the fact that the

poorer classes of the population are housed in the mediæval portion of the town, in crowded houses facing narrow streets and small, poorly ventilated courts; a considerable part of them (6½ per cent. in 1890) lived in cellars. The new rules require more sanitary arrangements, and, in case of cellars, more light and better safeguards against dampness.

Hamburg has a large number of hospitals, the most noteworthy being the Epidemic Hospital, opened in 1894, and considered one of the best in the world. Connected with the hospitals are stations equipped with large ovens for disinfection by heat of all kinds of household goods. Food inspection is in charge of the Hygienic Institute, where a thoroughly equipped bacteriological laboratory is maintained. A special sanitary service is maintained in the harbor, to see that all the sanitary regulations are complied with on incoming ships. Municipal baths and wash-houses were established in 1855. The establishments are built and run after the British model. (See LIVERPOOL; GLASGOW; MANCHESTER; etc.) The effect of all these measures is seen in the diminished death-rate, which declined from 30 per 1000 in 1865 to less than 20 in 1895 and about 17 in 1900. Hamburg owns both its gas-works and electric plant; but they are operated by a private company paying the city a high rental, and rendering excellent service under the strict supervision of the city authorities. The street cars are also in the hands of private companies, who pay the city a tax of one pfennig per passenger, in addition to all ordinary taxes levied by the city, besides keeping the streets in repair within the limits of one or two feet on either side of the tracks. At the expiration of the charter the property of the company reverts to the city. Electricity is supplanting the use of horse-power on most of the lines. There is also a line operated by steam, belonging to the Prussian Government, and connecting the various railway depots in the city. The fares range from 2½ cents upward, according to class and distance. The charitable institutions are numerous and well endowed. For the purposes of poor relief, the city is divided into nine districts, which are in turn subdivided into some 1600 smaller districts. The work of relief is administered by a charity board, composed of three Senators and fifteen members of the Lower House, elected for five-year terms. The amount spent for relief was 2,820,000 marks in 1884, 5,023,000 marks in 1893, and 6,538,000 marks in 1899. There are also a great many private societies and asylums for the relief or reception of needy persons. Besides the hospitals mentioned above, there are two general hospitals, a seamen's hospital, an establishment for the insane, with an agricultural colony at Langenhorn (1893), and other special institutions.

There are several large and excellent private schools, over 160 public schools, a school of art, and conservatory of music, in addition to the Johanneum, a public grammar school, founded in 1528. The city also maintains a correctional school (Strafschule), to which children may be sent for periods of from eight days to eight weeks, an orphan school, a school for deaf and dumb, and one for the blind. There are, besides, schools for technical instruction, building construction, machine-building, navigation, and phar-

macy. The public library contains over 600,000 volumes and 5000 manuscripts. The Kunsthalle, or public art gallery, is an important edifice in early Italian Renaissance. Its collection of paintings is extensive but third-rate. The Natural History Museum is excellent, as is also the Industrial Art Museum. An observatory, botanical museum and gardens, a fine zoölogical museum, and State laboratory, are among many other institutions of a scientific or educational nature; there are also several theatres and a great number of public gardens and places of amusement. The first German theatre for opera was established in Hamburg in 1678.

The geographical situation of Hamburg makes it the commercial emporium of Northern Europe. Through the Elbe, with its numerous branches and canals, ships leaving Hamburg can reach the heart of Germany; it is also the terminus of seven lines of railway, which furnish direct communication with all the German cities. In 1888 Hamburg became a member of the German Customs Union. This stimulated its trade still further, and about 1890 new docks were constructed at Cuxhaven for ocean steamers, involving an expenditure of \$40,000,000. The dock and harbor facilities are the most complete in the world; vessels drawing 23 feet can go up the harbor at high tide. The number and tonnage of vessels entering the port in the last years of the last three decades of the nineteenth century were as follows: 1880, about 6000 ships, of 2,800,000 tons; 1890, about 8000 ships, of over 5,000,000 tons; 1900, 13,100 ships, of 8,000,000 tons. The number of vessels and the tonnage of the mercantile navy of Hamburg surpass that of Holland. In 1880 Hamburg had 475 ships, of 230,000 tons; in 1890, 587 ships, of 538,000 tons; in 1900, 8,793 ships, of 989,000 tons. In 1900 the imports of Hamburg by sea, river, and land were valued at about \$951,000,000; the exports, \$285,000,000. The leading nations in respect to the amount of exports and imports are Great Britain and the United States. In 1893 the imports from Great Britain amounted to \$93,762,766, the exports to \$93,137,778. In the same year imports to the value of \$42,047,698 came from the United States, and the exports were \$39,410,896. But in 1900 the United States outstripped Great Britain in imports, the respective figures being \$114,954,000 and \$108,052,000. In the amount of exports the figures were \$103,530,000 for Great Britain and \$52,598,000 for the United States. The chief articles of import and export are foodstuffs and raw materials. Manufactured articles constitute about one-fourth of the total value. Hamburg is one of the largest coffee marts, and in money-exchange transactions is among the foremost cities of the world. It is also one of the principal emigration ports of Germany, 405,998 persons having left during 1891-95, of whom 356,365 were bound for the United States. Among the principal industries are cigar-making, spirit and sugar refining, brewing, meat-curing, machine and ship building, coffee-roasting, chocolate manufacture, flour-milling, manufacture of furniture, pianos, leather, ivory, and celluloid, etc.

The city-State of Hamburg constitutes one of the States of the German Empire. Its official name is the Free and Hansa City of Hamburg (Freie- und Hansa-Stadt Hamburg). Its constitution is democratic. The executive power is

vested in a Senate of eighteen members, chosen for life by the two governing bodies. One-half of the Senators must have studied law or finance, and seven of the remaining nine must be members of the merchants' guild. The Senate elects a first and a second burgomaster from its own members, for a term of two years. The legislative power is confined to the House of Burgesses, consisting of 160 members, who are elected for six years, one-half retiring every three years. The Senate, however, has a veto power in all matters except those pertaining to taxation and revenue. In case of a deadlock between the two bodies, the matter is referred to a joint arbitration board, or to the Supreme Court of the German Empire.

The administration of the city-State is divided into several departments, each being presided over by a Senator. The chief departments are:

1. The Board of Health—(Medicinal-Collegium).
2. Board of Public Works—(Bau-Deputation).
3. Police Board—(Polizei Behörde).
4. Board of Charities—(Armen-Deputation).
5. Prison Board—(Gefängniss-Deputation).
6. Department of Finance—(Finanz-Deputation).
7. Harbor Administration—(Hafen-Verwaltung).
8. Board of Education—(Oberschulbehörde).

Hamburg is the seat of the upper Hanseatic court and of the three provincial courts of Bremen, Hamburg, and Lübeck. It sends three members to the Imperial Parliament at Berlin.

Hamburg virtually has a municipal fire-insurance institution, making insurance compulsory for every householder; it also subsidizes a private employment bureau, and maintains a municipal pawnshop, established in 1650. The debt is heavy, but is largely offset by productive public property, as, for instance, the harbor and its equipment. The debt has latterly grown rapidly, and amounted to about \$105,500,000 at the close of 1900. In 1902 the expenditures amounted to \$25,500,000; the revenues, \$9,000,000. Of the expenditures \$5,000,000 went for public buildings, \$5,300,000 for the service of the debt, \$4,200,000 for the police department, and \$2,750,000 for education. About \$600,000 of the revenue is earned by the municipal lottery.

The population of the city has more than doubled within the thirty years 1871-1900, having risen from 339,000 to 706,000. Hamburg is the largest city, according to population, in Germany, next to Berlin. The total population of the city-State in 1900 was 768,349, nearly all Protestants.

Somewhere between 805 and 811 Charlemagne founded the castle of Hamburg as a defense against the heathen Slavs. In 831 an episcopal see was erected there (soon to be united with that of Bremen), and Hamburg became a centre of civilization for Northern Europe. The town was repeatedly burned and plundered by Norsemen, Danes, and Slavs. In 1189 it received important commercial privileges from Frederick Barbarossa. By treaties with Lübeck and Bremen, in 1241 and 1249, it initiated the Hanseatic League (q.v.). From that time it increased rapidly in wealth and commercial importance, augmenting its territory by the purchase of the township of Ritzebüttel, at the mouth of the Elbe (where the harbor of Cuxhaven is now situated), and several villages and islands in the vicinity of the town. Under the protection of the German emperors, Hamburg soon became powerful enough to defend itself and its com-

merce, both by sea and land, and carried on war for a considerable period against the Dutch and the Danes, though with varying success. Maximilian I. declared Hamburg an Imperial city in 1510, though the act was not confirmed by the Imperial Chamber till 1618. In 1529 the city officially adopted the Reformed religion, and the large number of religious refugees from the Iberian Peninsula and Holland enriched it greatly during the sixteenth and seventeenth centuries. After 1750 its commerce developed wonderfully, owing to the American and French revolutions, the wars between England and France, and the downfall of the trade of the Netherlands. Napoleon's Continental system, however, proved fatal to its commerce, especially after 1810, when it was made a part of the French Empire. In 1813-14 the city endured a terrible reign of pillage and oppression at the hands of the French general Davout. By 1814 its population had sunk from 100,000 to 55,000. In 1815 it entered the German Confederation as a free city of the Empire. It thrived exceedingly, in spite of a disastrous fire which swept off a quarter of the city in 1842. After forming part of the North German Confederation, Hamburg became a member of the German Empire in 1871. Jealousy of its commercial privileges kept Hamburg out of the Zollverein till 1888. In 1892 a severe outbreak of cholera killed nearly 9000 of the inhabitants.

HAMBURG. A breed of domestic fowls, noted as economical egg-producers. They are of trim build, resembling Leghorns, and of great beauty of plumage. Six varieties are recognized—the golden spangled, silver spangled, golden penciled, silver penciled, black and white. The large black 'redcap' and the Dutch 'campine' are also in this class. The designations refer to the markings. The 'spangles' or 'moon eyes' are round or oval spots; the 'pencilings' are bars of reddish bay or black, or of clear silvery white and black. The most popular varieties are the spangled (see Colored Plate of POULTRY), because of their fine form as well as beauty of coloration. Their 'points' are as follows: Comb, square at front, tapering nicely into a long spike, full of points by no means plain, firmly and evenly set on the head; face, red; ear-lobes, moderate size, round as possible, and clear white; legs, leaden blue; carriage, graceful; plumage, very profuse. (Thus far the specifications belong to the whole Hamburg breed.) Silver-spangled cock: Color, clear, silvery-white ground, every feather tipped or spangled, the breast as bold as possible, but showing the spangle, the bars of the wing regular and bold; neck, back, and saddle nicely tipped; bow well marked (by no means cloudy, brown, or brassy); back, as green as possible. Silver-spangled hen: The white clear and silvery, the spangles large, green as possible, distinct and

clear. Golden-spangled cock: Ground, rich; clear spangles, large and distinct. Hen: Color, very black and rich ground, the back glossy green; the neck, back, and saddle nicely striped; bow of wing well marked.

HAMDİ BEY, hām'dē bā, OSMAN (1842—). A Turkish statesman and scholar, son of Edhem Pasha, born in Constantinople and educated in Paris. He was Governor of Bagdad (1868-70), a delegate to the Vienna Exposition in 1873, General Secretary of Foreign Affairs, then Governor of Pera, in 1882 director of the Imperial museums at Stambul, and (1888) connected with the Department of the National Debt. A painter, with some reputation for his rendering of Oriental interiors, he founded in 1882 a Turkish Ecole des Beaux-Arts, which is not limited in its courses by the provisions of the Koran. He edited with Reinach *La nécropole royale de Sidon* (1892-93), and built at his own expense, near the Tehinli Kiosk, a Greek building, in which the sarcophagi from the Sidon Necropolis might rest.

HAMEL, ā'mēl', LOUIS ERNEST (1826-98). A French historian and politician, born in Paris. He was educated at the Lycée Henri IV. and in the law school of the University of Paris; but he practiced little, preferring literature and politics. He was a contributor to the liberal sheets; was an editor of *L'homme libre*; was three times defeated as candidate for the National Assembly; but in 1878, 1881, and 1884 was elected to the Parisian municipal council. Besides his earliest work, *Les dernier chants*, a book of verse (1851), his writings are historical: *Histoire de Saint-Just* (1859); *Histoire de Robespierre* (1865-67), in three volumes, of which the publishers refused, for fear of prosecution, to publish the last two volumes until they were compelled to do so at their own risk by legal decision; *Monsieur Michelet, historien* (1869); *Précis de l'histoire de la révolution française* (1870); *Histoire de la république française sous le Directoire et sous le Consulat* (1872); *Histoire des deux conspirations du général Malet* (1873); *Histoire illustré du second Empire* (1873); *Souvenirs de l'homme libre* (1878); *Histoire du premier Empire* (1882); *Histoire de la Restauration* (1887); *Histoire du règne de Louis Philippe* (1889); *Histoire de la seconde République* (1891); and *Histoire du second Empire* (1893-94).

HAMELIN, hām'e-lin, THE PIED PIPER OF. See PIED PIPER OF.

HAMELN, hä'mēln. The capital of a circle in the Prussian Province of Hanover, situated at the confluence of the Hamel with the Weser, 25 miles southwest of Hanover, with which it is connected by rail (Map: Prussia, C 2). The Weser is crossed by a suspension bridge. The town has an old-fashioned appearance, and contains many specimens of mediæval and Renaissance architecture. It has a 'real' gymnasium. The chief industrial establishments are sugar-refineries, tanneries, distilleries, machine-works, flour-mills, paper-mills, etc. The commerce is quite important, and there is considerable shipping in the harbor. Hameln is noted on account of the legend of the Pied Piper of Hameln (q.v.). Hameln had its origin in the Abbey of Saint Boniface. It was sold to the Bishop of Minden in 1259, but the transaction did not meet with the approval of the townspeople, who, after

a bloody battle, placed themselves under the protection of Brunswick. The town was a flourishing member of the Hanseatic League. It was taken by the Swedes in 1633, and surrendered to the French in 1757 and in 1803. It finally passed to Prussia in 1866. Population, in 1890, 13,675; in 1900, 18,965.

HAMERIK, hä'me-rik, ASGER (1843—). A Danish composer. He was born at Copenhagen, and, despite the opposition of his parents, studied music unaided, and when but fifteen years of age had so far succeeded in his ambition as to be able to study openly, under Gade, Matthison-Hansen, and Haberbier. In 1862 he went to Berlin to become a pupil of Von Bülow, and two years later, when studying in Paris, met Berlioz, with whom he visited Vienna (1866-67). His *Hymne de la paix*, written for the Paris Exhibition, earned for him a gold medal, and was greatly esteemed for its splendid orchestration. He wrote several operas, which were produced either in France or Italy, and in 1871 was appointed director of the Peabody Conservatory of Baltimore, and also of the Peabody symphony concerts. In 1890 the King of Denmark conferred upon him the honor of knighthood. Not long afterwards he resigned his post in Baltimore and returned to Europe. Among his more important works are: *Der Wanderer* (1872), a festival cantata; *La Vendetta* (1870), an Italian opera; the choral work *Christliche Trilogie*. The operas *Tove-lille* and *Hjalmar and Ingeborg* were only given in part. He also composed much successful chamber music, and was particularly happy in his solo work for the 'cello.

HAMERLING, hä'mër-ling, ROBERT (1830-89). An Austrian poet, dramatist, and novelist, born March 24, 1830, at Kirchberg am Walde, in Lower Austria. For four years he was a choir-boy at the Cistercian Monastery of Zwettl. Later he went to a gymnasium in Vienna, and afterwards matriculated for the study of medicine. Besides natural science, Hamerling cultivated classical and Oriental languages and also philosophy. In 1855 he became a professor in Trieste, but ten years later chronic illness forced him to withdraw. An Imperial decree now granted him a pension, and he was likewise helped out by a Viennese lady. On July 13, 1889, after years of pain, he died in his villa near Gratz. Hamerling's style is rich and highly colored, his ideas are daring and keen. His mastery over his language is notable. Among his many writings some of the most striking are: *Ein Sangesgruss vom Strande des Adria*, poetry (1857); *Sinnen und Minnen*, youthful poems (1859, 1886); *Gesammelte Kleinere Dichtungen* (1871, 1890); *Blätter in Winde* (1887, 1888); the epic *Ahasver in Rom* (1886; 23d ed. 1892), a description of Nero's Rome; *Der König von Sion* (1868, 1890); *Die Lieben Todssünden* (1887); *Homunculus* (1880, 1890); *Danton und Robespierre*, a tragedy (1871, 1877); *Aspasia*, a novel of the time of Pericles (1876). Selections from his Works appeared in 1901. Consult: Kleinert, *Robert Hamerling, Ein Dichter der Schönheit* (Hamburg, 1889); Polzer, *Robert Hamerling, Sein Wesen und Wirken* (ib., 1890); Rabenlechner, *Hamerling, Sein Leben und Seine Werke* (ib., 1895); id., *Hamerling* (Dresden, 1902).

HAMERTON, PHILIP GILBERT (1834-94). An English writer on art, painter, and etcher. He

was the son of a solicitor, and was born at Lane-side, near Shaw, Lancashire. His mother died when he was an infant, and his father, who was an inebriate, died ten years later. For these and other reasons Hamerton's boyhood was lonely. He gave up in displeasure his preparation for Oxford, turned to poetry and art, and began writing for the reviews. He traveled in Wales, visited France, and in 1857 began his periodic encampments on an island in Loch Awe in the Scotch Highlands, described in *A Painter's Camp in the Highlands and Thoughts About Art* (1862). This notable work was followed by the more technical *Etching and Etchers* (1868); *Contemporary French Painters* (1868); and *Painting in France After the Decline of Classicism* (1869). In 1869 he founded the *Portfolio*, an excellent art magazine, which he edited till his death. Among his other numerous writings are: *The Intellectual Life* (1873); *Life of Turner* (1879); *The Graphic Arts* (1882); *Human Intercourse* (1884); *Landscape* (1885); and *French and English* (1889). Hamerton, who had married a French woman, passed his latter years in France, and died at Boulogne-sur-Seine. Like Ruskin, Hamerton was an art interpreter to his generation, the medium between the artist and the public. For this he was eminently suited because of the catholicity of his taste, and his agreeable style. Consult *Philip Gilbert Hamerton: An Autobiography and a Memoir by His Wife* (London, 1896).

HAMI, hä'më, or **KOMUL**, kō'mūl. A small town of Chinese Turkestan, situated in a fertile district 30 miles south of the eastern end of the Tian-Shan or 'Celestial Mountains,' near the northern verge of the desert of Gobi, about 60 miles southeast of Barkul. Its elevation above the sea is about 3000 feet. The oasis of Hami, which has an area of between 80 and 100 square miles, produces wheat, barley, maize, millet, pumpkins, watermelons, and excellent grapes. The poppy is also grown. The 'town' consists of an old town (Lao-ch'eng), built about two centuries ago, and a new town (Sin [or Hsin] Ch'eng), surrounded with moated walls, 20 feet in height, pierced with four gates, each surmounted with a tower in true Chinese style. The Mohammedan quarter, built over 300 years ago and called Khamil, is about a mile off. It is surrounded by a mud wall, and contains some 250 to 300 families. Here the kings of Hami lie in a mausoleum, the dome of which is covered with green-colored tiles. The population of the old town is said to be about 5000. Hami is advantageously situated as a trade centre, as here the great travel-route from east to west forks into two branches—one, the Tian-Shan Nan-lu, running along the south side of the Celestial Mountains to Kashgar and Yarkand; and the other, the Tian-Shan Peh-lu, proceeding by an easy pass 9000 feet high over the mountains along their northern foot to Kulja and beyond.

HAMILCAR (Phœnician, grace of Melkart, Gk. Ἀμίλκας, *Amilkas*). A name borne by several distinguished Carthaginians, the most celebrated of whom were: (1) The commander of the great Sicilian expedition, B.C. 480. (2) One of the commanders of a Carthaginian army defeated by Timoleon, the Corinthian general, at the Crimisus, B.C. 339. (3) (Surnamed Rhodanus) the ambassador to Alexander the Great after the fall

of Tyre (B.C. 332). (4) Governor of Sicily, B.C. 317. (5) The son of Gisco, who succeeded the preceding, and carried on military operations against the Syracusans and other States with great success, but was at length taken prisoner and put to death (B.C. 309). (6) A commander during the First Punic War, who was very successful against the Romans by land in Sicily, but was afterwards defeated in a sea fight off Ecnomus, and was thereafter recalled to Africa to oppose Regulus.

The greatest of all was Hamilcar, surnamed Barca or *Barak*, 'lightning.' While very young he was appointed to the command of the Carthaginian forces in Sicily, in B.C. 247, at which time the Romans had possession of almost all the island. Hamilcar's first care was to discipline his infantry thoroughly; he then established himself on Mount Herete, and from this point made pillaging excursions in all directions, sending his privateers along the coast of Italy as far north as Cumæ, thus obtaining abundant supplies for his troops. From this position the Romans endeavored to dislodge him, but in vain. After three years he left Herete, and established himself on Mount Eryx, keeping up his communication with Drepanum and the sea, where the same tactics were repeated on both sides, and with the same want of success on the part of the Romans. The Carthaginian admiral, Hanno, having been totally defeated off the Ægates Islands, B.C. 241, Hamilcar was compelled to evacuate his fortress and evacuate Sicily. While Hamilcar was engaged in Sicily he had made large promises to his mercenary troops which he was unable to fulfill; they revolted in consequence, and were joined by some of the African tribes. Hanno endeavored to suppress the revolt, but failed; Hamilcar was accordingly appointed to the command, and succeeded in utterly defeating the rebels, capturing all their towns and putting to death their leaders. Hamilcar was next appointed commander-in-chief of the Carthaginian Army, and was engaged for some time in wars with the neighboring tribes, which were abruptly ended by Hamilcar's entering upon his Spanish campaign about B.C. 236. His great aim was to found a new empire in Spain, from which, as his basis, he might assail the Romans. Such a kingdom he saw would increase the power and wealth of his native country, and atone to her for the loss of Sicily and Sardinia. This end he did not himself accomplish, but he prepared the way for its accomplishment by Hasdrubal and Hannibal. He marched westward, while the fleet under his son-in-law, Hasdrubal, cruised along the coast; he then crossed over the Strait of Gibraltar, and made war on the natives of Spain, in the course of which he penetrated to the very heart of the country, subdued many tribes and cities, and amassed immense wealth. He spent nine years in Spain, and at length, in B.C. 228, met his death on the field of battle while fighting against the Vettones. His military genius is considered scarcely inferior to that of his son Hannibal.

HAMILTON. The capital of Dundas and Normandy counties, in the western district of Victoria, Australia, on Grange Burn Creek, 50 miles northeast of Portland, and 198 miles west of Melbourne, with which it has railway connection. It is a pastoral, agricultural, and stock-raising centre, with important biennial exhibi-

tions and race meetings. Population, in 1901, 4026.

HAMILTON. The capital of the Bermudas (q.v.), situated on Hamilton Island. Population, in 1901, 2246.

HAMILTON. The capital of Wentworth County, Ontario, Can., a city and port of entry on Burlington Bay, at the southwestern extremity of Lake Ontario, and on the Grand Trunk and the Great Western railways, 70 miles northwest of Buffalo, N. Y. (Map: Ontario, D 4). The port is reached by a canal dug through a sandbar which, stretching across the bay for five miles, serves as a breakwater for a fine harbor. Desjardins Canal, four miles long, connects the harbor with Dundas. There is daily steam communication with other lake ports, and an extensive trade with the Maritime Provinces. Hamilton is the centre of Western Canada's fruit district. The output of its numerous industries comprises iron wares, sewing-machines, agricultural implements, glass, cotton, woolen, and tobacco products, musical instruments, and other manufactures. It is the fifth city of importance in the Dominion, and is frequently styled the Canadian Birmingham. The United States is represented by a consul. The city sends two representatives to the Dominion House of Commons, and one to the Provincial Legislature; it is the seat of Anglican and Roman Catholic bishops. The town, laid out in 1813, is built on a plateau, has wide streets, market and county-house squares, and many elegant residences on the rising ground which culminates in 'the Mountain,' 250 feet high, with its inclined railway. It has Wesleyan Female College, and a Mechanics' Institute, a free public library, a lunatic asylum, an excellent race course, electric street railways, and an extensive system of water-works in connection with Lake Ontario. The sandbar, known as Burlington Beach, is a popular summer resort, with a good hotel. Population, in 1891, 48,980; in 1901, 52,550.

HAMILTON. A market town and municipal borough in Lanarkshire, Scotland, on the left bank of the Clyde, 11 miles southeast of Glasgow (Map: Scotland, D 4). The inhabitants are chiefly employed in neighboring coal and iron mines, and limestone quarries; market-gardening and muslin-weaving are minor industries. The town is irregularly built on rising ground, commanding fine views. Its prominent structures are the burgh buildings with a clock tower 130 feet high, the county buildings, in the Grecian style, and the cavalry barracks. The town owns its gas and water works. It gives the title to the first peer of Scotland, the Duke of Hamilton and Brandon, whose famous family seat, Hamilton Place, in the midst of extensive pleasure grounds, is adjacent to the demesne of Cadzow Castle with the remains of its forest, where primeval oaks and a herd of the original breed of wild cattle are preserved. Population, in 1891, 24,859; in 1901, 32,775. Consult Grant, *The Commissariat Record of Hamilton* (Edinburgh, 1898).

HAMILTON. A village in Madison County, N. Y., 28 miles southwest of Utica; on the New York, Ontario and Western Railroad (Map: New York, E 3). It is the seat of Colgate University (q.v.) with the Hamilton Theological Seminary

(Baptist). Lumber-yards and a canning-factory represent the leading industries. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 1744; in 1900, 1627.

HAMILTON. A city and the county-seat of Butler County, Ohio, 25 miles north of Cincinnati; on the Great Miami River, the Miami and Erie Canal, and the Cincinnati, Hamilton and Dayton, the Pittsburg, Cincinnati, Chicago and Saint Louis, and other railroads (Map: Ohio, B 7). The splendid water-power derived from both the river and canal has materially aided the city's development as a manufacturing centre; its industrial establishments include breweries, paper, flour, and woolen mills, iron-foundries, machine-shops, and safe, agricultural implement, and tool works. The first settlement here was made in 1791, when Gen. Arthur Saint Clair built a fort and called it Fort Hamilton in honor of Alexander Hamilton. Hamilton was first incorporated in 1810. The city is governed under a charter of 1898, by a mayor, chosen every three years, and a board of control, consisting of five members, elected at large. This board, superseding the old city council, has been subdivided, each member being the head of a department. The members in the first instance were appointed by the Common Pleas Judge for terms ranging from one to five years; subsequently they were elected for a period of five years. The water-works, gas plant, and electric-light plant are all owned and operated by the city. Population, in 1890, 17,565; in 1900, 23,914.

HAMILTON. A famous noble Scotch family of English origin. The name, obviously territorial, was doubtless taken from some one of the many English manors called Hamilton, scattered through Buckinghamshire, Hampshire, Surrey, Lancashire, Rutlandshire, Yorkshire, and Leicestershire. The pedigree of the family is traced to 'Walter Fitz-Gilbert (or Gilbertson) of Hamilton,' who, in 1296, held lands in Lanarkshire, and swore fealty to King Edward I. of England as overlord of Scotland, and in 1314 kept the Castle of Bothwell, on the Clyde, for the English. His early surrender of this strong fortress, and of the English knights and nobles who had fled to it from the field of Bannockburn, was rewarded by King Robert Bruce by grants of the lands and baronies of Cadzow and Machanshire in Clydesdale, Kinneil and Larbert in West Lothian, Kirkinner and Kirkowen in Galloway, and other lands forfeited by the Comyns and other adherents of England. He attained the rank of knighthood, and married Mary, daughter of Sir Adam of Gordon of Huntly, by whom he left two sons. To a long list of illustrious descendants accrued the titles, emoluments, and territories comprised in the lordships of Abercorn, Bargeny, Belhaven and Stentoun, Hamilton, Pisley, and Strabane; in the viscountships of Boyne, Clanboy, Hamilton, and Strabane; in the earldoms of Arran, Abercorn, Clanbrassil, Haddington, Orkney, Ruglen, and Selkirk; in the marquisesats of Abercorn and Hamilton; and in the dukedoms of Abercorn, Brandon, Chatelherault, and Hamilton. The present leading representatives are Alfred, thirteenth Duke of Hamilton and Brandon, surname Douglas-Hamilton, premier peer of Scotland and hereditary keeper of Holyrood Palace, and James, second Duke of Abercorn, surname Hamil-

ton, Groom of the Stole. Consult: Anderson, *Historical and Genealogical Memoirs of the House of Hamilton* (London, 1823); Fraser, *History of the Earls of Haddington* (Edinburgh, 1889).

HAMILTON, ALEXANDER (1757-1804). An eminent American statesman. He was born at Charles Town, in the island of Nevis, West Indies, on January 11, 1757, and appears to have been the natural son of a Scotch trader named James Hamilton, who died on the island of Saint Vincent about 1799, and Rachel Levine, originally named Faucette, and of French-Huguenot descent, who some time previously had separated from her husband. After a brief period of schooling, the future statesman at the age of twelve—his mother having died in the previous year—was placed in a counting-house at Christiansted, on the island of Saint-Croix; but having shown signs of literary ability, especially in a pamphlet describing a West Indian hurricane, he was sent to the English colonies on the continent when sixteen years of age, for the purpose of continuing his education. Arriving in Boston in October, 1772, he proceeded at once to New York, studied for a year in a grammar school at Elizabethtown, N. J., and then entered King's College (now Columbia University). He soon became intensely interested in the controversy then raging between the Colonies and the British Government, and partly as a result of a visit to Boston during the tension consequent upon the passage of the Boston Port Bill (q.v.), became firmly attached to the patriot cause. On July 6, 1774, he attended in New York a great meeting in the 'fields' (now City Hall Park) assembled to take action on the calling of a general congress, and made, extemporaneously, an impassioned but well-reasoned speech, which brought him to the notice of men of prominence and of the people generally. Soon afterwards he published anonymously two remarkable pamphlets—*A Full Vindication of the Measures of Congress from the Calumnies of Their Enemies* (1774) and *The Farmer Refuted* (1775)—in answer to those of a 'Westchester Farmer,' then much read, and in them endeavored to prove that the Colonies owed allegiance directly to the British Crown, were therefore not amenable to Parliament, and were justified in resorting to extreme measures to vindicate their rights. The pamphlets were at first variously attributed to such men as Jay and Livingston, and their authorship finally becoming known, they added greatly to Hamilton's growing reputation. In 1775 he twice took a stand, as an advocate of order, against mobs bent on chastising Loyalists. Meanwhile, perceiving that an outbreak of hostilities was imminent, he had devoted himself to the study of military science, and, after serving for a time in a volunteer corps, he was appointed on March 14, 1776, to the command of an artillery company, which soon became so conspicuous for the excellence of its drill that Nathanael Greene, under whose notice it fell, introduced Hamilton to General Washington with a recommendation for advancement. During the retreat after the battle of Long Island, Hamilton distinguished himself by the coolness and courage with which he brought up the rear. He also attracted attention by the skillful manner in which he served his battery at White Plains; participated in the retreat through

New Jersey, and in the battles of Trenton and Princeton; and on March 1, 1777, became an aide on the staff of General Washington, with the rank of lieutenant-colonel. In this capacity he acted as Washington's confidential secretary, attending to much of the correspondence from headquarters; and in November, 1777, was sent on a delicate mission to Albany for the purpose of securing reinforcements from General Gates and General Putnam.

In December, 1780, he married Miss Elizabeth Schuyler, the daughter of Gen. Philip Schuyler, thus allying himself with one of the most influential families in New York. In February, 1781, in a fit of resentment, he left the staff of the commander-in-chief because the latter had rebuked him, on the ground of disrespect, for a delay in obeying orders; and, returning to the line, he successfully led one of the attacking columns at Yorktown (q.v.).

Soon after the outbreak of the war he had begun to take a lively interest in the financial and administrative problems that confronted the Confederation, and in 1780 and 1781 wrote able letters to Duane and Morris, respectively, pointing out the defects in the Articles of Confederation, and the necessity of a strong central Government, and proposing an elaborate scheme for the reorganization of the finances, and the establishment of a bank. From May to November, 1782, he acted as receiver of Continental taxes in the State of New York; and was a member of the Continental Congress in 1782-83, during which time he took a conspicuous part in all debates concerning taxation and finances generally; served on various important committees; proposed an elaborate plan for a military establishment in time of peace; and became convinced, even more strongly than before, of the weakness of the existing Government and the need for complete reorganization. Early in the summer of 1782, after a brief course of study, he had been admitted to the bar at Albany, and upon leaving Congress he took up with assiduity the practice of his profession in New York, meeting with immediate success. He attracted particular attention by his advocacy of the liberal treatment of Loyalists, and in the celebrated case of Rutgers *vs.* Waddington braved popular opinion by attacking the 'Trespass Act' of New York, which provided that a Whig dispossessed by the British could collect rent from those who had occupied his property during his absence. Besides practicing his profession, he took part in the discussion of public measures, was one of the founders of a State bank, and was active in the organization of the Society of the Cincinnati. During the most critical period of national history he vigorously aided the movement for a stronger central Government. He, with Egbert Benson, represented New York in the Annapolis Convention of 1786 (q.v.), and it was he who drafted the report which led to the assembling of the Constitutional Convention at Philadelphia in the following year. Upon his return from Annapolis he was elected to the State Legislature, and was there instrumental in securing the appointment of delegates from New York to the approaching convention, he himself being chosen, along with Robert Yates and John Lansing. Though his influence in the convention was to a great extent nullified by the opposition of his strongly Anti-Federalist associates, who

finally withdrew altogether, as did Hamilton for a time, he exerted himself, while in attendance, to impress upon the delegates the need of a thorough reorganization of the Government, and in June, 1787, made an elaborate speech in which he expressed a warm admiration of the British Constitution, and proposed a plan which provided for a strong and virtually independent Executive, and the subordination of the individual States to the Central Government—the Executive and Senators to hold office during good behavior, the State Governors to be appointed by the Central Government, and to have a veto on all State legislation, and the Lower House of Congress to be elected directly by the people. He vigorously supported the Constitution as finally adopted, especially by his production, with Madison and Jay, of the *Federalist* (q.v.) which exerted a powerful influence, and remains the best contemporary exposition of that document; and in the New York convention achieved a remarkable triumph by securing ratification in face of an Anti-Federalist majority at the outset of 65 to 19, making numerous speeches and finally winning over Melancthon Smith, himself, who had led the debate on the opposing side.

In September, 1789, six months after the organization of the General Government under the new Constitution, Congress passed an act establishing a Treasury Department, and President Washington immediately selected Hamilton as first Secretary of the Treasury. In the then unsettled state of the country financially and economically, this was a position of primary importance, and during his term of office Hamilton rendered to the nation services scarcely less invaluable than those of Washington himself. With tireless energy and remarkable ability he applied himself to the various economic problems which then pressed so insistently for solution, and in report after report laid down policies, which, adopted by Congress, reestablished the public credit, brought prestige to the National Government in spite of the disintegrating tendencies of the time, and formed precedents which for the most part have since been followed, and have thus in some lines determined the whole subsequent history of the nation. His reports dealt, among other things, with the public credit, the raising and collection of the revenue, estimates of income and expenditures, the temporary regulation of the currency, navigation laws, and the coasting trade, the organization of the post-office, the management of the public lands, the purchase of West Point by the National Government, the establishment of a mint, the founding of a national bank, the policy of the Government with regard to manufactures, and the adoption of an excise; and, in addition, when, at the close of 1791, his administration was attacked as corrupt by the opposition under the lead of Madison and Giles, he sent into Congress a succession of detailed reports, setting forth the operations of his department with such comprehensiveness and lucidity as to turn abuse into praise, and utterly to refute the charges of his assailants. His proposals that the National Government should assume the Revolutionary debts of the individual States, that Congress should establish a national bank by virtue of the 'implied powers' granted by the Constitution—the first suggestion of this doctrine—and that Congress should impose an excise—all of which had in view the strengthen-

ing of the Central Government—precipitated successive controversies in which those who favored Hamilton were uniformly successful, though party lines were sharply drawn, and a powerful opposition, strenuously antagonistic to centralization, was created, under the leadership of Hamilton's great rival, Thomas Jefferson (q.v.). Out of these controversies grew the Federalist and Republican (later Democratic or Democratic-Republican) parties. Hamilton also took an active interest in foreign affairs, and, during the Revolutionary turmoil in Europe and the wars between France and England, uniformly advocated a policy of strict neutrality on the part of the American Government; while by his attitude toward Genet (q.v.) and his well-known views concerning the excesses of the French Revolution, as well as by his freely expressed admiration of the British Constitution, he gave color to the charge frequently brought against him by his opponents, that he was the leader of a strongly pro-English and anti-French faction. At the time of the Whisky Insurrection (q.v.), he advocated the adoption of a vigorous repressive policy on the part of the National Government, and accompanied in person the troops which were sent against the insurgents. On January 31, 1795, he resigned from the Cabinet to resume the practice of his profession in New York City, but kept in close touch with political affairs, continued to be consulted by Washington, and maintained unimpaired his commanding influence in the Federalist Party. He vigorously upheld the Jay treaty (q.v.), in support of which he wrote a series of powerful articles, under the signature "Camillus;" assisted Washington materially in the preparation of his Farewell Address; opposed the first drafts of the Alien and Sedition Acts (q.v.); and strongly combated the doctrines of the Virginia and Kentucky Resolutions (q.v.). A coolness which had appeared in the relations between Hamilton and John Adams (q.v.) as early as 1788, owing to the former having exerted his influence to prevent an equal vote being cast for Washington and Adams, gradually became pronounced, and was especially marked after the election of the latter to the Presidency, when Hamilton, though holding no office, exerted perhaps as much influence over the members of the Cabinet as did the President himself. Hamilton, moreover, strongly disapproved of the mildness and apparent indecision of President Adams's policy toward France. (See X Y Z CORRESPONDENCE.) At Washington's request, however, he was placed in 1798 at the virtual head of the army when hostilities with France appeared imminent, and while acting in this capacity, with the rank of major-general and the position of inspector-general (from July 19, 1798, to June 15, 1800) he devoted himself with energy and ability to the task of organization and preparation, effecting various much-needed reforms, and perfecting plans for the invasion of Louisiana and the Floridas. In the Presidential election of 1800 Hamilton showed a preference for Pinckney over Adams for the Presidency, and by publishing an ill-advised pamphlet sharply criticising Adams and advocating the casting of an equal vote by the Federalists for their two candidates, he greatly weakened his party, and deeply offended Adams and his immediate following. When, after the election, the famous contest for the Presidency arose in Congress, he suppressed his strong dis-

like for Jefferson, and by the use of his powerful influence was instrumental in securing the defeat of Burr. With the fall of the Federalists Hamilton's political career virtually ended. In 1804 Burr, who had at various times been balked in his political schemes by Hamilton, challenged the latter to a duel, on the ground of an alleged insult, and Hamilton, feeling that by refusing to acknowledge the accepted code, of which he strongly disapproved, he would lose his influence, and anticipating a crisis in the affairs of the nation with which he would probably be called upon to deal, consented to a meeting. The duel occurred at Weehawken, N. J., on July 11, and Hamilton fell, mortally wounded, at the first fire—having, it is said, discharged his own weapon into the air. He died the following day.

Hamilton's services to the nation can scarcely be overestimated. At a time when disintegrating tendencies were pronounced; when, British rule having been overthrown, the mass of the people were restive under any restraint; and when financial and economic ruin threatened the very existence of the nation, he contended steadily for the establishment of a strong Central Government, initiated various measures which were influential in bringing about such a result, and did more than any other man to put the nation on a firm financial footing, to restore the public credit, and to inculcate in the minds of the people sounder views than were then current with regard to political economy and finance. Judged by modern economic standards, some of his opinions show confusion of thought with regard to capital and wealth, but for the most part he undoubtedly saw further and clearer in his own special field than any of his contemporaries. He was not, however, like Jefferson, a great political leader, and, frankly distrusting the people, a large element of whom distrusted him in return, he never had a large personal following.

The best edition of Hamilton's *Works* is that by H. C. Lodge (9 vols., New York, 1885-86). Consult: J. C. Hamilton, *History of the Republic of the United States as Traced in the Writings of Alexander Hamilton and His Contemporaries* (7 vols., New York, 1857-64; 4th ed., 7 vols., Boston, 1879); J. C. Hamilton, *Life of Alexander Hamilton* (unfinished) (2 vols., New York, 1834-40); Morse, *Life of Alexander Hamilton* (2 vols., Boston, 1876); Shea, *Life and Epoch of Alexander Hamilton* (New York, 1879); Lodge, *Alexander Hamilton* (Boston, 1882), in the "American Statesmen Series;" Sumner, *Alexander Hamilton* (New York, 1890), in the "Makers of America Series;" and a brief sketch by Conant, *Alexander Hamilton* (Boston, 1901), in the "Riverside Biographical Series." A list of books concerning Hamilton, and of Hamilton's writings, is given in Ford, *Bibliotheca Hamiltonia* (New York, 1886).

HAMILTON, ANDREW (?-1703). A Colonial Governor of New Jersey. He was of Scottish birth, and before emigrating to East Jersey had been a merchant in Edinburgh. In 1686 he was appointed a member of Governor Lord Neill Campbell's council, and a year and a half later, December 10, 1687, on the latter's return to Europe, was appointed his substitute. While on a visit to London in 1692 he was regularly commissioned Governor of East Jersey, and soon afterwards received the appointment to the same office in West Jersey. In 1697 the proprietors

deposed him because of his Scottish birth, in accordance with an act of Parliament passed shortly after Sir George Barclay's attempt to assassinate King William; but in 1699 he was reappointed. In 1701 William Penn appointed him Deputy Governor of Pennsylvania. He was for some time Postmaster-General in America, and either he or his son, Col. John Hamilton, established the first colonial postal service under a patent dated 1694.

HAMILTON, ANDREW (c.1676-1741). An American lawyer, born in Scotland. Of his early history nothing is known, nor is it certain that Hamilton was his real name, as he was for some time called Trent. About 1697 he came to Virginia, and afterwards removed to Philadelphia, where he was made Attorney-General (1717) and a member of the Provincial Council (1721). He was prothonotary of the Supreme Court and Recorder of Philadelphia, a member of Assembly (1727) and its Speaker in 1729. He and his son-in-law built as a private property the State House, which later became Independence Hall. Hamilton is best known for his defense (1735) of John Peter Zenger (q.v.) on the charge of libel. He advanced as defense the truth of the publication, and gained a verdict of 'not guilty,' which did much for the freedom of political discussion, so that Gouverneur Morris styled him 'the dog-star of the American Revolution.' He was trustee of the General Loan Office and (1737) judge of the Vice-Admiralty Court of the Province of Pennsylvania.

HAMILTON, ANTHONY (1646-1720). An English courtier and French author of fables and of the scandalous *Mémoires du Chevalier de Gramont*, otherwise known as the *Histoire amoureuse de la cour d'Angleterre* (1713). He was born at Roscrea, Ireland, the third son of Sir George Hamilton, a son of the first Earl of Abercorn, and was brought up in France and as a Roman Catholic. This prevented his promotion by Charles II., at whose Court he was very popular, but furthered it under James II., who made him colonel of an Irish regiment and Governor of Limerick. After the fall of James he went back to France, where he found a patroness in the Duchess Ludovise of Maine. At her country-seat at Sceaux he wrote the famous *Mémoires*. His last public enterprise was a share in the fiasco of the Old Pretender in 1708. Hamilton's *Contes de féerie* aimed at once to rival and to ridicule the *Arabian Nights* of Galland (q.v.). They err through artificiality, and the intrusion of personal and local allusions. The *Mémoires de Gramont*, on the other hand, will always remain one of the most remarkable pictures that we possess of the noble younger son, the cadet of the *grand siècle*—light yet hard-hearted, keenly witty, profoundly skeptical, chivalrously brave when in view, capable of dastardly meanness behind the scenes. The *Mémoires* were printed in English in 1714. There is an illustrated translation with notes by Walter Scott (1811), and many editions in both languages. The *Fables* were first printed in 1730, and Hamilton's *Works* in six volumes in 1749. Editions after 1812 are more complete. Consult: Sainte-Beuve, *Causeries du Lundi*, vol. i. (Paris, 1857-62).

HAMILTON, ELIZABETH (1758-1816). An author, of Scotch parentage, born in Belfast. She was educated by relatives in Stirlingshire, and

began to write at an early age. *Hindoo Rajah* (1796), containing Eastern impressions of England; *Memoirs of Modern Philosophers* (1800); *Letters on Education* (1801-02); *Memoirs of Agrippina, the Wife of Germanicus* (3 vols., 1804); *Letters on the Formation of the Religious and the Moral Principle to the Daughter of a Nobleman* (1806), are her more serious works; but she is best known by her Scottish tale, *The Cottagers of Glenburnie* (1808), and the ballad "My ain Fireside." She was unmarried, but called herself Mrs. Hamilton, and was personally revered as a philanthropist.

HAMILTON, EMMA, Lady (1761?-1815). Mistress of Horatio Nelson, the famous English admiral. She was a daughter of Henry Lyon, a man in very humble circumstances. Her career was for a long time an obscure one, and she gave birth to several illegitimate children. In 1784 she fell in with Sir William Hamilton, Ambassador at Naples, and he was captivated by her great beauty. She became his mistress, but he married her in May, 1791. At Naples she played a great social and political rôle, being an intimate of Queen Maria Carolina. Nelson first met Lady Hamilton at Naples in 1793, again in 1798, and from 1800 onward they lived together. In 1801 Lady Hamilton gave birth to a child, Horatia, by Nelson. After Nelson's death Lady Hamilton's affairs became involved, and in 1813 she was even arrested for debt. She died at Calais, on January 15, 1815. Her child by Nelson lived with the latter's sisters. She died March 6, 1881. Another child by Nelson died in infancy. See NELSON, HORATIO.

HAMILTON, FRANK HASTINGS (1813-86). An American surgeon, educated at Union College and in the medical department of the University of Pennsylvania. In 1861 he became professor in the Bellevue Hospital Medical College. He was a military surgeon for two years in the Civil War, and was appointed medical inspector with the rank of lieutenant-colonel in 1863. Among the many positions of honor and trust which he held was the presidency of the New York Society of Medical Jurisprudence. His services as consulting surgeon to various hospitals and asylums were highly prized, and he became widely known as an authority on surgery, his three large works having a recognized place in the literature of medical science. They are: *Treatise on Fractures and Dislocations* (1860); *Practical Treatise on Military Surgery* (1861); and *The Principles and Practice of Surgery* (1872).

HAMILTON, GAIL. The pseudonym of Mary Abigail Dodge (q.v.).

HAMILTON, GAVIN (1730-97). A Scotch painter and antiquary. He was born at Lanark. At an early age he was sent to Rome, where he studied painting under Massucci. His best pieces were designed from the *Iliad*, such as "Achilles Beside the Dead Body of Patroclus," "Andromache Bewailing the Death of Hector," and "Helen and Paris." Hamilton, however, rendered greater service to art by his discoveries of precious fragments of ancient monuments than by his direct contributions to it. The latter part of his life was devoted to excavations in various parts of the Roman States, but especially at Civita Vecchia, Velletri, Ostia, and above all at Hadrian's villa at Tivoli. The statues, busts,

and bas-reliefs found by him form the most interesting portion of the Museo Pio-Clementino in the Vatican, after the treasures of the Belvedere. Many collections in England, Germany, and Russia are deeply indebted to his labors. To one of the best of these—the Townley Gallery—Hamilton contributed a large number of valuable marbles. In 1773 he published at Rome *Schola Italica picturæ*, illustrated after his own drawings of the great Italian masters.

HAMILTON, Lord GEORGE FRANCIS (1845—). He was born in Brighton, England, and is the third son of the first Duke of Abercorn. He was educated at Harrow, entered the Rifle Brigade as ensign in 1864, and in 1868 was transferred to the Coldstream Guards, with a lieutenant's commission. In 1868 he entered Parliament as a Conservative from the county of Middlesex, and continued to serve from 1874 to 1880. From 1874 to 1878 he was Under-Secretary of State for India. With the return to power of the Conservative Party in 1885 he became First Lord of the Admiralty, an office which he occupied until 1892. During Lord Salisbury's third Administration he was Secretary of State for India. His naval reconstruction scheme of 1889 was the most extensive one ever adopted. Great credit is due him for ability and judgment displayed in dealing with the troubles in India. He was appointed provisional Grand Master of Middlesex County in 1892, served as chairman of the London School Board for the year of 1894, and was appointed Captain of Deal Castle in 1899.

HAMILTON, JAMES (c.1710-83). A Colonial Governor of Pennsylvania, son of Andrew Hamilton (q.v.), the lawyer, and born probably in Accomac County, Va. He was prothonotary of the Supreme Court of Pennsylvania after his father's resignation, was six times a member of the Provincial Assembly, was elected Mayor of Philadelphia (1745), and a member of the Provincial Council (1746). Two years later he became Lieutenant-Governor, which office he resigned in 1754. He was prominent in the defense of the Colonies against the Indians in 1755, and was Deputy Governor (1759-63, 1771, and 1773). While the British held Philadelphia he was a prisoner on parole. He was prominent in educational and scientific circles after the war, acting as president of the Board of Trustees of Philadelphia College and head of the Philosophical Society.

HAMILTON, JAMES (1769-1829). A British teacher of languages. Hamilton went to school for four years only, to two Jesuits in Dublin. As a business man he lived in France and Hamburg, where he learned German from an émigré, D'Angeli, who used no grammar, but taught by literal translation. On the rupture of the Peace of Amiens, Hamilton was 'detained' in France, and his Continental business was ruined. In 1815 he came to New York, intending to manufacture potash. Instead, he became a teacher of languages, combining the methods of his Jesuit teachers and of D'Angeli. This analytic method met with almost incredible success in New York City and in Philadelphia, where he published English interlinear translations of works in Greek, Latin, French, Italian, and German. Opposition to his methods in Baltimore College roused him to a defense which resulted in the total desertion by the students of the

college to the Hamiltonian Institute. After teaching in many college towns of the United States and in Canada, he went to London (1823). Throughout England and Scotland he was again marvelously successful. Hamilton's great work was *History, Principles, Practice, and Results of the Hamiltonian System* (last ed. 1831).

HAMILTON, JAMES (1786-1857). An American politician, born in Charleston, S. C. He received a good education in his native city, studied law, and soon attained a high position at the South Carolina bar. In 1812 he was appointed a captain in the army, and served in the campaigns on the Canadian frontier. He was Mayor of Charleston for several terms, and in 1822 while serving in that capacity he detected, and by his measures suppressed, a well-planned negro conspiracy. After serving in the State Legislature, he was in 1822 elected a member of Congress as a States Rights Democrat, to fill a vacancy, and was twice reelected, serving until 1829. He was an ardent supporter of Andrew Jackson, both in 1824 and 1828, and after Jackson's election in the latter year he was offered the position of Secretary of War or of Minister to Mexico, both of which he declined. Returning to South Carolina, he was in 1830 elected Governor of the State on an extreme States Rights platform, and immediately recommended to the Legislature that it authorize armed resistance to the enforcement of the provisions of the tariff of 1828. He advised the passage of the Nullification Act, which brought affairs to a crisis, and in 1832 was appointed by Gov. Robert Y. Hayne, who in that year succeeded him in the Governorship, to the chief command of the State troops recruited to resist the National Government. He never acquiesced in the settlement of the trouble, and soon thereafter removed to Texas, where he became interested in some colonization schemes. In 1841 he was the accredited representative of Texas in Europe, and it was due to his efforts that the independence of the republic was recognized by England and France in that year. He next bent all his energies to securing the admission of Texas into the Union. In 1857 he was elected United States Senator from Texas, but was drowned in a steamship collision off the Texas coast before he took his seat.

HAMILTON, JAMES (1814-67). A Presbyterian divine. He was born in Paisley, Scotland, November 27, 1814; educated at Glasgow and Edinburgh; entered the ministry, and from 1841 till his death, November 24, 1867, was minister of the National Scotch Church, Regent Square, London. His literary activity was very great, as aside from editorial labor he produced numerous volumes, and contributed the articles upon botany in Fairbairn's *Imperial Bible Dictionary* (London, 1867). His *Collected Works* were published in six volumes (London, 1869-73).

HAMILTON, JAMES CLELAND (1836—). A Canadian barrister and author. He was born at Belfast, Ireland, but was educated in America, and graduated at Toronto University. He published some travel sketches; but his more important work is contained in the papers upon literary and scientific subjects written for the Canadian Institute, of which he was elected vice-president, and printed in its *Proceedings*—such as *The Great Centre, an Astronomical Study*; and *The Paris, an Historical Outline of Ca-*

nadian Indian Slavery in the Eighteenth Century.

HAMILTON, MOUNT. See LICK OBSERVATORY.

HAMILTON, PATRICK (c.1504-28). A precursor of the Scottish Reformation. He was born probably in the year 1504, either at Stanehouse or Kincael. He was educated at the University of Paris, where he took his degree of A.M. in 1520, after which he probably proceeded to Louvain and Basel. In 1523 he was back in Scotland, and was admitted to Saint Andrews University. While abroad he had formed new tastes and interests, but for some time his opinions attracted no attention. Gradually, however, his convictions matured. From agreeing with Erasmus he came to agree with Luther, and about 1526 he appears to have announced his new views in such a manner as to draw the notice of Archbishop Beaton. Early in 1527 Beaton made 'inquisition' into the grounds of the rumor against him, and Hamilton fled to Wittenberg, where he became familiar with Luther and Melancthon, and then passed on to Marburg, where the university was just opened. After six months he returned to his native country, in the autumn of 1527. He repaired to the family mansion at Kincael, and there, in the neighborhood of Linlithgow, preached openly. In some way he was induced to go to Saint Andrews in January, 1528, and took up his abode in a lodging provided for him by the Archbishop. A conference was held, in which his opponents showed a conciliatory spirit, and even to some extent expressed concurrence in his views. He was allowed to depart in peace, and for some time to promulgate his sentiments in the city and University of Saint Andrews. After a month or so he was summoned to answer before Beaton to a charge of heresy. He was condemned for divers heresies and 'detestable opinions,' deprived of all dignities and benefices in the Church, and delivered over to the secular power to be punished. The sentence was carried out without delay. On the very same day on the morning of which he was tried (February 29, 1528), Hamilton was consigned to the stake in the front of the gate of Saint Salvador's College. His only publication is known as *Patrick's Places*, and is an evangelical treatise, written in Latin; it was translated by Frith (London, 1807). For his life, consult Lorimer (London, 1857).

HAMILTON, ROBERT (1743-1829). A Scottish writer on finance, born in Edinburgh, educated at the University of Edinburgh. He entered a banking house, but at the age of twenty-six left mercantile pursuits, and became successively rector of Perth Academy, professor of natural philosophy in Aberdeen University (1779), and professor of mathematics (1817). In 1777 he wrote an *Introduction to Merchandise*; in 1790, three essays on *Peace and War*; in 1822, *Management of the Poor*, a work displaying enlightened views on economics. His most important work is the *Essay on the National Debt*, which appeared in 1813. A posthumous volume published in 1830, *The Progress of Society*, is also of great ability, treating of economical principles by tracing their natural origin and position in the development of social life.

HAMILTON, SCHUYLER (1822—). An American soldier, a grandson of Alexander Ham-

ilton. He was born in New York, graduated at West Point in 1841, served with great gallantry in the Mexican War, and was brevetted first lieutenant in 1846 and captain in 1847. From the latter year until 1854 he was aide-de-camp to Gen. Winfield Scott. He then resigned from the army, but upon the outbreak of the Civil War volunteered as a private in the Seventh Regiment, New York National Guard. He was rapidly promoted, becoming a brigadier-general of volunteers in 1861, and a major-general of volunteers in 1862. He was actively engaged in the operations against New Madrid, Mo., and Island No. 10, in the Mississippi River, and in the campaigns in Tennessee and Mississippi. Sickness compelled him to resign in 1863. He was hydrographic engineer in the Department of Docks, New York City, in 1871-73, and superintendent of yards in 1873-75, and subsequently, owing to ill health, lived in retirement. He wrote *A History of Our National Flag* (1852).

HAMILTON, THOMAS (1789-1842). An English prose writer, of Scottish descent, born in Glasgow. He was educated at Glasgow University, and became the friend of Wordsworth and Scott. His novel *Cyril Thornton* (1827) was popular in its day, while in *Men and Manners in America* (1833) he showed himself a kindly critic, shrewd and humorous.

HAMILTON, WALTER (1844-99). An English writer, born in London, and educated at the Collège de Dieppe. He was a fellow of the Royal Historical Society, vice-president of the Société Française des Collectionneurs d'Ex Libris, and vice-president of the Ex Libris Society. His published works include: *A Memoir of George Cruikshank* (1878); *The Origin of the Office of Poet Laureate* (1879); *The Poet Laureates of England* (1879); *The Æsthetic Movement in England* (1882); *Parodies of the Works of English and American Authors, Collected and Annotated* (5 vols., 1884-88); *French Book Plates for Ex Libris Collectors* (1892); *Dated Book Plates* (2 parts, 1894-95).

HAMILTON, WILLIAM (1704-54). A Scottish poet, born at Bangour, Linlithgowshire. Between 1724 and 1727 he contributed lyrics to Allan Ramsay's *Tea Table Miscellany*. In 1745 he joined the cause of Prince Charles, and celebrated the battle of Prestonpans in an ode beginning, "As over Gladsmuir's blood-stained field." After the disaster of Culloden he lurked for several months in the Highlands, and at length escaped to France; but the influence of his friends at home procured him permission to return to Scotland. Broken in health, he went back to France, where he died. Though Hamilton wrote much graceful verse, his fame rests upon what Wordsworth called 'the exquisite ballad,' "The Braes of Yarrow."

HAMILTON, Sir WILLIAM (1730-1803). Grandson of William Douglas, third Duke of Hamilton, born in Scotland. In 1764 he was appointed English Envoy Extraordinary and Plenipotentiary to the Court of Naples. During his residence there he devoted much time to a study of Vesuvius and other volcanoes, and embodied his results in *Campi Phlegræi* (2 vols. and suppl., Naples, 1776-79), and shorter papers. He was also an enthusiastic collector, particularly of ancient vases, which he seems to have been one of the first Englishmen to appreciate

for their artistic merit. His first collection was sold in 1772 to the British Museum for £8400, and formed the nucleus of the present department of Greek and Roman antiquities. This collection was described by D'Hancarville, in *Antiquités étrusques, grecques et romaines* (4 vols., Naples, 1766-67; and 2d ed., Florence, 1801-08). In 1787 he resumed collecting, and in 1798 sent a second collection to England for sale, but the vessel was wrecked, and only about two-thirds of the cases were recovered. The whole of the collection was drawn by Tischbein in his *Collection of Engravings from Greek Vases . . . in the Possession of Sir W. Hamilton* (Naples, 1791 et seq.). From 1793 to 1800 Hamilton took an active part in the diplomacy of the Court of Naples, but his health failed, and in 1800 he was recalled. A claim upon the British Government for special services was not allowed, but he was granted a pension of £1200. Hamilton's first wife was Miss Barlow, who died in 1782. In 1791 he married his mistress, Emma Lyon, who as Lady Hamilton is prominent in the life of Lord Nelson.

HAMILTON, Sir WILLIAM (1788-1856). An eminent philosopher of the Scottish school. He was born March 8, 1788, at Glasgow, where his father, Dr. William Hamilton, and his grandfather, Dr. Thomas Hamilton, held in succession the chairs of anatomy and botany. After gaining distinction, especially in the philosophical classes, at Glasgow, he went in 1807 to Balliol College, Oxford, as a Snell exhibitioner, and made a brilliant record for himself as a student of literature. He left Oxford in 1810, and instead of going into the practice of medicine, which he had studied, he became a member of the Scotch bar in 1813, but seems never to have had any practice in his profession except what became incumbent on him afterwards, on being appointed Crown solicitor of the Court of Teinds. In 1820, on the death of Dr. Brown, he was an unsuccessful competitor for the chair of moral philosophy in Edinburgh. In the following year, however, Hamilton was appointed to the professorship of history in that university. He took part in 1827 in the discussion of the scientific value of phrenology, and made careful investigations for himself of the brains of various animals in order to become acquainted at first hand with the facts of the case. In 1829 there appeared in the *Edinburgh Review* a critique of Cousin's *Cours de Philosophie* of the previous year, in which was developed Hamilton's famous doctrine of the infinite. The critique, which was entitled "The Philosophy of the Unconditioned," immediately drew attention to him from philosophers both in Great Britain and on the Continent. For some years after this Hamilton was a regular contributor to the *Edinburgh Review*, writing articles on philosophy, literature, medicine, education, and university reform. Many of these contributions were translated into German, French, and Italian. In 1852 they were all edited by Hamilton himself, with large notes and appendices, under the title of *Discussions in Philosophy and Literature, Education, and University Reform*. In 1836, after a severe contest, Hamilton was elected to the chair of logic and metaphysics in Edinburgh. In 1846 he published in two volumes *The Works of Thomas Reid*, carefully edited with notes and supplementary descriptions, which give fairly satisfactory views

of his own philosophy. Extensive notes of his university lectures were taken by his students; numerous copies of them, transcribed from shorthand reports, were in circulation during the later years of his life, and formed the basis of Mansel and Veitch's edition. In 1844 he had a stroke of paralysis. He was, however, able, with an assistant, to perform the duties of his class till the close of session 1855-56, when his health suddenly became worse. He died May 6th. In logic Hamilton proposed the so-called doctrine of 'the quantification of the predicate' in affirmative propositions. In his view the predicate of every proposition has a definite logical quantity assigned to it in thought, and an explicit statement of this quantity simplifies logical operations. In this contention, Hamilton may properly be regarded as the forerunner of the algebraic school of logicians. (See LOGIC.) His psychology was a cumbersome analysis of psychic operations that perhaps went to the extreme length of 'faculty psychology' (q.v.). In philosophy he was an exponent of the common sense Scottish school, but in some respects he went beyond the tradition of the school. Agreeing with Reid that 'the root of our nature cannot be a lie,' and that the deliverance of consciousness must be trusted, he accepted a naïve sort of natural realism, maintaining that we are directly conscious of the existence of external objects and of ourselves. And yet knowledge is often all relative. "To think is to condition." In this doctrine of the relativity of knowledge consists his departure from Scottish traditions, and it led him to maintain in the spirit of Kant that the unconditioned cannot be known. God is an object of faith, not of knowledge.

Philosophy, according to Hamilton, cannot say whether God is absolutely limited or absolutely unlimited. One or the other He must be, for between contradictions there is no compromise; but either characteristic is inconceivable. Again, our conception of causality is nothing positive. It is nothing but the *inability* of the mind to conceive an absolute beginning. So the infinity of space and time is the inability of the mind to conceive a point when space comes to an end or a moment after which time shall be no more. But this inability to think is no test of unreality. Thus philosophy is only a learned ignorance (*docta ignorantia*), or a well-assured conviction of the limits of our knowledge. In many ways this reminds one of Kant, from whom Hamilton indeed learned much. Some historians have characterized his philosophy as a hopeless attempt to unite the 'common sense' of Reid with the criticism of Kant. His philosophy of relativity changed in the hands of Herbert Spencer, who gave up 'common sense,' into agnosticism. Consult: Veitch, *Memoir of Sir William Hamilton* (London, 1869); id., *Hamilton*, in Blackwood's *Philosophical Classics* (Edinburgh, 1879); and *Hamilton, the Man and His Philosophy* (ib., 1883); J. S. Mill, *Examination of Sir William Hamilton's Philosophy* (London, 1878); Martineau, *Reviews and Addresses*, vol. iii. (London, 1891); A. Seth, *Scottish Philosophy* (Edinburgh, 1890); Stirling, *Sir William Hamilton* (London, 1865); Monek, *Sir William Hamilton* (New York, 1881). His principal writings are accessible in the four volumes of lectures edited by Mansel and Veitch, reprinted in two volumes

(Boston, 1859-60). A college edition of his writings was published in 1855, by O. W. Wight.

HAMILTON, WILLIAM GERARD (1729-96). An English statesman, Chancellor of the Exchequer in Ireland. Of Scotch family, but born in London, he passed through Winchester College to Oriel, Oxford, though he did not graduate. He entered himself as a student at Lincoln's Inn (1744), but left the law for political life, and was a member of Parliament for both English and Irish boroughs. 'Single Speech Hamilton' was a misnomer, since Horace Walpole remarks upon the brilliance of his oratory on more than one occasion. Boswell mentions that he also charmed Dr. Johnson by his personality and conversation. He went to Ireland in 1761, as chief secretary to the Lord Lieutenant, and his own secretary was Edmund Burke. Hamilton was Chancellor of the Irish Exchequer (1763-84), and retired to England with a pension of £2000 a year. He was so notable a figure in his time that the *Letters of Junius* were ascribed to him, but he was more of a politician than a statesman. His published writings were collected by Malone under the title of *Parliamentary Logick* (1808).

HAMILTON, SIR WILLIAM ROWAN (1805-65). A Scotch-Irish mathematician, born at Dublin. His father, a solicitor, went to Dublin as a boy. William was remarkable as a child, having a good knowledge of Hebrew at the age of seven, and at twelve having studied not only Latin, Greek, and the leading modern languages of Europe, but also Syriac, Persian, Arabic, Sanskrit, Hindustani, and Malay. This devotion to languages was encouraged by his father because of the opportunities for service in the East India Company. During this same period his mathematical powers began to be manifest, and in his tenth year he entered a contest with the young American calculator (see **CALCULATORS, REMARKABLE**) Zerah Colburn, who was then visiting Dublin, and, although defeated, made a creditable record. Before he went to Trinity College, Dublin (1823), in his eighteenth year, he had not only mastered Euclid, Newton's *Arithmetica Universalis* and the *Principia*, and Laplace's *Mécanique céleste*, but he had discovered an important error in the last-named work, and had written an original memoir on osculation of certain curves of double curvature. His career at Trinity was one of remarkable brilliancy. While only a second-year student he read before the Royal Irish Academy a "Memoir on Caustics," which attracted wide attention, and led Airy to assert that "it had made a new science of optics." While still an undergraduate (1827), Hamilton was appointed Andrews professor of astronomy and superintendent of the observatory, and soon after became Astronomer Royal for Ireland. He was twice honored with the gold medal of the Royal Society, first for his work on optics, and again for his contributions to dynamics. He was knighted in 1835, and was subsequently made president of the Royal Irish Academy, and corresponding member of the Academy of Saint Petersburg and of the *Académie des Sciences* of Paris.

Hamilton is chiefly known for his discovery of quaternions (q.v.). He announced the theory in 1844, and in 1848 began to lecture upon it at Trinity. His *Lectures on Quaternions* (1853)

and *Elements of Quaternions* (posthumous, 1866; 2d ed. 1899) were not, however, written in a style to appeal to a large circle of mathematical readers, and it is owing chiefly to the work of Professors Tait and Kelland that the theory has attracted the attention that it merits. Consult Graves, *Life of Sir William Rowan Hamilton* (Dublin, 1882-89).

HAMILTON COLLEGE. An institution of higher education, situated at Clinton, N. Y. It was founded in 1793 by the Rev. Samuel Kirkland, a Congregational missionary among the Oneida Indians, for the education of the white and Indian population. The erection of a building, of which the corner-stone was laid by General Steuben in 1793, was brought to a standstill for lack of funds, and was only completed in 1797 through the untiring efforts of the founder. In that year the school was formally opened, and until 1812 was known as Hamilton Oneida Academy, deriving its name from Alexander Hamilton, one of its benefactors and trustees. In 1812, the necessary \$50,000 having been collected, the institution was chartered by the University of the State of New York as Hamilton College. It grew steadily for a while, but during President Davis's administration differences arose between him and the students, and the college suffered in consequence. Under President North's administration, however, the institution developed into one of the best-known classical colleges in the United States, and has since maintained a national reputation, especially in the departments of rhetoric and oratory. It has made no effort to give 'university' or specialized training, but has consistently upheld high scholastic standards. The two courses offered are the classical and the Latin-scientific, both offering numerous electives. One fellowship, fifty-five scholarships, and a large number of prizes are available. The attendance in 1902 was 200, and the faculty numbered 20. At the same time the endowment was \$500,000, the gross income \$400,000, and the value of real estate and collections was estimated at \$500,000. The library contains 43,000 volumes. The campus, covering 95 acres, is notable as representing the contributions of a large number of individual graduates and college classes in buildings, grounds, and other college improvements. The presidents of the college have been: Azel Backus (1812-16); Henry Davis (1817-33); Sereno Edwards Dwight (1833-35); Joseph Renney (1835-39); Simeon North (1839-57); Samuel Ware Fisher (1858-66); Samuel Gilman Brown (1866-81); Henry Darling (1881-91); Melancthon Woolsey Stryker (1892—).

HAMILTON INLET. An indentation of the Labrador coast, North America, 150 miles long, with a maximum breadth of 30 miles (Map: Canada, T 6). It forms the estuary of the Grand or Hamilton River (q.v.). From the north it receives the waters of Grand Lake.

HAMILTON RIVER. See **GRAND RIVER.**

HAMILTON SERIES. See **DEVONIAN SYSTEM.**

HAMITES, or HAMITIC. Designations applied to peoples and languages of the white or Caucasian branch of mankind settled from remotest times in Northern and Northeastern Africa and the Canary Islands. Both in biological character and in speech, as well as in situation and activities, they are nearest to the Semites.

The Hamites are in touch with African tribes south of the Sahara, and mixture with negroes has influenced the type of the population during thousands of years. On the other hand, Hamite culture has extended far from its original province. The eastern branch of the Hamites includes: (1) The ancient Egyptians, the oldest known people of the white race to develop a high civilization. Their descendants are the Copts, or native Christians, interspersed among the population, and the Fellahin or peasant class, speaking a Semitic language and practicing a Semitic religion.

(2) Farther up the Nile the Nubians, strongly negroid, are mixed with Hamite Bejas.

(3) The aboriginal population on the Abyssinian plateau. Agau Hamites.

(4) Ethiopian Hamites: Somalis, in many tribes; Gallas, one branch of whom, including Shoas and Amharas, extends into Abyssinia; Danakils in Afarland.

(5) Masai, in British East Africa, south of the Equator and east of the Victoria Nyanza. They are Hamites in language, have dark skin and frizzled hair, and are physically among the most magnificent races.

(6) Wahuma or Watusi, the ruling race in Northwestern German Africa, almost identical in speech and biological character with the Gallas. Passing westward from the Egyptian area along the north of Africa, the Berber Hamites, including Tuaregs, Shluhs, and Kabyles, occupy the littoral region and the Sahara. They are the descendants of the oldest known inhabitants of this territory, who were believed to have been the founders of the Mediterranean race.

(7) Tibus or Tubus, Hamites of the Sahara north of Lake Chad, mixed with negroes. Their speech is of doubtful affiliation.

(8) Fulah or Fulbe, in extreme Western Africa, in Futa-tor and Futa Jallon.

(9) Guanches, ancient Hamites of the Canaries.

Each of the separate peoples here named is described in its proper place. Among the Hamites are tribes that show blond characteristics, but it cannot be decided whether this is due to albinism or to invasion of Teutonic nations. The standard color is dark Brunette; the hair is black and curly, the body is over medium height, and in some tribes of great stature. The Hamites have, in recent years, come into especial prominence through their connection with the origin of Mediterranean peoples and early culture, some ethnologists tracing their type into the heart of Europe. Hamitic speech in its three varieties, Egyptian, Ethiopian, and Berber, belongs to the inflected class, near to the Semitic, from which it has been separated for millenniums. The oldest writing in the world is the hieroglyphic inscriptions placed on their monuments by the Hamitic Egyptians. They also were the earliest engineers, machinists, and architects in massive stones. Consult: Sergi, *Africa: Anthropologia della stirpe camitica* (Turin, 1897); Stanford, *Africa* (London, 1895); Keane, *Man, Past and Present* (London, 1899).

HAMITIC LANGUAGES. See AFRICAN LANGUAGES.

HAM'LET. See AMLETH.

HAMLET. An opera by Ambrose Thomas (1868), the French libretto being adapted by

Barbier and Carré from Shakespeare. An Italian version, *Amleto*, was presented in 1869 in London.

HAMLET. (1) The common spotted moray (q.v.). (2) The Bermuda grouper. See GROUPEE.

HAM'LEY, SIR EDWARD BRUCE (1824-93). An English general and author, born at Bodmin, son of Vice-Admiral William Hamley, and educated at Woolwich. In 1854 he was made adjutant, and later became aide, to Richard Dacres, and served through the Crimean War. He was appointed professor of military history at Sandhurst in 1859, and in 1882 he went with Sir Garnet Wolseley to Egypt, fought at Tel-el-Kebir, and was much aggrieved that his division was not recognized, insisting that it had won the day. He was made general in 1890, as a recompense for his ill-treatment. Hamley's best-known works are: *The Story of the Campaign of Sebastopol* (1855); *The Operations of War Explained and Illustrated* (last ed. 1878), an excellent work; *The War in the Crimea* (1891); *Lady Lee's Widowhood* (1854); and reprints from *Blackwood*, with which he was long connected.

HAM'LIN, ALFRED DWIGHT FOSTER (1855—). An American architect, born at Constantinople, Turkey, the son of Cyrus Hamlin, founder of Robert College there. He graduated at Amherst in 1875; subsequently studied at the Massachusetts Institute of Technology and at the Ecole des Beaux-Arts in Paris. In 1883 he became special assistant in Columbia University. He was appointed assistant professor of architecture there in 1889, adjunct professor of architecture in 1891, and afterwards professor of architecture. Among his publications, in addition to many magazine articles, are: *A History of Architecture* (1896), and a *Handbook of the History of Ornament*.

HAMLIN, CYRUS (1811-1900). An American Congregational missionary and educator. He was born at Waterford, Me., and graduated at Bowdoin College in 1834, and at Bangor Theological Seminary in 1837. In the latter year he went to Constantinople, as a missionary under the direction of the American Board. In 1860 he began the work of establishing Robert College at Constantinople, and succeeded in spite of the strong opposition of the Turkish authorities. He acted as its president until 1876, and then became professor of dogmatic theology in Bangor Seminary. In 1880 he was elected president of Middlebury College, Vt., which post he retained till 1885. He published *Among the Turks* (1877), and *My Life and Times* (1893).

HAMLIN, HANNIBAL (1809-91). An American political leader, vice-president of the United States in 1861-65. He was born at Paris Hill, Me., and prepared for college at Hebron Academy, but his father's death prevented his taking a college course. After some years spent in running the home farm and a short period as proprietor of a country weekly at Paris, he studied law, was admitted to the bar, and in 1833 began practice at Hampden, Maine. His long political career of almost a half-century began in 1835 with his election to the lower branch of the Maine Legislature as a Democrat. To this he was a number of times reelected, and served as its presiding officer in 1837, 1839, and 1840. In the last year he was a Democratic nominee

for Congress, but was defeated in the Whig landslide of that year. Two years later he was elected to the Twenty-eighth Congress, and was reelected to the Twenty-ninth, serving from 1843 to 1847. Early in his Congressional career he took a pronounced stand as an anti-slavery man, opposed the annexation of Texas, and drew particular attention to himself by introducing the famous Wilmot Proviso (q.v.) during the temporary absence of its author, and securing its acceptance by the House by a vote of 115 to 106. In 1848 he was elected to the United States Senate to fill a vacancy caused by the death of Senator Fairfield. In spite of his action in speaking and voting against Clay's compromise measures, he was reelected for a full term of six years in 1851. Before the completion of this term, however, he had taken an active part in the founding of the Republican Party, and resigned his seat in the Senate in 1856 upon being elected by that party Governor of his native State. In 1857, however, he resigned from the Governorship to resume his seat in the Senate, to which he had been reelected, and where he thought he could be of more use to the anti-slavery cause than in the Governor's chair. He remained in the Senate until after his election, in 1860, as Vice-President of the United States on the ticket with Abraham Lincoln. During the Civil War he was a valued adviser of President Lincoln, and the relations between the two were especially intimate. He was again United States Senator, 1869-81, and was Minister to Spain, 1881-83. Consult C. E. Hamlin, *Life and Times of Hannibal Hamlin* (Cambridge, 1899).

HAMLINE, LEONIDAS LENT (1797-1865). A Methodist Episcopal bishop, born in Burlington, Conn. He studied for the ministry, but afterwards read law, and practiced in Ohio. In 1830, however, he became a preacher in the Methodist Church, in 1836 was chosen assistant editor of the *Western Christian Advocate*, and four years later chief editor of the *Ladies' Repository*. In 1844, when the Methodist Church divided on slavery, he was a member of the General Conference, and drew up the plan of separation. He was elected bishop at that session, and served until 1852. Hamline University, Minnesota, was named in his honor. A number of his sermons are given in the *Works of L. L. Hamline, D.D.*, edited by Rev. F. G. Hibbard, D.D. (1869). Consult Palmer, *Life and Letters of Leonidas L. Hamline, D.D.* (New York, 1866).

HAMLINE UNIVERSITY. A coeducational Methodist Episcopal college at Hamline, Minn., midway between Saint Paul and Minneapolis. It was situated at Redwing until 1869, when it was closed, and reopened in 1880 at Hamline. It has a preparatory department with about 100 students; a college of liberal arts, with an attendance of 200; and a college of medicine, with 150 students, at Minneapolis. The college faculty in 1902 numbered 20, and the medical faculty 48. At the same time the university library contained 6000 volumes, the buildings and grounds were valued at \$150,000, the endowment was \$200,000, and the annual income was \$24,000.

HAMM, häm. The capital of a circle in the Prussian Province of Westphalia, situated at the confluence of the Ahse with the Lippe, 23 miles northwest of Arnsberg (Map: Prussia, B 3).

It is surrounded by old ramparts and a moat, and contains a Catholic church dating from 1510, and an old gymnasium. It is at the junction of several railroad lines, and produces many varieties of iron articles, gloves, flour, liquors, starch, leather, bricks, etc. In the vicinity are thermal baths. Hamm was formerly the capital of the County of Mark and a member of the Hanseatic League. Population, in 1890, 24,969; in 1900, 31,371.

HAMMACHER, hä'mäg-ër, FRIEDRICH (1824 —). A German politician, born at Essen, and educated at Bonn and Berlin. He had to leave the Government service in 1850 because of his part in the rising of '48, and went into business. He soon became interested in the mining industries of the Rhine District and of Westphalia, and founded at Dortmund a union for mining interests. A member of the Prussian House of Deputies (1864-68), and of the Reichstag from 1869 to 1898, with two interruptions, he was one of the founders and leaders of the National Liberal Party; took an especial interest in economic questions, and drew up the declaration of more than two hundred Deputies, which, in 1878, altered Bismarck's commercial policy. He was one of the promoters of a Government system of railroads in Prussia in the following year, and a founder and director of the German Colonial Union. In 1889 he mediated the disagreements between the Rhenish Westphalian miners and mine-owners in the coal strike of that year.

HAMME, häm'me or häm. A town in the Province of East Flanders, Belgium, situated on the right bank of the Durme, 18 miles east-northeast of Ghent (Map: Belgium, C 3). It contains grain and oil mills, has manufactures of lace, ribbons, and linen, and carries on trade in flax. Population, in 1890, 12,039; in 1900, 13,755.

HAMMER (AS. *hamor*, Icel. *hamarr*, OHG. *hamar*, Ger. *Hammer*; connected with OChurch Slav. *kamy*, Lith. *akmū*, stone, Gk. *ἀκμων*, *akmōn*, anvil, Skt. *āman*, stone). A tool used for applying the force of impact either for the purpose of beating or forging malleable materials into a specific shape, or for driving nails, spikes, wedges, etc. Hammers may be divided into two general classes, viz. hand hammers and power hammers. Hand hammers are made in a variety of forms to suit the particular purposes for which they are employed. They are all made with a steel or iron head set crosswise of a wooden handle. The part of the hammer which strikes the work is called the face, and the opposite part is called the pane. The pane of the ordinary carpenter's hammer is bent, and has a V-shaped notch to permit its use as a lever for drawing nails; that of a geologist's hammer is wedge-shaped, etc. Many hammers have two faces, either of which may be used indifferently. Hammers of large size requiring the use of both hands to wield them are commonly called sledges, and usually have two faces.

Power hammers are of several forms, the most important of which is the direct-acting steam hammer and its modifications, the drop-press and drop-hammer. One of the oldest forms of power hammer is the tilt-hammer, which consists essentially of a handle working on a horizontal axle at or near one end, and having a head at the other end. The handle and head are usually made of iron, and very heavy. This

type of hammer is operated by a cam or eccentric (see CAM; ECCENTRIC), which swings up the head end one or two feet and lets it drop. An anvil placed so as to receive the blow is an essential part of the mechanism. Various modifications of this simple device have been devised, but, like the original form, they have become practically obsolete in forging operations, having been replaced by the direct-acting steam hammer. This tool was invented by James Nasmyth, who first conceived the invention in 1839, but did not patent it until 1842. Meanwhile a steam hammer had been actually built at the iron-works of Le Creusot, France, the idea of which, according to English writers, had been obtained from Nasmyth's preliminary sketches, to which the French builders had had access. Be this as it may, the fact is that the first Nasmyth hammer was erected at the Bridgewater Foundry at Patricroft, near Manchester, England, in 1843. This hammer consisted of two vertical uprights or columns surmounted by an entablature, which carried an inverted vertical steam cylinder midway between the two columns. In this cylinder was a piston, with a piston-rod projecting downward between the two columns and carrying at its end a casting which formed the hammer proper. An anvil block occupied the space between the feet of the columns, and received the blow of the hammer. To operate the hammer steam was admitted to the cylinder below the piston, which raised it with its attached piston-rod and hammer to any height desired, limited by the height of the cylinder; when at the desired height the steam was allowed to escape into the air, and the piston and its attachments fell by gravity. The force of the blow depended upon the weight of the hammer and the height of the fall. The hammer was worked by means of an ordinary slide-valve and a long lever, requiring great labor and constant attention in order to give the blow required; so that some contrivance capable of adjustment was necessary in order to have complete command over the power of the blow, and in order that, the instant the blow was struck, the block should rise again, so that not only no loss of time should ensue, but that the heat in the mass of iron on the anvil might not be reduced or carried off by the cold face of the block. The peculiar difficulty of securing a true automatic arrangement will be seen when it is considered that the instant of percussion must vary with almost every blow that is struck; for the piece on the anvil becomes thinner and thinner by each succeeding blow, and in flat bars a blow is first given on the flat side, and then on the edge, the difference in the fall of the hammer in the two cases being oftentimes several inches; and further, that the hammer must be under perfect control at all times.

Nasmyth, after many and protracted trials, failed to produce the motion required, and, as a consequence, the whole hammer scheme was on the point of being abandoned. In this dilemma, and during Nasmyth's absence from the works, his partner, Gaskell, applied to their engineering manager, Robert Wilson, who afterwards became managing partner and successor to Nasmyth, to endeavor to solve the problem which had hitherto baffled the skill of Nasmyth. Wilson took the matter in hand, and in little more than a week a mechanism was invented and attached to a hammer upon which former experiments

had been made, and was at once found to answer most admirably every condition required. Under the influence of this very beautiful mechanical device every variety of blow

STEAM HAMMER.

Section showing cylinder and valve mechanism.

could be given—from the gentlest tap to the heaviest blow within the compass of the hammer—and that, too, perfectly self-acting in every respect, the long lever and the hard work before

STEEL-HAMMER.

For forging iron and steel.

referred to being now entirely banished. By simply altering the position of the tappet lever by means of two screws, a blow of the exact force required could be produced and continued so long as steam was supplied. On August 18, 1843, the first hammer was delivered to the Low Moor Iron Works, near Bradford, Yorkshire, and gave such satisfaction that orders for this remarkable tool began to flow in from all parts of the country. The hammer remained in this condition, with the exception of a few minor details, from 1843 to 1853, when Wilson (who had become connected with the Low Moor Iron

Works) invented, patented, and applied to the hammers at Low Moor and elsewhere what is called the 'circular balanced valve.' He later devised for the steam locomotive a balanced slide-valve, in which, by a most ingenious arrangement, the valve is allowed to float, as it were, in an atmosphere of steam pressing equally upon it on every side, entirely doing away with all superincumbent pressure upon the valve, no matter what the pressure in the boiler may be. The great advantage of this invention will be apparent when it is stated that hammers are now made of such a size that if the valve were not balanced a small steam-engine would be required to move it. In June, 1861, Wilson patented and introduced another very important improvement, popularly known as the *double-acting hand-gear motion*. By this arrangement, the steam is admitted as before to raise the piston, and when it has attained the required elevation, and at the very moment when about to descend, by slightly increasing the travel of the hand lever (more than when working single-acting), the steam is admitted into the cylinder above the piston, which accelerates and increases the intensity of the falling blow and the consequent capacity of the hammer so much that a 5-ton hammer is, by this double-action arrangement, increased to at least a 12½ or 15 ton one.

Since 1861 the chief improvements in steam hammers have been in the nature of mechanical improvements in detail and construction to enable larger hammers to be built. A steam hammer of great size was erected at the Bethlehem Steel Works, South Bethlehem, Pa., in 1889, to be used in forging armor plates and other large steel objects. The steam cylinder is 76 inches in diameter, and has a stroke of 16½ feet, and the weight of the moving parts is 125 tons; the anvil is made up of three 22-inch iron blocks, each weighing 70 tons. This hammer, it is interesting to note, has been put out of commission. At Perm, Russia, there is a 50-ton hammer; at the Terni Steel Works, in Italy, one of 100 tons; at the Krupp Works at Essen, Germany, one of 50 tons; at Woolwich Arsenal, England, one of 25 tons; and at Le Creusot, France, one of 50 tons. Recently steam hammers have been replaced by hydraulic presses for forging armor plate and similar large forgings, and they are now seldom built in the large sizes stated above. In smaller sizes for making drop-forgings (see FORCE, FORGING), and for forging the vast majority of smaller work, they are still extensively used. In some works compressed air is used in place of steam for operating their hammers. For a description of a class of compressed-air operated hammers for light work, such as driving rivets, calking, etc., see PNEUMATIC TOOLS. The steam hammer doubtless ranks as one of the most important economic inventions of all time.

HAMMER, hä'mër, JULIUS (1810-62). A German poet, born in Dresden. He studied jurisprudence at Leipzig, but in 1834 made the acquaintance of Tieck and Theodor Hell by his play *Das seltsame Frühstück*, and decided to devote himself to literature. It was largely due to him that the Schiller Society was formed at Dresden in 1855. The early period of his literary activity was taken up with fiction of comparatively small value, only *Einkehr und Umkehr* (1856)

deserving mention; and his dramatic attempts met with little success and had not much worth. He is best known for his poetry; the popular collection of proverbs, *Schau um dich und schau in dich* (1851, 33d ed. 1892). A similar didactic tendency is characteristic of his other lyric productions, *Zu allen guten Stunden* (1854); *Fester Grund* (1857); *Auf stillen Wegen* (1859); *Lerne, liebe lebe* (1862), all republished many times. He also published a poetic version of the Psalms, *Die Psalmen der heiligen Schrift* (1861); *Unter dem Halbmond* (1860); and the religious anthology *Leben und Heimat in Gott* (13th ed. 1896). Consult Ende, *Julius Hammer* (Nuremberg, 1872).

HAMMER, THE. A popular name for Judas Maccabæus.

HAMMER AND SCOURGE OF ENGLAND, THE. A popular title for William Wallace.

HAMMER-CLOTH. A cloth which covers the driver's seat in some kinds of carriages, said to be so called from the former custom of using the box as a receptacle for tools. Another explanation of the name is that it is a corruption of hammock-cloth, the seat which the cloth covers being formed of straps or webbing stretched between two crutches, as a sailor's hammock is suspended, to secure ease of motion. A third suggestion has been made that *hammer* is a corruption of the Dutch *hemel*, canopy. Hammercloths are usually ornamented with fringes, and bear the arms of the proprietor of the carriage. They are old-fashioned, and now seen only on the ceremonial carriages of royalty.

HAMMERFEST, hä'mër-fëst. A seaport of Norway and the most northern town in the world, situated in latitude 70° 40' 11" N., and longitude 23° 30' E., on the west shore of the island of Kvalö, in a barren, treeless district (Map: Norway, L 1). The town is almost entirely built of wood. The sun is above the horizon from the 13th of May to the 29th of July. Its absence for several months in the winter has led to the extensive introduction of electric lighting, the power being derived from waterfalls. The chief occupations of the people are the production of cod-liver oil and walrus-hunting. There is an active trade with the Russian port of Archangel. Population, in 1891, 2188; in 1901, 2298.

HAMMERHEAD, or HAMMERFISH. (1) A shark of the genus *Sphyrna*, consisting of four or five species, and constituting a family, *Sphyrnidae*, distinguished from all other fishes by the extraordinary form of the head, which in the adults resembles a double-headed hammer, with the eyes at the ends of the lateral extensions. The mouth is below the centre of the head. Some of the species attain a length of fifteen feet, and are very voracious. The great hammerhead (*Sphyrna zygaena*) is found in all warm seas, occurring on the coast of the United States and Europe. These sharks are ovoviviparous, and produce about 40 young at a birth. See Plate of GREAT SHARKS. (2) See HAMMERKOP.

HAMMERHEAD BAT. An extraordinary fruit-eating bat (*Hypsignathus monstrosus*), discovered about 1860 by Du Chaillu in the Gabun region of West Africa. It is about five inches long, and has the nose greatly swollen and pro-

longed, as shown in the illustration of its head on the Plate of BATS. Nothing is known of its habits.

HAMMERICH, hä'mēr-ik, MARTIN JOHANNES (1811-91). A Danish linguist and teacher, brother of Peter Frederik Adolf Hammerich, historian and theologian. He studied theology, but early showed interest and marked ability in mythology and philology; received his degree in 1836, was instructor of Sanskrit at Copenhagen from 1841 to 1844, and was head of a gymnasium at Christianshavn. His important works are: a translation of the *Sakuntala* of Kalidasa (last edition, 1879); *Om Ragnaroksmýthen* (1836); *Bidrag til en Skildring af Holberg* (1858); *Ewalds Levned* (1860); *Danmark-Norges Litteratur i kort Overblik* (1864); *Thorvaldsen og hans kunst* (1870).

HAMMERKOP. The Dutch name in South Africa for a bird, the umbrette (q.v.), Anglicized as 'hammerhead.'

HAMMER OF HERETICS. A title applied to Saint Augustine; also to Pierre d'Arly, president of the Council of Constance (1414-18).

HAMMER OF THE SCOTCH, THE. A popular name for Edward I. of England. It appears on his tombstone in Westminster Abbey.

HAMMER-PURGSTALL, häm'mēr pōōrg'-stäl, JOSEPH, Baron (1774-1856). An Austrian historian and Orientalist, born at Gratz. He studied in the Oriental Academy of Vienna, took part in the publication of an Arabic-Persian-Turkish lexicon, and was appointed interpreter to the Internuncio at the Porte in 1799, continuing in the Austrian diplomatic service until 1817, when he was made Aulic Counselor. In 1847-49 he was president of the newly established Academy of Sciences of Vienna. Meanwhile he wrote constantly on many subjects connected with the history and literature of the Orient. He translated from the Arabic, Persian, and Turkish works previously unknown in Europe. One of his most important contributions was the *Litteraturgeschichte der Araber* (1850-56), and one of his best known, the *Divan des Hafiz* (1812). He also wrote the *Geschichte der Assassinen* (1818), and *Geschichte der osmanischen Dichtkunst* (1836-37).

HAMMERSCHMIDT, hä'mer-shmīt, ANDREAS (1611-75). A Bohemian musician, born at Brüx. In 1635 he became organist of Saint Peter's, Freiberg, and four years later accepted a like position at Zittau. He remained there for nearly forty years, and upon his death a statue was erected to his memory. His compositions were of great importance at their time, and include: *Weltliche Oden* (1650); *Chormusik fünfter Theil* (1652); *Kirchen- und Tafelmusik* (sacred concertos, 1662).

HAMMER-SHELL.

HAMMER-SHELL. An Oriental bivalve mollusk, of the wing-shell family (Aviculidæ) and genus *Malleus*, remarkable for the T-shape of its shells, which are

expanded along the hinge-margin. It is also called 'hammer-oyster,' and the flesh is eaten.

HAMMERSMITH. A metropolitan borough of London, Middlesex, England, on the left bank of the Thames, 6 miles west-southwest of Saint Paul's; formerly a suburban village with large nursery and market-gardening interests (Map: London, E 5). It has numerous educational and benevolent institutions and is a populous Roman Catholic centre. It is traversed by several important railways. Population in 1891, 97,283; in 1901, 112,245.

HAMMOCK. The apparatus in which a sailor slings his bed derives its name through the Spanish *hamaca*, from a Peruvian word, the custom of thus suspending a bed having been derived from Peru, where the natives fasten the two ends of a piece of canvas, or of a netting of grass twist, to the branches of a tree. A sailor's hammock consists of a rectangular piece of hempen or cotton canvas, about six feet long and three in width, gathered together at each end by means of cords and a clew, and hung to hooks under the deck. The hammock thus suspended forms a sort of bag capable of containing the sailor's mattress, his blankets, and himself, as soon as he has acquired the far from easy knack of climbing into it. The hammocks are taken below at sunset and hung in rows about two feet apart, in the men's portion of the ship. When done with in the morning the bedding is carefully tied up within each, and the whole stowed in the *hammock-netting*, which is no longer a netting, but is a locker or box-shaped receptacle, and is generally in the bulwarks of the waist.

HAMMOND. A city in Lake County, Ind., 21 miles south by east of Chicago, Ill.; on the Grand Calumet River, and on the Erie, the Michigan Central, the Baltimore and Ohio, the Wabash, and several other railroads (Map: Indiana, B 1). With its exceptional railroad facilities, the city is of considerable importance as a commercial and manufacturing centre. The industries include extensive steel-spring and chemical works, nail-mills, a slaughtering and meat-packing plant, flour-mills, carriage-works, a distillery, starch-works, a glue-factory, brick-yards, etc. Settled in 1869, Hammond was incorporated in 1883, the charter of that date being still in operation. The government is vested in a mayor, chosen every four years, and a city council, which elects administrative officials. The water-works are owned and operated by the municipality. Population, in 1890, 5428; in 1900, 12,376.

HAMMOND, ANTHONY (1668-1738). An English pamphleteer and poet. He was born in Huntingdonshire, for which he was elected a member of Parliament in 1695. As a fluent and well-informed speaker on financial questions, he soon gained a considerable reputation, but his lack of tact stood in his way. He was twice chosen as member for Cambridge University, and in 1701 was appointed a commissioner for stating the public accounts. The following year he was made a commissioner of the Navy, under Godolphin's Administration. After another term as member of Parliament he went in 1711 to Spain as paymaster of the British forces there, but soon retired and devoted himself to literary pursuits. In 1720 he edited a *New Miscellany of Original Poems, Translations and Imitations*, and he also

published several pamphlets on political and financial subjects.

HAMMOND, EDWARD PAYSON (1831—). An American evangelist. He was born at Ellington, Conn.; graduated at Williams College in 1858, and studied theology at the Union Theological Seminary, New York, and at the Free Church Seminary, Edinburgh. After being ordained to the Presbyterian ministry in 1863, he engaged in evangelistic work in the United States, Canada, and Great Britain, and met with remarkable success. He wrote many tracts and a number of hymns for use in his work. His work is described by Headley, in *The Reaper and the Harvest* (1884).

HAMMOND, HENRY (1605-60). A learned English divine and controversial writer, born at Chertsey, Surrey. He was educated at Magdalen College, Oxford, and in 1629 became rector of Peshurst. His devotion to Charles I. cost him the living; nevertheless he continued to act as chaplain to the King until 1647, when all the royal attendants were dismissed. After that he was subdean of Christ Church, Oxford, but was soon imprisoned, and spent the rest of his life in Worcestershire. His separate works numbered fifty-eight, the most celebrated of which are the *Practical Catechism* (1644), and *Paraphrase and Annotations on the New Testament* (1653). His *Miscellaneous Theological Works* have been published (1847-50). His *Life*, by Fell, Bishop of Oxford (London, 1661), is a charming biography, and has been followed by several modern biographers.

HAMMOND, JABEZ D. (1778-1855). An American author and politician, born in New Bedford, Mass. He practiced medicine in Vermont, but afterwards studied law and followed that profession at Cherry Valley, N. Y. He was a Democratic Congressman from New York in 1815-17, a State Senator in 1817-21, and in 1825 was made a commissioner in the settlement of the claims of New York against the Federal Government. In 1838 he was elected county judge at Albany, where he had lived since 1822, and he was one of the regents of New York University from 1845 until his death. His published works include: *The Political History of New York to December, 1840* (1843); *Life and Opinions of Julius Melbourn* (1847); and *Life of Silas Wright* (1848).

HAMMOND, JAMES HENRY (1807-64). An American politician. He was born in Newberry District, S. C., graduated at South Carolina College in 1825, and was admitted to the bar in 1828. In 1830 he became editor of the *Southern Times*, published at Columbia, S. C. He entered Congress in 1835, was Governor of South Carolina in 1842-44, and was a member of the United States Senate from 1857 to 1860. Both as an editor and as a member of Congress he was a vigorous exponent of nullification and States' rights, and a defender of the institution of slavery. Several letters written by him in defense of slavery, as a reply in part to an anti-slavery circular by Clarkson, were published, with various essays advocating the same view, in a volume entitled *The Pro-Slavery Argument* (1853).

HAMMOND, JOHN HAYS (1855—). An American mining engineer, born at San Francisco. He graduated at the Sheffield Scientific

School of Yale University in 1876, and after a mining course at the Bergakademie, Freiberg (Saxony), Germany, he was appointed mining expert on the United States Geological Survey and Mineral Census for the examination of California gold-fields. In 1882 he became superintendent of silver-mines at Sonora, Mexico, and later was consulting engineer to a mining company at Grass Valley, Cal. He then became consulting engineer to an iron company in San Francisco and to the Southern and Union Pacific railway companies. In 1893 he was appointed consulting engineer to the various mining companies operated by a London firm in South Africa, and later to the British South Africa Company, known as the Chartered Company, to the Consolidated Gold Fields Company, and other organizations of promoters acting in that region. While in South Africa he was connected with the Jameson raid, was tried for complicity in the revolt against the South African Republic, and was sentenced to death. This sentence was, however, commuted to fifteen years' imprisonment, and later Hammond was released by the Boer authorities upon the payment of a fine of \$125,000. Afterwards he established himself in London, whence he directed mining interests in Mexico and the United States.

HAMMOND, ROBERT (1621-54). A soldier in the English Civil War. He was born in Surrey, was educated at Oxford, and in 1643 was appointed captain in one of the cavalry regiments of the Parliamentary forces which were then being organized. His career in the earlier part of the war was so creditable that he was made colonel of an infantry regiment in 1645. He was present at the battle of Naseby, and at the capture of Bristol and of Dartmouth. In the struggle which soon afterwards began between the army and Parliament, Hammond at first sided with the former, but his scruples finally compelled him to change his mind, and he resigned from military service, accepting the appointment of Governor of the Isle of Wight. King Charles I., having been led to expect that he would be befriended by Hammond, threw himself upon the latter's protection; but Parliament ordered the King to be kept in custody, a duty which the Governor performed, with many misgivings, from November 13, 1647, to November 29, 1648. In 1654 Hammond was appointed by Cromwell a member of the Irish Council, but he died in Dublin shortly after his arrival.

HAMMOND, SAMUEL (1757-1842). An American Revolutionary soldier. He was born in Richmond County, Va., and as a youth took part in Indian warfare. In the Revolution he participated in the battles of King's Mountain, Cowpens, Eutaw Springs, and other engagements. In 1803-05 he was a member of Congress from Georgia; from 1805 to 1824 was military and civil Governor of Upper Louisiana; and from 1831 to 1835 was Secretary of the State of South Carolina.

HAMMOND, WILLIAM ALEXANDER (1828-1900). An American neurologist, born in Annapolis, Md. He graduated in medicine at New York University in 1848; was assistant surgeon in the United States Army from 1848 to 1850, and surgeon from 1850 to 1860; professor of anatomy and physiology in Maryland University from 1860 to 1861; and again surgeon in the United

States Army from the outbreak of the rebellion in 1861. He was Surgeon-General of the Army, with the rank of brigadier-general, from 1862 to 1864, when he was dismissed from the service upon the charge of official corruption after trial by court-martial. In 1878 President Hayes, under authorization of Congress, reviewed the findings of the court-martial, following which action Dr. Hammond was restored to his rank and placed on the retired list as a brigadier-general. He was professor of mental and nervous diseases in Bellevue Hospital Medical College from 1867 to 1873, and occupied the corresponding chair in New York University from 1873 to 1882. In 1882 he became a founder of the New York Post-graduate Medical School, in which he was professor of mental and nervous diseases till his death. He established the *Quarterly Journal of Psychological Medicine and Medical Jurisprudence*, and was a founder of the *New York Medical Journal*. Among his published works are: *Physiological Memoirs* (1863); *Military Hygiene* (1863); *Lectures on Venereal Diseases* (1864); *On Wakefulness* (1866); *Sleep and Its Nervous Derangements* (1869); *Insanity in Its Medico-Legal Relations* (1866); *The Physics and Physiology of Spiritualism* (1871); *Diseases of the Nervous System* (1871); *Insanity in Its Relations to Crime* (1873); *Mental Work and Emotional Disturbances* (1878); *Cerebral Hyperæmia* (1895); *Fasting Girls* (1879); *Sexual Impotence in the Male* (2d ed. 1885); *Treatise on Insanity* (2d ed. 1883).

HAMMURABI, hä'mōō-rä'bī. King of Babylonia (c.2240-2185 B.C.). The dynasty to which he belonged seems to have been of Canaanitish origin. It began to reign over Babylonia B.C. 2379. Probably in the time of Hammurabi's grandfather, Apil Sin, while Sin-idinnam ruled in Larsam, an invasion of Babylonia by the Elamite Kuturnachunta took place. The date of this event is known from the statement by Assurbanipal (B.C. 668-626) that he brought back from Susa the statue of Nana which an Elamitish king had captured 1635 years before. The conquest therefore occurred in B.C. 2285. One of Kuturnachunta's successors, Simti-Shilchak, made his son, Kutur-mabuk, lord of Yamutbal. He became a great conqueror, putting an end to Sin-idinnam's power in Larsam and apparently taking possession of Syria. His son, Rim Sin, was made viceroy in Larsam; Sin-muballat, Hammurabi's father, was driven out of Ishin. But Hammurabi himself was finally successful in expelling the Elamites, and, as recently discovered inscriptions show, extending his own power so far as to include Susa itself. He was thus a great conqueror and builder of a large empire. Yet it is as an organizer of this empire that he has become particularly famous. He not only ruled over a realm that seems to have extended from the Mediterranean into the mountains of Susiana, from the foot of the mountains of Kurdistan to the Persian Gulf, but he wisely cared for the inner development of his kingdom and established it by law. In his inscriptions he records especially the building of a large canal to bring the water of the overflow into the land of Shumir and Akkad. He also erected a great granary for the storing of wheat against times of famine. And there are numerous accounts of his building operations in the extension of temples

and palaces. The social life of Babylonia in the time of Hammurabi has long been known more intimately than that of any other period of its history, thanks to the great number of contract-tablets, deeds, testaments, bills of sale, and the like that have been found. A discovery recently made by De Morgan throws an interesting light upon the laws which were recognized in the empire. A great stele, giving in 44 columns 280 edicts, was found in Susa. These laws, probably intended to be enforced in the conquered province, deal minutely with the various situations in life that must be considered in the administration of justice, and show Hammurabi to have been a wise legislator, as well as a great conqueror and administrator. This code of Hammurabi was probably followed in Syria, as well as in Susiana and in Babylonia, and it is therefore natural that many of the statutes should remind of those which found embodiment from time to time in the law codes of Israel. Consult: Winckler, *Geschichte Babylo-niens und Assyriens* (Leipzig, 1892); Maspéro, *Histoire ancienne: les premières mêlées* (Paris, 1897); Rogers, *A History of Babylonia and Assyria* (New York, 1900); King, *Letters and Inscriptions of Hammurabi* (London, 1898); Winckler, *Der alte Orient*, Heft 4 (Leipzig, 1902).

HAMON, ä'môn', JEAN LOUIS (1821-74). A French genre painter. He was born at Saint Loup, near Plouha, in northern Brittany, March 5, 1821. He was educated for the priesthood, but his artistic temperament carried him to Paris, where he studied painting with Delaroche and Gleyre. He exhibited the "Tomb of Christ" in the Salon of 1848, "Equality in the Harem" in 1849, and a "Roman Poster" in 1850. In 1849 he found employment in the porcelain manufactory at Sèvres, in which work he was very successful. His enameled casket, exhibited at the London Exposition of 1851, took a medal. His "Human Comedy" (1852), and the celebrated "Ma sœur n'y est pas" ("My Sister is Not at Home") made his reputation; the latter was purchased by Napoleon III. At the Paris Exposition of 1855 he received a second-class medal and the ribbon of the Legion of Honor. In 1862 he went to Rome, and in 1865 he established himself at Capri. The last years of his life were spent at Saint Raphael (Provence), on the Mediterranean, where he died May 29, 1874.

Hamon belonged to the 'Neo-grec' or Pompeian School. His art is the logical development of that of Ingres and Gleyre; it represents modern ideas in a classical garb. It is delicate and mythical, and graceful in execution, but without real life. The Luxembourg and the Museum of Marseilles possess examples of his work, and there are several in America. Among his later subjects are: "The Muses at Pompeii" (1866); "The Promenade" (1867); and "Le triste rivage" (the "Sad Shore"), his last work, exhibited in 1873. Consult La Fenestre, "Hamon," in *L'Art*, vol. ii. (1875).

HAMPDEN, JOHN (1594-1643). An English statesman and patriot. He was born in 1594, the eldest son of William Hampden, of Great Hampden, Buckinghamshire, and Elizabeth, daughter of Sir Henry Cromwell, of Hinchinbrooke, Huntingdonshire, aunt of Oliver Cromwell. In 1610 he was entered a gentleman commoner at Magdalen College, Oxford, and in 1613

was admitted to the Inner Temple, where he made considerable progress in the study of law. On January 30, 1621, he first entered the House of Commons as a member for Grampound. He attached himself to the party of Saint John, Selden, Coke, Pym, and those who opposed the arbitrary encroachments of the Crown; but at first took no very forward part in public business, and spoke but seldom. In the first three Parliaments of Charles I. he sat for Wendover. In 1627, for refusing to pay his proportion of the general loan which the King attempted to raise on his own authority, Hampden was imprisoned in Hampshire for nearly a year. His uncle, Sir Edmund Hampden, with whom he is sometimes confused, was one of the five knights who sued for liberty on a writ of *habeas corpus* in the famous Five Knights case. The prisoners were all set free when Charles found it necessary to summon his third Parliament. Hampden's industry in Parliament now rendered him one of its leading and most useful members; he was on most of its committees; but after the dissolution of the Parliament of 1628-29 he retired to his estate and devoted himself to study, and country sports and occupations. In 1634 Charles had recourse to the impost of ship money, claiming that it was not a tax, but a commutation for the military service, which every one owed. At first limited to London and the maritime towns, and levied only in time of war, it was in 1635 extended to inland counties in time of peace, when Hampden resolutely refused to pay it, and his example was followed by nearly the whole County of Buckingham. In 1637 he was prosecuted before the Court of Exchequer for non-payment, when a majority of the judges gave a verdict against him. The moral victory, however, was clearly with Hampden. In the Short Parliament of 1640 Hampden took a prominent part in the great contest between the Crown and the House of Commons. To the Long Parliament he was returned for both Wendover and the County of Buckingham, and made his election for the latter. For his resistance to the King's proceedings, he was one of the five members whom Charles, on January 4, 1642, rashly attempted in person to seize in the House of Commons. On the breaking out of the Civil War he raised and became colonel of a regiment in the Parliamentary Army under the Earl of Essex. He was also a member of the Committee of Public Safety. He was an excellent soldier, and constantly urged Essex to a more energetic conduct of the campaign. Some of his reputed victories over the Royalists, however, as at Aylesbury and Reading, are unhistorical. Prince Rupert having attacked a Parliamentary force at Chinnor, near Thame, Hampden joined a small body of cavalry that was rallied in haste to oppose him, and in the fight that ensued at Chalgrove Field received in the first charge a wound of which he died six days later, on June 24, 1643.

See Anthony à Wood, *Athenæ Oxonienses*, vol. iii. (Oxford, 1813-20); Clarendon's *History of the Rebellion* (6 vols., Oxford, 1888); Lord Nugent, *Memorials of John Hampden* (2 vols., London, 1832), with letters; Macaulay's essay on *Lord Nugent's Memorials of Hampden* (New York, 1861); John Forster, *Life*, in "Eminent English Statesmen," vol. iii. (London, 1837); id., *Arrest of the Five Members* (London, 1860); id., *Debates on the Grand Remonstrance* (London,

1860); id., *Sir John Eliot* (2 vols., London, 1864); S. R. Gardiner, *History of England, 1603-42* (10 vols., London and New York, 1883-84); and his *Great Civil War* (4 vols., London and New York, 1893).

HAMPDEN, JOHN (c.1656-96). An English politician, grandson and namesake of the famous statesman. By 1679 he represented his native county, Buckingham, in Parliament, but made no great sensation there, and became known more as a partisan than as a debater, while his long sojourns in France developed free-thinking tendencies. On suspicion of being implicated in the Rye House Plot, he was imprisoned in the Tower (1683), tried and condemned to death, but saved himself by appealing to the King's mercy and revealing even more than he knew. He thus lost caste with his own party, and when it gained the ascendancy at the accession of William III. Hampden did not receive the honors nor the position he expected. He was defeated when he ran for Parliament, and turning despondent, committed suicide.

HAMPDEN, RENN DICKSON (1793-1868). Bishop of Hereford. He was born in Barbadoes, March 29, 1793, and educated at Oxford. Having left the university in 1816, he held different curacies, and in 1827 published *An Essay on the Philosophical Evidence of Christianity*, followed by a volume of *Parochial Sermons Illustrative of the Importance of the Revelation of God in Jesus Christ*. In 1829 he returned to Oxford and was tutor at Oriel (1832), after having twice acted as public examiner in classics. He was selected to preach the Bampton Lectures in 1832, when he chose for his subject *The Scholastic Philosophy Considered in Its Relation to Christian Theology* (London, 1833). Notwithstanding a charge of Arianism, he became principal of Saint Mary's Hall (1833), and professor of moral philosophy (1834), and in 1836 regius professor of divinity. There resulted a widespread and violent, though ephemeral, controversy, his opponents objecting to certain of his views placing the authority of the Scriptures higher than that of the Church. Later he published a *Lecture on Tradition* (1839; 5th ed. 1842), and a lecture on *The Thirty-nine Articles of the Church of England* (1842). His nomination by Lord John Russell to the vacant See of Hereford, in December, 1847, was again the signal for a violent and organized opposition, and his consecration in March, 1848, took place in spite of a remonstrance by many of the bishops and the resistance of Dr. Merewether, the Dean of Hereford. Among the more important of his later writings were the articles on "Aristotle," "Plato," and "Socrates," contributed to the eighth edition of the *Encyclopædia Britannica*, and afterwards reprinted with additions under the title of *The Fathers of Greek Philosophy* (Edinburgh, 1862). He died in London, April 23, 1868. Consult his life by his daughter (London, 1871).

HAMPDEN, RICHARD (1631-95). An English statesman. He was the second son of the famous John Hampden (q.v.), and at the age of twenty-five entered political life as member for Buckinghamshire. As an ardent supporter of Cromwell Hamnden had a seat in Parliament until the end of the Protectorate, and afterwards during a considerable part of the reigns of Charles II. and James II. Inheriting the politi-

cal principles and sterling character of his father, he resisted the Stuart encroachments upon popular rights, and his fear of the religious consequences led him to advocate earnestly the measure for excluding the Duke of York, afterwards James II., from the throne. In the Parliamentary deliberations in 1689, which ended in the call of William, Prince of Orange, to the British throne, Hampden bore an important part, and upon the establishment of the new dynasty was rewarded with responsible appointments. He was made Privy Councillor, a Commissioner of the Treasury, and finally Chancellor of the Exchequer in 1690.

HAMPDEN-SIDNEY COLLEGE. A college situated near Farmville, Prince Edward County, Va.; founded in 1776, and chartered in 1783. It is under Presbyterian auspices, but is non-sectarian. It offers courses leading to the degrees of Bachelor of Arts, Bachelor of Science, and Bachelor of Literature. The attendance averages 100. The college has buildings and grounds valued at \$225,000, productive funds amounting to \$150,000, and an income of \$13,000. The library contains some 16,000 volumes. Among its early trustees were Patrick Henry and James Madison, and among its presidents Rev. John Blair Smith, afterwards first president of Union College, New York, and Rev. Archibald Alexander, afterwards founder of Princeton Theological Seminary.

HAMPPOLE, RICHARD, ROLLE OF. See ROLLE, RICHARD.

HAMP'SHIRE, SOUTHAMPTON, or familiarly HANTS. A maritime county in the south of England, bounded on the west by Dorsetshire and Wiltshire, on the north by Berkshire, on the east by Surrey and Sussex, and on the south by the English Channel (Map: England, E 5). Area, including Isle of Wight, 1466 square miles. The surface is irregular, being traversed by the North and South Downs. The principal rivers are the Anton or Test, the Itchen, and the Avon. The climate of the country is in general mild and favorable to vegetation; the climate in the south of the Isle of Wight is milder than that of any other portion of Great Britain. Hops are cultivated, and the bacon cured here is famous. Vegetable gardening is an important pursuit. Southampton and Portsmouth, both termini of important railways, are the chief centres of trade, while Winchester is the capital. The New Forest is an extensive tract in the southwest of the county. Hampshire contains many interesting relics of the early ages of English history. Of these the chief is Porchester Castle, at the head of Portsmouth Harbor. Consult Shore, *History of Hampshire* (Southampton, 1892).

HAMPSTEAD. A metropolitan borough of London, in Middlesex, England, 4 miles northwest of Saint Paul's Cathedral (Map: London, D 6). The borough has an area of 3½ square miles, over 15 per cent. of which is devoted to the finest open public grounds, of the metropolis. Hampstead is the seat of several benevolent and other metropolitan institutions, has one of the finest of London town halls, municipal electric lighting, baths, and public library. It is situated on a range of hills that reach their greatest altitude of 443 feet in Hampstead Heath, which commands extensive views. It was formerly a village celebrated for its mineral springs as far

back as the Roman period, and many valuable archeological finds have been made here. From early times it has been a favorite residential section, with numerous elegant mansions and villas of Londoners. It has interesting artistic and literary associations of Pope, Addison, Gay, Johnson, Byron, Keats, Leigh Hunt, Joanna Baillie, Constable, Du Maurier, and others. Hampstead Heath, with an area of 240 acres, and Parliament Hill, on the southeast with 265 acres, acquired by the London Board of Works since 1870 as public grounds, are popular and greatly frequented resorts on Sundays and holidays. Population, in 1891, 68,126; in 1901, 81,942. Consult Baines, *Records of Hampstead* (London, 1890); White, *Sweet Hampstead* (London, 1901).

HAMP'TON. A city and the county-seat of Franklin County, Iowa, 59 miles north by west of Marshalltown; on the Iowa Central and the Chicago Great Western railroads (Map: Iowa, D 2). It has a fine court-house and a public park. The city is the centre of an agricultural and stock-raising district, and is an important market for horses. Population, in 1890, 2067; in 1900, 2727.

HAMPTON. A town and the county-seat of Elizabeth City County, Va., on the north side of Hampton Roads, 2½ miles northwest of Fortress Monroe and 16 miles north by west of Norfolk; on the Chesapeake and Ohio Railroad (Map: Virginia, H 4). It is a popular resort, with good bathing facilities; and has considerable trade in agricultural produce, fish, oysters, and canned crabs. The town is the seat of the Hampton Normal and Agricultural Institute, and has the Church of Saint John (Protestant Episcopal), built in 1660, a National Soldiers' Home, with 2000 inmates, and a National Cemetery where 3323 bodies are interred, 600 of unknown dead. The government is administered under a charter of 1887 by a mayor, elected every two years, and a unicameral council. Population, in 1890, 2513; in 1900, 3521. Hampton was settled (before 1610) on the site of an old Indian village, Kiquotan, and for many years was known by that name. It was one of the original boroughs represented in 1619 in the first Virginia Legislature. During the Revolution and the War of 1812 it suffered by fire at the hands of the English, and again in August, 1861, it was burned by a Confederate force under General Magruder.

HAMPTON, JOHN SOMERSET PAKINGTON, Baron (1799-1880). An English statesman, born in Worcestershire. His father was William Russell, but he adopted his mother's name, Pakington, upon inheriting estates from her family. He received his education at Eton and Oxford, but took no degrees, and entered Parliament in 1837. In 1852 he was Colonial and War Secretary under Lord Derby, First Lord of the Admiralty in 1859, and was again appointed to the same position in 1866, when his party returned to power. He was War Secretary under Disraeli, and was made a baron in 1875. His Parliamentary labors tended toward advancement in education and freedom in religion.

HAMPTON, WADE (1754-1835). An American soldier and planter, grandfather of Gen. Wade Hampton (1818-1902). He served with distinction under Marion and Sumter in the Revolutionary War, but, as McMaster says in his *History of the People of the United States*

(vol. iv., p. 49), he "was another of that small class of officers who, after serving with credit in the War for Independence, fought with discredit in the War of 1812." Not only did he show no ability during the disastrous campaign in which he took part as major-general in Wilkinson's army, but he helped to render abortive the projected invasion of Canada in 1813 by the enmity which he displayed toward his superior. The next year he resigned his commission, and returned to South Carolina, where he became one of the wealthiest planters in the State. He was twice elected to Congress, once in 1794 and again in 1802.

HAMPTON, WADE (1818-1902). An American soldier and politician, the third of that name, born at Columbia, S. C., the son of one of the wealthiest planters in the South. He studied law at the University of South Carolina, but instead of practicing gave all his time to the management of his extensive estates. Although a Democrat in politics, he belonged to the Union rather than the States Rights wing of the party, a fact which shut him out from political preferment in a State where radicalism was so rife as it was in South Carolina. With the secession of his State from the Union, however, he entered enthusiastically into the movement for the establishment of the Confederacy, and early raised and equipped from his private means the command which, under the name of 'Hampton's Legion,' did good service for the Confederate cause throughout the war. At the head of these troops Hampton participated in the first battle of Bull Run and in the Peninsular campaign, was wounded at Fair Oaks, and soon afterwards was commissioned brigadier-general of cavalry. He took part in Lee's northward advance in 1863, was thrice wounded at Gettysburg, and was promoted major-general on August 3d following. He was engaged in opposing the advance of Sheridan in the Shenandoah Valley in 1864, where he showed such high qualities as a cavalry commander that he was in August of that year commissioned lieutenant-general and placed in command of all Lee's cavalry. Later he commanded the cavalry in Johnston's army, which opposed Sherman's advance from Savannah in 1865. After the war he entered enthusiastically into the work of building up the South and reconciling its citizens to the outcome of the struggle. In 1876 he was nominated by the Democrats for Governor, and after successfully contesting the election with his Republican opponent, Daniel H. Chamberlain, he served until 1878, when he was elected to the United States Senate. There he served by reelection until 1891, when his opposition to the Populist tendencies of the Tillman Democracy in his native State led to his retirement. From 1893 to 1897 he was United States Commissioner of Railroads, to which office he was appointed by President Cleveland.

HAMPTON COURT. An English royal palace, situated amid extensive pleasure grounds, on the north bank of the Thames, one mile from the village of Hampton and about 15 miles west-southwest of London. It dates from 1515, when it was built for Cardinal Wolsey, who presented it to Henry VIII. The palace is built of red brick with stone facings, and consists of three quadrangles, with some smaller courts. The great eastern and southern fronts were built from

designs by Sir Christopher Wren, for William III. In the palace Edward VI. was born, Queen Jane Seymour died, and Charles I. was imprisoned. It was the occasional residence of Cromwell, and was a favorite periodical residence of the sovereigns until the reign of George II. It contains one thousand rooms, eight hundred of which in suites are now occupied by needy persons of rank in favor with the King. There is a famous picture gallery, with a valuable collection of old masters. The gardens cover 44 acres of land; one of the most notable features is the labyrinthine maze. The palace and grounds are opened daily to the public, free of charge, and constitute a popular holiday resort of the Londoners. Consult Law, *Hampton Court in Tudor, Stuart, Orange, and Guelph Times* (3 vols., London, 1885-91).

HAMPTON COURT CONFERENCE. A conference at Hampton Court, shortly after the accession of James I. to the throne of England, for the discussion of religious differences. The King presided, and was supported by Archbishop Whitgift, with eight bishops, seven deans, and two other clergymen. The Puritan party, whose demands were under consideration, were represented by four eminent clergymen of moderate views. These demands had been presented to the King in the previous year in what is known as the Millenary Petition, because it was intended to be signed by one thousand Puritan clergymen, though in fact it seems not to have been done, about seven hundred and fifty clergymen having probably signified their adherence by letter. It disclaimed schism, and, unlike former demands of the Puritan party, carefully refrained from attacking episcopacy, restricting its prayers to a purification of the ritual and the encouragement of preaching as an essential part of the service, together with greater latitude of belief for those clergymen who objected to subscribing to the whole of the Prayer-Book; and, lastly, to the reform of a few enumerated abuses, principally in matters of discipline.

There were three sessions of the Conference—on January 14th, 16th, and 18th. The petitioners were admitted to the second, in which James preserved an appearance of impartiality until the unfortunate use of the word 'presbyter' threw him into a passion, and he left the room with the declaration: "I shall make them conform themselves, or I will harry them out of the land, or else do worse." On the third day the King's decision, save for a few points entirely adverse to the petitioners, was announced in indecorously harsh language. This marks the beginning of the close connection between the bishops and the House of Stuart, and the alienation of the Puritan party.

The Millenary Petition is printed in Prothero, *Statutes and Constitutional Documents, 1559-1625*, p. 413 (Oxford, 1894), together with a few documents bearing upon the Conference. The Petition and James's proclamation for the use of the Prayer-Book are also to be found in Gee and Hardy, *Documents Illustrative of English Church History* (London, 1896). See also Gardiner, *History of England, 1603-42* (London and New York, 1883-84), i. 146.

HAMPTON NORMAL AND AGRICULTURAL INSTITUTE. An institution for the education of negroes and Indians, situated on

a plantation of 185 acres on the Hampton River, Virginia, two miles from Old Point Comfort. The school was opened in 1868 under the auspices of the American Missionary Association, with Gen. S. C. Armstrong in charge. In 1870 it received a charter from the State. It is a private corporation, administered by a board of 17 trustees of different denominations. The school has 55 buildings, including, besides dormitories and recitation-halls, a library with 11,000 volumes, a church, a hospital, gymnasium, sawmill, planing-mill, various shops, a well-equipped trade school, and a large building for domestic science and agriculture. The instruction comprises academic, trade, agricultural, domestic science, and normal courses. The Armstrong and Slater Memorial Trade School, opened in 1896, gives training in the theory and practice of carpentry, painting, blacksmithing, tailoring, and other handicrafts. The girls are instructed in housework, laundry-work, cooking, sewing, upholstery, and other home and farm occupations. A farm with barn and stock, greenhouses, and experiment station furnishes work and instruction for agricultural students. Five miles from the school is another farm of 600 acres, largely for stock, also worked by students. The expenses of tuition are met by contributions; but in pursuance of the school's policy to foster independence in the students, those who are unable to pay their board are required to make a return in labor. The young men are under military discipline, and are organized in a battalion of six companies. The school publishes a monthly paper, the *Southern Workman*, devoted to matters relating to the two races, and printed, as is all other school literature, by the students' printing department. In 1902 the school had 80 instructors and an attendance of 1079, of whom about 110 were Indians. The day school is closed from June to October, but the industrial departments continue through the summer. A normal institute is carried on during six weeks in the summer for the colored teachers of the South. Between four and five hundred attend. The institute has graduated over 1100 students, of whom 60 per cent. are engaged in teaching. At least 6000 undergraduates have gone out from the school. Of the colored students who have finished their trade studies since 1885, about 80 per cent. are either teaching trades or working at them. Many former students of both races are successful farmers or engaged in various business enterprises, while a limited number have fitted themselves for professional careers. The most noted graduate is Booker T. Washington (q.v.), of the class of 1875. The endowment of Hampton is nearly \$1,100,000, and the annual income of about \$165,000 is received from endowments, from the State land scrip and agricultural funds, from the Government Indian funds, from the Slater and Peabody funds, and from private benefactions, mostly in the form of scholarships.

HAMPTON ROADS. The lower part of the estuary of the James River, Virginia, where it falls into Chesapeake Bay (Map: Virginia, H 5). It is an important military point, and is defended by Forts Wool and Monroe. Its channel is broad and deep, and the harbors along its shores, especially that of Norfolk, are excellent. This fact, together with the number of railroad

lines which terminate at Norfolk and other points on its shores, gives it a considerable commercial importance. During the Civil War there were two naval engagements in and near Hampton Roads. On March 8, 1862, the frigate *Congress*, the sloop-of-war *Cumberland*, the steam frigates *Minnesota* and *Roanoke*, and the ship *Saint Lawrence* were in the roadstead, when the *Virginia*, an iron-clad Confederate craft, formerly the United States steam frigate *Merrimac*, which had been seized the year before, attended by two small steamers, came from Norfolk, passed rapidly by the *Congress*, exchanging broadsides, and ran directly into the *Cumberland*, which sank in less than three-quarters of an hour. The *Congress* was disabled and set on fire, and eight hours later her magazine exploded. The other Union vessels escaped. The Union loss was 286; that of the Confederates only about a dozen. On the following day the famous contest occurred in the Roads between the Federal *Monitor* and the *Virginia*. See MONITOR.

HAMPTON ROADS CONFERENCE. In American history, an informal conference, with reference to the arrangement of a peace between the North and South, held on a vessel, the *River Queen*, near Fort Monroe, February 3, 1865, toward the close of the Civil War, between President Lincoln and Secretary of State Seward, representing the United States Government, and Vice-President Alexander H. Stephens, Senator Robert M. T. Hunter, and Assistant Secretary of War John A. Campbell, representing the Confederate States. The conference was brought about primarily by Francis P. Blair (q.v.), who conceived that the war might be closed and the two sections of the country reunited by arranging for joint action on the part of the Federal and Confederate armies against Maximilian in Mexico, with a view to the enforcement of the Monroe Doctrine and the possible absorption of Mexico by the United States, the Southern States to agree, however, to the complete abolition of slavery within their boundaries. President Lincoln refused to consent to such a conference except on the basis of union, and the Southern commissioners somewhat equivocally acceded to his terms. During the conference, which lasted for four hours, President Lincoln expressed himself in favor of the admission of the Southern States, after their surrender, to immediate representation in Congress, and stated that in regard to the confiscation acts he should "exercise the power of the executive with the utmost liberality," but that he would never modify to the slightest extent the Emancipation Proclamation, though "if the war should then cease, with the voluntary abolition of slavery by the States," he should, personally, favor the payment by the Federal Government of a fair indemnity to the former slave-owners. He disapproved, however, of the project for a joint attack upon the French in Mexico, and refused to consent to any treaty with the Confederate Government as such, or to consider any proposition for peace which did not provide for the complete restoration of the Union. The conference broke up without any agreement having been reached, and the Confederate commissioners immediately returned to Richmond. Consult: Nicolay and Hay, *Abraham Lincoln: A History*, vol. x. (New York, 1890); A. H. Stephens, *The War Between the States*, vol. ii. (Philadelphia, c.1868-70); and

Davis, *Rise and Fall of the Confederate Government*, vol. ii. (New York, 1881).

HAM'STER (Ger., from OHG. *hamstero*, weevil; possibly borrowed from Lith. *staras*, hamster). A burrowing gregarious rodent of the Old World, representing a subfamily (Cricetinae) of the mice (Muridae), and having the troublesome habits of the North American gophers. The group is characterized by the tuberculous crowns of the molar teeth, by the extensive cheek-pouches, and by the short, hairy tail. The hamster (*Cricetus vulgaris*) is a native of the north of Europe and of Asia, and is abundant in many parts of Germany and Poland, but rare west of the Rhine. It is of variable color, usually reddish-gray above, the belly black, the feet white, and large white spots on the sides, throat, and breast. It is larger and of stouter form than the common rat, with the tail only about three inches long. It burrows in dry soils, each individual making a burrow for itself, to which there are more entrances than one, and which also contains several holes or compartments, one of them lined with straw or hay, in which the animal sleeps. Some of the chambers are capacious enough for the storing of large quantities of seeds or other provisions, even to the amount of 60 or 100 pounds of grain or beans, which the animal carries thither in its cheek-pouches, and on which it feeds during the milder parts of winter, spending the most severe part of that season in a state of torpid hibernation. It is a great pest to the farmers, and the object of their unceasing hostility; but it is very prolific, and produces two or three broods in the year, 16 to 18 at a birth. This leads, occasionally, to their appearing in countless swarms, overrunning the fields in migrating hordes which form a devastating plague until gathering enemies and disease kill them off. The hamster feeds generally on vegetable food, as leaves, seeds, and the like, and is said also to devour small quadrupeds, birds, frogs, etc. It is a fierce and pugnacious animal, and exhibits more than the pertinacity of the bulldog. The skins of hamsters are of some value. There are several other smaller species of the genus, mostly Asiatic, and two other genera in the subfamily, both African.

HAN. A Chinese dynasty. It was founded by one Liu Pang, a soldier of fortune (born B.C. 247, died B.C. 195), who rebelled, took to soldiering, became Duke of P'ei, later Prince of Han, and after much fighting and many adventures became the acknowledged Emperor of the country, and mounted the throne about B.C. 206. The capital was at Chang-an (now Si-ngan-fu in Shen-si); but later, in the reign of the fifteenth Emperor (A.D. 25), it was changed to Lo-yang in Ho-nan. Hence the division of the dynasty into Western or Former, and Eastern or Later Han. It came to an end in A.D. 220, when the Empire became divided into 'Three Kingdoms,' one of which is known as the Minor Han (A.D. 221-264). In all fourteen emperors ruled during the Former Han, twelve during the Later, and two during the Minor Han.

One of the first acts of Kao-ti, its founder, was to abolish the tyrannical laws of his predecessors, and to establish a new code characterized by moderation and justice, and in the reign of his successors literature began to revive. In B.C. 91 appeared the first general history of the coun-

try, from the pen of Sze-ma Ts'ien, the Herodotus of China, whose works covered the period from 2697 to B.C. 104. Two hundred and twelve years later appeared the great dictionary of Hiu Shin, in which all the words in Chinese literature—about ten thousand in all—are defined and explained. Early in the dynasty the Jews entered China and established a colony in Hon-nan (see KAI-PUNG-FU), and in B.C. 121 silk was introduced into Europe. In A.D. 67 Buddhism entered China under Imperial auspices, and Taoism, under the influence of the new cult, began to take on its present forms. The practice of burying slaves with the dead was abolished and clay figures used instead, and it would appear that marionettes were invented during this dynasty. Though not without internal troubles at times, and a usurpation that threatened the continuity of succession, the Han period was one of increasing prosperity and advancing civilization and culture. Consult: Williams, *Middle Kingdom* (New York, 1883); and Giles, *Historic China* (London, 1882). See CHINESE EMPIRE.

HAN'AFORD, PHEBE ANNE (COFFIN) (1829—). A Universalist minister and author, born on the island of Nantucket. She was brought up a Quaker. She was married in 1849; was ordained a minister in 1868, and has preached with success in Massachusetts, at New Haven, and at Jersey City, and on several occasions has performed the duties of chaplain to the Legislature of Connecticut. She has also been conspicuous in temperance work. She has been a voluminous writer, having published poems, essays, addresses, stories, and lives of *Abraham Lincoln* (1865), of *George Peabody* (1870), and of *Charles Dickens* (1870). Other works include *Leonette, or Truth Sought and Found* (1857); *The Soldier's Daughter* (1866); *The Young Captain* (1868); and *From Shore to Shore, and Other Poems* (1870).

HANAU, hä'nou. The capital of a circle in Hesse-Nassau, Prussia, situated at the junction of the Kinzig with the Main, 12 miles east of Frankfort (Map: Prussia, C 3). The newer portion of Hanau was founded in 1597 by Wallons and Protestants from the Netherlands, and with this date begins the town's industrial development. The most notable buildings are the castle, formerly the residence of the counts of Hesse-Philippsthal and now owned by the city; the old Church of Saint Mary, mentioned at the beginning of the fourteenth century; the seventeenth-century Church of Saint John; the two ancient town halls, dating from the fifteenth and sixteenth centuries respectively; the seventeenth-century town hall, the theatre, and the house formerly occupied by the brothers Grimm, natives of Hanau. Hanau is an important industrial centre, and is noted for its gold and silver ware. There are also manufactures of tobacco, cigars, gloves, carpets, paper, knit ware, machinery, and chemicals. Hanau has, near by, one of the largest powder-factories in the world. There is a considerable trade in local manufactures, agricultural products, and lumber. The town possesses canal communication, and is well equipped with advanced schools and the most modern improvements. In the vicinity are situated the fine palace of Philippsruhe and the bathing resort of Wilhelmsbad, with its iron springs. Population, in 1890, 25,029; in 1900, 29,846, mostly Protestants.

Hanau is believed to have had its origin in a Roman settlement. It was raised to the rank of a city early in the fourteenth century, and was fortified in 1528. During the Thirty Years' War it was occupied repeatedly by the Swedes and the Imperial troops, and it was the scene of the last battle fought by Napoleon on German soil. This conflict, which took place on the 30th and 31st of October, 1813, resulted in the severe defeat of the allied armies under Wrede.

HAN'BURY, BENJAMIN (1778-1864). An English Nonconformist historian, born at Wolverhampton. He was employed in the Bank of England from 1803 to 1859. He devoted himself to collecting documents bearing on all Nonconformist matters, and took the most lively interest in the promotion of the cause. His works include: *An Historical Research Concerning the Most Ancient Congregational Church in England* . . . (1820); *Historical Memorials Relating to the Independents* . . . (1839); and *A Life of Calvin* (1831).

HAN'COCK. A village in Houghton County, Mich., opposite Houghton; on Lake Portage and on the Duluth, South Shore and Atlantic Railroad (Map: Michigan, E 1). A ship canal to Lake Superior affords transportation facilities also by water. Hancock is in the centre of the Lake Superior copper region, and besides several highly productive copper-mines has smelting-works, foundries and machine-shops, and other industrial establishments. Montezuma Park and a Finnish college are among the features of the village. It was settled in 1859, and in 1863 was incorporated. Under a charter of 1895 the government is vested in a president, chosen annually, and a village council, elected on a general ticket. The water-works are owned and operated by the municipality. Population, in 1890, 1772; in 1900, 4050.

HANCOCK, JOHN (1737-93). An American patriot of the Revolutionary period, president of the Continental Congress, a signer of the Declaration of Independence, and the first Governor of the State of Massachusetts. He was born at Braintree, Mass., January 23, 1737, graduated at Harvard in 1754, and was adopted by an uncle, Thomas Hancock, who in 1764 left him a fortune of about £80,000, and to whose large mercantile business he succeeded. After his graduation he spent some time in England. He was for several years one of the selectmen of Boston, and after 1766 was repeatedly elected to the Massachusetts General Court, where he steadily resisted the encroachments of the British Ministry. After the 'Boston Massacre' (q.v.) in 1770, Hancock was a member of the committee which was appointed by the people of Boston to demand of Governor Hutchinson the removal of the British troops from Boston, and on the fourth anniversary of the 'massacre' he delivered the customary commemorative oration, and by his boldness and eloquence attracted attention to himself anew as one of the leaders of the Patriot or Whig Party. In June, 1774, he was appointed by the General Court, of which he was a member, one of the representatives of Massachusetts in the first Continental Congress, and in October he was appointed chairman (later president) of the first Provincial Congress of Massachusetts, which adjourned on December 10th. He was likewise president of

the second Provincial Congress, which assembled at Cambridge in February of the following year, and by his activity in this and other extra-legal proceedings incurred, with Samuel Adams, the bitter hostility of Governor Gage, whose expedition to Lexington and Concord on April 18th-19th (see LEXINGTON) was sent out in part to secure the capture of these two leaders, and who, when issuing his proclamation of pardon on June 12th, expressly excepted Hancock and Adams, "whose offenses," he said, "are of too flagitious a nature to admit of any other consideration than that of condign punishment." In defiance of the known hostility toward Hancock of the British Ministry, and partly, no doubt, with a view to winning over members of the wealthier and more aristocratic families in New England, who as a class were inclined to conservatism, and were disposed to remain loyal to the home Government, Hancock was elected president of the Continental Congress in May, 1775. Though he resigned this position in October, 1777, he remained a member of the Congress until 1780, and served again in that body in 1785-86. In 1778, as major-general of Massachusetts militia, he commanded the State troops in the Rhode Island expedition. In 1780 he was a member of the Constitutional Convention of Massachusetts, and upon the adoption of the Constitution there framed was elected first Governor of the State, in which position he was retained by annual reëlections until 1785. After an intermission of two years he was again Governor from 1787 until his death. Though at first thought to be opposed to the Federal Constitution as drawn up by the convention at Philadelphia in 1787, he presided over the Massachusetts convention which ratified that document in 1788, and used his influence to win over those who favored rejection. Concerning Hancock's character and the extent of his influence there has been much difference of opinion among historical writers; but he is now generally considered to have been a man of undoubted patriotism and of considerable ability, whose usefulness at times was impaired by his vanity and his jealous disposition. There is no adequate biography of Hancock, but considerable material bearing upon his life may be found in Abraham E. Brown, *John Hancock, His Book* (Boston, 1898).

HANCOCK, WINFIELD SCOTT (1824-86). A distinguished American soldier, born February 14, 1824, at Montgomery Square, Montgomery County, Pa. He graduated at West Point, June 30, 1844, number eighteen in a class of twenty-five, and was assigned, July 1, 1844, as a brevet second lieutenant to the Sixth Infantry, with which he served for two years in the Indian country. He was appointed second lieutenant in the same regiment in June, 1846. In the Mexican War he commanded a company at the National Bridge (August 12, 1847), and subsequently earned the brevet of first lieutenant "for gallant and meritorious conduct at Contreras and Churubusco." From 1848 to 1855 he served successively as regimental adjutant and quartermaster, and for a short time as assistant adjutant-general, Department of the West. Having shown great aptitude in all staff details, he was appointed captain and assistant quartermaster in November, 1855, and was assigned to duty in Florida. He accompanied General Harney to Kansas, serving during the

border troubles there, and in 1855 was ordered to proceed to Utah, arriving at Fort Bridger with his wagon-train after a march of 700 miles in 28 days. At this point he found his old regiment under orders to march overland to California. He was directed to accompany it, in charge of the transportation. Organizing and equipping a train of 128 wagons, from inferior materials, he conducted it safely over a rough trail of 1100 miles to its destination, at Benicia. From May, 1859, to August, 1861, he was chief quartermaster on the Pacific Coast, with headquarters at Los Angeles.

At the outbreak of the Civil War Captain Hancock was among the first to be appointed to the grade of brigadier-general of United States Volunteers, his commission being dated September 23, 1861. Assigned to command a brigade in Smith's Division, Fourth Corps, Army of the Potomac, he first led it in action at Williamsburg, Va. (May 5, 1862), where he earned the mention, in General McClellan's dispatches, that "Hancock was superb." At Antietam, upon the death of General Richardson, he was placed in command of the First Division, Second Corps. In November, 1862, he was promoted to be major-general United States Volunteers. At Fredericksburg, Va., December 13, 1862, his new command suffered a loss of 40 per cent., including 150 officers killed and wounded. The battle of Chancellorsville (May 2-4, 1863) was to a great extent prevented from becoming a total rout of the Federal forces by the steadiness of Hancock's division. Soon afterwards the command of the Second Corps was given to him. On the morning of July 1, 1863, the advance of Lee's army, having encountered the left wing of the Army of the Potomac in front of Gettysburg, was steadily pressing it back, with the loss of its commander, Reynolds. General Meade ordered Hancock to proceed to the battlefield, assume command there, and virtually to decide at his discretion whether the Army of the Potomac should meet the Army of Northern Virginia at that time and place. Hancock arrived on the field at 3.30 p.m., to find the Confederates massing their forces for a farther advance while confronted by the depleted lines of the Federal Army. He quickly infused confidence among the troops, reformed the Federal lines, and in various ways so strengthened his position as to deter General Lee from making his contemplated attack. On the following day, during the nearly successful attempt of Lee to turn the flanks of the Federal Army, Hancock was placed in command of the left wing, and, by judicious handling of his men and gallant personal effort, stemmed the tide of battle. On the third day a Confederate charge was directed against Hancock's command, the Federal centre, and succeeded in penetrating the first line, but was finally repulsed. Each side suffered terrible losses, and Hancock received a wound from which he never entirely recovered. In March, 1864, he resumed command of his corps, which, in the reorganization of the army under Grant, was reinforced by the transfer of two divisions from the Third Corps, making an aggregate strength of 43,055. Hancock was distinguished by the energy, good judgment, and tactical skill displayed in the Wilderness campaign. The unfortunate engagements in front of Petersburg and at Ream's Station were the first

occasions in which his command met with reverses. On August 12, 1864, he was promoted to be brigadier-general in the Regular Army, and in November he was placed in command of the Middle Military Division. He received his commission as major-general in the Regular Army on July 26, 1866. He was then sent to command the Department of Missouri, with headquarters at Fort Leavenworth, and during the year 1867 personally led an expedition against the Indians. In August of that year he was sent to New Orleans to supervise the rehabilitation of the States of Louisiana and Texas. In a general order he defined his duty, stating that "crimes and offenses committed in this district must be left to the consideration and judgment of the regular civil tribunals," but added that "armed insurrection or forcible resistance to the law will be instantly suppressed by arms." His conservative course not meeting with the support from the Washington authorities which he expected, he was at his own request relieved, and assigned to command the Military Division of the Atlantic, with headquarters at Governor's Island, where he remained until March, 1869, when he assumed charge of the Department of Dakota. In 1872 he was reassigned to the Division of the Atlantic. While acting in this capacity, General Hancock was in 1880 made the Democratic nominee for President of the United States, but was defeated by his Republican opponent, Garfield. General Hancock died at Governor's Island after a brief illness, on February 9, 1886. In 1850 he married Miss Almira Russell, of Saint Louis, by whom he had two children. Consult: Walker, *General Hancock* (New York, 1894), in the "Great Commander Series;" and id., *History of the Second Corps* (1886).

HANCOCK HOUSE. The former residence in Boston of Governor John Hancock. It was erected in 1737 and taken down in 1863.

HAND (AS., Icel. *hond*, Goth. *handus*, OHG. *hant*, Ger. *Hand*; perhaps connected with Goth. *hinþan*, AS. *hentan*, to seize). The terminal portion of the superior limb of man. It is almost invariably distinguished by name from the same organ in other vertebrate animals; but actually there is little essential difference, and it is legitimate and proper, therefore, to speak of the terminal part of the fore limb of any quadruped as the 'hand' or *manus*, in distinction from the 'foot' or *pes*. We will first consider the human hand, and afterwards its homologue in the lower animals.

"That," says Cuvier, "which constitutes the *hand*, properly so called, is the faculty of opposing the thumb to the other fingers, so as to seize upon the most minute objects—a faculty which is carried to its highest degree of perfection in man, in whom the whole anterior extremity is free, and can be employed in prehension." The peculiar prehensile power of the human hand is chiefly dependent upon the length, power, and mobility of the thumb, which can be brought into exact opposition to the extremities of all the fingers, whether separately or grouped together. The general arrangement of the bones of the arm is similar to that of the leg. The *humerus* or arm-bone corresponds to the *femur* or thigh-bone; the lower end of the humerus is connected with the two bones of the forearm, the *radius* and the *ulna*, which correspond with the two bones of

the leg. Then come the *carpal* bones, the *metacarpal* bones, and the *phalanges*, as we have *tarsal* bones, *metatarsal* bones, and *phalanges* in the foot. We have a diagram showing the way in which the bones of the hand are arranged. The carpal bones are eight in number, and are arranged in the wrist in two rows. The first or up-

LEFT HAND (dorsal surface).

ra., radius; ul., ulna; sca., scaphoid; semi., semilunar; pisi., pisiform; cunei., cuneiform; trpz., trapezium; trpd., trapezoid; mag., magnum; uncl., unciform; metc., metacarpal; f.pha., first phalange; s.pha., second phalange; t.pha., third phalange.

per row consists practically of three bones, the scaphoid, semilunar, and unciform, the fourth, the pisiform, being regarded as belonging to the class of *sesamoid bones* (q.v.), and the second row of four bones, trapezium, trapezoid, os magnum, and unciform; so that, excluding the pisiform bone, the carpal and the tarsal bones correspond in number. As we commonly term the palm the *front* of the hand, the thumb becomes conventionally the *outer*, and the little finger the *inner*, digit; but according to the rules of comparative anatomy, and in order to compare the hand and foot, we ought to reverse these terms. The outer of the carpal bones of the first row supports the bones of the thumb and forefinger, and constitutes with them the *outer* division of the hand. The inner of the carpal bones bears the little and the next (the ring) finger, and constitutes with them the *inner* division of the hand; while the middle one bears the middle finger, and belongs to the *middle* division of the hand. The two outer bones are connected with the radius, while the inner bone is connected (indirectly by a thick ligament) with the ulna.

Collectively, the carpal bones are so arranged that the carpus presents a dorsal convex surface, upon which the tendons of the extensor muscles of the fingers play, and a palmar concave surface, on which the tendons of the flexor muscles lie. The several bones are joined to one another—each bone being united to three or more others—

by a large extent of surface, and are girded together by strong ligamentous bands. The wrist is thus as strong as if it had been constructed of one solid piece of bone, while the slight gliding movements which occur between the several bones give it an elasticity which serves to break the shocks that result from falls upon the hand. The uppermost surface of the first row of carpal bones is convex, and this convex surface is received into a wide cup or socket, formed by the lower articular surface of the radius, and by a ligament passing from that bone to the ulna. The metacarpal bones and the phalanges require no special description. Like the great toe, the thumb has only two phalanges, while each of the other digits has three.

We shall now notice the various movements of which the hand is capable. They may be divided into (1) the different directions in which the hand collectively can be moved, and (2) the movements of which the hand itself, without reference to the arm, is capable. The *scapula* or shoulder-blade, with which the principal arm bone articulates, is itself movable to a very considerable extent on the surface of the ribs on which it rests. Again, the socket in which the nearly spherical head of the *humerus* or arm-bone lies is very shallow—not unlike the cup in the well-known toy *cup-and-ball*—and the arrangements of the shoulder-joint generally are such as to permit so great a variety and so extensive a range of movements that we are able to apply the hand to every part of the body. This freedom of motion is due in a great degree to the clavicles or collar-bones, which, by steadying the shoulder-blades and keeping the shoulders apart, afford a fixed point for the various muscles which we employ in raising the arms, in folding them over the chest, in the act of hugging, etc. The movement at the next junction of bones, the elbow-joint, is very different from that at the shoulder. The latter is termed, from its construction, a ball-and-socket joint, and admits of motion in all directions within definite limits; while the elbow is a hinge joint, and merely admits of bending and straightening, or, in other words, of motion in one plane. We have next to consider a class of movements of the forearm and hand, to which there is nothing analogous (at least to any material extent) in the leg. The movements in question are called 'pronation and supination.' In *pronation* (from Latin *pronus*, with the face downward), we turn the palm of the hand downward, as in picking up any substance from the table; in *supination* (from Latin *supinus*, with the face upward), we turn the palm upward, as for the purpose of receiving anything that may be placed in it.

These movements of pronation and supination are so important to the usefulness of the hand that we must notice the three muscles by which they are chiefly effected. One of the three muscles passes from a projecting process on the inner side of the arm-bone, at its lower end, to the outer edge of the middle of the radius. Its contraction causes the radius to roll over, or in front of, the ulna. It thus pronates the hand, and is called a *pronator* muscle. Another muscle passes from a projecting process on the other side of the arm-bone to the inner edge of the radius near its upper part. It runs, therefore, in an opposite direction to the former muscle, and

produces an opposite effect, rolling the radius and the hand back into the position of supination. Hence it is called a *supinator* muscle. The third is a very powerful muscle, termed the *biceps* (q.v.), which not only bends the elbow, but, from the mode in which its tendon is inserted into the inner side of the radius, "also rotates the radius so as to supinate the hand; and it gives great power to that movement. When we turn a screw, or drive a gimlet, or draw a cork, we always employ the *supinating* movement of the hand for the purpose; and all screws, gimlets, and implements of the like kind are made to turn in a manner suited to that movement of the right hand, because mechanics have observed that we have more power to supinate the hand than to pronate it." Supination can only be performed to its full extent by man, and even in man it is not the natural or habitual position; monkeys can partially effect the movement, and in most of the lower animals the part corresponding anatomically to the hand is constantly in a state of pronation.

The movements of which the hand itself, without reference to the arm, is capable, are very numerous, and in this respect differ considerably from the corresponding movements of the foot. Thus we can bend the fingers down upon the palm, or we can extend them beyond the straight line; we can separate them from one another to a considerable extent, and we can close them with considerable force. The wrist and hand are bent forward or flexed upon the forearm by three muscles, which pass downward from the inner condyle or expanded end of the humerus, and are termed the *radial flexor*, the *ulnar flexor*, and the *long palmar* muscles. The first two of these muscles are inserted into wrist-bones on the radial and ulnar sides respectively, while the third expands into a fan-like *fascia* or membrane in the palm of the hand, and thus serves both to support the skin of the palm and to protect the nerves and vessels which lie below it. Beneath the palmar fascia lie two sets of *flexor* muscles of the fingers, and they present so beautiful a mechanical arrangement as to merit special notice.

The *superficial* or *perforated flexor* muscle passes down the front of the forearm and divides into four tendons, which become apparent after the removal of the palmar fascia, and are inserted into the second phalanges of the fingers, each tendon splitting at its termination, to give passage to the similar tendons of the *deep* or *perforating flexor* muscle, which passes from the upper part of the ulna to be inserted into the last phalanx of each finger. These *flexor* muscles are antagonized by the *common extensor* muscle of the fingers, which, like the flexors, divides into four tendons, one for each finger. Besides these, there are a special *extensor* of the index-finger, a series of muscles forming the ball of the thumb, which move that organ in almost every direction, and various small slips giving lateral and other movements to the fingers.

The hand possesses marvelous adaptability to a great variety of uses. The fingers are fitted for grasping small objects, or for suspending the body from a horizontal bar. The hand may be made into a cup for conveying fluid to the mouth, or extended rigidly, as when swimming. A small needle may be used with great precision and delicacy in the same hand that wields a heavy sledge-

hammer or holds a taut rein over the back of a turbulent horse. The great flexibility of the fingers and their capacity for training in accurate work is seen in their use in playing upon the violin or the piano. Some of the commonest daily uses of the hand consist of very intricate and complex working of groups of muscles in which coördination is exact. Controlling the pencil in drawing or writing, and rolling a cigarette may be cited as examples. It is not strange, in view of its adaptability and capacity for such accurate adjustment, that the hand was thought in old times to be a reservoir of special force which passed out of it upon occasion. The 'laying on of hands' for the cure of the sick, or for the transmission of a beneficent influence, is as old as the Scriptures; and the touch of royalty was supposed to possess special virtue in healing scrofula, or 'king's evil.'

The markings in the palm of the hand are supposed to be indications of the character and temperament, and disciples of palmistry (q.v.) believe they can read the secrets of the future in the records of palmar lines and folds. The papillæ on the skin of the finger-tips are arranged in concentric or ovoid lines. Probably these lines are never identical in different individuals. It is said that the Chinese use an impression of the papillary lines on the pulp of the thumb-tips as a means of identification; and it was seriously proposed in this country to add to the measurements of criminals by the Bertillon method impressions of their thumbs as an additional standard of comparison and identification. The investigations of Francis Galton (q.v.) in this respect were noteworthy. Fingers differ much in their size and model, and give hands different expressions. From the natural position of the hand at rest may be inferred much concerning the temperament, genius, and mentality of its owner. This fact is well stated in Warner's *Physical Expression* (New York, 1886), from which we reproduce several types of hands. Right-handedness is a natural condition, for which several causes have been assigned, no one of them being convincing. It has been considered due to a larger arterial supply to the right side; to "an innate tendency to a predominance of nutrition on the right side in fetal life" (Breschet); to the position of the fetus *in utero*; and to the assumed fact that the centre of gravity of the body lies on the right side. Left-handedness occurs in about 9 per cent. of human beings.

There are many congenital and developmental anomalies encountered in a study of hands. In some rare cases the hand is wanting altogether. This condition is termed 'acheiria.' If one or more fingers be missing, the condition is termed 'ectrodactylism.' 'Hypophalangism' is the name given to the condition in which the number of phalanges in a finger is less than normal. 'Polycheiria' denotes a supernumerary hand; 'polydactylism,' a supernumerary finger; 'polyphalangism,' the condition in which the number of phalanges in a finger is greater than normal. The union of fingers together, web fingers, or 'syndactylism,' also occurs; as well as cleft-hand, club-hand, and other deformities. In the disease acromegaly (q.v.) an enlargement of the hands takes place. Changes in the fingers and hands occur in many other diseases, as in myxœdema and syringomyelia (qq.v.). In pulmonary tuber-

culosis the extremities of the fingers are bulbous, or clubbed, from change in the condition of the peripheral circulation.

Consult Gray, *Anatomy, Descriptive and Surgical* (London, 1897).

HAND, COMPARATIVE ANATOMY OF THE. In birds the hand has been so profoundly modified for flight that it is considered as a distinct sort of organ—the 'wing.' Among Amphibia we find the tailed forms have the hand constructed on the same general plan as the foot; it thus consists of digits, palm, and wrist; or, in terms of the skeleton, phalanges, metacarpals, and carpals, the latter the equivalent of the tarsals of the foot; in all amphibians there are four digits on the hand, except in three genera which have only two or three, but the number of phalanges differs considerably. The Urodela have a carpus of nine bones, a centrale, radiale, ulnare, intermedium, and five carpales; but in the Anura the intermedium is wanting. Among reptiles we find a general resemblance in the hand to that of the Urodela, though the digits bear claws or nails, which are always wanting in the Amphibia; crocodiles have no intermedium, and the carpales are only partially developed.

Among mammals we find a very great variety in the form and uses of the hand, the number of functional digits varying from one to five, though the number of phalanges is remarkably constant, for except in Cetacea there are two in the first and three in each of the others. In monotremes and marsupials the hand possesses no peculiar features worthy of special note, though in Echinidna it is very stout and powerful, while among kangaroos it is rather small and comparatively feeble. The hands of the Edentata are remarkable for the reduction in the number of digits to four, three, or even two, and the long and very strong claws which they bear. In the Ungulata we find an even stronger tendency toward suppression of digits, for there are never more than four, and usually there are only two, sometimes only one, functional. In this order the hand resembles the foot (q.v.) so closely that it is not necessary to repeat here the various modifications; suffice it to say that the tapirs have four digits on the hand and only three on the foot, and that the metacarpals of the camel are separated by a deep cleft. In the Sirenia there are only four digits, and these are united by the integument to form paddles and bear only rudimentary nails. The Cetacea also have the hands transformed into paddles; but the carpus is made up of polygonal bones, the phalanges are numerous, and there are no nails. The hand of the Carnivora has never less than four digits, and they always bear claws, usually sharp and curved, and in cats retractile. The hand of the elephant is remarkable for being larger than the foot, and for its very short and thick carpal, metacarpal, and phalangeal bones. Hyrax has four toes on the hand, but only three on the foot, and the nails are nearly flat. The Rodentia have rather small, often weak hands, with five clawed digits, while the Insectivora have rather stout hands, especially the moles. Of all mammals, bats have the most profoundly modified hands, since with them, as with birds, flight is the object in view. There is only one bone in the proximal series of the carpus, and the metacarpal bones and phalanges are greatly elongated to form the framework

for the wing, which consists of a delicate membrane stretched between the digits and the foot. There are five digits, but only the first two (sometimes only the first) are provided with claws. Among the Primates we find a hand more nearly like that of man, the digits being provided with flat nails, and the first digit being opposable to the others and thus forming a true thumb. The marmosets, however, have sharp curved claws, and the thumb is not opposable. Of all mammals, the gorilla has a hand most like that of man.

HAND, EDWARD (1744-1802). An American soldier of the Revolution, born at Clyduff, Kings Co., Ireland. He came to America in 1774, and practiced medicine in Pennsylvania until the outbreak of the Revolution, when he served at the siege of Boston as lieutenant-colonel in William Thompson's brigade. In 1776 he was appointed colonel. He served in the battles of Long Island and Trenton in 1777; was promoted to brigadier-general; succeeded John Stark at Albany (1778); and took part in Sullivan's campaign against the Six Nations. He was in command of a brigade of light infantry (1780), and soon after succeeded Scammell as adjutant-general; in 1798 Washington recommended him to a like post for the war with France. He was elected to Congress (1784), and was a signer of the Pennsylvania Constitution (1790).

HANDBALL. A variety of 'Fives' practiced in the United States chiefly on account of its physical benefits in training for contests of endurance, though it is also one of the sports under the regulations of the Amateur Athletic Union. In its simplest form it consists of scoring the ball against a single back wall, with a lined-out space in front; but in its home, Ireland, the court or 'alley' on which it is played has also side walls extending the length of the court (60 feet). The floor is 60 × 28 feet, and about the centre of it, parallel with the end wall, a line is drawn called the 'short line.' Sixty feet from the end wall another line is drawn, called the 'over line,' and every service coming off the wall must fall between these two lines to be in play. The game is started by one player 'tossing' out the ball on to the ground and hitting it on the rebound, with his hand, against the end wall. If it falls inside the short line, and the other player fails to return it, it counts an 'ace' to the server. Should it be returned and the original server fail to return it, it is a 'hand out.' Then the service changes, and the game goes on alternately. The game is won by the player who first gets 15 or 20 aces, as agreed.

HANDEL, GEORGE FREDERICK, Ger. GEORG FRIEDRICH HÄNDEL, hën'del (1685-1759). A famous German musical composer, chiefly renowned for *The Messiah*, still the most popular of oratorios. He was born at Halle an der Saale, February 23, 1685. His father, a barber, and afterwards a surgeon, at Halle, so opposed the development of his son's musical proclivities that the lad was obliged to practice at night upon a small clavichord secretly placed in the attic, when the rest of the family were asleep. A visit paid with his father in 1692 to a stepson in the service of the Duke of Saxe-Weissenfels

had important results. Whenever, during this visit, young Handel found opportunity, he stole into the ducal chapel and played upon the organ. The Duke, chancing to hear him, questioned him, and learning of his father's opposition, persuaded the latter to abandon his intention of making a lawyer of the boy. As a result, on returning to Halle, Handel began a thorough study of music under Zachau. Going to Berlin in 1696 to pursue his studies further, he became acquainted with Ariosti and Buononcini.

In 1703 he took a modest position in the orchestra of the Hamburg Opera House, but soon astonished the public by the skill with which he presided at the harpsichord during the temporary absence of the renowned Keiser. At this time he also applied for the post of organist at Lübeck; but learning that one of the stipulations in the competition was that the successful candidate should marry the daughter of the retiring organist, he withdrew. At Hamburg he formed a friendship with Mattheson, and when, in 1705, Handel produced his first opera, *Almira*, Mattheson took the chief rôle.

Visiting Italy, Handel produced in Florence the opera *Roderigo*, and in Venice *Agrippina*, which he composed in three weeks, and which was received with enthusiasm. He met Scarlatti, who so greatly influenced Handel's subsequent works, Gasparini, and Lotti, and in Rome became the intimate of Cardinal Ottoboni. In 1709 he took service with the Elector George of Hanover (afterwards George I. of England).

In 1710 Handel went to England, where he spent practically the rest of his life. There the taste for Italian music was on the increase, and his *Rinaldo* achieved great success. The opera was patched together from his earlier works in fourteen days, and would have been finished sooner had the translator of the libretto been able to keep pace with him. The score contains the familiar "Lascia che io pianga," still a very popular concert number. The year 1713 saw the production of his "Te Deum" and "Jubilate," in celebration of the Peace of Utrecht. They brought him a life pension of £200. When George I. ascended the English throne, Handel, though previously in his service, avoided him. He feared his Utrecht music might have offended the former Elector, as the German Protestant princes had not regarded the treaty with favor. But his "Water Music," performed during the Thames fête, led to a second annuity of £200. For three years, beginning 1718, Handel was musical director to the Duke of Chandos, and during that time composed, among other pieces, the two Chandos "Te Deums" and the twelve Chandos anthems. From this time also dates "The Harmonious Blacksmith," which he is said to have written after having taken refuge in a smithy during a storm. During the period from 1720 to 1740, Handel, spurred on by the rivalry of Ariosti and Buononcini, produced over a score of excellent operas. The fact that their instrumentation was not fully written out, and the change in the style of opera demanded in England, has prevented these works from receiving their just appreciation; but it is beyond cavil that they were superior to the compositions of his contemporaries, and were scarcely inferior to his oratorios.

Handel's career in England should have been uninterruptedly prosperous, but he ruined him-

self financially by undertaking, in rivalry with Buononcini, whom he finally vanquished, the responsibilities of operatic management as well as of composition. He, however, retrieved his fortunes by his oratorios. In January, 1739, he produced *Saul*, followed in April by *Israel in Egypt*, but although both oratorios were highly praised they met with no popular favor at the time. The latter is considered by many even superior to his famous *Messiah*. *The Messiah* was produced in the autumn of 1741 in Dublin. At the first London performance, March 23, 1743, in Covent Garden, when the "Hallelujah Chorus" was reached, the King and the whole audience rose, and thus established a custom which continues to this day. George II.'s victory at Dettingen was celebrated by Handel with the "Dettingen Te Deum and Anthem." In 1752 his eyesight began to fail, and he became totally blind. He, however, continued to accompany his oratorios on the organ, and did so at a *Messiah* performance only eight days before his death, which occurred April 14, 1759. He is buried in Westminster Abbey.

Though of liberal disposition and much interested in charity, Handel was at times choleric. Quarrels with his singers had much to do with his failure as a manager.

Handel's service to music lies largely in the grace and freedom with which he handled the musical forms of his day, especially as compared with the severer Bach, of whom he was a contemporary. Though Bach is now acknowledged to be far the greater, the fact that their immediate successors took them both for models gave greater variety and plasticity to the development of music. Handel founded no school; he lacked the genius for creating new forms, or for revolutionizing existing musical conditions. His choral work, especially in *Israel in Egypt*, *The Messiah*, and *Solomon*, is great because of the massive effects he obtains by apparently simple means, though in reality many of the choruses are worked out with infinite detail. Greater musicians have superseded him in the fields of operatic and instrumental composition, but in oratorio he is still supreme. It has been shown that on occasion he helped himself to the music of other composers, but he was original enough to borrow without losing esteem. Beethoven greatly admired his music, and during his last illness found enjoyment in looking over a new edition of Handel's works. See ACCOMPANIMENT.

BIBLIOGRAPHY. Marshall, *Handel*, in the "Great Musicians Series" (New York, 1883), an excellent short life; Rockstro, *Life of G. F. Handel* (London, 1883), and Chrysanther, *G. F. Handel* (Leipzig, 1858-67), the most authoritative biographies; Bray, *Handel: His Life, Personal and Professional* (London, 1857); *Great German Composers* (New York, 1878); Whittingham, *Life and Works of Handel* (London, 1882); Mainwaring, *Memoirs of the Life of Handel* (London, 1760).

HANDEL AND HAYDN (hî'd'n) SOCIETY. See CHORAL SOCIETIES.

HANDELMANN, hân'del-mân. GOTTFRIED HEINRICH (1827-91). A German historian and antiquary, born at Altona, and educated at Kiel, Heidelberg, Berlin, and Göttingen. His first historical work was *Die letzten Zeiten hanischer Uebermacht in skandinavischen Norden* (1853).

With his friend Theodor Lehmann he edited *Jahrbücher für die Landeskunde der Herzogtümer Schleswig-Holstein und Lauenburg* (1858-63). After several years devoted to American history, he turned his attention again to German antiquities, especially in his own province. In 1866 he was made professor at Kiel and conservator of the antiquities of Schleswig-Holstein. Handelman's other historical works include: *Geschichte der Vereinigten Staaten* (2d ed. 1860); *Geschichte der Insel Haiti* (2d ed. 1860); *Geschichte von Brasilien* (1860); *Die dänische Réunionspolitik um die Zeit des Siebenjährigen Kriegs* (1866, 1870).

HANDEL SOCIETY. (1) A society formed in England in 1843 for the purpose of publishing Handel's works. Its object was accomplished between 1843 and 1858. The society, however, was dissolved in 1848. (2) A German society formed at Leipzig in 1856, which under the editorship of Chrysander has issued Handel's works in 100 folio volumes (1856-94).

HANDEFASTING (AS. *handfæstnung*, a clasp-
ing of the hand, from *hand*, hand + *fæst-*
nung, fastening, from *fæstnian*, to fasten, from
fæst, OHG. *fasti*, Ger. *fest*, fast, firm). An an-
cient ceremonial of betrothal, which prevailed ex-
tensively in Western Europe during the early
Middle Ages, and which consisted in the plight-
ing of troth and the clasping of hands in the
presence of witnesses. It belonged to the class of
betrothals known as *sponsalia per verba de pre-*
senti. In Scotland the practice of handfasting
developed into an irregular form of marriage of
a temporary character, good for a year and a
day. At the end of that time the relation came
to an end or was made permanent by a ceremonial
marriage. See BETROTHAL; MARRIAGE.

HAND GRENADE. A shell designed for
throwing with the hand. In various forms they
were used for many hundred years; at first, as
mere envelopes containing incendiary composi-
tion, and afterwards as explosive shells. The in-
vention of the shell-gun caused them to fall into
disuse, and upon the advent of the modern high-
powered fast-firing gun, which stopped hand-to-
hand fighting, they disappeared entirely. See
GRENADE.

HANDICAPPING (from *handicap*, appar-
ently *hand i' cap*, in allusion to the drawing of
lots from a cap). In all contests dependent upon
strength and skill there will be some so superior
that if they start under equal conditions with
the other contestants they must always win. The
consequence of this, if unrestricted, would be to
deter other contestants; whereby not only would
the sport be limited to these few, but the second
class of players would lose the benefit of playing
with them, and learning from them the highest
class in form. To remedy both these evils re-
course is had to handicapping, i.e. an extra bur-
den is placed upon, or a special requirement
made of, a superior competitor, in favor of an
inferior, in order to make their chances of win-
ning equal.

In all sports wherein the competitors are to
meet as members of the same association, careful
note is taken of the performances of every man,
as they occur, i.e. the number of times he com-
petes against other members of it, against whom
it is and by what margins he wins.

In speed foot-races, in swimming, and in simi-

lar point to point contests, the slower performer
in a handicap race has so much start ahead of
the man whose past performances have put him
in the first class, and therefore has a shorter
distance to travel than his expert rival. In lawn
tennis the players are handicapped by giving or
owing strokes, or by giving *bisques*. In cricket
handicapping is usually accomplished by allowing
a large number of players to the inferior team, 11
men playing against 18 or 22. In horse-racing on
the flat, the horse which has proved himself in
the past by his performances, or who by age
or size or sex is naturally superior, is, where
handicapping is resorted to, required to carry
a heavier jockey, or to have weights placed on
the saddle which, with the jockey's weight, will
effect the same object. In polo, as practiced in
America, the different players are handicapped
by an allowance or penalty of so many goals, i.e.
in matches the teams whose aggregate handicaps
are less than those of their opponents are al-
lowed the number of goals which is the difference
between them and their opponents. In yachting,
the boats and their sails are measured, and the
boats whose hull and sails are the largest have
to make an allowance which is deducted at the
end of the race from the actual time which it has
taken to sail over a given course. In chess and
draughts certain 'men' are allowed to the inferior
player, and in billiards the better of two players
allows a certain number of 'points' so as to
equalize the game. These are the principles of
handicapping; their application is an inexhaust-
ible subject.

HAND LEAD. A small lead, weighing from
5 to 15 pounds, used for sounding in shallow
water. Since the general adoption of the Thom-
son sounding-machine leads weighing more than
15 pounds are seldom used. See LEAD.

HAND ORGAN. See BARREL ORGAN.

HANDS, IMPOSITION OF. The ceremony em-
ployed in religious use, both ancient and modern,
to symbolize the conferring of certain inward
spiritual gifts. Aaron and his sons were directed
to lay their hands upon the heads of the victims
which were to be offered in sacrifice (Ex. xxix.
10, 15, 19). By a similar ceremony Moses set
Joshua apart as the leader of the people (Num.
xxvii. 23). Christ was entreated to heal the
ruler's daughter (Matt. ix. 18) by the same
action, and He Himself adopted it in blessing chil-
dren (Matt. xix. 15). It is apparent from the
New Testament that it was considered from the
beginning of the Christian Church to convey
spiritual grace, specifically the gift of the Holy
Ghost (Acts viii. 17; I. Tim. iv. 14). It was
accordingly employed in confirmation, ordina-
tion, and the reconciliation of penitents. The
name *chirothesia* was used for the actual laying
on of hands, while that of *chirotonia* designated
the mere symbolic extension of the hand where
the recipients of the grace were more than one.
The imposition of hands is retained in the Roman
Catholic and Anglican communions in confirma-
tion and ordination, for the latter purpose
among the Presbyterians also; while in the mod-
ern Roman Catholic Church the mere authorita-
tive lifting of the priest's hand has taken the
place of the former actual contact in absolution.

HANDSAW-FISH. A name in California,
translating the Spanish *serra*, for the local lancet-

fishes, in reference to their rows of sharp teeth. See LANCET-FISH.

HANDSEL (AS. *handselen*, Icel. *handsal*, delivery into the hand, from *hand*, hand + AS. *selen*, *sylen*, Icel. *sal*, Eng. *sale*, a giving, from *sellan*, *syllan*, to give, OHG. *sellan*, Eng. *sell*). A transaction of sale or barter of chattels or the striking of a bargain, evidenced by the shaking of hands—an ancient ceremonial which can be traced in many systems of primitive law. Its modern form is the giving of earnest (q.v.). The term is also sometimes used to denote earnest-money, or part payment, by way of binding a bargain. In Scotland it popularly signifies a first transaction in trade, as, for example, the first sale effected in the day or week; and is likewise employed to signify a present in the nature of a New Year's gift on the first Monday in the year—hence called Handsel Monday.

HANDSOME SWORDSMAN, THE. See BEAU SABREUR.

HANDSWORTH. A suburban municipality of Sheffield, in Yorkshire, England, three miles east-southeast of that town (Map: England, E 3). It is noted for its extensive manufacturing industries. Population, in 1891, 10,300; in 1901, 14,150.

HANDSWORTH. A manufacturing town of Staffordshire, England, a suburb of Birmingham (Map: England, E 4). It has undergone extensive improvements, and has a number of public works. Population, in 1891, 32,750; in 1901, 53,000.

HANDWRITING. The authentic signature or other writing of a person by his own hand. Modern law, which makes the validity of many legal acts depend upon their being committed to writing and subscribed by the party to be charged thereon, has conferred great importance upon the handwriting of the signature of legal instruments, and where such handwriting is in dispute, it must often be proved by the evidence of third persons. This is effected by calling a witness who either saw the individual write the identical words, or who by correspondence, or by having previously at other times seen the same person write other papers, can swear that the paper is the handwriting of the individual to whom it is attributed. It will be noticed, however, that unless the making of the writing in question was actually observed by the witness, his testimony will belong to the class of opinion evidence, the probative force of which is very different from that of direct evidence. Sometimes, where no direct evidence can be had, bank tellers and others accustomed to compare the niceties of handwriting are allowed to give their evidence, or rather state their belief as to the writing; but this kind of evidence is looked upon with great suspicion, and is much discountenanced. The great and growing importance of handwriting evidence in recent times has produced a class of professional experts, who have given a new value to evidence of this character by the profound and scientific character of their study of handwriting. But their evidence remains mere opinion and continues to share in the discredit which has usually attached to evidence of this character. See EXPERT EVIDENCE; FORGERY.

In cases where a jury are called upon to determine a disputed question of handwriting, they are now allowed to form their own opinion by

comparing the disputed writing with other writings admitted to be by the same party. In England this could not be done before 1854, but it is now permitted in both civil and criminal cases. In Scotland, a jury may also be allowed to judge of the handwriting in this way in any case. In some countries—as, for example, in Scotland—a will, if written in the testator's handwriting, is admitted to be genuine without the attestation of witnesses, being then called a holograph (q.v.) instrument; but there is no such privilege in England or Ireland, as all wills, by whomsoever written, must be attested by witnesses. Consult: W. Anderson Smith, *Progress of Handwriting* (1887); Frazier, *Manual of the Study of Documents* (1894).

HANDY ANDY. A humorous Irish story by Samuel Lover (1842), notable for its Irish wit.

HÄNEL, hä'nel, ALBERT (1833—). A German jurist and politician, born in Leipzig. He studied at Vienna, Leipzig, and Heidelberg, in 1860 became a professor at Königsberg, and in 1863 at Kiel. One of the founders of the Liberal Party in Schleswig-Holstein after the annexation of the duchies to Prussia in 1866, he was elected to the Prussian Chamber of Deputies and the Reichstag of the North German Confederation, and subsequently to the Imperial Reichstag. He became known as a leader of the so-called 'Fort-schrittspartei,' or Progressists, which, after the fusion with the Secessionists in 1884, was styled the 'Deutschfreisinnige Partei.' Upon the break-up of the party in 1893, he represented the 'Freisinnige Vereinigung' (Liberal Union), but in the elections of the same year to the Reichstag he was defeated by the Social-Democratic candidate. In 1898 he was reelected. His writings include: *Studien zum deutschen Staatsrecht* (1873-88), and *Die Gesetzgebung des deutschen Reichs über Konsularwesen und Seeschifffahrt* (1875).

HANFSTÄNGL, hänf'stäng'l, FRANZ (1804-77). A German lithographer and photographer, born in Bayernrain. He studied lithography under Mitterer at Munich, and spent six years in the Munich Academy (1819-25). He went to Dresden in the following year and began his great work, completed in 1852, of copying in lithograph the canvases of the Dresden Gallery. In 1844 he returned to Munich, leaving his establishment at Dresden to his brothers Max and Hans. From 1848 to 1853 he gave up lithography for galvanography, and then devoted himself almost entirely to photography and later to photogravure and heliogravure. His son EDGAR HANFSTÄNGL (1842—) succeeded to the business in 1868. The most important publications of the house are the periodical *Die Kunst unserer Zeit*, first published in 1890, and fine collections of carbon-print reproductions, including the contents of the principal European galleries, and the *Galerie moderner Meister*.

HANG-CHOW, häng'chou'. A foo or departmental city of China, and capital of the Province of Che-kiang, the smallest of the 18 provinces (Map: China, E 5). It is situated near the southern end of the Grand Canal, within two miles of the left bank of the Ts'ien- (or Ch'ien-) tang River. Its walls have a circuit of 12 miles, are 30 to 40 feet high, 20 to 30 feet thick, and are pierced with 10 large gates, controlled by the Tatar general, who has a force of 7000

Tatars under his command. The streets are tolerably wide and clean, and there are many good shops. The principal street which runs from north to south is four miles long. The western wall is washed by the famous Hsi-hu or West Lake, the chief attraction of the city. It is a beautiful sheet of water about eight miles in circumference, dotted with islands on which are built monasteries, memorial halls, and shrines. On its western side is an abrupt but magnificent range of hills. A little farther to the west are numerous finely situated Buddhist temples to which tens of thousands of pilgrims repair daily. Hang-chow has long been noted for its magnificence, its wealth, and its luxury. Marco Polo visited it several times toward the close of the thirteenth century, and describes it as 100 miles in circuit, and gives the number of its bridges as 12,000, all of them of stone. The name he gives it is *Kinsay*, a corruption of Chinese Kingsze, meaning 'capital' or 'metropolis,' Hang-chow having become in 1127 the capital of the Sung dynasty when the Kin Tatars conquered the northern provinces.

In December, 1896, Hang-chow was opened to foreign residence and trade in accordance with a treaty made at Shimonoseki between the Chinese and Japanese in the spring of the preceding year. A foreign settlement containing 1809 *mou* or Chinese acres, or about 300 English acres, has been laid off on the east bank of the Grand Canal about 10 *li* (3½ English miles) from the Wu-li Gate. It is described as low and marshy, and infested with mosquitoes. Communication with the city can be maintained by small canals leading from the Grand Canal. Hang-chow is noted for its silk. Here is the Imperial silk-factory in which are woven the beautiful silk fabrics for the use of the Imperial household, and there are about 7000 private looms giving employment to about 30,000 persons. There is also a cotton-spinning mill with 15,000 spindles. Hang-chow is noted for its fans, and fan-making is an important industry. It has no direct foreign trade, all produce of native origin finding its way to Shanghai by the canal or coastwise, and foreign goods come in in the same way. The exports consist chiefly of silk, paper fans, lotus-nuts, and tea; and the imports of copper and spelter from Japan for use in the mint, and of native produce, of brass buttons, leather, and tobacco. In 1899 the gross trade of the city passing through the custom-house amounted to 12,000,000 taels. The Ts'ien-tang River and the Grand Canal are the chief arteries of inland trade. The former is navigable at all seasons, but unfortunately is tortuous and shallow, and at certain seasons of the year is subject to an 'eagre' or 'bore' which rises to a height of 15 feet, and has a velocity of 15 miles an hour. Further it is not connected with the Grand Canal, some miles distant, and the transfer of goods and passengers is very slow, troublesome, and expensive. There are 400 houses engaged in the steam-launch transportation business on the canal, and the journey to Shanghai may be made in from 20 to 24 hours. The seaport of Hang-chow is Chapu, 20 miles lower down the river. The population of the city proper is estimated at 500,000, but the suburbs, which are properly included in the name Hang-chow, are densely populated, and the whole may be set down as 800,-

000. On December 29, 1861, Hang-chow was captured by the Tai-ping rebels after a protracted siege in which it suffered much.

BIBLIOGRAPHY. *Marco Polo*, edited by Yule (2 vols., London, 1874); *Notes on Hangchow*, by G. E. Moule (1889); and Scidmore, *China, the Long-lived Empire* (New York, 1900).

HANG'ER, GEORGE (c.1751-1824). An English soldier and military writer, fourth Baron Coleraine. After completing his education at Eton and Göttingen, he entered the army as a guardsman, but was afterwards captain in the Hessian force sent to America during the Revolutionary War. By 1782 he was major of a British dragoon regiment which was disbanded at the peace, and as Hanger found he could not live upon half pay, he spent nearly a year in a debtors' prison until his retiring allowance was doubled. He set himself up as a prophet, foretold the Civil War in America, and was a well-known man about town in London, intimate with the Prince Regent, and noted for his eccentric vulgarity even more than for his published works: *An Address to the Army in Reply to Strictures by Roderick McKenzie on Tarleton's History of the Campaigns of 1780 and 1781* (1789); *Anticipation of the Freedom of Brabant* (1792); *Military Reflections on the Attack and Defense of the City of London* (1795); and *The Life, Adventures, and Opinions of Colonel George Hanger* (2 vols., 1801).

HANG FIRE. When the powder-charge of a gun fails to explode promptly upon being ignited it is said to *hang fire*. It is due to a variety of causes, such as moisture, insufficient priming charge, etc., and is a prolific cause of accidents with modern breech-loading guns. Smokeless gunpowder is not easy to ignite, and the small priming charge of black powder sometimes fails to give out a sufficient burst of flame, in which case only a small portion of the charge takes fire, and the burning may last several seconds before the charge explodes. When several guns are being fired the man who operates the breech may think his own has gone off and open the breech while the powder is still burning. If the gun is of large size premature opening of the breech may cause the death or serious injury of every one in the vicinity. See GUNS, NAVAL.

HANGING. The common-law mode of inflicting capital punishment. The sentence pronounced by the court indicates the method of execution, viz. that the convict "be hanged by the neck until he is dead." The time and place of the execution are also, within statutory limits, fixed by the sentence. In England, formerly, in atrocious cases, it was usual for the court to direct a murderer to be hung upon a gibbet in chains near the place where the crime was committed—also at a later period to order the body to be dissected—and the execution to take place on the next day but one after the sentence was passed. But these useless severities were abolished by the statute 6 and 7 Will. IV., c. 30.

The mode of punishment by hanging was first adopted in England in 1241, when Maurice, a nobleman's son, was hanged for piracy. Other more barbarous modes of inflicting death were long in use, but have been abolished, and hanging has long been the ordinary, because the most humane, mode of executing capital punishment, in the United States as well as Great Britain.

In a few of the United States electrocution (q.v.) has been substituted for hanging as a less repulsive and more humane method of capital punishment. The publicity which formerly attended the hanging of criminals has, in most civilized communities, been done away with. In treason, hanging is part of the statutory punishment, coupled with mangling the body, though the Crown may change the sentence into simple beheading, except in the case of women, who are, in deference to their sex, legally exempt from the latter form of execution.

The cause of death in hanging is complex. The compression of the windpipe by the cord, the obstruction of the return of venous blood from the head, and of the flow of arterial blood to the brain, the stretching or tearing of the nervous structures of the neck, and, in some instances, dislocation or fracture of the vertebræ, may concur in the production of the fatal effect, which, though attended with violent struggles in some cases, is probably as nearly instantaneous as possible. See STRANGULATION; EXECUTION; CAPITAL PUNISHMENT.

HANGING, DRAWING, AND QUARTERING was, in English criminal jurisprudence, a mode of executing the sentence of capital punishment on a traitor. It consisted in drawing the criminal to the place of execution on a hurdle, and, after hanging him, dividing the body into quarters. This form of executing the sentence was substituted by statute (54 Geo. III., c. 146) for the more ancient and barbarous practice (to which the word 'drawing' originally referred) of disemboweling the criminal. The more humane and decent method of execution by hanging, without the spectacular concomitants of drawing and quartering, is now employed in Great Britain as well as in the United States.

HANGING GARDENS OF BABYLON.

The name commonly given to a structure of ancient Babylon, famed as one of the seven wonders of the world. It appears to have been a sort of tower or pyramid, rising in terraces, planted with trees, flowers, and shrubs, and is said to have been constructed by Nebuchadnezzar for the gratification of his Median Queen, because the Babylonian plain seemed dreary to her in comparison with the mountain scenery of her native land. Strabo says the structure was a square, four plethra in area; it rested on arches supported by hollow pillars of burnt brick, filled with earth, in which the roots of the trees were planted; the top consisted of terraces, and a force of men was constantly employed pumping up water from the Euphrates for irrigation. The account that ascribes the gardens to the mythical Semiramis has no historical value. It is thought that the northern portion of the mound Amran ibn Ali which forms part of the ruins of Babylon occupies the site of the gardens.

HANGING ROCK, BATTLE OF. A battle fought on the western bank of Hanging Rock Creek, S. C., on August 6, 1780, during the Revolutionary War, between about 800 American militia under Colonel Sumter, and an equal number of Loyalists under Major Carden. The Americans in an impetuous charge at first drove the Loyalists back from their camp, but delaying to plunder, fell into disorder, and, in consequence, were themselves driven back and forced to re-

treat. The Loyalists lost 269 in killed, wounded, and missing. The loss of the Americans was not recorded. Consult: Dawson, *Battles of the United States* (2 vols., New York, 1858); and Lossing, *Field Book of the American Revolution* (2d ed., New York, 1855).

HANGINGS. Pieces of textile fabrics, used to cover the walls of rooms, especially of churches, during the early Christian and Romanesque epochs. They were often of high artistic value. See TAPESTRY.

HANGING WALL. A term used to designate the upper or covering wall of an inclined ore body, mineral vein, or stratum. If the mineral deposit be flat the term *roof* is used. In mining it is usually necessary to support the hanging wall either by pillars of ore or masonry, or by props of wood. See FOOT-WALL.

HANGNEST. A name often used in books, for the birds of the American family Icteridæ, sometimes called 'troupials,' but more usually orioles, all of which build pensile nests. (See NIDIFICATION; ORIOLE.) The Baltimore oriole is the most familiar North American representative of the family, and is commonly known as 'hang-bird' in certain localities.

HANGUL, hūn'gool (native name). The Kashmir stag (*Cervus Kashmirianus*), which closely resembles the red deer (see DEER) of Europe, of which it may probably be only a local race. The antlers differ from those of the European stag in not forming a cup at the crown, which is simply forked. It is a forest-haunting animal, and in summer remains at elevations between 9000 and 12,000 feet, but in winter is driven down into the valleys by snow. The proper shooting season is in October and November, when the stags are full-antlered and seeking the does. They roam widely.

HANIFAH, hā-nē'fā, or **ABU-HANIFAH** (702-72). One of the four great Mohammedan Imams or Church fathers. He was born at Kufa on the Euphrates, and became founder of the Hanifites, the oldest of the sects of Mohammedans considered orthodox. His teachings were subsequently formulated into a code of Mohammedan law, which is still in force in many parts of the Ottoman Empire. He died in prison at Bagdad, where he had been placed for contumacy in refusing the office of Kadi, offered him by the Caliph, and declined because he thought himself unworthy of it.

HANKEL, hān'kel, **HERMANN** (1839-73). A German mathematician, son of Wilhelm Gottlieb Hankel, born at Halle. He studied at Leipzig and at Göttingen under Riemann and Möbius, became privat-docent in mathematics at Leipzig in 1863, and professor extraordinary in 1867, and in the same year was called to Erlangen in the same capacity. His chief works were: *Zur allgemeinen Theorie der Bewegung der Flüssigkeiten* (1861); *Vorlesungen über die komplexen Zahlen und ihre Funktionen* (1867); *Die Entwicklung der Mathematik in den letzten Jahrhunderten* (1869; 2d ed. 1884); *Zur Geschichte der Mathematik im Altertum und Mittelalter* (published posthumously, 1874); *Die Elemente der projektivischen Geometrie in synthetischer Behandlung* (also posthumous, 1875). For his biography and an estimate of his works, consult Zahn, "Einige Worte zum Anden-

ken an Hermann Hankel," in the *Mathematische Annalen* (Leipzig, 1874).

HANKEL, WILHELM GOTTLIEB (1814-99). A German physicist. He was born at Ermsleben, and studied physics and chemistry at the University of Halle, where he later was appointed professor. In 1849 he became professor of physics at Leipzig, and served there until 1887, when he was forced to give up active duties. He devoted himself to the study of thermo-electric properties of crystals, and made many interesting discoveries in this field. Hankel's researches are published for the most part in Poggendorff's *Annalen* (Leipzig), and the *Berichte und Abhandlungen* of the Saxon Academy of Sciences. He also prepared a German edition of Arago's works, which was published at Leipzig (1854-60).

HAN-KIANG, hān'kyāng'. The name of several rivers of China, the most important of which is that which flows into the Yang-tse at Hankow (q.v.). It rises in the mountains in Shen-si, known as Ta-pa-ling (sometimes also called Kiu Tiao Shan, the 'mountain of nine ridges'), and flows east and south through the provinces of Shen-si and Hu-peh for a distance of about 1300 miles, for 1260 of which it is navigable in some degree. Its upper courses are through a mountainous region, and rapids are both numerous and dangerous. In certain seasons floods are common, the water rising in the narrower parts with great suddenness, sometimes to a height of 24 feet in as many hours. On such occasions the rapids are wiped out, and the river becomes a raging torrent. From Sin-pu-wan, the limit of navigation, to Tsze-yang Hien (400 miles), only small boats can be used. At the latter place goods and passengers are transhipped to larger craft, subject to a second transshipment at Lao-ho-k'ow (400 miles) or Fan-cheng (450 miles) to the ordinary river junk of the Han. At Lao-ho-k'ow the country opens out, and for the remaining 460 miles to Hankow navigation is easy, though shallows and shifting banks abound. The traffic on the river is considerable, and with a little dredging it is capable of being used by steamers of light draught as far as Fan-cheng or Lao-ho-k'ow, the two most important trading centres on the river. Other cities besides those already mentioned are Hing-an-fu, a large walled city on the right bank, with a great military depot in the vicinity, and Siang-yang-fu (also on the right bank), a quiet walled city opposite Fan-cheng, both of which are noted for the long and stubborn resistance (1268-73) which they offered to the Mongol armies of Kublai Khan. (Consult Yule, *Marco Polo*, vol. ii., London, 1871.) Prior to 1470 the river branched off from its present course about three miles above its present mouth and flowed through the plain behind what is now the foreign settlement of Hankow, and entered the Yang-tse some miles lower down. In that year it suddenly changed its course and poured its waters into the Yang-tse through its present channel.

HANKOW, hān'kou' (Chin., Han-mouth). An important river-port and commercial centre of China, situated in the very heart of the country, 600 miles from the sea, on the left bank of the Yang-tse, at the point where it is joined by the river Han in latitude 30° 32' N., longitude 114° 19' E. (Map: China, D 5). It occupies the angle formed by the junction of these two rivers,

stretching along the east or left bank of the Han for over two and one-half miles, and eastward along the left or north bank of the Yang-tse for one mile. Its streets are narrow, crooked, and dirty, and usually much crowded with the screeching, heavily laden wheelbarrows used in the conveyance of the enormous quantities of goods which here find their point of transshipment. Adjoining the native town on the east is the foreign settlement, originally a British concession, but thrown open to all foreigners by the British Government shortly after the opening of the port in 1861. It extends along the Yang-tse for a distance of about 800 yards, a wide 'bund' or esplanade running along its entire length. It has fine streets, kept in splendid condition by a municipal council elected by the land-tenants. Ground-rent is paid to the Chinese authorities through the British consul. The houses and business buildings are substantial, and are in marked contrast with those of the native town.

To the east of this lie the 'concessions' more recently acquired by the French, Russians, and Germans, and the foreign water-front has now a length of nearly three miles. Another new 'concession' has recently been opened by the Chinese authorities on the south or Wu-chang side of the Yang-tse, where foreigners may build business places and residences on certain conditions.

West of the native town, and across the Han, is the departmental city of Han-yang, to which Hankow (which is not a city) is subordinate, and directly across the Yang-tse from Han-yang stands the large and imposing city of Wu-chang-fu, capital of the Province of Hu-peh, and the seat of the Governor-General (or viceroy) of the two provinces of Hu-nan and Hu-peh, unitedly known as Hu-kwang, or Liang Hu—that is, 'the two Hu.' These three centres of population are included in the port and customs district of Hankow, and situated as they are in the centre of an unsurpassed network of rivers and lakes, they form the most important commercial centre of the country. Their total population is estimated at 1,500,000, of which Hankow has 800,000, or more than half.

Hankow is the first of the 'Five Chin' or great commercial emporia of the country. Its trade is chiefly distributive, but it has some industries, including a cotton-mill, a hemp-factory, a mint, and an ore-crushing establishment in Wu-chang, an arsenal and great iron and steel works in Han-yang, and a few miles lower down the river are great tanks for storing oil (capacity 5000 tons) which is tinned on the premises. The mouth of the Han swarms with native shipping, and the scene presented everywhere is one of great commercial activity. Regular steam communication is maintained with Shanghai and the other river and lake ports both above and below Hankow. I-chang, about 500 miles above Hankow, being at present the limit of steam navigation westward. The largest ocean steamers come to Hankow and load at great hulks moored off the river-bank. The Yang-tse, opposite the foreign settlement, is 1400 yards wide from brink to brink. In winter its average low-water depth is 40 feet in mid-channel, but in summer, when the rivers are in flood, the swollen waters frequently rise 50 feet to the brink of the bund, sometimes overflowing it, inundating the town. In flood time the scene off the native town is most exciting; many junks and boats come to

grief, and many lives are lost, notwithstanding the efforts of the stanch, splendidly managed 'Red Boats' of the native Life-Saving Society, whose stations are found throughout the whole course of the Yang-tse.

In 1900 the gross value of the trade of the port, according to the report of the Imperial Maritime Customs, amounted to \$56,513,103, against \$65,432,903 in 1899, the decrease of nearly \$9,000,000 being due to the Boxer movement in the north and the consequent general unrest in the Yang-tse Valley. Of this, foreign imports amounted to \$19,595,371, as follows: From Chinese ports, \$19,017,810; the Continent of Europe (excluding Russia), \$338,702; Japan, \$144,975; Hong Kong, \$75,488; the United States, \$18,409. The chief imports of foreign origin were: Opium, 43,855 pounds; cotton piece-goods, 1,684,237 pieces; cotton yarn, 30,945,595 pounds; woolen goods, 48,886 pieces; metals, 3,563,242 pounds (including 18,201 piculs of lead for lining tea-chests). Among the 'sundries,' kerosene oil figures as 12,854,380 gallons. The chief exports are tea, rice, silk, tobacco, beans, coal, hemp, hides, vegetable wax, medicines, and wood-oil. Tea is always one of the largest items. In 1900, 36,306,654 pounds, value \$4,356,624, were exported direct to foreign countries, and 26,441,654 pounds, value \$3,176,534, to Chinese ports, whence no doubt much of it was re-exported to foreign countries. These figures include the large quantity sent overland via Kiahkta to Russia, as well as that sent by direct steamer to Odessa—usually the finest black tea which can be produced. One of the items of export to Europe was 4665 tons of crushed antimony ore (obtained from the Province of Kwei-chow), crushed, dried, and packed in bags in Wu-chang.

The shipping engaged in this great commerce is given in the Customs Report for 1900 as follows:

STEAMERS ENTERED INWARD

British.....	510	carrying	567,747	tons
Chinese.....	375	"	231,419	"
Japanese.....	142	"	111,364	"
German.....	107	"	115,800	"
Russian.....	8	"	16,024	"
Swedish and Norwegian.....	6	"	4,459	"

The number of steamers clearing outward was 1162, and the cargo carried, 1,049,704 tons, the different nationalities being represented in about the same proportion.

Hankow is one of the principal stations of the great trunk railway which is to connect Peking in the north with Canton in the south. The Hankow-Peking section (called the Lu-Han Railway) is already well advanced toward Hsin-yang, 346 miles north of Hankow. The Hankow station is a few miles below the foreign settlement, but a branch with the necessary stations runs to the Han behind the foreign settlements. Hankow and the neighboring cities were all but destroyed during the Tai-ping Rebellion. (See HAN-YANG and WU-CHANG.) Consult Seidmore, *China, the Long-lived Empire* (New York, 1900).

HANLEY. A manufacturing town and municipal borough in Staffordshire, England, on the North Staffordshire Railway, and on a branch of the Trent and Mersey Canal, two and one-half miles from Newcastle-under-Lyme (Map: England, D 3). It is known as 'The Metropolis of the Potteries,' and is famous for its manufactures

of earthenware and fine porcelain. It has coal and iron mines, iron furnaces and foundries, and brick-works. The principal portion of the town is on an elevated site; the streets, wide and regular, are brick-paved, and there are many handsome residences. The chief buildings are the town hall, mechanics' institute, museum, infirmary, national and board schools. There is a fine park. The town owns an electric-light plant, and maintains markets, baths, a cemetery, a free technical museum, and free libraries. It utilizes its sewage for the manufacture of fertilizers. Hanley's rise dates from the inception of the pottery industry. It has absorbed the former township of Shelton, and it received a municipal constitution in 1857. Population, in 1891, 55,000; in 1901, 61,500.

HANLIN YUAN, hān-lēn' yōō-wān' (Chin., College of the Forest of Pencils). The National Academy of China, membership in which is the highest literary honor China has to bestow on her scholars. It was founded by the Emperor Hsian Tsung in 725, first as a coterie of scholars and poets whose society he courted, then as a learned body of copyists engaged in multiplying books. Lo-yang, in Ho-nan, then the capital, was its home; since then it has shared the fortunes of successive dynasties, and has been in Peking since 1403. During the 'Boxer' trouble of 1900 it was purposely burned down. Its members are the historiographers of the country, the compilers of its great encyclopædias, editors and commentators of its classics, etc., and have charge of literary matters in general, or are drafted off to the provinces as superintendents of education, literary chancellors, etc. Its membership is made up of honor men at the triennial examinations at Peking. See Martin, *Hanlin Papers* (New York, 1880).

HANMER, Sir THOMAS (1677-1746). An English statesman and scholar. He was educated at Westminster and at Christ Church, Oxford; was elected to Parliament for Suffolk (1701), and in 1713 became Speaker of the House of Commons. He retired from politics in 1727 and devoted himself to literature. He published (1744) an edition of Shakespeare, with illustrations by Gravelot, a work of no critical value, but of splendid typography. Pope, in the *Dunciad*, alludes to him under the name *Montalto* (book iv., 105).

HANN, hān, JULIUS (1839—). A German physical geographer and meteorologist, born near Linz (Upper Austria). He was educated at the University of Vienna, became a lecturer there on meteorology in 1868, and in 1873 professor of physical geography. Having held a professorship at Gatz from 1897 to 1900, he returned to Vienna in the latter year to occupy the chair of cosmic physics. In 1866 he established with Jelinek the *Zeitschrift der Oesterreichischen Gesellschaft für Meteorologie*, and in 1877 was appointed director of the Central-Anstalt für Meteorologie und Erdmagnetismus of Vienna, and elected to the Academy of Sciences. His researches dealing with such questions as the theory of storms, the decrease of temperature attendant upon increased elevation, and the violent south wind known to the Swiss as the Föhn, are extensive. His publications include: *Astronomische Geographie und Physik der Erde* for the *Allgemeine Erdkunde* (4th ed. 1886) of Hochstetter

and Pokorny; *Handbuch der Klimatologie* (1883); and *Die Temperaturverhältnisse der oesterreichischen Alpenländer* (1887).

HANNA. The usual name in British Guiana for the hoactzin (q.v.).

HAN'NA, MARCUS ALONZO (1837—). An American manufacturer and politician, born at Lisbon, Columbiana County, Ohio, of Scotch-Irish parentage. In 1852 his father removed with his family to Cleveland, Ohio, where he established himself in a wholesale grocery business that soon became one of the most extensive in northern Ohio. Young Hanna was educated in the Cleveland public schools, and began a course at Western Reserve University, which was interrupted in 1857 by the failing health of his father. His father died in 1862, and he conducted the business with success until 1867, when he formed a partnership with his father-in-law, Daniel P. Rhodes. The firm of Rhodes & Co. dealt in coal, iron ore, and pig iron, and, under the management of the junior partner, its scope was extended, so that in a few years its property included coal and iron mines, and a line of lake steamships constructed in its own shipyards. In 1877 the firm name was changed to M. A. Hanna & Co., and Hanna became the controlling partner; but his activities required new fields, and he became interested in theatrical enterprises, the Cleveland Street Railway, banking, and railroading. At length he turned his attention to politics, gradually extending his influence from his home ward to city, State, and finally to national politics. In 1880 he was an active Republican worker in Cleveland; in 1884 he was a delegate to the Republican National Convention, and in 1888 he was again a delegate to that body, and this time made himself known as one of the managers of John Sherman's canvass for the nomination. In 1896 he suddenly acquired national prominence by the part he took in securing the nomination of William McKinley for the Presidency at the Republican National Convention at Saint Louis. Immediately after the convention he became chairman of the Republican National Committee, and conducting the campaign on the same principles that had won him success in the business world, secured the election of McKinley by the largest popular plurality ever given at a Presidential election. In March, 1897, Governor Bushnell appointed him United States Senator from Ohio to succeed John Sherman, who had resigned to become Secretary of State in President McKinley's Cabinet, and in the following year he was chosen by the Legislature Senator for the full term of six years. In the Senate he did not take a prominent part either as a debater or a legislator; but up to the death of President McKinley he was recognized as one of the most influential advisers of the Administration. He actively interested himself in the problem of the relation between capital and labor, and upon the organization of the National Civic Federation was made its president. In December, 1901, he became a member of a permanent board appointed to settle labor disputes.

HANNA, WILLIAM (1808-82). An English clergyman, author, and editor, born at Belfast. He studied at the universities of Glasgow and Edinburgh, was ordained a minister of the Church of Scotland, was installed as pastor at East Kilbride (Lanarkshire) in 1835, and in 1837 became pastor at Skirling (Peeblesshire). Upon

the establishment of the Free Church of Scotland in 1843 he, with his entire congregation, withdrew from the State Church and formed, at Skirling, a Free Church society. From 1850 to 1866 he was the colleague of Thomas Guthrie (q.v.) at Saint John's Free Church, Edinburgh. His pulpit discourses were marked by a quiet yet forceful manner of utterance, clear thought, and much literary excellence. He was appointed editor of the *North British Review* in 1847, but soon resigned, and wrote numerous works, of which the *Last Day of Our Lord's Passion* (1863) had a wide circulation. He is, however, best known for his edition of *The Posthumous Works of Thomas Chalmers* (9 vols., 1847), and his *Memoirs of the Life and Writings of Thomas Chalmers* (4 vols., 1849-52), which two publications won for him from Glasgow the degree of LL.D.

HANNAHILL. A local name for the black sea-bass (*Centropristes striatus*). See SEA-BASS.

HAN'NAY, DAVID (1853—). An English journalist and author, born in London. Besides work on the *Pall Mall Gazette*, the *Saturday Review*, and *Saint James's Gazette*, Hannay wrote several books, mostly connected in some way with the navy: *Short History of the Royal Navy* (1898); *Admiral Blake* (1888); *Rodney* (1891); *Life of Murrat* (1889); *Life of Smollett* (1887). To the "Public Men of To-Day Series" he contributed *Don Emilio Castelar* (1896), and to the *Periods of European Literature*, "The Later Renaissance" (1898), his most elaborate work in literary history.

HANNAY, JAMES (1842—). A Canadian journalist and historian, born at Richibucto, N. B., where his father was settled as Presbyterian minister. Called to the bar in 1867, he was appointed official reporter of the Supreme Court of the province (1867-73), and published two volumes of reports. Resigning his post, he became assistant editor of the *Saint John Daily Telegraph* (1873-83) and of the *Montreal Herald* (1883-84), and after serving on the staff of the *Brooklyn Eagle* (1885-87) he returned to Saint John to take the editorship of the *Gazette* (1888). In 1893 he became chief editor of the *Saint John Telegraph*. As a journalist, Hannay became well known throughout Canada for able editorials, brilliant sketches, stories, and ballads. Among his historical works are: *History of Acadia* (1879); *The Story of the Queen's Rangers in the American Revolution* (1883); *The History of the Loyalists* (1893); and *Life and Times of Sir Leonard Tilley* (1897).

HANNEMAN, HÀN'NÈ-MÀN, ADRIAEN (1601-71). A Flemish painter, born at The Hague. He was a pupil of Ravesteyn in his native city, and went to England early in the reign of Charles I. He worked in London under Mytens, in the style of Van Dyck, and produced a number of portraits notable for fine color. On his return to The Hague he became Court painter to Mary of Orange. His works include portraits of Charles I., in the Vienna Museum; Jan de Witt (1652, Rotterdam Museum); and William Frederick of Orange (1661, Weimar Museum).

HAN'NIBAL. A city in Marion County, Mo., 112 miles northwest of Saint Louis, on the Mississippi River, and on several railroads, including the Chicago, Burlington and Quincy, the Wabash, and the Missouri, Kansas and Texas (Map;

Missouri, E 2). It has steamboat communication with various cities on the river; a large trade in lumber, tobacco, flour, and agricultural produce, and manufactures of lumber, stoves, shoes, car-wheels, cigars, cement, and lime. Among the features of the city are the public library building, the United States Government building, the municipal buildings, the city park, and a long iron and steel railroad and wagon bridge across the river. Settled in 1819, Hannibal was incorporated as a town in 1839. The government is conducted under a charter of 1845, revised in 1873. The mayor, annually elected, controls appointments to the administrative departments, those to the library board and finance committee alone being ratified by the council, which is unicameral, and of which the executive is a member. The school board is chosen by the people. The city owns and operates its electric-light plant. Population, in 1890, 12,857; in 1900, 12,780.

HANNIBAL (Phœnician, grace of Baal, Gk. Ἄννιβας, *Annibas*). A common name among the Carthaginians, the list of those famed in history extending to fourteen or fifteen. The greatest of all was the Hannibal of the Second Punic War, the son of Hamilcar Barca. He was born in B.C. 247. When he was nine years old he accompanied his father on his Spanish expedition, and before starting swore an oath of eternal hatred to the Roman name, which he kept throughout his whole life. After the death of Hamilcar he was employed by Hasdrubal, his brother-in-law, in most of the military operations which he undertook. When Hasdrubal was assassinated, the army with one voice elected Hannibal commander-in-chief—an appointment which the authorities at Carthage at once ratified. Hannibal, at this time in his twenty-sixth year, undertook the command, for he longed to strike a death-blow at his country's rival by attacking her on her own soil. Before he entered on a task of such magnitude he deemed it prudent to complete the subjugation of Spain, and accordingly spent two years in contests with some tribes hitherto independent of Carthage. Saguntum, a city in alliance with Rome, was attacked by him on the ground that its inhabitants were making aggressions on the *Torboletes*, subjects of Carthage. After a siege of eight months the city was taken, and the Romans, after an embassy had unsuccessfully demanded the surrender of the general who had thus violated the treaty, declared war in B.C. 218. Having taken measures for the defense of Africa and Spain during his absence, he started from New Carthage in B.C. 218, with 90,000 foot and 12,000 horse. This force was much thinned by his contests with the tribes between the Iberus and the Pyrenees, by the necessity of leaving Hanno with 11,000 men to keep them in subjection, by desertion in the passage of the Pyrenees, and by his sending home a portion of his Spanish troops. His object in this last act was to inspire the soldiers with thorough confidence in themselves and their general. From the Pyrenees he marched to the Rhône without opposition, since Scipio was at Massilia, four days' march from the point where Hannibal crossed the river in the face of the Celtic hordes who sided with the Romans. His next great difficulty was the passage of the Alps, which he effected in fifteen days, in spite of the

attacks of the mountain tribes, the snows, storms, and other difficulties. Much discussion has taken place as to whether Hannibal crossed the Cottian Alps by the pass of Mont Genève (or Cenis), or the Graian Alps by the pass of Little Saint Bernard. For the former route, Michelet, Thierry, and most French writers argue; and for the latter, with better reasons, Niebuhr, Arnold, Mommsen, and others.

After allowing his army (now about 26,000 strong) some time to recruit in the rich villages of the friendly Insubrians, he first subdued the Taurini, a tribe hostile to the Insubrians, and took their chief city after a siege of three days, and thus forced into alliance with him all the Ligurian and Celtic tribes on the upper course of the Po. Scipio, having returned from Massilia, took the command of the army in the north of Italy, and met Hannibal on the plain near the river Ticinus. The Romans were entirely routed, and Scipio, who was severely wounded, retreated across the Po. The armies again met at the Trebia, with a like result, though the Romans, who had received reinforcements, were much more numerous. These battles were fought in B.C. 218. Having wintered in the neighborhood of the Po, and levied additional troops among the Gauls, most of whom were now his friends, Hannibal started southward as soon as spring permitted, marching through Liguria and the swamps of the Arno. In this difficult route immense numbers of his beasts of burden and horses perished, and he himself lost the sight of one eye. He next inflicted a severe defeat, near Lake Trasimenus, on the consul Flaminius. After this victory he crossed the Apennines to Picenum and Apulia, and thence recrossed to the fertile Campania, which he ravaged. Thither Fabius was sent with an army to oppose him, but no general engagement took place, the consul endeavoring to lead Hannibal into snares, which he succeeded in doing; but the Carthaginian extricated his army by a stratagem, and returned to Apulia. He wintered at Canne, and in June, or, according to others, in August (2d) of B.C. 216, almost annihilated a Roman army of 90,000 men under Terentius Varro and Æmilius Paulus, in the battle which was fought a little below the town. About 50,000 are said to have fallen, including Æmilius Paulus, and a host of Roman knights, senators, and other distinguished persons. Here Hannibal committed, perhaps, the greatest military error of his life, in not marching direct to Rome; but it is supposed that he refrained in order to allow the tribes of Italy to declare in his favor. Many in the south of Italy did attach themselves to his interests, but not in such numbers as he had anticipated. After some delay he marched on Neapolis, which he did not succeed in taking, but the gates of Capua were opened to him, and here he wintered. The enervating effect which the luxury of Capua is said to have had on his army has been greatly overdrawn; but his residence there forms, in one point of view, the turning-point in the war, which from this time became more of a desultory kind. Hannibal's great purpose was to arm the Italian nations against Rome, and so to crush her power by means of her own subjects; the Romans, on the contrary, henceforth avoided coming to a pitched battle with the Carthaginians, but sought rather to keep the tribes in awe and harass Han-

nibal and his lieutenants by small armies in different parts of the country. Hannibal traversed Italy in all directions, surprised the Roman generals, defeated their armies, captured their towns, such as Casilinum, Arpi, Tarentum, Metapontum, Thurii, Locri, and many others; he defeated Sentenius near Capua; Cn. Fulvius at Herdonea; Fulvius Flaccus on the Anio; Crispinus and Marcellus in Lucania; and the besieging army before Locri. In all these cases the armies were almost annihilated. The defeat of Hasdrubal, his brother, at the river Metaurus, and the loss of his army, compelled Hannibal to confine himself to the mountainous peninsula of Bruttii, where for four years he resisted all the efforts of the Romans to dislodge him. At length, after having maintained himself in Italy for upward of fifteen years, he was recalled to Africa, to defend his country against Scipio; but notwithstanding his utmost exertions, and the bravery of his veteran troops, he was defeated by Scipio near Zama, with a loss of 20,000 men (B.C. 202). Peace was concluded in the following year (B.C. 201).

Hannibal's scheme had been baffled, but his hatred of Rome was not diminished, and he set himself to make preparations for a still more deadly struggle. He turned his attention in the first place to political reforms, and made some constitutional changes by which he placed the finances on a better footing. But his enemies accused him to the Romans of stirring up Antiochus the Great of Syria to make war on them, and when ambassadors came to Carthage Hannibal fled to the Court of Antiochus at Ephesus. In the war which followed he took no conspicuous part, but the King bitterly regretted afterwards that he did not take the advice of Hannibal to carry the war into Italy. When peace was concluded, the surrender of Hannibal was one of the conditions; but, foreseeing such a result, he fled to Prusias, King of Bithynia, for whom he gained a naval victory over Eumenes, King of Pergamus. He was at length demanded by the Romans, and, seeing no hope of escape, he took poison, which he always carried with him for such an emergency. The date of his death was probably B.C. 183.

Our information about Hannibal is derived largely from Livy, Polybius, Plutarch, Appian, Cornelius Nepos, and Tonaras. For an estimate of the man, see Morris, *Hannibal* (1897); for an account of his military operations, Dodge, *Hannibal* (1891).

HANNINGTON, JAMES (1847-85). An English missionary, first Bishop of Eastern Equatorial Africa, born at Hurstpierpoint, near Brighton. He was educated at Oxford, and entered the ministry of the Established Church. In 1882 the Church Missionary Society sent him out to reënforce the missionaries already in Uganda, but his health gave way, and he was compelled to go back to England. Two years later he was consecrated Bishop of Eastern Equatorial Africa, and started a second time for Africa. After having conquered the many obstacles and perils which he encountered in his attempt to reach the interior, he was murdered by the command of Mwanga, King of Uganda, near Lake Victoria Nyanza. Consult Dawson, *James Hannington, First Bishop of Eastern Equatorial Africa* (London, 1887).

HAN'NO (Phœnician, merciful) (c.755-c.715 B.C.). A King of Gaza. He is called Hanunu in the inscriptions of the Assyrian King Tiglath-pileser III.; and this name is identified with that of the Carthaginian family, who possibly were his descendants. He was situated between Assyria and Egypt, and in 732 rebelled against Tiglath-Pileser, but fled without giving battle. Against Sargon II. he allied himself with Sabaco (biblical So), King of Egypt; was defeated with him at Raphia (720) and carried into captivity.

HANNO. A common name among the Carthaginians. The earliest of note who bore the name was a Carthaginian admiral who was sent on a voyage of discovery and colonization along the west coast of Africa, which he explored as far as the modern Sierra Leone. The date of this expedition is not known, but is supposed to be about B.C. 570. He founded a number of towns, and on his return he deposited an account of his voyage in the Temple of Moloch. This account was translated into Greek; and the translation, known as *Ἄνωρος Περίπλους*, or *Voyage of Hanno*, is still extant. There is an old English translation by Falconer (London, 1797). Consult Mer, *Mémoire sur le Périphe d'Hannou* (Paris, 1888).—**HANNO** (?-B.C. 204). A Carthaginian admiral in the first Punic War. In command of a Carthaginian fleet, near Messana, Hanno allowed the city to fall into the hands of the Romans. He was recalled and executed.—**HANNO** (third century B.C.). A Carthaginian general, successor in command to the above. He was the son of a Hannibal; with Hiero II. besieged Messana, but was defeated by the consul Appius Claudius.—**HANNO** (c.300-c.250 B.C.). A Carthaginian general in the first Punic War. He was defeated near Agrigentum in 262. In 256, with Hamilear, he was defeated in a naval battle off Ecnomus.—**HANNO THE GREAT** (c.275-c.195 B.C.). A Carthaginian politician. At the outbreak of the revolt of the Carthaginian mercenaries he was put in command of the army, but was so badly defeated that Hamilear Barca was sent out to share the command with him. The two agreed so ill that the home Government decided on a single command, but left the choice to the army in the field, which chose Hamilear. Hanno tried to break down Hamilear's power, after his death opposed intrusting the chief command to Hannibal, urged the surrender of Saguntum to Rome, and was head of the peace party. At the close of the Second Punic War he became leader of the party which was friendly to Rome.—**HANNO** (last half of third century B.C.). A Carthaginian lieutenant of Hannibal. He was in command of the left wing at the battle of Canna; conquered several towns in Lucania and Bruttium, and was beaten by Tiberius Gracchus (B.C. 214) near Beneventum.

HANOI, há'no-é' (Chin. *Ho-nei*, within the river). One of the most important cities of Annam, capital of the Province of Tongking, and the seat of the government of French Indo-China (Map: French Indo-China, E 2). It is picturesquely situated in a region of lakes and trees, on the right bank of the Songkoi or 'Red River,' which rises in the Chinese Province of Yun-nan, and enters the China Sea 110 miles below Hanoi. The native town lies between the citadel and the river. The streets are fairly wide

and the houses good, many of them being of brick and well built. Since coming under French control the part nearest the water-front has been much improved; new wide streets lined with trees have been opened, lighted with electricity. They have been given French names, and in this part the principal shops and hotels are found. French missionaries have long resided here, and a two-towered cathedral is a conspicuous feature of the landscape. In the middle of this newer part of the city is a small island, with some quaint pagodas; and on the shore of Grand Lake, in the neighborhood of the city, is a Buddhist temple with a colossal bronze figure of Buddha. In the space near the water-front is a bronze statue of Paul Bert, unveiled July 14, 1900. Hanoi was fortified by French officers at the beginning of the nineteenth century, but the defenses are now of little importance. The citadel, which stands on higher ground than the rest of the city, is a quadrilateral of 3600 feet to a side, and is surrounded by a wall and a deep moat. Within this inclosure are the palace, the royal pagoda, public offices and official residences, the treasury, court of justice, barracks, arsenals, magazines, etc. The principal trade is in silk and rice, and is largely in the hands of the Chinese, and embroidery and pearl-work form important industries. The Songkoi is navigable at all seasons as far as Hanoi by vessels drawing eight or nine feet. Above that point the river is shallow, and there are many rapids, but flat-bottomed vessels drawing not more than three and one-half feet can ascend quite a distance. Haiphong (q.v.) is the port of Hanoi, which is connected with it by rail as well as with Langson on the Chinese frontier. Several French newspapers are published in Hanoi, and a new race-course was opened there in 1890. The population in 1897 was 102,000, of whom 950 were Europeans and 1697 Chinese.

HANOTAUX, á'nó'tó', GABRIEL (1853—). A French historian and politician, born at Beaufort, Aisne. From being a specialist in paleography and modern history, he passed into the civil service (1879), as director of the historical department in the national archives, and became in 1881 sub-chief of Gambetta's Cabinet, and later chief of that of Jules Ferry. In 1885 he was Counselor of Legation at Constantinople, and the following year he was elected Deputy for Aisne. He served in the Chamber till 1887, and was mainly conspicuous for his opposition to Boulanger. He was appointed Director in the Ministry of Foreign Affairs in 1892, and in May, 1894, became Minister of Foreign Affairs in the Dupuy Cabinet, remaining in office through several changes of Premiership, till October, 1895. In the Méline Ministry (1896-98) he again held the portfolio of Foreign Affairs. In 1897 he was elected to the Academy. Among his published works are: *Les villes retrouvées: Thèbes, Ninive, Babylone, Troie, Carthage, Pompéi, Herculaneum* (1880); *Origines de l'institution des intendants des provinces* (1884); *Henri Martin, sa vie, ses œuvres, son temps* (1885); *Etudes historiques sur le XVIème et le XVIIème siècle en France* (1886); *Le recueil des instructions données aux ambassadeurs à Rome* (1888); *Histoire du cardinal de Richelieu* (1893-96); *La France et la royauté avant Richelieu* (1898); and *La Seine et les quais Promenades d'un bibliophile* (1901).

HANOTEAU, á'nó'tó', HECTOR (1823-90). A French landscape painter, born at Decize (Nièvre). He was a pupil of Gigoux, and constantly exhibited at the Salon. His works are characterized by sturdy realism and skillful color. They include "The Village Pond," "The Frogs," and "The Water Lilies," all in the Luxembourg. He also painted portraits. He was awarded medals at the Salons of 1864, 1868, and 1869, a first-class medal at the Paris Exposition of 1889, and the Legion of Honor in 1870.

HAN'OVER, Ger. **HANNOVER**, há-nó'vēr. A former kingdom of Germany, constituting since 1866 the most northwestern province of Prussia (Map: Prussia, C 2). The North Sea and the Elbe River border the region on the north and northeast, the Prussian Province of Saxony and Brunswick on the east, the Prussian provinces of Hesse-Nassau and Westphalia on the south and southwest, and Holland lies on the west. Hanover nearly surrounds the Grand Duchy of Oldenburg. It embraces the old Brunswick-Lüneburg possessions, together with the principalities of Hildesheim, East Friesland, Göttingen, Osnabrück, etc. Area, 14,869 square miles.

GEOGRAPHICAL FEATURES. The general physical character of Hanover is that of an extended alluvial plain with slight undulations—the western continuation of the great low plain of Northern Germany. In the south, however, the country is mountainous, embracing a considerable part of the western Harz (reaching a height of about 3350 feet), together with the lesser heights of the Eichsfeld, and other mountain ranges. The mountains are covered with dense woods. The valleys between the mountains are fertile, with a good clayey loam, and well adapted to agriculture. Beyond the valleys, toward the north, the country is traversed from northwest to southeast by a sandy tract from 50 to 80 miles in width known as the Lüneberger Heide, which is almost wholly unfit for agricultural purposes. Toward the northwest from the mountain region extend elevated levels, characterized by heaths and other dry areas. Great marshes, peat-moors, 'floating-fields,' cover the northwestern and extreme northern districts of the province. These sections have in some parts been successfully drained and fertilized and furnish good pasture, but a large portion is still unreclaimed, and is regarded as one of the least productive parts of Germany. The morass of Bourlange, on the borders of Holland, alone covers 500 square miles. The coast, partaking of the nature of the Holland coast, is low, and requires protection from the overflowing of the 'German Friesland,' the land being in many localities below the level of the sea. Along the banks of the rivers and adjoining the dike-protected coast are very fertile and highly cultivated districts. The principal rivers are the Elbe, which receives several affluents from the southwest; the Weser, on whose affluent, the Leine, is situated the capital, Hanover, and among whose other tributaries are the Aue, the Emmer, and the Aller; the Ems; and the Vechte—all falling into the North Sea. There are only two considerable lakes, the Dümmersee and the Steinhuder Meer.

CLIMATE AND MINERAL RESOURCES. The climate is damp near the ocean, where fogs and heavy winds are frequent; in the south it is drier and colder, being bleak in the Harz in

winter. In the vicinity of the moors fevers are prevalent, and the mortality is high. The mean annual temperature is about 47° F. The mining industry is important, and is carried on mostly in the Harz region. The chief minerals are coal and iron, of which about 650,000 tons each are mined annually. Silver, lead, and copper are also mined, while salt products are prominent. Turf and peat are large and important outputs, being shipped up the streams and canals toward the interior for use as fuel. Some mineral oil is found.

AGRICULTURE. About one-third of the total area of the province is under tillage—farm and garden—a little over one-fifth is under pasture, and nearly one-sixth under forest. According to the census of 1895, there were 345,159 land holdings, with a total area of 7,192,500 acres. Of these, 200,870 holdings covered less than 5 acres each; 66,240, from 5 to 12½ acres each; 55,869, from 12½ to 50 acres each; and 22,180, over 50 acres each. In the drier regions of the country rye is the prominent crop; in the marsh and moor districts, wheat, oats, barley, buckwheat, rape, and potatoes are grown. Cattle-raising is an important industry. For wheat and oats Hanover is one of the leading regions in Germany. In the mountain valleys the farming is intensive, and fruit is the leading product. The sugar-beet industry is rapidly growing; the number of factories was 43 in 1900. Clover, hops, flax, and tobacco are raised. The number of head of stock in the province generally increased about 10 per cent. during the decade from 1890 to 1900, the sheep holdings alone having fallen off.

MANUFACTURES AND COMMERCE. The manufacturing industries are prosperous and growing, especially in the southern part of the province. The industrial census of 1895 gives the number of industrial establishments as 158,756, employing 418,837 persons, or about 16 per cent. of the population. In that number were included 67,058 establishments without any help and 1181 establishments employing 150,487 hands. Among the chief manufactured products are cotton and woolen textiles, machinery, wagons, leather, glassware, cigars and tobacco, paper, chemicals, and spirits. Shipbuilding is a prominent industry. There are several Chambers of Commerce that actively further the interests of manufacturing and agriculture. The commerce is extensive, Hanover ranking among the thirteen leading commercial towns of Prussia. Trade is greatly facilitated by the numerous splendid waterways of the province, as well as by its ample roads and railways, the last exceeding 1500 miles in length and belonging for the most part to the State. The Province of Hanover has about 40 ports, of which six are important shipping centres, including Harburg and Geestmünde. The Hanoverian shipping trade owned in 1900 about 850 boats, which had, however, a light tonnage—56,000.

GOVERNMENT AND INSTRUCTION. For purposes of administration Hanover is divided into the six counties of Hanover, Hildesheim, Lüneburg, Stade, Osnabrück, and Aurich, which are divided into 78 circles. The province is represented by 36 members in the Prussian Chamber of Deputies and by 10 in the Upper House. It sends 19 members to the German Reichstag. In educational matters Hanover holds high rank. Edu-

cation is free, compulsory, and thoroughly diffused. There are over 100 secondary schools and other schools of advanced instruction. There is also the famous university at Göttingen (q.v.). Among the practical schools are the royal mining academy in Clausthal, the building school in Nienburg, and the forestry school in Münden. There are a technical high school (in the capital), five navigation schools, several agricultural institutions, a school for the cultivation of meadows, a veterinary high school, and several unions for the diffusion of practical knowledge, as well as various associations fostering the interests of science, art, history, natural philosophy, engineering, and architecture. There are two large libraries: that of Göttingen University, and the Royal Library in the capital. The Royal Theatre of Hanover holds a creditable rank in Germany.

POPULATION. The population of the province was 2,422,020 in 1890; in 1900, 2,590,336, of whom 2,227,816 were Protestants. The population per square mile was 174.2 in 1900. There were 1784 emigrants in 1900, nearly all to the United States.

HISTORY.

The early history of Hanover is that of Brunswick. In 1235 Otho, the grandson of Henry the Lion, of the famous House of Guelf (Welf) was recognized as Duke of Brunswick by the Emperor Frederick II. On the death of Ernest the Confessor, Duke of Lüneburg, in 1546, his dominions were divided between his sons, Henry, who became the founder of the Brunswick-Wolfenbüttel line, and William, who founded the new line of Brunswick-Lüneburg. (See BRUNSWICK, HOUSE OF.) Several divisions were made among the members of this family, the most important of which occurred in 1635, when George, the son of William, received the principalities of Calenberg and Göttingen, and took up his residence in the city of Hanover. Duke George died in 1641, and was succeeded by his son, Christian Louis, who in 1648 succeeded to the possession of Lüneburg, transferring Calenberg to his brother George William. In 1665 George William in turn secured Lüneburg, and Calenberg fell to the possession of his younger brother John Frederick, who was succeeded by still another brother, Ernest Augustus, in 1679. This prince introduced the law of primogeniture into the succession of the principality in 1683, and in 1692 secured the electoral dignity for his house from the Emperor Leopold I., becoming Elector of Hanover. He married Sophia, the daughter of Elizabeth, wife of the Elector Palatine, Frederick V., and the granddaughter of James I. of England, thus connecting the Hanoverian house with that of England and Scotland. Their son, George Louis, succeeded his father in the Duchy of Calenberg and in the electoral dignity in 1698, and, by marrying his cousin Sophia Dorothea, he united the two duchies of Calenberg and Lüneburg, on the death, in 1705, of George William. In 1714, on the death of Queen Anne, George Louis, Elector of Hanover, ascended the throne of Great Britain as George I. (q.v.), being the nearest Protestant heir, through his mother, the Electress Sophia. With George, a brighter epoch opened for the inhabitants of Hanover, who were relieved from the burden of maintaining the court and dual household, while the revenues of the Crown were thenceforth appropriated solely to

the general purposes of the State. The secularized sees of Bremen and Verden were obtained in 1715 by purchase from Denmark. George II., who succeeded in 1727, participated in the War of the Austrian Succession as an ally of Austria. In the Seven Years' War, however, during which Hanover suffered materially at the hands of the French, who were the allies of Austria, he sided with Prussia. This King founded the University of Göttingen in 1734. The first thirty years of the reign of George III. (q.v.) of England, who succeeded to the Electorate of Hanover on the death of his grandfather in 1760, contributed largely toward the prosperity of the electorate. Like the other States of Northern Germany, Hanover profited by the increased English and American trade, for which the Hanoverian ports and rivers formed the regular channels of communication with the rest of Germany. In 1793-95 Hanoverian troops took part in the wars against the French Republic, but the expense of their maintenance was defrayed by England, and it was not till 1801, when Prussia, refusing to acknowledge the neutrality of Hanover, threw troops into the electorate, that Hanover suffered from the consequences of the anomalous position in which its relations to England placed it with regard to the other States of Germany. The Prussian troops evacuated Hanover in the following year, in accordance with the treaty entered into between France and England. In 1803, when war was renewed between the two powers, Napoleon threw an army, under the command of Mortier, into Hanover, and the result of this measure was to compel the Hanoverian Government to enter into a convention by which it bound itself to abstain from taking part against France during the pending war; to give up fortresses and munitions; to subsidize French troops; and to participate unconditionally in the general costs of the war. In 1807, Napoleon, after having ceded Hanover to Prussia, and again withdrawn it, appropriated a portion of the electorate to complete the newly formed kingdom of Westphalia, which in 1810 received the whole of the Hanoverian territory. Later in 1810 a portion of Hanover was united with France, and divided into the departments of Bouches de l'Elbe, Bouches du Weser, and Leine. After the expulsion of the French, Hanover was handed over to George III., November 4, 1813. The Congress of Vienna raised Hanover to the rank of a kingdom and granted it important territorial additions.

In 1816 the Duke of Cambridge, brother of the Prince Regent of England, became Governor-General of Hanover; and in 1819 a new constitution was granted, providing for two representative chambers. The Government remained largely autocratic, however, and the influence of Count Münster was paramount in Hanoverian affairs. Very little was done toward the improvement of the administration, and when William IV. ascended the throne in 1830, the general disaffection and distrust had risen to the highest pitch. The influence of the July Revolution extended to Hanover, and in 1831 disturbances broke out at Osterode and Göttingen. These were speedily put down, but as the national discontent did not abate, Count Münster was dismissed, and the Duke of Cambridge, who had hitherto acted as Governor-General, was invested with the title of Viceroy, and intrusted with very extensive pow-

ers. The Duke recommended gradual reforms, but as the popular feeling was decidedly in favor of a thoroughly remodeled constitution, the Estates were convoked, and in September, 1833, a new organic instrument was promulgated. The death of William IV., in 1837, placed Hanover under the rule of the next male heir, Ernest Augustus, Duke of Cumberland, son of George III. One of the first measures of the new King was to abrogate the Constitution of 1833, to which he had from the time of its adoption refused his assent, and to restore that of 1819. In consequence of their refusal to take the oath of allegiance required from all persons holding office under the State, seven of the professors at Göttingen, among them Dahlmann, Ewald, Gerwinus, and the brothers Grimm, were expelled from the university. In 1840 a new constitution was promulgated; but its limited concessions failed to satisfy the demands for a thoroughly constitutional government. From this period till 1848, when the success of the French Revolution compelled the German rulers to adopt a more liberal policy toward their subjects, the King showed himself resolutely averse to reform, though the Hanoverian people themselves were strongly in favor of the Constitution of 1833. Only the danger of a revolution in 1848 forced the King to grant a constitution more liberal in nature than even that of 1833. The danger once over, however, he reverted to his former policy and dismissed his liberal Ministry. A revolution was prevented by his death in 1851. Ernest Augustus was succeeded by his son George V., who, though blind, was active and energetic. He cherished high ideas of the royal power and favored the claims of the aristocracy. The early measures of the new King were not calculated to allay the fears entertained of his policy; but the decisive declaration of the Chambers that they were desirous of seeing the reforms completed which had been begun by the late King, and their expression of want of confidence in the new Cabinet, prevented any marked retrogressive movement on the part of the Ministry. In 1854 Hanover joined the German Zollverein. In 1855 the Constitution underwent various modifications in accordance with the demands of the federal Diet, by which it was made to approximate more closely to that granted by Ernest Augustus in 1840. Although the changes were unpopular, they met with no energetic opposition. In the war of 1866 Hanover threw in her lot with Austria, and in June the kingdom was occupied by Prussian troops, and on the 28th of that month the Hanoverian army was forced to capitulate. By the Peace of Prague the incorporation of Hanover with Prussia was recognized. Both George V., who died in 1878, and his son, Ernest Augustus, Duke of Cumberland (q.v.), refused to acknowledge the act of annexation, and went into exile. On this account, their private estates in Hanover were sequestrated by Prussia, the proceeds being denominated the Guelph Fund (q.v.). The Hanoverian Deputies kept up a constant protest in the Reichstag against the annexation, but finally, in 1892, Ernest Augustus renounced any intention of intriguing against Prussia, and the income of the Guelph Fund was handed over to him.

HANOVER. The capital of the Prussian Province of Hanover (q.v.), formerly the capital of the Hanoverian kingdom, situated in a low, level region, on both sides of the Leine, which here becomes navigable, in latitude 52° 22' N., and longitude 9° 45' E. (Map: Prussia, C 2). Its area is over 16 square miles. The mean annual temperature is 48.5° F.—January 34.2°, July 65.4°; average rainfall 22.61 inches.

Hanover is composed of the Altstadt (old town), the Aegidien-Neustadt, the Calenberger-Neustadt (dating from the thirteenth century), inclosed by the Leine and its little tributary the Ihme, and a number of suburbs. The town of Linden lies beyond the Ihme. Fifteen river bridges facilitate the communication between the various sections of the city. The environs abound with spacious parks and promenades which ennoble the city and justify its fame for dignified beauty. The Eilenriede—the city forest (about 1650 acres)—adjoins the town on the east, and contains the zoölogical gardens. The magnificent wide Lindenallee, about one and one-half miles long, is celebrated, as well as the Grosse Garten, laid out by Le Nötre and richly adorned with statues, etc. The Herrenhausen Castle, with its parks, its great fountain, and its rare collection of palms, is visited by all tourists, as is also the fine adjacent mausoleum containing monuments to Ernest Augustus and his Queen, by Rauch. In the oldest portion of Hanover are found many houses dating from the fifteenth and sixteenth centuries, with stucco facades. The newer parts of the city are generally modern in appearance, being handsomely built of stone and brick, and profusely adorned with monuments, fountains, etc. Among the conspicuous recent edifices are the magnificent municipal buildings, such as the railway station and the new Rathaus. The most venerable church in Hanover is the fourteenth-century brick Marktkirche, situated in the centre of the old town. It has a tower 300 feet high, and contains some fine stained glass and a carved altar. The Gothic Aegidienkirche, dating also from the fourteenth century, with a Renaissance tower, the modern Christuskirche with its fine stained glass, the Roman Catholic Marienkirche, and the old Nikolaikapelle, are the other noteworthy ecclesiastical edifices. In the churchyard of the Gartenkirche lies buried Goethe's famous Lotte (Charlotte Kestner), whose family has long been identified with Hanover.

Among the secular buildings the most prominent are the Royal Palace, originally constructed in the seventeenth century, and rebuilt in 1817, with its majestic colonnade, its fine chapel con-

taining a beautiful altarpiece by Cranach, and interesting frescoes; two other royal palaces associated with the history of the reigning families of Hanover and England, among them the old palace of George V., which was the favorite palace of George I. and George II. of England, and now used as a town hall; the splendid old late-Gothic Rathaus, built in 1439-55 and recently restored, with a frescoed Ratskeller by Schaper, and a bronze Gothic fountain in front; the Royal Theatre, completed in 1853, with an attractive façade decorated with statues of famous dramatists and composers, and, in the foreground, a statue of Marschner, formerly conductor of the Hanoverian Royal Orchestra; the provincial museum; the Kestner museum; and the barracks, situated on the Waterlooplatz. This square is adorned by the Waterloo Column, surmounted by a figure of Victory, erected in 1826-32 in honor of the Hanoverians who fell at La Haye Sainte. Among the numerous monuments in the city are the fine bronze equestrian statues of King Ernest Augustus, by A. Wolff; the imposing war monument (one of the best in Germany) by Voltz, dating from 1884, with symbolic figures of Germania and Hanover; and Dopmeyers's famous artistic "Goose-girl fountain." Another object of interest is Leibnitz's house, recently restored by Haupt.

The city is a well-known educational centre, and a favorite place of residence for foreign families, who are attracted not only by the pleasant and quiet charm of the capital, but by the purity of the German spoken there. The educational establishments comprise a school of technology (one of the four in Prussia), having various interesting collections, and an attendance of nearly 1500; a veterinary high school (one of the two in Prussia), founded by George III. of England in 1778; several seminaries for teachers; a decorative art high school; and a number of lyceums and military and industrial schools. The Royal Library contains over 200,000 volumes and 3500 manuscripts. The municipal library is also rich in manuscripts. The new provincial museum has among its various treasures an important collection of pre-Christian antiquities, two picture-galleries of minor interest, including both ancient and modern canvases, and some statuary by Canova and Rauch. The Kestner Museum contains Egyptian and Roman antiquities, old manuscripts and incunabula, the famous Eulemann collection, paintings, miniatures, etc. The Royal Theatre, with seats for 1800, is one of the leading theatres of Germany of the second rank. There are two good private theatres. The city has a celebrated military riding-school, and numerous scientific, historical, art, and art-industrial organizations, as well as important hospitals and charity homes.

The city, as the capital of the Province of Hanover, is the seat of the Presidency and the higher courts. The administration of the city is in the hands of a director, a syndic, an executive board of fifteen senators or magistrates, and a municipal council of 24 members. The city is lighted by electricity, has an electric street railway, good water-works, and owns a market and a slaughter-house. Its budget for 1901-02 nearly balanced at about \$2,100,000.

The industrial importance of the city has been greatly increased in late years by reason of the

improvement in its railway connections. It is now a railway and a manufacturing centre. Among the larger industrial establishments are an oilcloth factory, a railway repair-shop, a number of machine-shops, iron foundries, iron-bridge works, piano-factories, and chemical works. There are also produced lacquer ware, books, lamps, liquors, and asphalt. Leather is an important output. The trade, which is of considerable magnitude, is actively promoted by a number of prominent commercial, agricultural, and manufacturing associations, banks, and other institutions of credit. The city is the seat of the leading industrial provincial organizations. The population of Hanover proper was 163,593 in 1890, and 235,649 in 1900—an increase of 12 per cent. It is the tenth city in size in Germany and the fifth in Prussia. The population of greater Hanover (including several adjacent towns not officially incorporated, but closely allied with the city) was 302,054 in 1900. Nearly all the population is Protestant. Consult: Hoppe, *Geschichte der Stadt Hannover* (Hanover, 1845); Hartmann, *Geschichte der Residenzstadt Hannover* (Hildesheim, 1886) Hirschfeld, *Hannover's Grossindustrie und Grosshandel* (Leipzig, 1891).

HISTORY. Hanover originally was a little fishing town, and nothing is known of it worth recording until 1203, at which time Henry, the son of Henry the Lion, Duke of Saxony, received it with his share of lands left by his father. He soon handed it over to his nephew Otho, the founder of the House of Brunswick. From Duke Otho, Hanover received in 1241 a municipal charter, and soon after it joined the Hansatic League, in which, however, it played only a minor rôle. Its importance rose after 1636, when it became the residence of one line of Brunswick dukes. (See HANOVER, Province.) In 1714, however, the Elector of Hanover became King of England, and until 1837 the city was a monotonous provincial town. Upon the death of William IV. of England, Ernest Augustus, Duke of Cumberland, the new King of Hanover, took up his residence here. In 1866 the Kingdom of Hanover was annexed to Prussia, and since then the city has been the capital of the Prussian province of the same name. Hanover has grown rapidly in recent years, and is more prosperous under Prussian rule than it ever was as the capital of an independent kingdom.

HANOVER. A town in Grafton County, N. H., 55 miles northwest of Concord, on the Connecticut River, opposite Norwich, Vt., with which it is connected by a bridge (Map: New Hampshire, F 7). It is the seat of Dartmouth College (q.v.), and has the Mary Hitchcock Memorial Hospital. There are minor manufactures, but the town is interested mainly in agriculture, dairying, and lumbering. Population, in 1890, 1817; in 1900, 1884.

HANOVER. A borough in York County, Pa., 42 miles north by west from Baltimore, Md., on the Pennsylvania and the Western Maryland railroads (Map: Pennsylvania, E 4). It is in a productive agricultural region which also has iron-ore deposits, and is of considerable commercial and industrial importance, its manufactures including cigars, gloves, shoes, machine-shop products, and carriages. Settled about 1730, Hanover was incorporated in 1813. It is gov-

erned by a Burgess, elected triennially, and a borough council. Population, in 1890, 3746; in 1900, 5302.

HANOVER COLLEGE. An educational institution situated at Hanover, Ind.; chartered as an academy in 1828, and as a college in 1833. It is under Presbyterian control, and since 1880 has admitted women. The number of students was, in 1902, 100 in the academic department, and 50 in the preparatory and musical departments. At the same time the college had a library of 17,000 volumes, an endowment of \$200,000, grounds and buildings valued at \$175,000, and an annual income of \$14,000. No tuition fee is charged. The college provides a course for teachers and offers degrees in arts, science, letters, philosophy, divinity, and law.

HANOVER COURTHOUSE, BATTLE OF. An engagement fought at Hanover Courthouse, 17 miles north of Richmond, Va., on May 27, 1862, between a part of the Federal Army of the Potomac under General Fitz-John Porter and a Confederate brigade under General Branch, the latter, after offering a stubborn resistance, being driven from the field. The Federals lost 355 in killed, wounded, and missing; the Confederates 265.

HANOVER SQUARE. A London square, laid out in 1731. Near it stands Saint George's Church, the scene of the most fashionable London weddings.

HANSA, THE. See HANSEATIC LEAGUE.

HAN'SARD. A well-known name in connection with the printing of the British Parliamentary records. The first of the family was Luke Hansard, who was born in 1752 at Norwich, and coming to London, worked for some years as compositor in the office of Hughes, the printer to the House of Commons, and in 1800 succeeded Hughes as sole proprietor of the business, which is still carried on by his family. Competition and other causes have led to a division of the Parliamentary printing, but the Messrs. Hansard still print the bills before Parliament, the reports of committees, and some of the accounts.

The name of Hansard is connected with an important question of Parliamentary privilege. The case was briefly as follows: A bookseller named Stockdale brought an action for libel against the Hansards, the libel consisting of statements in the Parliamentary reports which the latter had printed, and Lord Chief Justice Denman decided in favor of Stockdale. This decision seemed to violate the clause in the Bill of Rights that "debates and proceedings in Parliament ought not to be impeached or questioned in any court or place out of Parliament." A committee of the Commons reported that Parliament, and each House, had a right to authorize the publication of such matter as it believed to be for the public good, and further that to call this right in question was contrary to law and a breach of privilege of the House. The right to publish must necessarily carry with it the right to protect the publishers. So the struggle began, and, before it ended, the Sheriff who served the decrees of the courts, the attorneys of Stockdale, as well as Stockdale himself, and many others, were imprisoned by the authority of the Commons. On the other hand, the property of the Hansards was seized under the decrees of the

court. After three years of strife and debate Parliament ended the anomaly of a conflict between the two departments of Government, and also did away with the antiquated methods of Parliamentary redress, by enacting a law that any proceedings against persons for publication of papers printed by order of either House of Parliament are to be stayed by the courts of law, upon delivery of a certificate and affidavit that such publication is by order of either House.

The Hansards are, however, most widely known by the reports of the debates in Parliament, which are published by them and bear their name. The accuracy of these reports is rarely questioned. They are not, however, prepared by shorthand reporters employed by the Hansards, but are compiled from the reports in the London newspapers, and then submitted to the speakers for correction. The speeches as they appear in Hansard are not, therefore, in all cases the spoken words, but frequently are the product of the closet, the reviser inserting in many cases what he intended to say, or wished he had said, and omitting the heated passages which he regretted to have uttered. Cobbett's—often called Hansard's—*Parliamentary History* (1066-1803) in 36 volumes furnishes the most complete available record of its proceedings during these centuries. Since 1803 the Hansards have published the debates of Parliament in four series: (1) 1803-20, in 41 volumes; (2) 1820-30, in 25 volumes—an index of the whole forming an extra volume; (3) 1830-91, in 356 volumes; (4) the present series: begun in 1892, by 1900 76 volumes had been published. The executive Government takes a certain number of copies of *Hansard* for distribution among the public offices and departments. Many peers and members of Parliament, foreign governments, and public libraries, also subscribe to this work, which is issued at a certain fixed price, which the Messrs. Hansard guarantee, at the commencement of each session, shall not be exceeded.

HANSCH, hânsh, ANTON (1813-76). An Austrian painter, born in Vienna. He was a pupil of Mössmer at the Academy of Vienna, and afterwards traveled and studied in Germany, Belgium, Switzerland, and Italy. His works consist of landscapes remarkable for composition and careful detail. Notable pictures are: "Region Bordering on the Königsee" (1849); "The Jungfrau in Switzerland" (1853); "Under the Linden Trees on the Shore of Chiem Lake" (1858), all in the Vienna Museum; "The Lake of Constance," "Firwood in the Salzkammergut" (Vienna Academy); "From the Wilderness of Styria," "At Bernina Pass," "After the Storm," and "The Wetterhorn."

HANSEATIC LEAGUE, or **HANSA**, THE (from OHG. *hansa* [*hansc*], Goth. *hansa*, AS. *hôs*, league). A union established in the thirteenth century by some of the cities of Northern Germany for their mutual safety and for the protection of their trade. This union grew out of associations of German merchants organized abroad. In order to travel and trade with greater security, these had long been accustomed to band themselves together into companies; and through such associations had secured privileges in certain cities, notably in London, Novgorod, Bergen, in Norway, Bruges, and Wisby, in Gothland, off the coast of Sweden. In London the mer-

chants of Cologne had obtained a letter of protection as early as 1157, and other German merchants who resorted to London joined the Cologne Hanse. When Lübeck, in the thirteenth century, began to threaten the supremacy of Cologne, the merchants of the latter city endeavored to exclude the men of Lübeck from trading in England. Possibly this opposition was influential in causing Lübeck to seek allies to strengthen its position. Between 1241 and 1255 she entered into a treaty with Hamburg for the mutual protection of the commercial highway between the two cities. This alliance, which is often regarded as the origin of the Hanseatic League, resulted in putting the control of commerce in the Baltic and the North Seas into the hands of the merchants of Hamburg and Lübeck. In 1259 Lübeck, Rostock, and Wismar formed an alliance against pirates on the sea and robbers on land. In 1267 the merchants of Lübeck were allowed to form a separate hanse in London. In 1284-85 the five Wendish cities of Lübeck, Wismar, Rostock, Stralsund, and Greifswald waged war against King Eric of Denmark, and secured from him certain privileges. Before the end of the thirteenth century Cologne had been forced to take a subordinate position, and Lübeck was the recognized leader.

In the thirteenth century there were several instances of alliances formed between different groups of cities. These allied cities gradually found it advantageous to join the Lübeck union, which was constantly becoming more powerful. In 1343 it was officially designated as The Hansa. In 1362 the allies began a war against Waldemar IV. of Denmark, who had attacked Wisby in 1361, and in 1370 Denmark was compelled to conclude a treaty with the 'seventy-seven hansen,' in which the latter were guaranteed freedom to trade and an indemnity for the losses which they had suffered. In addition, it was agreed that no one in the future should receive the Danish crown without the advice of the cities and without the confirmation of the privileges of the Hanseatic League.

The entire League, which at one period embraced at least eighty-five towns, and included every city of importance between the Netherlands and Livonia, was divided at first into three, and later into four, classes or circles: (1) The Wendic cities of the Baltic; (2) the towns of Westphalia, the Rhineland, and the Netherlands; (3) those of Saxony and Brandenburg; (4) those of Prussia and Livonia. The capitals of the respective circles were Lübeck, Cologne, Brunswick, and Danzig.

The professed object of the League was to protect the commerce of its members by land and by sea, to defend and extend its commercial relations with and among foreigners, to exclude as far as possible all other competitors in trade, and firmly to maintain, and, if possible, to extend, all the rights and immunities that had been granted by various rulers to the corporations. For the promotion of these ends, the League kept ships and armed men in its pay, the charge of whose maintenance was defrayed by a system of taxation and by the funds obtained from the money fines which the Diet levied for infringements of its laws. In its factory at Bergen, in Norway, only unmarried clerks and serving men were employed, and an almost monastic discipline was enforced; but the by-laws of the

League prescribed a system of daily sports and light occupations for the recreation of the men, while judicious regulations for their comfort and cleanliness, and for the celebration of festivals at certain fixed times of the year, bear evidence of the sound sense that influenced the mode of government of the Hansa. This was further shown by the injunction to the masters of its factory to avoid everything that could hurt the prejudices of the foreigners among whom they were placed, and to conform in all things lawful to the habits of the country. At the Steelyard in London, where a German hanse was established as early as 1250, the regulations were similar in their severity to those of Bergen, and probably the customs at other factories were not far different.

For many years the Hanseatic League was the undisputed mistress of the Baltic Sea and the German Ocean. It created new centres of trade and civilization in numerous parts of Northern Europe, and contributed to the expansion of agriculture and of the industrial arts by the construction of canals and roads. It carried on trade with every European country. The greatest powers dreaded its hostility and sought its alliance, and many of the powerful sovereigns of the Middle Ages were indebted to it for most substantial benefits.

The League reached its culminating point in the fifteenth century. Its decline was rapid. In proportion as the seas and roads were better protected by the States which now arose in Europe with the passing of the old feudal anarchy, and as rulers learned to comprehend the true commercial interests of their dominions, the power of the Hansa declined. The discovery of America and of the new sea route to India gave an entirely different direction to the trade of Europe. The Hansa had, moreover, arrogated to itself, in the course of time, the right of imposing the greater and lesser ban, and of exercising other acts of sovereignty which were incompatible with the supremacy of the rulers in whose States they were enforced. Hence the League was necessarily brought into frequent hostile collision with the local authorities. In accordance with their narrow commercial policy, the Hansards refused to grant to merchants trading in foreign parts the same privileges in the Hanseatic cities which they themselves had enjoyed for centuries in England, Russia, and Scandinavia, and hence arose dissensions, which not unfrequently ended in a fierce maritime warfare. By way of retaliation for the pertinacity with which the League refused to grant to the English the same immunities which had been accorded to traders of other nations, the English Parliament required that Germans should pay the tax on wool and wine which was exacted from all other foreigners in the English markets; and although the Hansards strongly resisted, they were at length condemned by the courts, in 1469, to pay a fine of £13,500. They would probably have lost all they possessed in England if their cause had not been advocated by Edward IV., who had more than once been indebted to them for money and aid, and who in 1474 secured for them, by a clause in the Treaty of Utrecht, a restitution of nearly all their former rights in England. In 1598 their obstinacy in insisting upon the maintenance of their old prerogatives, notwithstanding the altered condition of the

times, drew upon them the anger of Queen Elizabeth, who dispatched a fleet under Drake and Norris to seize upon the ships of the Hansa, sixty-one of which were captured. At the same time she banished the Hansards from their factory in London. These measures had the desired effect of compelling the League to receive English traders on equal conditions, and thenceforward the Hansards were permitted to occupy the Steelyard, as before. The Hansa had, however, outlived its usefulness, and at the Diet held at Lübeck, in 1630, the majority of the cities formally renounced their alliance. Hamburg, Lübeck, Bremen, and for a short time Danzig, remained faithful to their ancient compact, and continued to form an association of free republics, which existed unchanged until 1810, when the first three were incorporated in the French Empire. In 1815 they became members of the German Confederation. By a convention concluded in July, 1870, the powers and privileges of the three free towns were reestablished and reorganized, and under the new German Empire they still retain their self-government. Consult: Sartorius, *Geschichte des hanseatischen Bundes* (Göttingen, 1802-08); Barthold, *Geschichte der deutschen Hansa* (Leipzig, 1854); *Hansische Geschichtsblätter* (Leipzig, 1871 et seq.); *Hansische Rezesse* (21 vols., Leipzig, 1873-99); Lindner, *Die deutsche Hansa* (Leipzig, 1901); Helen Zimmern, *The Hansa Towns* (New York, 1889).

HANSEMANN, hän'se-mán, DAVID JUSTUS LUDWIG (1790-1864). A German publicist and statesman, born at Pinkenwerder, near Hamburg. He set up as a wool-dealer at Aix-la-Chapelle in 1817, and after having attained considerable reputation in commerce and through railway construction, was elected a Deputy in the Provincial Diet of Rhenish Prussia in 1845. In 1847 he was elected a member of the United Diet, in which he became conspicuous as a leader of the Liberal Opposition, and in 1848 he was for a brief period Prussian Minister of Finance. He was the founder of the Diskontogesellschaft of Berlin, one of the most important financial institutions of Germany. His published works deal with economic and political topics of his time, and include: *Preussens wichtigste Eisenbahnfrage* (1837), and *Das preussische und deutsche Verfassungswerk* (1850).

HANSEN, hän'sen, GERHARD HENRIK ARMAUER (1841—). A Norwegian physician, born at Bergen. He is known chiefly as the discoverer of the bacillus of leprosy. He received his early education in the cathedral schools of his native city, and on the completion of his medical studies became resident physician in the Rigshospital of Christiania. Later he spent some time as medical officer at the great Lofoten fisheries. In 1868 he was made assistant medical officer to the Bergen Leper Hospital, of which Danielssen was director. It was under the influence of this teacher that Hansen began his lifelong study of leprosy. Hansen's first investigation was to work out the significance of the 'leper cells' of Virchow. After more study in various universities, he returned to Norway to resume his investigations of leprosy. His researches pointed to the contagious and specific nature of the disease, and in recognition of the value of his work the Medical Society of Christiania voted a sum of money to enable him to continue his studies.

In his journeys about the country he came across instances of the disease which were explainable only by the theory of contagion. The conclusions at which he thus arrived conformed with those of Drogmat-Landr , who had studied leprosy in Surinam, and who had published his views in 1869. Hansen's further labors were rewarded by the discovery of a bacillus in unstained preparations. Later the micro-organism was stained, and became known as Hansen's bacillus. This was in 1873. Subsequently Hansen for years tried to cultivate and inoculate the leprosy bacillus, but his efforts were unsuccessful. Nevertheless, legislation called forth by Hansen's proof of the contagious nature of leprosy has effected a marked diminution of the disease throughout Norway.

HANSEN, HANS CHRISTIAN PETER (1840—). A Danish critic, born at Copenhagen. Noted as a journalist and critic, he became editor of *N r og Fjern* (1872-80), a high-class newspaper, afterwards called *Illustreret Tidende*, which he also edited from 1880 to 1884. He made a Danish rendering of Goethe's *Faust* (1881-89), and his original publications include: A romance, *Kristian K benhavnner* (1882); an illustrated history of Danish literature, *Illustreret dansk Literaturhistorie* (1886); and a history of the Danish theatre, begun in 1889.

HANSEN, MAURITS CHRISTOPHER (1794-1842). A Norwegian poet and novelist, born at Modum. He was a teacher, and prepared numerous text-books, but is best known by his novels. They were the first accurately to describe the life and surroundings of the small towns of his own country, and were very popular. They include: *Luren*; *Den gale Christian*; and *Bjergmanden*. After his death a collection of them was made by Schwach (8 vols., Christiania, 1855-58). A further selection, *Noveller i Udvalg*, was printed at Christiania in 1882. Hansen also wrote a volume of poems, *Digtninger* (1816).

HANSEN, PETER ANDREAS (1795-1874). A German astronomer, born in Schleswig. He was employed by Schumacher, director of the Altona observatory, to assist in the measurement of an arc of the meridian in Holstein. In 1825 he succeeded Encke as director of the observatory of Seeberg, near Gotha, where he remained for the rest of his life. He devoted his attention chiefly to the lunar theory, and his *Tables de la Lune* (1857) were so excellent that they were awarded a prize of  1000 by the British Government, and were published at its expense. The tables have been adopted for use in the calculations of the various astronomical ephemerides and nautical almanacs. Hansen was also the author of a large number of papers relating to the determination of the orbits of comets and planets. Hansen was a foreign member of the Royal Society of England, and an associate of the English Royal Astronomical Society, and was on two occasions awarded their gold medal for his research work in astronomy and his lunar tables. He will rank for all time as one of the first mathematical astronomers of the nineteenth century.

HANSEN, THEOPHILUS VON (1813-91). An Austrian architect, born in Copenhagen. He studied in the Copenhagen Academy, and for further training traveled extensively in Italy and Greece. At Athens he practiced his profes-

sion to some extent, until the Revolution of 1843 compelled him to withdraw to Vienna, where he was appointed superior councillor of architecture in 1869, and was for several years professor of architecture in the Academy of Fine Arts. He was an exponent of the classic Greek style, and executed numerous works at Vienna, including the Greek Church, the restored fa ade of the Sina Palace, the Academy of Fine Arts, the Bourse, and the Epstein Palace. Niemann and Feldegg published *Theophilus Hansen und seine Werke* in an edition de luxe at Vienna, in 1893.

HANSE TOWNS, LAWS OF THE; also known as the HANSEATIC CODE. A code of maritime law, ordained for the regulation of commerce by the towns comprised in the Hanseatic League. It was established about the end of the sixteenth century, and enjoyed great authority until superseded nearly a century later by the *Guidon de la Mer* and the *Ordonnance de la Marine* of Louis XIV. It was first published in German in 1597, and in 1614 was revised and enlarged by a congress of delegates from the several towns of the League, which was held at L beck. It has been translated into Latin (by Kuricke) and French (by Cleirac, in *Us et Coutumes de la Mer* (Paris, 1647)).

HANSLICK, H NS'LICK, EDUARD (1825—). An Austrian musical critic and author. He was born at Prague, and prepared himself for the bar, studying law at Prague and Vienna. In 1849 he received his degree of doctor of law, and entered the Government service; but the attraction which music had for him gradually drew him into the career he subsequently followed. His studies under Tomaschek at Prague, and later his experiences as musical critic of the *Wiener Zeitung* (1848-49), increased his interest in music. His most prominent characteristic was an uncompromising antagonism to exaggerated and foolishly sentimental criticism in music, and his celebrated work, *Vom Musikalisch-Sch nen: ein Beitrag zur Revision der Aesthetik der Tonkunst* (1854; 10th ed. 1902), is particularly severe. He was one of Wagner's most bitter opponents, and one of the last of the critics to recognize the possibilities in the new style of opera. His position with regard to the emotional content of music is, that music is incapable of conveying any meaning other than the one inherent in the tonal sequence. Few men of his day and generation have exercised a more healthy or restraining influence on musical criticism and the treatment of so-called programme music than Hanslick. It has been charged that he was unsympathetic, and that his legal training precluded a true conception of the real content of music. He was for many years musical editor of the *Neue Freie Presse*, and has been since 1861 professor in Vienna University, in the department of musical history and aesthetics. He is the author of many valuable treatises and works connected with his life work, among them being: *Geschichte des Konzertwesens in Wien* (1869-70); *Die modern Oper* (1875-1900); and *Konzerte, Komponisten und Virtuosen der letzten f nfzehn Jahre* (1896). His autobiography, *Aus meinem Leben*, appeared in 1894.

HAN'SOM, JOSEPH ALOYSIUS (1803-82). An English architect and inventor. He was born at York, and began to practice his profession as an

architect at Halifax in 1825. He designed and built the Birmingham Town Hall, which he completed in 1833; but he became bankrupt under the terms of his suretyship for the builders. In 1831 Hansom patented a safety cab. The modern vehicle which bears his name differs materially from the original one. After 1842 he resumed his work as an architect, ecclesiastical and domestic, chiefly for the Roman Catholic Church, to which he belonged. Among the best known of the buildings designed and erected by him are Saint Walburge's Church, Preston, Lancashire; the cathedral at Plymouth; the Church of Our Lady and Saint Philip Neri at Arundel; the Jesuit church at Manchester; the Church of Saint François de Sales, near Boulogne; and Saint Asaph College.

HANSOM CAB. A light two-wheeled, one-horse, covered carriage, with the driver's seat elevated behind. It received its name from the inventor. See CARRIAGE.

HAN'SON, ALEXANDER CONTEE (1786-1819). An American editor and politician, born in Maryland, and educated at Saint John's College, Annapolis. As editor of the *Federal Republican*, of Baltimore, he published an article in 1812 attacking the Madison Administration with such bitterness that a mob, by way of reprisal, wrecked his office. A subsequent attempt to continue publication led to renewed violence, and he and a number of friends and supporters were removed to the local jail for safety. The populace, however, made its way into the jail, wounded Hanson and others, and killed General Lingan. From 1813 to 1817 Hanson was a Federalist member of the National House of Representatives, and from 1817 until his death was in the Senate.

HANSON, LEVETT (1754-1814). An English author, born in Melton, Yorkshire. He was a lifelong friend of Admiral Nelson, with whom he went to school at Walsham, Norfolk. Hanson studied at Cambridge, but went abroad when twenty-two years old, and spent the remainder of his life there, with but occasional visits to England. He was the recipient of many foreign orders and honors, while his experience in European courts gave him opportunity to collect material for his book, *An Accurate Historical Account of All the Orders of Knighthood at Present Existing in Europe* (1803). This was dedicated to Nelson, and his *Miscellaneous Compositions in Verse* (1811) to another friend, Warren Hastings.

HANSTEEN, HÄN'STÄN, CHRISTOPHER (1784-1873). A Norwegian astronomer, born at Christiania. At first intended for the legal profession, he subsequently devoted himself entirely to the study of mathematical science. In 1814 he was appointed to the chair of mathematics in the University of Christiania, and there, in 1819, published his celebrated work on magnetism, which was afterwards translated into German under the title *Untersuchungen über den Magnetismus der Erde*, and produced a great sensation, especially in England. He made an extensive journey to Siberia, for the purpose of making magnetic observations, in the years 1828 to 1830, and returned to Europe with a large collection of facts, which were of much service in aiding to dispel the obscurity which enveloped this subject. On his return to Christiania he

prevailed upon the Government to erect an observatory, fitted also for magnetic observations. Besides occupying his chair in the university, Hansteen was professor of mathematics in the school of artillery, superintended the triangulation of Norway, and helped in the reorganization of the national system of weights and measures. He published lectures on astronomy, a work on mechanics, another on geometry, several scientific memoirs, and was one of the editors of the *Magazin for Naturvidenskaberne*.

HANSWURST, HÄNS'VÖRST (Ger., Hans Sausage). The conventional buffoon in old German comedy. The name first appears in 1519, and is used by Luther in his *Wider Hanns Worst* in 1541, and as the name of a peasant in a play of 1553, but first occurs in 1573 as the title of a character in comedy. The character received its conventional form and garb at Vienna, about the beginning of the eighteenth century, when Joseph Stranitzky represented it as a simple countryman of Salzburg. A bitter fight was waged against the existence of Hanswurst on the German stage, and he was defended by Lessing in his *Hamburgische Dramaturgie*.

HANTS. A colloquial name for the English county of Hampshire (q.v.).

HANUMAN, HÄ'NŪMĀN. The sacred monkey of India, representing the god Hanuman (q.v.). See LANGUR; MONKEY; and PLATE OF MONKEYS OF THE OLD WORLD.

HANUMĀN, or HANŪMĀN. A famous monkey chief in Hindu mythology and the legends of the epic period of India, and still a favorite divinity in Hindustan. He is represented in the Sanskrit epic *Rāmāyana* (q.v.) as the special ally and friend of Rāma, and as leading the monkey hosts that helped this hero to recover his wife Sītā, who had been carried off by the demon Rāvana. The exploits of Hanumān play an important part in the account of this expedition and the great war which followed. On one occasion Hanumān bridged over the passage between India and Ceylon with enormous rocks, which he and his monkey followers threw into the sea. Adam's Bridge in the straits between the island and the mainland is still pointed out, according to tradition, as the remains of those boulders. Many other stories and curious legends regarding him are told in the *Rāmāyana*. His birth was semi-divine. His mother was a celestial nymph that had been cursed to assume a simian shape; his father was the god of the wind. Hence Hanumān is sometimes called Māruti, a child of the wind. His large face or monkey jaw is likewise accounted for in a legendary manner. The god Indra, angered at his youthful prowess, tried to slay him by the thunderbolt, but was able only to fell him and break his jaw. From this circumstance he received the name Hanumān, 'he of the (broken) jaw.' The monkey features, or mask-like face of this deified ape, whose idols are easily recognized by the prodigious tail, are familiar enough in India, and episodes taken from his history are found represented in sculpture or in painting almost everywhere in Hindustan. According to the *Rāmāyana*, he was an astute grammarian, and skilled in many branches of learning. His prowess is also recounted in the *Mahābhārata*, and a Sanskrit drama, the *Hanumān-nāṭaka*, celebrates his deeds in fourteen acts. It is not unlikely that

underneath the curious and uncouth figure of Hanumān and his monkey hosts we may recognize some representatives of the earlier and ruder civilization of lower India that may have joined forces with the invading Aryan civilization. The reverential regard paid to monkeys around the Hindu temples may, in a way, be associated also with Hanumān. Consult: Dowson, *Hindu Mythology* (London, 1879); Wilson, *Hindu Mythology* (London, 1900). See DRAVIDIANS; KOLARIANS; RĀMĀYANA. For illustration see Plate of Hindu Deities in the article INDIAN MYTHOLOGY.

HAN'US, PAUL HENRY (1855—). An American educator, born at Hermsdorf unter'm Kynast, Silesia, Prussia. He was educated at the Wisconsin State Normal School (Platteville), and the University of Michigan, became a teacher, and in 1891 was appointed assistant professor of education at Harvard University. His publications include: *Elements of Determinants* (1886); *Geometry in the Grammar School* (1894); and *Educational Aims and Educational Values* (1899).

HAN'WAY, JONAS (1712-86). An English traveler and philanthropist, born at Portsmouth. On the death of his father the family moved to London, and in 1719 Hanway was apprenticed to a merchant in Lisbon. In 1743 he became interested in trade with the East, and journeyed through Persia, experiencing many hardships. After his return from Persia he spent five years in Saint Petersburg, at the end of which period he received a large bequest which enabled him to retire from business. He returned to London in 1750, where, excepting for two trips abroad, he spent the remainder of his life, devoting himself to philanthropy and literature. In 1756 he was one of the founders of the Marine Society, organized to train seamen for the navy, and two years later became a governor of the Foundling Hospital, where he was active as an opponent of indiscriminate relief. In 1758 he helped to found Magdalen Hospital for Fallen Women. Hanway was almost constantly employed in the promotion of important reforms, such as the protection of the infant parish poor and of child chimney-sweeps, the solitary confinement of prisoners, and the establishment of Sunday schools. He was, however, a man of many harmless eccentricities, of which his antipathy to tea-drinking was one of the most amusing, and his attack on the habit had the unique honor of drawing a reply from Samuel Johnson. It is said that he introduced the use of the umbrella in London, after thirty years of ridicule. As a writer Hanway was most prolific. Seventy-four books and pamphlets by him are enumerated, of which only one, his *Historical Account of the British Trade Over the Caspian Sea* (4 vols., 1753), which contains an account of his travels, is of any lasting value. The most of his writings were occasional in character, and were concerned largely with the reform movements in which he was interested. He also wrote several theological works, and *Common Sense: Nine Dialogues on the American War* (1775). As a reward for his public services, Hanway was appointed one of the commissioners for victualing the navy in 1762—an office which he held until obliged to resign, on account of ill health, in 1783. Consult Pugh, *Remarkable Occurrences in the Life of Jonas Hanway* (London, 1787).

HAN'WELL. A town in Middlesex, England, 10 miles west of Saint Paul's, London. It is the seat of the Middlesex County Lunatic Asylum (Map: England, E 4). It has a progressive municipality, owns a sewage farm and recreation grounds, and maintains an isolation hospital. Population, in 1891, 6100; in 1901, 10,400.

HAN-YANG, hān'yāng'. A departmental city of China, situated on the left bank of the Yang-tse, at the point where it receives the waters of the river Han, which separates it from Hankow. Its most conspicuous feature is Ta-pieh Shan, a precipitous hill crowned with ruined fortifications, from which a fine view of the surrounding country can be obtained. Commanding as it does both the Han and the Yang-tse, it early became an important military post, and the possession of Ta-pieh Shan was always an object of much interest to the contending parties in the numerous revolutions, rebellions, and wars which have characterized Chinese history from the earliest times. It received its present name in the sixth century, and while it continued to be a strong military post, its advantageous position for trade soon attracted attention, and it became a very populous and flourishing city. Notwithstanding its proximity to Hankow, this state of things continued until the Tai-ping Rebellion (1852-64), when it was almost entirely wiped out. Han-yang never recovered until Chang Chih-tung, Governor-General of Hu-kwang, selected it in 1889 for the site of the arsenal and the great steel and iron works, cotton-spinning factories, etc., which he has established there. The iron-works (begun in 1891) cover 70 acres, and include four immense hot-air blast-furnaces, several large steam hammers, innumerable rollers, and all the necessary machinery for producing everything required for the Hankow-Peking Railway, which he planned and which is now partly constructed. The sheds cover 20 acres. The coke used is obtained from Wales, but the ore needed in the manufacture of the rails is mined near Wang-shih King, 76 miles below Hankow. Both hard and soft coal are mined in the same neighborhood. The plant in Han-yang also includes a railway 1½ miles long, from the Yang-tse to the works, and thence to the Han, with an inclined plane on the Yang-tse bank, 300 feet high, up which the cars are hauled by powerful machinery. The whole is under foreign management.

HAN YÜ, hān yü, better known as **HAN WĒN KUNG,** hān wūn kōng (768-823). A Chinese poet, essayist, and philosopher. He was born at Tēng-chow, in Ho-nan, in 768, became a diligent student of the classics, graduated with honors at twenty-four, and shortly thereafter entered the public service. In 819, while vice-president of the Criminal Board, he incurred the displeasure of the Emperor, a great patron of Buddhism, by addressing to him a strongly worded remonstrance against certain public honors with which an alleged relic of Buddha was being conveyed to the palace. Through the intervention of friends he escaped with his head, but was dismissed from the Court and banished to a semi-barbarous region in the present Province of Kwang-tung. There he served for eight months as Governor, civilizing the inhabitants and conferring upon them many benefits. Afterwards he was recalled to the capital, restored

to high office at Court, and loaded with honors, dying at fifty-seven, in 823. He was canonized as *Wên Kung*, 'Prince of Letters,' was ennobled as Earl of Ch'ang-li, and in 1084 his tablet was placed in the Temple of Confucius. Many editions of his works have appeared, and his name is venerated as the foremost scholar in China.

HAPARANDA, hä'pä-rän'dä. The most northerly town of Sweden, situated near the mouth of the Torneå, near the northern shore of the Gulf of Bothnia (Map: Sweden, L 4). It is noted chiefly for its meteorological station, established in 1859, and known as one of the northernmost stations of the world. Population, in 1890, 1252.

HAPAXANTHIC, hä'päks-än'thīc, **HAPAX-ANTHOUS** (from Gk. ἀπαξ, *hapax*, once + ἄνθος, *anthos*, flower). A botanical term applied to plants that blossom and fruit only once in their life cycle. They are also characterized by the almost complete absence of vegetative reproduction. The term and its synonym, monocarpic, are in contrast to pleioecyclic (q.v.). All annuals, most biennials, and a few perennials (such as the century plant) are hapaxanthic plants.

HAPHTARAH, häf-tä'rä (plural *haphtaroth*, Heb., sections, from *pätar*, to split). The fifty-four sections from the prophets used in the synagogues on Sabbaths and feast-days, in connection with the same number of sections into which the law is divided, called *parshioth*. This reading of the law and prophets is alluded to in the New Testament (Luke iv. 17; Acts xiii. 15).

HAPLOMI (Neo-Lat. nom. pl., from Gk. ἁπλοος, *haploos*, single + ὄμος, *ōmos*, shoulder). An order of soft-rayed, pike-like fishes, characterized chiefly by the absence of the mesocoracoid bone. They are mostly inhabitants of fresh waters, and include the mud-minnows (Umbriidæ), the pikes (Luciidæ), the great group of top-minnows, killifishes, and other 'cyprinodonts' (Pœciliidæ), and the blindfish (Amblyopsidæ).

HAPPY VALLEY, THE. A blissful abode, in Johnson's *Rasselas*, which is shut in by mountain barriers from the cares and sorrows of the outside world, and accessible only through a single passage. From it the Prince of Abyssinia starts on his journey through the world.

HAPSBURG, or **HABSBURG**, häps'bu͡ʊrk, HOUSE OF. The Imperial royal house of Austria-Hungary. It is commonly supposed to have derived its name from the Castle of Habsburg, or Habichtsburg (Hawk's Castle), on the bank of the Aar, in the Swiss Canton of Aargau. The castle is said to have been built about 1027 by Werner, Bishop of Strassburg. His nephew, Werner I., was the first Count of Hapsburg; but the real founder of the House of Hapsburg was Albrecht or Albert III. (c.1172), the son of Werner II., who, in addition to extensive estates which he had inherited in Upper Alsace, acquired several Swiss districts (in the neighborhood of Zurich, the Lake of Lucerne, etc.). To these his son, Rudolph I., added the Countship of Aargau. On Rudolph's death, in 1232, his sons, Albert IV., the Wise, and Rudolph II., divided their father's possessions—Rudolph becoming the founder of the Hapsburg-Lauffenburg line. This branch became extinct in 1415, its possessions,

except the Klettgau, reverting to the Austrian line.

The son and successor of Albert IV., Rudolph III., was elected to the Imperial throne of Germany in 1273 (as Emperor, styled Rudolph I.), and founded the greatness of the House of Hapsburg. In 1276 he vanquished Ottokar II. of Bohemia and forced him to give up the duchies of Austria and Styria, with other territories. In 1282 he invested his sons Albert and Rudolph with the territories which he had thus acquired. Albert I. purchased his brother's share in 1283, and on the death of his father, in 1291, succeeded to that prince's possessions, which included large districts in Switzerland. (See AUSTRIA-HUNGARY.) He was raised to the Imperial throne of Germany in 1298, and was murdered in 1308 by his nephew, John the Parricide, while preparing to subdue the Swiss, who had risen in defense of their liberties. Of his six sons, Rudolph was King of Bohemia, 1306-07, and Frederick I. was one of the rival kings of Germany (as Frederick III.) from 1314 to 1322 (died 1330). For the succeeding hundred years the Imperial office was held by other families, and the Hapsburgs were occupied mainly in ruling their hereditary possessions. It was a family principle that the lands were indivisible, and that the brothers should rule jointly. This principle was neglected at times, but the deaths of holders of territories which had been separated from the main possessions brought all Hapsburg lands under a single rule in 1457, and again in 1490. During this early period there were relatively few children, and many of the princes died without leaving heirs. This is in striking contrast with the later Hapsburgs, who were remarkably prolific, families of thirteen to fifteen children being common.

From 1438 until the abdication of Francis II. in 1806, all but two of the Emperors of the Holy Roman Empire (Charles VII. and Francis I.) were Hapsburgs. The house attained its greatest power through the marriage alliances in the last quarter of the fifteenth century. In 1477 Maximilian, who became Emperor in 1493 (Maximilian I.), married Mary of Burgundy, daughter of Charles the Bold, and thus obtained all the Burgundian possessions, which included the Netherlands, at that time the most opulent country in Europe. His son, Philip, who died in 1506, married Joanna, heiress of Spain, daughter of Ferdinand and Isabella. Their eldest son, Charles I. (Charles V. of the Empire), received as his share of the family possession Naples, Sicily, and Sardinia, while the Austrian possessions (Austria, Styria, Carinthia, Carniola, Tyrol, Alsace, Breisgau, etc.) were left to him and his brother Ferdinand, jointly. His share in these last Charles relinquished to Ferdinand. In 1535 Charles added the Duchy of Milan to his possessions. Charles was the founder of the Spanish line of Hapsburgs. Ferdinand was elected in 1526 to the throne of Bohemia (the Bohemian kingdom at this time including Moravia, Silesia, and Lusatia), which soon became practically hereditary in the Hapsburg line. At the same time he was elected king in a part of Hungary, the crown of which country, after the expulsion of the Turks, was by violence made hereditary in the Austrian dynasty (1687). The union of so many different countries in the hands

THE HAPSBURG FAMILY

of one family threatened the security of the other European countries, and especially of France, which was shut in by the possessions of Charles V. The rivalry which resulted continued until the end of the eighteenth century, and brought upon Europe many wars. (See EUROPE.) In the sixteenth and seventeenth centuries the struggles between France and the Hapsburgs were involved with the religious wars. In the second half of the sixteenth century the power of the Spanish branch of the Hapsburgs received a severe blow in the revolt of the Netherlands, the northern provinces of which finally achieved their independence. By the middle of the seventeenth century the Hapsburg power was declining steadily. The Spanish branch, which after Charles I. (Charles V.) had been represented by Philip II., III., and IV., and Charles II., became extinct in 1700. The Austrian Hapsburgs became extinct in the male line by the death of Charles VI. in 1740. By the Pragmatic Sanction (q.v.), however, his daughter, Maria Theresa, succeeded to the throne. She was married to Francis I. of the House of Lorraine, and their descendants have continued to rule in Austria until the present day. One of Maria Theresa's fifteen children was Marie Antoinette, the wife of Louis XVI. of France; a great-granddaughter, Maria Louisa, was the wife of Napoleon; another great-granddaughter was the wife of Pedro I. of Brazil; and a great-grandson was Maximilian I. of Mexico.

Consult: Lichnowsky, *Geschichte des Hauses von Habsburg* (8 vols., Vienna, 1836-44); Coxe, *House of Austria* (3 vols., London, 1807); Schultze, *Geschichte der Habsburger in den ersten drei Jahrhunderten* (Innsbruck, 1887); Wehrlich, *Stammtafel zur Geschichte des Hauses Habsburg* (Prague, 1892); Hoernes, *Oesterreich-Ungarn und das Haus Habsburg* (Teschen, 1892). See genealogical table of the Hapsburg family.

HAPTERA (Neo-Lat. nom. pl., from Gk. ἅπτεν, *hapterin*, to fasten). A botanical term denoting organs for attachment that contain no vascular bundles, and are, therefore, not roots. They occur on various marine algae, on the tendrils of *Ampelopsis*, etc.

HARA-KIRI, hā'rā-kē'rē (Japanese, belly-cut), or, more elegantly, **SEPPŪKŪ**, sēp-pōw'ku (the Japanese pronunciation of *Ts'ich-fuh*, to cut belly). Self-disembowement; a form of suicide permitted in feudal Japan among the territorial nobles and Samurai (q.v.), when unwilling to survive some disgrace. From being a custom, it had, about A.D. 1500, developed into a privilege, so that noblemen and gentlemen could demand that the form of judicial punishment be death at their own hands, instead of dying like common criminals. The ceremonies and etiquette of *seppūkū* became very elaborate, and this form of judicial suicide degenerated into execution at the hands of one's best friend. Arrayed in the neatest of clothing, in a measured space, behind white curtains, the victim and his friends and the official witnesses took their places. The dirk was laid upon a tray and presented by the second, while at the moment of incision, or while the principal was stretching out his hand to seize the dirk, the 'best man' or friend of the accused took off the latter's head with a sweep of his sword. Then, the official witnesses having inspected and identified the head, it was reverent-

ly washed by friends. With the decay of feudalism, the custom has fallen out of use, but is even yet occasionally practiced. *Harri-karri*, a form of the word *hara-kiri*, which is frequently found in newspapers and other more pretentious publications, is erroneous, as is the translation 'happy dispatch.' Consult: Mitford, *Tales of Old Japan* (London, 1876), and Chamberlain, *Things Japanese* (London, 1891).

HAR'ALD or **HAR'OLD I.**, surnamed **HAARFAGR**, or **FAIR-HAIRED** (c.850-933). King of Norway from about 860 to about 930. He was a descendant of the ancient race of the Ynglings, and the son of Halfdan the Swarthy, the most powerful of the many jarls or petty kings who then ruled in Norway. According to the popular saga, Harald was induced to attempt the subjugation of the whole of Norway, by his love for a beautiful maiden, named Gyda, who declared that she would not be his wife until he was sole king of the country; and he swore that he would neither cut nor comb his hair till he had subdued all the land to his sway—an oath which he kept. After many years' contest with his brother jarls, and after defeating the last general confederacy of the independent Norwegian chieftains, in a naval battle at Hafrsfjord, west of the present Stavanger, he remained sole ruler of the land (872). Harald's severity compelled the deposed rulers to seek other homes; and his reign is memorable for the many new settlements which were made by these exiles in the Orkneys, the Hebrides, the Shetlands, the Faroe Islands, and Iceland. Thence they continued their customary sea-roving and plundering until these islands, too, with the exception of Iceland, were subdued by Harald. The most celebrated of the Norwegian jarls exiled by Harald was Rolf the Ganger, or Walker, who, after repeatedly ravaging the northwestern portions of France, received from Charles the Simple, in 911 or 912, an extensive grant of territory in that region, and became the first Duke of Normandy. Although a barbarian, Harald ruled with a sound policy in advance of his age, and by his firmness succeeded in suppressing for a time the private warfare and sea-piracy which had prevailed in Norway before his reign. The dissensions of his numerous sons, however, checked all the good that might have resulted from his measures. To restore concord in his family, he divided his dominions among his children, but vested the supreme power in his eldest son, Eric Blodoexe, or Bloodaxe (c.930). Harald died about 933. Consult Boyesen, *Norway* (New York, 1886).

HARALD or **HAROLD III.**, surnamed **HAARDRAADE**, or **HARD RULER** (1015-66). King of Norway from 1046 to 1066. He was the son of Sigurd, chief of Ringerike, and a descendant of Harald I. In his boyhood he was present at the battle of Stiklestad in 1030, in which his brother, Olaf, King of Norway, surnamed the Saint, was slain. Harald subsequently went to the Court of Jaroslaff, Grand Prince of Novgorod and Kiev, and afterwards to Constantinople, where he became captain of the Varangian body-guard of the Greek Emperors. In this office he experienced many marvelous adventures, which have supplied abundant materials for the narratives of the older sagas and the modern romances of the North. According to these, he took part

in the expedition against the pirates of the Mediterranean, and visited Jerusalem, where he fought successfully against the Saracens, whom he also defeated in eighteen pitched battles in Sicily and Africa. On his return to Constantinople, he drew upon himself the vengeance of the Empress Zoë by an intrigue with her relative, Mary, after he had rejected Zoë's proffered love. He escaped with difficulty from prison, where he had been thrown on a charge of treason, returned to Russia, 1044, married the daughter of Prince Jaroslaff, and took her with him to Norway (1046), where his nephew, Magnus, the son of Saint Olaf, agreed to divide the royal power with him, in return for a share of his treasures. The death of Magnus, in 1048, left him sole King of Norway. His unruly spirit would not, however, suffer him to rest; and in violation of the pledge he had given his dying nephew, he entered into a war to dethrone the King of Denmark, to whose crown he had no just claim. Although he was successful in battle against the Danes, he gained no real advantages by the contest; and in 1064 he concluded a peace in which he recognized the right of Sweyn, the nephew of Canute, to the throne of Denmark. He occupied himself for a time with the internal affairs of Norway. In 1066 he landed in England to aid Tostig (q.v.) against his brother Harold, King of England, but was slain in battle at Stamford Bridge. Consult Boyesen, *Norway* (New York, 1886).

HAR'AN, or **CHARRAN**, kār'rān (Ass. *Kharranu*, road). A city in the north of Mesopotamia, and southeast of Edessa, on the small stream called Jullab, at the junction of the Damascus road with the highway from Nineveh to Carhemish. For the Assyrians it became a strategic position of first-rate importance, and is mentioned in inscriptions as early as the time of Tiglath-pileser I., about 1100 B.C. Sargon II. (B.C. 721-705) refers to his having restored the ancient privileges of the place, and later kings, like Assurbanipal, devoted themselves to the restoration of the temple to the moon-god, which enjoyed a high reputation as a place of pilgrimage. Haran, the Carrhæ of the Greeks and Romans, became, by virtue of its situation, the centre of considerable commerce. It was here that the Roman general Crassus, in his eastern expedition, was attacked and slain by the Parthians (B.C. 53), and here also the Emperor Caracalla was murdered at the instigation of Macrinus, A.D. 217. The place retained its importance down to the period of the Arab ascendancy; but by Albulfeda it is mentioned as having before his time fallen into decay. It is now wholly in ruins. According to the Book of Genesis, which traces the name to Haran, a son of Terah, Haran was the first resting-place of the latter and his family, after their migration from Ur of the Chaldees, and here Terah died before Abraham's migration into Canaan (Gen. xi. 31-32). The story is of value as recalling the tradition of the sojourn of some clans—probably of Aramean origin—associated with Hebrews at some remote period. Consult: Metz, *Geschichte der Stadt Harran* (1892); Sachau, *Reise in Mesopotamien* (Leipzig, 1899).

HARAR, hā-rār'. See HARRAR.

HARATIN, hār-rā-tēn'. 'Black' Berbers, living on the southern slopes of the Atlas Moun-

tains. Their darker complexion is doubtless owing to mixture with negroes. They form a division of the Imazighen or Atlas Berbers, who have been thus divided: (1) Abkail or Kabyles; (2) Shellala or Shilluhs (Shluhs); (3) the Haratin. They are interesting to the ethnologist in that they still preserve the patriarchal tribal state, similar to that of the Bible. These kinship groups survived in the midst of all the different forms of government to which they have been subject. See BERBERS; MOORS.

HARAU COURT, á-ró'kōgr', EDMOND (1857-). A French poet and novelist, born at Bourmont (Haute-Marne). His first work, *La légende des sexes, poèmes hystériques* (1883), under the pen-name of Le Sire de Chabley, attracted some attention. *L'âme nue* (1885), a collection of verse, in which some of the earlier poems were included, and *Seul* (1891), showed the poet's increasing power and melancholy charm. He also wrote the romance *Amis* (1887); *Shylock* (1889), a play; the *Passion* (1890), a drama; *Héro et Léandre* (1893); *Alienor*, an opera; *Don Juan* (1894); and *Elisabeth* (1894). He received the Academy prize for his poem, *Les Vikings* (1890).

HARBAUGH, hār'ba, HENRY (1817-67). An American clergyman of the German Reformed Church, born near Waynesborough, Pa. He took partial courses in Franklin and Marshall College and Mercersburg Seminary, and held pastorates from 1843 to 1864, when he became professor of theology in Mercersburg Seminary. He was the chief exponent of the 'Mercersburg theology,' and belonged to the high-church wing of that communion. From 1850 to 1866 he was the editor of the *Guardian*, a monthly magazine, and afterwards of the *Mercersburg Review*. He published some poems in the 'Pennsylvania Dutch' dialect. Among his many works are: *Heaven* (3 vols., 1843-53); *The Fathers of the German Reformed Church* (1858); and *Christological Theology* (1864).

HARBOR (ME. *harbor*, *herbore*, *herberwe*, *herberge*, Icel. *herbergi*, O.H.G. *heriberge*, Ger. *Herberge*, from O.H.G. *heri*, Ger. *Heer*, AS. *here*, army + O.H.G., Ger. *bergen*, AS. *beorgan*, to shelter). An indentation or inlet on the shore of a sea or lake so protected from the winds and waves, whether by natural conformation of the land or by artificial works, as to form a secure roadstead for ships. In the broadest meaning harbor works include all the structures and appurtenances which facilitate the safe anchorage, loading, unloading, and repairs of vessels which seek harbors in the way of commerce and safety from storm; in this sense quays, docks, breakwaters, jetties, piers, and wharves, etc., are essential parts of harbors. In this article, however, the broad question of harbor construction as illustrated by typical harbors will alone be considered, specific consideration of the parts of harbor works being limited to the articles on BREAKWATERS; DOCKS; JETTIES; LIGHTHOUSES; QUAYS; etc. Furthermore, only artificial harbors will be considered here.

EARLY HARBOR WORKS. With the birth of commerce and naval warfare, in the earliest ages of civilization, arose the necessity for artificial harbors. The Phœnicians set to work to protect their scanty strip of Levantine coast. At Tyre, two harbors were formed, to the north and to

the south of the peninsula on which the city was placed. At Sidon, similar but less extensive works long testified to the wealth and engineering genius of the Phœnicians. The breakwaters were principally constructed of loose rubble. Carthage, in another part of the Mediterranean, also possessed a harbor, though its site is not very satisfactorily determined. It was in two divisions, formed by moles; time, however, has dealt so hardly with it that few traces remain. In Greece nature provided so many navigable inlets that little remained to be done by man. Nevertheless, some minor works were executed at the Piræus and elsewhere, chiefly for warlike purposes. The Romans, finding ships necessary to the dominion of the world, set about constructing harbors for them. The coasts of Italy still show how well they understood both the principles and the practice of this branch of engineering. A distinguishing feature of their harbor-making is the open or arched mole. Built with open arches, resting upon stone piers, it gives full play to the tidal and littoral currents, thus preventing the deposit of sand or mud; but in proportion as this advantage is increased (by increasing the span of the arches), so also is the agitation, and consequent insecurity, of the water within.

The decay of commerce and civilization, consequent upon the fall of the Roman Empire, put a stop to harbor-making; nor did the art revive until the revival of commerce by the Italian republics of the Middle Ages. The rich traffic of Venice and Genoa soon led to the construction of suitable ports at those places; and the moles of the latter city, and the works in the lagoons of Venice, remain to this day. France was next in the field, embanking, protecting, and deepening the mouths of the rivers along her north-western shores, as at Havre, Dieppe, Dunkirk, etc. In 1627, during the siege of La Rochelle, Metzeau constructed jetties of loose rubble-stone, to prevent access to the city. England lagged far behind her Continental rivals. With few exceptions, her ports were absolutely unprotected, or rather uncreated, until late in the last century. Two of the few exceptions were Hartlepool, where a harbor was formed about 1250, and Arbroath, in 1394. In the seventeenth century, at Whitby and Scarborough, also in Yorkshire, rough piers were thrown out, protecting the mouth of the port; while at Yarmouth, in Elizabeth's reign, a north jetty, and subsequently a south one, were formed. An ancient mole existed at Lyme Regis. But the chief efforts of the early English engineers were directed against the shoals and waves of Dover. With the advent of Smeaton, however, things took a different turn; and now few countries surpass Great Britain in the number of artificially improved commercial harbors, or in the just appreciation of their importance.

The development of harbor works in America, of course, belongs entirely to modern times. The first regular appropriation for harbor work in the United States was made in 1802; it amounted to \$30,000, and was to be devoted to the erection of public piers at Philadelphia, Pa. In 1822 an appropriation of \$22,700 was made for the construction of a harbor of refuge in Delaware Bay. The first approach to a river and harbor bill was made in 1826, when about \$150,000 was appropriated for carrying on work in about twenty localities. From 1826 to 1838 aggregate appro-

priations carried by the various river and harbor bills were about \$9,000,000. From 1838 to 1866 the aggregate expenditure was \$6,600,000. The total aggregate expenditure of the United States on river and harbor works from 1820 to 1894 was \$262,845,900. Since 1894 the annual amount set aside by Congress for such works has rapidly increased, until in 1900-01 the River and Harbor Bill called for an appropriation of nearly \$60,000,000 for new work, and the Sundry Civil Service Bill called for an appropriation of \$7,000,000 for continuing work in progress.

HARBOR CONSTRUCTION. The designing and construction of harbors constitute one of the most difficult departments of civil engineering. In discussing this branch of the subject attention will be limited to commercial harbors, including harbors of refuge. The general plan of commercial harbors differs in different nations, and there is a great diversity of form due to the methods of commercial means of disposing of the freight received from vessels. It may be set down, as a general rule, that the ship itself does not determine the character of the harbor beyond the fact that it must be of sufficient depth to accommodate ships of the maximum draught using the harbor. In some of the most important ports of the world there are practically no installations for handling freight, the ships anchoring in the open harbor and discharging their cargoes into lighters. Railways play a far more important rôle in determining the arrangement of the harbor, particularly in regard to the dock and quay arrangement. In the last respect, also, the local movement of commerce of the city itself plays an important part.

Turning now to the natural conditions which influence the character and arrangements of harbors, it may be stated that the topographic and geologic conditions exercise a decisive influence. A harbor may be situated directly upon the seacoast or in some river, bay, or gulf, or far in the interior on some river or maritime canal. The effects of the ocean, the action of the winds and tides, and the general conformation of the shore-lines are other controlling factors in determining the arrangement of harbor works. Finally, the nature of the soil, whether alluvial, or diluvial, or rocky, plays an important part in the arrangement of the basins, either natural or artificial, and the adoption of quays, jetties, piers, etc.

The great variety of commercial and natural conditions which influence the arrangement of harbor works of course call for a corresponding variety of arrangements; it is obviously impossible to describe each here. For the sake of clearness we may somewhat arbitrarily divide harbors into, first, those located on a comparatively open coast; second, those located at river mouths or on bays or gulfs, and thus more or less landlocked; and third, those located well inland on rivers or maritime canals.

The simplest form of open-coast harbor consists of a quay wall or bulkhead wall open to the sea, and serving only to enable ships to tie up alongside the shore and discharge and receive cargoes. Such a quay affords comparatively no protection from the winds, tides, and currents. The next advance is a straight pier extending out from the shore. This pier affords little shelter to ships from waves coming directly inshore, but in case of winds and waves along shore it affords

protection on its lee side. Another step in advance is to build the pier bent or curved with its concave side toward the shore. A still further improvement is to build two curved piers converging toward each other so as to include a harbor basin with an opening between the sea ends of the piers. Still another method is to build off shore an insular breakwater, which prevents the waves from breaking on the shore, and thus forms a comparatively tranquil basin between the breakwater and the shore. Harbors of all these forms are found in practice. More generally, however, two or more of the structures mentioned are combined to form harbor basins of various forms and dimensions. Figures 1 and 2 show in outline form two representative open-coast harbors.

FIG. 1.

FIG. 2.

the case of a bay, gulf, or river-mouth, then the portion of it may be too much to take the place of one or more of the structures necessary to form an open-coast harbor. For example, the

FIG. 3.

harbor of New York is so inclosed by land that no artificial structures in the shape of piers or breakwaters are needed to secure a tranquil harbor basin. Where the bay or inlet is less perfectly landlocked, piers, breakwaters, or jetties are constructed to supply the necessary protection at the exposed points. Figs. 3 to 6 show actual arrangements of such structures in different circumstances.

FIG. 4.

those of Hamburg, Manchester, and Amsterdam, in Europe; and Charleston and Philadelphia, in America. Fig. 7 shows the entrance harbor of

the ship canal leading to the harbor of Amsterdam, and Fig. 8 that at the entrance of the Suez Canal, at Port Said.

In what has preceded, we have concerned ourselves only with the general arrangement of harbor structures under different topographic conditions. For specific information concerning jetties, breakwaters, docks, piers, quays, etc., the reader should consult the articles with these titles. Whatever the construction and arrangement of these constituent structures of a harbor may be, they are such that the harbor consists of an entrance, of an anchorage space, and of docks. By the entrance is meant the navigable piers by which vessels enter the harbor. Some ports have natural entrance channels of large dimensions and great depth, and in other harbors this channel is of small size and has to be artificially

FIG. 5.

FIG. 6.

constructed and maintained. Generally speaking, the minimum width of practical entrance for ships of modern dimensions is from 230 feet to 490 feet, but for large commercial ports it should be preferably from 650 feet to 1000 feet wide. Sometimes the entrance channels constitute the anchorage basin tributary to the entrance channel and the docks. No general rule can be laid down for the area of anchorage space, for this is governed by the local conditions at each port. When the natural harbor bank does not give sufficient room for the commerce of a harbor, various methods are adopted for increasing this shore space. The most simple is to build out from the shore a series of piers or wharves with water spaces between them to form docks. When this is not practicable quays are built which inclose dock basins. The nature of these two classes of structure is described in the article on Docks.

FIG. 7.

FIG. 8.

For a comprehensive treatise on harbors, consult: De Cordemoy, *Les ports modernes* (Paris, 1900); Vernon-Harcourt, *Harbors and Docks* (London, 1885). The best

descriptions of important recent harbor works will be found scattered through the proceedings of the various engineering societies and the engineering papers.

HARBOR. As judicially defined, a place to shelter ships from the violence of the sea, and where ships are brought for commercial purposes to load and unload goods and passengers. It includes quays or docks and other instrumentalities for the use and protection of ships. The term is generally considered a legal synonym for "haven" and "port," although at times it is employed in a somewhat narrower sense than either of these terms. It is not necessary, to constitute a harbor, that it be landlocked or absolutely safe for ships. It is enough that it affords a reasonably safe place of retreat from winds and storms.

In Great Britain the right to construct or control harbors is vested in the Crown, but at present they are generally owned or managed by boards or commissions under special acts of Parliament. Even when an individual is the owner of a harbor, under a grant from the Crown or by proseription, he holds it subject to the right of the public to make use of it and of the State to control it. The Government has the power, also, of closing particular harbors or ports, either absolutely, or to certain lines of imports or exports. It has the power, too, of regulating all harbor fees and the conduct of business transacted in harbors. At present, the various boards or commissions are authorized by Parliament to make all needful regulations and, within certain limits, to fix the charges on goods and ships. It is their duty, on the other hand, to keep the harbors in a reasonably safe condition for those entitled to use them. If they do not, they are liable for any injury which results from their negligence. This rule does not obtain in harbors controlled directly by the Government, and known as the King's harbors. Here the maxim applies that "the King can do no wrong;" that is, the State cannot be sued without its consent for injuries due to its negligence.

In the United States the development and control of harbors are shared to some extent by the Federal and the State governments. Large appropriations are frequently made by Congress for the improvement and defense of harbors, and the Federal Government, under its power to regulate foreign and interstate commerce, exercises a large degree of control over most ports. On the other hand, the ownership of docks, wharves, warehouses, and other harbor facilities afforded to commerce, is generally a matter of State legislation. Each State, too, has its pilot laws, its quarantine rules, and its harbor regulations, with which the Federal Government does not interfere, but which are subject to Federal laws so far as the subject—as quarantine, for example—is within the Federal jurisdiction.

A harbor master is a State official with extensive authority. He has power to regulate the times of landing, unloading, and loading vessels; to make room for such as need to be immediately accommodated by temporarily removing others; to collect harbor fees; to enforce obedience to his lawful orders, and, in certain cases, to settle disputes between the masters of vessels. In some States a board of harbor commissioners is provided for with large powers of control. Con-

sult: Moore, *History of the Foreshore and the Law Relating Thereto* (London, 1888); *United States Revised Statutes*, Secs. 5244-5255; Birds-eye, *General Laws of New York—Navigation Law and New York Harbor* (New York, 1901).

HARBOR GRACE. A port of entry on the west side of Conception Bay, Newfoundland, 27 miles west by south of Saint John's; the second town of importance in the island (Map: Newfoundland, G 5). The harbor is large, but exposed; it has a patent slip 260 feet long, and the wharves are protected by the beach. The trade of Harbor Grace is nearly one-fourth of that of the entire island. Population, in 1891, 6467; in 1901, 5184.

HARBORING. In law, the act of receiving and retaining a person in violation of the rights of another or of the public. Harboring the wife of another after notice from the husband not to do so is an actionable wrong against him, unless such act is a proper one for her protection. So the harboring of an apprentice or servant, with knowledge of the latter's obligation to his master, is an actionable tort at common law. One who knowingly harbors a felon becomes at common law an accessory to the crime, while the intentional harborer of one who has committed a misdemeanor is himself guilty of a misdemeanor. An innkeeper who is accustomed to harbor thieves is indictable at common law for maintaining a public nuisance. Some modern statutes make it criminal for any one to harbor thieves; that is, to shelter them or permit them to congregate on his premises. Other statutes impose a penalty for harboring seamen, knowing them to belong to any vessel. Under such statutes, and generally, the offense of harboring does not necessarily involve the element of secrecy or concealment. It is committed by merely sheltering or entertaining the prohibited person or permitting him to take refuge under one's roof. See **ACCESSORY; HUSBAND AND WIFE; MASTER AND SERVANT; PARENT AND CHILD;** and authorities there cited.

HARBORNE, WILLIAM (c.1545-1617). An English traveler and diplomat, the first English Ambassador to Turkey, born at Yarmouth. In 1575 he was elected to Parliament, but was not allowed to take his seat, and in 1577 he went to Turkey. Five years afterwards he was appointed Ambassador to that country. The Turkey Company, formed in 1579, received, thanks to his efforts, larger privileges than those granted to any other nation. He left Constantinople in 1588, and died at Mundham. An account of his journey from Constantinople in 1588 was printed in Hakluyt's *Collection of Voyages*, as well as the description of his outward voyage.

HARBOR-SEAL. The common seal (*Phoca vitulina*) of all northern seas, which formerly frequented numerous all the bays and harbors of the Atlantic coast as far south as Virginia, but now is uncommon south of Nova Scotia. Stragglers, nevertheless, are still seen at long intervals in the Hudson, and even in the Delaware rivers, where they once regularly ascended as far as tidewater went. It is still numerous in the Saint Lawrence, and has been taken in Lake Champlain. The leopard seal of the Pacific Coast (south to Southern California) is the same, and has been known to ascend the Columbia 200 miles. This seal attains a total length of about

5½ feet, and a weight of from 80 to 100 pounds. Brownish yellow with dark spots is the commonest color, but many variations occur, such as almost uniform dark brown, nearly black, and dark spotting on a light ground, or the reverse. It is distinct in habits from other seals, with which, in the North, it never associates on the ice-floes, but remains by itself on or near the shore, where it ascends the Arctic rivers almost to their sources in pursuit of the salmon. Hence it is known to seamen as the 'fresh-water' seal. The white skins of the young seals are regarded by the northeastern Eskimo as the best and prettiest material from which to make undergarments and the jackets of women and children. This is the common seal of Northern Europe and the British Islands. It is often captured young and petted and trained, when it shows great docility and affection, and its tricks are frequently exhibited in public shows.

HARBOR SPRINGS. A village and the county-seat of Emmet County, Mich., five miles northwest of Petoskey, on Lake Michigan and on the Grand Rapids and Indiana Railroad (Map: Michigan, H 3). It is a favorite summer resort, annually visited by some 5000 persons. It has an excellent landlocked harbor. The principal manufactures are lumber in various products, and flour. Population, in 1890, 1052; in 1900, 1643.

HARBURG, här'bōörk. The capital of a circle in the Prussian Province of Hanover, situated on an arm of the Elbe, over which are built a railroad and a street bridge on the road to Hamburg, 7 miles to the north (Map: Prussia, C 2). The most noteworthy building of the town is the old castle on the Elbe. Harburg has a 'real' gymnasium and several industrial and commercial schools. It is a place of some industrial activity, producing jute, linseed and cocoanut oil, gutta-percha wares, chemicals, leather, cement, glass, machinery, boilers, and small steamers. It is connected by rail with Hamburg, Cuxhaven, and Bremen, and with Hamburg also by an electric street railway, and has a growing trade in groceries, wine, oil, coal, timber, etc. Harburg obtained municipal rights in 1297; belonged to Lüneburg and Hanover; and passed to Prussia in 1866. Population, in 1890, 35,081; in 1900, 49,153.

HARCOURT, SIMON, first Earl HARCOURT (1714-77). An English diplomat and statesman. He was the only son of the Hon. Simon Harcourt, who died in 1720. On the death of his grandfather, Simon, first Viscount Harcourt, in 1727, he succeeded to the family titles and estates. After an excellent education and four years of foreign travel, he was appointed lord of the bed-chamber to George II. In 1745 he raised a regiment for defense of the kingdom against the rebels, and in 1749 was advanced to the dignity of an earl. Harcourt was appointed governor to the Prince of Wales, afterwards George III., but resigned owing to his dislike of the absolutist principles in which the young Prince was instructed. Promoted to be lieutenant-general in 1759, he was appointed in 1761 special ambassador to demand the hand of the Princess Charlotte in marriage for the young King, who had succeeded to the throne in 1760. He was made Ambassador to Paris in 1768, and Lord Lieutenant of Ireland in 1772. By a proposal to tax the rents

of absentee landlords he gained much popularity in that country, but the proposal was rejected by the Irish Parliament, which was swayed by English opinion. There was much official corruption during his term as Lord Lieutenant. He resigned in 1777.

HARCOURT, WILLIAM, third Earl of (1743-1830). An English field-marshal. His military career began at the age of sixteen, when he took command of a troop raised at his father's expense and known as 'Harcourt's Black Horse.' He was aide-de-camp to Lord Albemarle at the siege of Havana (1762), but returned home to represent Oxford in Parliament (1768-74). He was a lieutenant-colonel of dragoons in the American Revolutionary War, and distinguished himself in the capture of Gen. Charles Lee, near the Delaware. During the war in Flanders he was raised to the command of the Duke of York's cavalry (1795), was made a general the following year, as well as head of the Royal Military College, Great Marlow, a position he held from its opening until 1805, and he was created field-marshal on the occasion of the coronation of George IV.

HARCOURT, Sir WILLIAM GEORGE GRANVILLE VENABLES VERNON (1827—). An English statesman. He completed his preparation in Trinity College, Cambridge. Beginning the practice of law in 1854, he was in 1866 appointed Queen's Counsel. From 1868 to 1880 he represented Oxford in the House of Commons; from 1880 to 1895, Derby; and from 1895 to the present, Monmouthshire West has had him as a representative. His principles have been thoroughly liberal. His election to the professorship of international law in the University of Cambridge in 1869 is evidence of scholarship in his special field of study; so, too, was his appointment to the royal commission for amending the neutrality laws and to the royal commission for amending the naturalization laws. He was Secretary of State for the Home Department, 1880-85, and Chancellor of the Exchequer, 1886 and 1892-95. From 1894 to 1898 he led the Liberal opposition; and after the latter date he took an active stand against the policy of the Government with reference to the sinking fund, to the negotiations with the Transvaal, and to the raising of funds for the support of the South African War. As Home Secretary he introduced in 1884 an important bill for the reform of the municipal government of London. The budget which he, as Chancellor of the Exchequer, presented in 1894 made the income tax considerably more graduated, and reformed the 'death rates.' This budget is often mentioned as his greatest work. Amid his political labors he contributed to the *Saturday Review*; and various political pamphlets and letters originally printed in the *Times*, and signed 'Historicus,' were afterwards republished in a volume with considerable additions.

HARDANGER (här'däng-êr) **FJORD.** An inlet of the Province of South Bergenhus, Norway, on the southwest coast. It is about 68 miles long and extends northeastward and south, encircling the Folgefond. With a regular steamboat service, it is a notable visiting place for summer tourists, owing to its wild and picturesque scenery, embracing mountain peaks, lofty cliffs, waterfalls, and on the east the Hardanger Fjeld, an elevated

ice-clad plateau. The narrow strips of well-cultivated land along the shores are densely populated by the Harænger, a people distinguished for their interesting national customs and dress.

HARD CASH. See VERY HARD CASH.

HARD'CASTLE. A family, the members of which are principal characters in Goldsmith's *She Stoops to Conquer*. The scene is laid about the country house of jovial Squire Harcastle, the father of Kate, the heroine of the comedy, who assumes the airs of a barmaid in order to win the love of the bashful Marlow. The pretentious Mrs. Harcastle is the mother of Tony Lumpkin, the Squire's stepson.

HARD CLAM, or ROUND CLAM. The quohog. See CLAM.

HARDECANUTE', HARDACNUT, or HARTHACNUT (c.1019-42). King of England and of Denmark. He was the son of Canute the Great and Emma of Normandy, and at the time of his father's death (1035) was ruling as under-king in Denmark. Canute had intended the crown of England for Hardecanute, but the English Witan decided that his half-brother Harold should be King of the North, and Hardecanute should have only Wessex. As Hardecanute neglected to take possession of his kingdom, it passed to Harold in 1037. On the latter's death, however, in 1040, Hardecanute was chosen King of England by the Witan. He arrived in England with a fleet of sixty ships, for the maintenance of which he extorted a heavy *danegeld*. He was coarse and violent in his habits, and unscrupulous in the means he adopted for the establishment of his power. His reign was peaceful. He died June 8, 1042, at the marriage banquet of one of his nobles, and with him ended the Danish line in England. He was succeeded by his half-brother, Edward the Confessor (q.v.). Consult Freeman, *The Norman Conquest*, vol. i. (Oxford, 1869).

HAR'DEE, WILLIAM JOSEPH (1815-73). An American soldier, prominent on the Confederate side in the Civil War. He was born in Savannah, Ga.; graduated at West Point in 1838; and served with distinction through the Seminole and Mexican wars. At the outbreak of the Civil War he resigned from the United States Army to accept a commission as colonel in the Confederate service, and during the first year of the war held various commands in the West. The next spring he commanded a corps in the Army of the Mississippi, and at Shiloh, April 6, 1862, led the first Confederate line of battle. During Bragg's invasion of Kentucky in the following September, he commanded the left wing of the invaders, and later took a prominent part in the battles of Perryville and of Murfreesboro. By this time he had attained the rank of lieutenant-general. In the summer of 1863 he was placed in charge of the defense of Mississippi and Alabama, but rejoined the army in time to command his corps at the battle of Missionary Ridge. Soon after this, December 2, 1863, he succeeded General Bragg in command of the Army of Tennessee, but was himself replaced by Polk on December 23d, who, however, gave way to Joseph E. Johnston on December 27th. Under General Johnston, Hardee fought through the Atlanta campaign, and after the fall of Atlanta was assigned to the command of the

Department of South Carolina, Georgia, and Florida. His forces, largely composed of the local militia, were unable to make any effectual opposition to Sherman's march to the sea; and it was only by good generalship that Hardee was able to escape from Savannah before the Federal forces had completed its investment. He thereupon retreated northward through the Carolinas, and effected a junction with Johnston, under whose command he continued to serve until that general surrendered on April 26, 1865. After the war, he became a planter at Selma, Ala.

HARDELLOT, är'd'-lò', GUY D'. A French song composer, born near Boulogne-sur-Mer, of patrician ancestry. After her marriage she was a resident of London, England, where she became known by her husband's name (Rhodes), although her compositions were always published under the signature of D'HardeLOT. Her first published composition attracted attention to her work, after which Melba, Pol Plançon, and Calvé popularized her songs throughout the world, and particularly in the United States and England. Her songs, nearly all written to French words, although accompanied by an English translation, were marked by considerable melodic originality, and a general appropriateness of text and music; and as a rule make up in artistic daintiness what they lack in depth. Some of her better-known songs are: *A vous! Avec toi, Little Boy Blue, Mignon, Say yes, Truelove Land, Tristesse, Quand on aime, and A Bunch of Violets*. She made one visit to the United States, in company with Mme. Calvé.

HAR'DEN, MAXIMILIAN (1861—). A German journalist and author, born in Berlin. After a secondary education he became a contributor of essays and critiques on subjects of literature and the drama to the *Frankfurter Zeitung*, the *Gegenwart*, and the *Nation*. He first attracted attention by a series of articles on social and political topics, published originally in the *Gegenwart*, with the signature 'Apostata,' and subsequently in two volumes, with the title *Apostata* (1892). In 1892 he established the *Zukunft*, a weekly periodical which proved a very successful venture, and in 1896 published *Theatre und Litteratur*. His individual and witty style and his unreserved expressions of opinion made him *persona non grata* to the Government, which he particularly opposed in connection with the policy of Von Caprivi. In 1900 he was condemned to six months' imprisonment in a fortress on the charge of *lèse-majesté*.

HARDENBERG, här'den-bèrk, ALBERT (1510-74). A Dutch theologian, whose real name was Rizäus, but who is usually called Albert Hardenberg, from his birthplace in Holland. In 1517 he entered a monastic school, and about 1530 went to Louvain, where he soon developed a distaste for scholastic theology. At Mainz, where he went to study, he met Johannes a Lasco (q.v.), and was turned to Protestant ideas. He returned to Louvain, and preached the Reformation in a very mild form, but was forced to leave the city. He taught at Aduard for three years (1540-43), and then, through the efforts of A Lasco and of Melancthon, left the Roman Church and went to Wittenberg (1543). Afterwards he came under the protection of the Archbishop of Cologne, who was friendly to the Reformation, and was settled as pastor at Kem-

pen. He is best known in Church history for his opposition to Luther's doctrine of ubiquity, and for his attempt to introduce Calvinistic tenets on the nature of the elements in the sacrament. In 1561 he went to Bremen, then to Sengwarden, and in 1567 to Emden, where he died. Consult Spiegel, *Dr. Albert Rizäus Hardenberg* (Bremen, 1869).

HARDENBERG, FRIEDRICH VON. A German lyric poet. See NOVALIS.

HARDENBERG, KARL AUGUST, Prince (1750-1822). A Prussian statesman, born at Essenrode, in Hanover, May 31, 1750. He was educated at Leipzig and Göttingen, and in 1776-78 traveled in France, Holland, and England. On his return to Hanover he became Councilor of the Privy Chamber, and was raised to the rank of count; but a private quarrel with a member of the royal family induced him, in 1782, to quit the Hanoverian service. He took up his residence at the Court of Brunswick, where the Duke appointed him, in 1787, president of the Council of State. Soon afterwards he was sent on a diplomatic mission to Frederick William II. of Prussia, who received him with marked distinction. In 1790 the Margrave of Ansbach and Bayreuth requested the Prussian monarch to furnish him with a person competent to administer the affairs of his dominions, and Frederick William recommended Hardenberg. When Ansbach and Bayreuth were united with Prussia in 1791, Hardenberg was appointed Minister of State and a member of the Cabinet. At the commencement of the war with France, the King summoned him to his headquarters at Frankfort-on-the-Main as administrator of the army. Early in 1795 he was sent to Basel, where on April 5th he concluded a peace between Prussia and the French Republic. After the accession of Frederick William III., Hardenberg was recalled to Berlin (1798), and was intrusted with the partial management of foreign affairs. In 1804 he became first Prussian Minister on the resignation of Haugwitz, and in this capacity endeavored to keep Prussia neutral in the war between France and England. Nevertheless, by the victory of Napoleon at Austerlitz, Prussia was compelled to enter into an alliance with Napoleon in the winter of 1805-06. Hardenberg was deprived of his office in April, 1806, and Haugwitz, who was friendly to the French, returned to power. Prussia was driven in the same year to take up arms against Napoleon. After the fatal battle of Jena, Hardenberg accepted the portfolio of Foreign Affairs, which he held for a few months only, Napoleon, who considered him the chief opponent of France in Prussia, demanding his dismissal at the Peace of Tilsit. In 1810 he was appointed Prussian Chancellor. Hardenberg now proceeded to carry out Stein's plan for a regenerated Prussia through the enactment of radical and far-reaching reforms. The victories of the British troops in the Spanish Peninsula, and the disasters that overwhelmed Napoleon's vast army in Russia, made it possible for Hardenberg to realize his patriotic efforts, and he had the satisfaction of seeing his plans crowned with success. The War of Liberation freed Prussia. Hardenberg subscribed to the Peace of Paris, May 30, 1814, and was soon after raised to the rank of prince by his sovereign. He accompanied the allied sovereigns to London and took part in the

proceedings of the Congress at Vienna and in the conferences at Paris (1815). In 1817 he reorganized the Council of State, of which he was appointed president. He was present at the meetings of the monarchs of the Holy Alliance at Karlsbad, Laibach, Troppau, and Verona. His later policy showed reactionary tendencies, however, and lost him much of his previous popularity. During a tour through the north of Italy, he was taken suddenly ill at Pavia and died at Genoa, November 26, 1822. The services rendered by Hardenberg to his country were great; to him, next to Stein, Prussia is indebted for the improvements in her army system, the abolition of serfdom and feudal burdens, the throwing open of the civil service to all classes, and the complete reform of the educational system. Hardenberg's *Memoirs, 1801-07*, were suppressed until fifty years had elapsed, and were then edited with a biography by Ranke, *Denkwürdigkeiten des Fürsten von Hardenberg* (5 vols., Leipzig, 1877). Consult also: Klose, *Leben Karl Augusts, Fürsten von Hardenberg* (Halle, 1807); Meier, *Die Reform der Verwaltungsorganisation unter Stein und Hardenberg* (Leipzig, 1881); Seeley, *Life and Times of Stein* (London, 1879).

HARDEN-HICK'EY, JAMES ALOYSIUS (1854-98). An American adventurer and journalist, called a baron. He was born in San Francisco, but at the age of twenty-three settled in Paris, where he started a paper called the *Triboulet*, so conspicuous for its strong satirical attacks upon the Government that it was suppressed in about two years (1880). The editor had also been drawn into duels with other journalists, but his literary activity continued unabated, and under the nom-de-plume 'Saint-Patrice' he published *Un amour dans le monde* (1877); *Mémoires d'un gommeux* (1877); *Près du gouffre* (1877); *Sampiero* (1878); *Lettres d'un Yankee* (1879); *Aventures merveilleuses de Nabuchodonosor Nosebreaker* (1880); *Les facéties de Trogneville* (1883); *Nos écrivains* (1888); *La théosophie* (1890); *Plagiats bibliques* (1891).

HARDERWIJK, här'dēr-vik. A small seaport and fishing town of the Netherlands, situated on the southeastern shore of the Zuyder Zee, 28 miles east of Amsterdam (Map: Netherlands, D 2). It is a fortified town and a recruiting station for the Dutch East India troops. The chief exports are grain, lumber, and fish. Population, in 1900, 7300. Harderwijk was a Hanse town and from 1648 to 1811 was the seat of a university.

HARDHACK. See SPIREA.

HARDHEAD. A fish. (1) See HALFBREAK. (2) See STEELHEAD. (3) A sailors' name for the California gray whale (q.v.), said to be due to its propensity for striking and upsetting the whalers' boats with its head.

HARDICANUTE. See HARDECANUTE.

HAR'DIE, JAMES ALLEN (1823-76). An American soldier, born in New York City. He graduated at West Point in 1843, and during the Mexican War was the military commandant of San Francisco. During the Peninsular, Maryland, and Rappahannock campaigns of the Civil War he was acting adjutant-general of the Army of the Potomac, and on November 29, 1862, was commissioned brigadier-general of volunteers. In

1863 he was appointed assistant adjutant-general with the rank of major on the staff of the regular army, and on May 24, 1864, was made inspector-general with the rank of colonel. After the close of the war he was a member of the board which decided upon the disposition of the arms and munitions in the Government arsenals, and he audited the war claims of Massachusetts and Kansas. On March 13, 1865, he was brevetted a major-general in the Regular Army.

HARDING, CHESTER (1792-1866). An American portrait painter. He was born in Conway, Mass., September 11, 1792. In 1812 he enlisted in the army as a drummer boy. Owing to failure in business, he went to Pittsburg, where he was engaged as a house-painter. At this time he became interested in portrait painting, and went to Paris, Ky. After a short time spent in study at Philadelphia he spent successful seasons at Saint Louis and Washington. In 1823 he established a studio in Boston, where he enjoyed great popularity. In 1832 he went to Europe. In London he met David Leslie and Sir Thomas Lawrence, and during a stay of three years painted the portraits of several prominent Englishmen, including the Dukes of Essex, Norfolk, and Hamilton, Samuel Rogers, and Lord Aberdeen. The chief characteristic of his portraits is their indication and appreciation of character. Harding had many friends, one of whom was Daniel Webster, whose portrait by Harding hangs in the Bar Association, New York. He died in Boston, April 1, 1866. Among his principal portraits are those of Washington Allston, John Randolph (Corcoran Gallery, Washington), General Sherman, Henry Clay, John C. Calhoun, Chief Justice Marshall, Charles Carroll, and Presidents Madison, Monroe, and John Quincy Adams.

HARDING, JAMES DUFFIELD (1798-1863). An English landscape painter and teacher, born in Deptford. He first studied painting and engraving, and then took up water-colors and became a member of the Water-Color Society (1821). He was one of the first after Turner to use body-color in this medium, and obtained excellent results with it. His paintings treat European scenes in a rather studied manner. He was the inventor of 'Harding's papers' (paper in different tints and textures for sketching), which were used until recently. He gave much attention to lithography, and obtained two gold medals from the Academie des Beaux-Arts for his plates. Among his works in it are *Home and Abroad* (1836, fifty plates), *Park and Forest* (1841), and *Picturesque Selections* (1861). Harding was a successful teacher, and published a number of text-books of no great importance.

HARDING, KARL LUDWIG (1765-1834). A German astronomer, born at Lauenburg. He was educated at Göttingen, where he studied theology, and became a tutor in the family of Schröter in Lilienthal. Schröter was an enthusiastic astronomer, and Harding was soon appointed observer and inspector in his observatory. Here he discovered the third planetoid, Juno (1804). In 1805 he went to Göttingen as professor of astronomy, and eight years afterwards discovered, independently of Pons, the second comet of 1813. His published works include: *Atlas Novus Cælestis* (1808-23; reëdited by Jahn, 1856), for long

the most complete astronomical chart; *Kleine astronomische Ephemeriden* (edited with Wiessen, 1830-35); and the fifteenth in the series of Sternkarten of the Berlin Academy's publications (1830).

HARDING, STEPHEN (?-1134). The third abbot of the celebrated monastery of Cîteaux. Of his parentage and youthful history little is known beyond the fact that he was born at Sherborne, near Dorehester, England, of a respectable family, and in early life traveled first to Scotland, then to Paris, and later to Rome. On his way back he stopped at the Benedictine monastery at Molsme, near Dijon, Burgundy, and joining the Order, received the name of Stephen. He delighted in austerities, and left the monastery with some twenty companions, including the abbot and prior, in order that they might start a new monastery where the Benedictine rule should be strictly observed. Cîteaux, the 'cisterns,' fifteen miles south of Dijon, a barren and marshy spot, seemed attractive to the band, and there the monastery was built. In 1110 Stephen was elected its abbot. The rigor of observance which he enforced had such an effect in deterring novices from entering the new Order that at first grave fears were entertained for its stability; but Stephen persevered, and was rewarded in 1113 by the accession of Saint Bernard (q.v.) and thirty others, who gave such an impulse to the institute that in a short time the number of claimants for admission compelled him to found several new convents, and especially that of Clairvaux (1115), which, under the rule of Saint Bernard, attained to the very highest distinction in that age. Stephen continued till his death, at Cîteaux, March 28, 1134, to direct the fortunes of the Cistercian Order. In 1119 he drew up, in conjunction with Saint Bernard and other members of the brotherhood, the well-known constitutions of the Order, entitled the *Charter of Charity*, which were approved by Popes Calixtus II. and Eugenius III., and, with some modifications, have continued down to modern times as the rule of the Cistercian institute. Two of Stephen's letters are preserved among the *Epistole Sancti Bernardi* (Epp. 45 and 49). See CISTERCIANS.

HARDINGE, här'ding, Sir HENRY, first Viscount HARDINGE of LAIORE (1785-1856). An English field-marshal and commander-in-chief. The third son of the Rev. H. Hardinge, rector of Stanhope, Durham, he was born at Wrotham, Kent, on March 30, 1785. After a brief education at Eton, he was gazetted as ensign to the Queen's Rangers in Upper Canada before he had attained his fifteenth year. In 1806-07 he studied with success at the Wyeombe Royal Military College. He obtained a brigade command in Spain before his twenty-fifth year, after which he was attached to the Portuguese Army from 1809 to 1813 in the capacity of deputy quartermaster-general. On Napoleon's return from Elba, Hardinge joined the allied armies in Belgium, and was appointed by the Duke of Wellington commissioner at the Prussian headquarters. He lost his hand at Ligny, and was unable to participate in the victory of Waterloo. In 1826 he entered Parliament, and in 1828 succeeded Lord Palmerston as Secretary of War. He next filled the office of Secretary for Ireland. From 1844 to 1847 he was Governor-General of India. When the Sikh

War broke out, he hurried to the northwestern frontier of India, and served as second in command under Lord Gough during the battles of Mudki, Ferozeshah, and Sobraon. After the pacification of Lahore, his services were rewarded by a viscounty, the East India Company granting him a pension of £5000, and Parliament voting him an annuity of £3000 for himself and his next two successors. On the death of the Duke of Wellington in 1852, Hardinge was appointed Commander-in-Chief of the British Army, and filled the home command during the Russian War. He resigned through illness a few months before his death. In October, 1855, he was advanced to the rank of field-marshal. He died September 24, 1856, at his seat, South Park, near Tunbridge, Kent.

HARD LABOR. As a form of criminal punishment, hard labor is comparatively modern. It was introduced in England as an alternative to transportation and penal servitude. It is the creation of statute law both in Great Britain and in this country. A court has no right to sentence a convicted criminal to hard labor, in addition to other punishment, unless a statute gives authority therefor. Hard labor is generally authorized by Federal as well as by State legislation, however, in most cases where the convicted criminal is subject to imprisonment in a State prison or penitentiary. The kind and amount of labor required of the sentenced criminal are regulated by statute or by prison rules. Consult: Stephen, *History of the Criminal Law of England* (London, 1883); *Encyclopædia of the Laws of England*; United States Revised Statutes, § 5542. See PUNISHMENT.

HARDMAN, FREDERICK (1814-74). An English novelist and journalist. He was the son of Joseph Hardman, a London merchant, but, disliking the life in a counting-house for which his father intended him, went to Spain in 1834 and served against the Carlists. In 1840 he began contributing to *Blackwood's Magazine*, and after ten years of literary work became foreign correspondent of the *London Times*. Among his works are: *Peninsular Scenes and Sketches*, and *The Student of Salamanca*, both reprinted from *Blackwood*; *Central America* (1852); and a translation of Weiss's *History of the French Protestant Refugees* (1854).

HARDMOUTH. A fish. See CHISELMOUTH.

HARDNESS, SCALE OF. The hardness of a solid substance may be measured by its capacity for scratching, or being scratched by, other substances. The variations in degree of hardness presented by different minerals give valuable physical indications by which one mineral may be readily distinguished from others. The hardness of a given substance is generally determined with reference to a few well-known minerals, which form a standard 'scale of hardness,' as follows:

- | | |
|--------------|--------------|
| 1. Tale. | 6. Feldspar. |
| 2. Gypsum. | 7. Quartz. |
| 3. Calcite. | 8. Topaz. |
| 4. Fluorite. | 9. Sapphire. |
| 5. Apatite. | 10. Diamond. |

Tale is easily scratched by the finger-nail; gypsum is not easily scratched by the finger-nail; calcite has about the same hardness as coin-copper; fluorite is not scratched by a copper coin, and does not scratch glass; apatite scratches glass

with difficulty, and is easily scratched by a knife; feldspar scratches glass easily, and is not easily scratched by a knife; quartz is not scratched by a knife, and yields with difficulty to the file; topaz, sapphire, and diamond are all harder than flint.

HARDOUIN, ărdō'ăn', JEAN (1646-1729). A French scholar, born at Quimper, in Brittany. He early entered the Jesuit Order, for a time lectured on rhetoric, and in 1683 became librarian in the Collège Louis le Grand, Paris. His attainments were notable, his vagaries profound. He prepared an edition (1685) of the *Historia Naturalis* of Pliny the Elder, of which Huet observed, with some exaggeration, that Hardouin had accomplished in five years a task for which five other savants together would have required fifty; and on the other hand, he solemnly adduced theories which involved him in controversy with many of the chronologists and antiquaries of his time, and disagreement with all, and provoked his superiors to demand a public recantation (1708). This curious archaeologist declared that the greater part of the books commonly attributed to the ancients are in reality the work of Benedictine monks of the Middle Ages under the direction of a hypothetical Severus Archontius. He accepted as genuinely classic only Homer, Herodotus, Pliny the Elder, Cicero, the *Epistole* and *Satyre* of Horace, and the *Georgics* of Vergil. In all other cases allusions to Christianity, references to historical events of the Middle Ages, or obvious allegory (as, for example, the *Æneid*, which describes the voyage of Saint Paul to Rome and the proclamation of the Gospel in Italy), determine a recent origin. Similarly all coins and medals pretending to be of the antique world are the work of modern artists. Also, despite all evidence, no council of the Roman Catholic Church was held previous to that of Trent. Hardouin's epitaph by Jacob Vernet, professor of theology at Geneva, well reads: "Illic jacet hominum paradoxotatos." His further publications include the titles: *Numeri Antiqui Populorum et Urbium Illustrati* (1684), and *Councilorum Collectio Regia Maxima* (1714-15). Consult De Baeker, *Bibliothèque des écrivains de la compagnie de Jésus* (Liège, 2 vols., 1853-54).

HARDPAN. The hard stratum of earth beneath the layer of surface soil, especially noticeable in alkali soils (q.v.). Sometimes this is produced in arable lands by the pressing of the plow and the trampling of the team; but it may be prevented or destroyed when formed, by plowing at varying depths.

'**HARDS,**' or '**HARD-SHELLS.**' The name of a short-lived faction of the Democratic Party in New York State. See BARNBURNERS and HUNKERS.

HARDTAIL. A fish. See JUREL.

HARD TIMES. A novel by Charles Dickens, which appeared as a serial in *Household Words*, and was published in 1854. The story is a satire on those who see nothing in life but statistics, illustrated by the leading character, Mr. Gradgrind.

HARDWAR, or HURDWAR, hürd-wär' (*Hari dwara*, gate of Hari or Vishnu). A frontier town of the Saharanpur District, United Provinces, British India, one of the most famous

spots on the Ganges (Map: India, C 3). It stands on the west bank of the river, at the mouth of a gorge where the waters emerge from the sub-Himalayas into the plains of Hindustan, and at the head of the Ganges Canal (q.v.). From its position on the sacred stream, it attracts immense numbers of pilgrims for the purposes of ablution. The chief feature is the Hari-ke-charan, or bathing ghat, with the adjoining temple of Gangadwara. The *charan*, or foot-mark of Vishnu, imprinted on a stone let into the upper wall of the ghat, forms an object of special reverence. The orthodox pilgrim season comprises the end of March and the beginning of April. In ordinary years the attendance amounts to 200,000 or 300,000; but on the occasion of every twelfth year a feast of peculiar sanctity takes place, the latest having occurred in 1894; the visitors, from the commencement to the close of this festival, are stated to have averaged about 2,000,000. Commerce mingles with religion in an annual fair, which possesses considerable mercantile importance, being one of the principal horse fairs in Upper India. Commodities of all kinds, Indian and European, find a ready sale, and the trade in grain and foodstuffs of the surrounding districts is considerable. Hardwar is 1024 feet above the sea, in latitude 29° 57' N. and longitude 78° 14' E. Population, in 1891, 29,125; in 1901, 25,597.

HARDWARE. A commercial term which includes an enormous variety of articles manufactured from iron, copper, brass, or bronze, and variously known as *carpenters'*, *housekeepers'*, or *builders'* hardware. It is almost impossible to classify the articles which come under the general term, including, as it does, implements and materials used by saddlers, miners, contractors, machinists, stationers, car-builders, and furniture makers and dealers. Many toys and the limitless varieties of what are called 'fancy' articles belong to this branch of manufacture, as indeed does almost any article not assignable to any other branch of trade. A typical hardware catalogue contains the list of a regular stock of nearly fifty thousand articles and sizes. Until the latter half of the nineteenth century the United States was almost wholly dependent on England and Germany for its hardware. Such implements as were made at home were usually the work of the village blacksmith, who was an individual of the first importance in those days. The manufacture of American hardware in general began about 1850, and has increased till now the American product is in many branches the standard for excellence the world over. A characteristic of American hardware is the neatness with which the finished product is packed and incased for the market.

HARDWICK, CHARLES (1821-59). An English clergyman, born at Slingsby, Yorkshire. He was educated at Cambridge; was professor of divinity, Queen's College, Birmingham, 1853, and two years later lecturer on divinity at King's College, Cambridge. Soon after being appointed Archdeacon of Ely he was killed by falling over a precipice in the Pyrenees. He ranked high as a Church historian, his chief works being *History of the Articles of Religion* (1851); *History of the Middle Age of the Church* (1853; 6th ed. by Dr. William Stubbs, 1888); *History of the Reformation* (1856; 9th ed. by Stubbs, 1888); and

Christ and Other Masters (1855-58; 3d ed. by Francis Proctor, 1874).

HARDWICKE, PHILIP YORKE, first Earl of (1690-1764). An English jurist and Lord Chancellor, born at Dover. He was educated at a private school in Bethnal Green, was then apprenticed to a London solicitor, studied at the Middle Temple, and was admitted to the bar in 1715. The favor of Lord Macclesfield, together with his own talents and attractive personality, resulted in his rapid advance in the profession. In 1719 he was elected a member of Parliament for Lewes, and the following year for Seaford, which he represented until he became a peer. Within a few days of his first speech, in 1720, on the supremacy of the British over the Irish Parliament, he was appointed Solicitor-General, and three months later was knighted. In 1724 he succeeded to the Attorney-Generalship; in 1733 was appointed Lord Chief Justice of the King's Bench, and was created Baron Hardwicke of Hardwicke; and in 1737 he became Lord Chancellor. Among the chief events of his long career were his co-administration of the Government during the King's absences in 1740, 1748, and 1752; the punishment of Edinburgh for the Porteous riots in 1737; the pacification of Scotland after the Jacobite rebellion of 1744, wherein the wisdom of the abolition of heritable jurisdictions was somewhat counterbalanced by his injudicious proscription of the tartan; and the loss of Minorca and the trial and execution of Byng. To him is largely due the reduction of English equity to a scientific system of logical deduction. In 1754 he was created Viscount Royston and Earl of Hardwicke, and two years later he retired into private life. Consult Harris, *The Life of Lord Chancellor Hardwicke* (London, 3 vols., 1847).

HARDY, är'dé', ALEXANDRE (c.1570-c.1631). A very fertile French dramatist, born in Paris. He is thought to have written 600 plays, of which 41 were printed (1624-28). Of these the best is *Mariamne*. He was an artisan rather than an artist, and first appears in 1593 as author for a strolling company of actors. In 1599 he filled a similar place in Lecomte's company at the Parisian Theatre of the Hôtel de Bourgogne. Of his life little else is known. In his dramas he emancipated the stage from the scholarly mannerisms of Jodelle (q.v.), and became the founder of popular secular tragedy in France. The scenic traditions remained, but Hardy ignored the classic unities of time and place, and soon discarded the chorus. Hardy had little stylistic or poetic talent, but he had dramatic tact and the instinct of stage effects, using old material freely for tragedies, tragi-comedies, and pastorals, which in freeing the French stage from the bondage of Latin, Spanish, or Italian models, made it an attractive field for literary men. Before Hardy's death, Théophile had written his *Pyramus and Thisbe*, Racan his *Shepherd Plays* (*Bergeries*), Mairet his *Sylvie*, Gambaud his *Amaranthe* (1617-25), all for the Hôtel de Bourgogne. He lived to see the first successes of Corneille (q.v.), and the first 'regular' French tragedy, Mairet's *Sophonisbe* (1639). Hardy's Works have been republished in 5 vols. (Marburg, 1884). Consult Rigal, *A. Hardy et le théâtre français* (Paris, 1889).

HARDY, ARTHUR SHERBURNE (1847—). An American novelist, diplomat, and writer on mathematics. He was born at Boston, graduated at West Point at the age of twenty-two, and served for some time in the army. He was professor of civil engineering, Iowa College, from 1871 to 1873, received the degree of Ph.D. from Amherst in the latter year, then studied abroad, and held the chairs of civil engineering (1874-78) and mathematics (1878-93) at Dartmouth. The latter position he resigned for the purpose of devoting himself to literary and diplomatic pursuits. He was United States Minister Resident and Consul-General at Teheran, Persia (1897-99); Minister to Greece, Rumania, and Servia (1899-1901); Minister to Switzerland (1901-02); and in 1902 was appointed Minister to Spain. His mathematical publications include the following: *Elements of Quaternions* (1881); *New Methods in Topographical Surveying* (1884); *Elements of Analytic Geometry* (1888); *Elements of Calculus* (1890); and a translation of Argand's work on Imaginaries (New York, 1881). He is better known by his fiction, which includes: *But Yet a Woman* (1883); *The Wind of Destiny* (1886); *Passé Rose* (1889). He is also author of two poetical works, *Francesca of Rimini* (1878) and *Songs of Two* (1900), and of the *Life and Letters of Joseph Hardy Neesima* (1891).

HARDY, ARTHUR STURGIS (1837-99). A Canadian statesman. He was born at Mount Pleasant, Ont.; was educated at the grammar school of his native town and at Rockwood Academy; studied law, and was called to the bar in 1865. After a period of successful law practice, he was made a Queen's Counsel in 1876. He entered political life in 1873, and was returned as Liberal member for South Brant in the Ontario Legislature. In 1877 he was made Provincial Secretary, and in 1899 Commissioner of Crown Lands in the Mowat Cabinet, and when the latter became a member of the Dominion Cabinet at Ottawa in 1896, Mr. Hardy became Premier and Attorney-General of Ontario. He was an active and very useful legislator, and in his term of office introduced many bills, most of which were passed, relating to railways, courts, and legal procedure, sanitation, and liquor licenses.

HARDY, SIR CHARLES (c.1716-80). An English admiral. He was the son of Vice-Admiral Sir Charles Hardy, entered the navy in 1730, and in 1737 was promoted to be a third lieutenant. After serving on several ships he was sent in 1744 in charge of a convoy to Newfoundland. In this he was unsuccessful, and having been blamed for the loss of part of the convoy, was court-martialed, but was acquitted. In 1745 he commanded a ship off the coast of Portugal, where he fought a severe though indecisive action with a French man-of-war. Appointed Governor of New York in 1755, and rear-admiral of the blue the following year, he aided Admiral Boscawen in the siege and reduction of Louisbourg in 1758. He was second in command under Hawke during the blockade of Brest, and at the battle of Quiberon Bay was made vice-admiral in 1762, and admiral in 1770. The most important event in Hardy's professional life was his appointment to the command of the Channel Fleet in 1779, when an invasion by the combined French and Spanish fleets was immi-

nent. He had only thirty-nine ships of the line against the enemy's sixty-six; but the allied admirals declined to attack, and returned to Brest.

HARDY, GATHORNE. See CRANBROOK, First Earl of.

HARDY, THOMAS (1840—). An English realistic novelist, born in Dorsetshire. At the age of sixteen he was articled to an ecclesiastical architect in Dorchester. He studied for a time at King's College, London, and in 1863 received a prize from the Royal Institute of British Architects for an essay upon *Coloured Brick and Terra-Cotta Architecture*. He worked as an architect—especially in the Gothic School—under Sir A. Blomfield in London from 1862 to 1867, and though he deserted it for literature the following year, the influence of his early studies is left upon his writing. His desire for scientific precision sometimes leads him to the introduction of technical words and phrases, which mar the otherwise severe simplicity of his style. The architect is perforce the antiquary, and from the days when Hardy took professional excursions to different village churches to see if they were worth restoring, he steeped himself in the lore of his native county, which he calls Wessex.

His first publication was an article in *Chambers's Journal* (March, 1865), entitled *How I Built Myself a House*, and after an unsuccessful attempt, called *The Poor Man and the Lady*, which George Meredith advised him to reconsider, he brought forth his first novel, *Desperate Remedies* (1871), a crude and fantastic effort, but interesting as illustrative of the author's formative stage. He struck a surer note in *Under the Greenwood Tree* (1872), an idyllic love story, or, as the title-page has it, "A Rural Painting of the Dutch School." Here, the lightness of touch is equalled in none of his later work. *A Pair of Blue Eyes* (1873) marked Hardy's progress in the study of the whimsicalities of womankind, and their resultant tragedy; but *Far from the Madding Crowd* was the book which first gained him popular favor. While running as an anonymous serial in the *Cornhill Magazine* throughout the year 1874, it was attributed to George Eliot, not from any similarity of style, but because no other living author was considered capable of writing it. A farcical production, called *The Hand of Ethelberta: A Comedy in Chapters* (1876), illustrated by George Du Maurier, preceded *The Return of the Native* (1878), the first really great work of Hardy, and one which by some is even regarded as his masterpiece. By this time he had shaken off self-consciousness, invention had given place to imagination, and he was able to create dramatic characters and situations worthy of their inimitable stage setting, Egdon Heath. His description of that wild moorland, in the opening chapters, is a fitting introduction to the stormy lives that are mingled with it; and here the author's feeling for nature is most vividly illustrated. In *The Trumpet Major* (1880), he returned to his earlier manner of the *Greenwood Tree* and the *Madding Crowd* without attaining the graceful charm of the one or the strength of the other. Hardy is supreme in his own Wessex; here, he exhibits, on the one hand, a high degree of sensibility to the delights of her rural life, and, on the other, the keenest sympathy with the rustic point of

view. When he forsakes the types of these regions, the result is not convincing. A *Laodicean* (1881) justifies the name, in being neither cold nor hot. The tale *Two on a Tower* (1882) develops a very curious and complicated situation with much skill. But he is tethered to Wessex, and paints more confidently on that background, in *The Romantic Adventures of a Milkmaid* (1883), and in the *Mayor of Casterbridge: The Life and Death of a Man of Character* (1886), a title which is no misnomer. Henchard, the hero, is a strongly drawn personality, to whose level the author has been climbing, through similar types of men.

The Woodlanders (1887), though flanked by *The Return of the Native* and *Tess of the D'Urbervilles*, suffers from comparison with neither, expresses the same intimate kinship of man with nature, and gives like instances of true nobility engaged in the lowliest occupations. Of the *Wessex Tales* (1888), gathered from different magazines, the strongest is *The Three Strangers* (*Longman's*, March, 1883), which was dramatized under the title *The Three Wayfarers*, and produced at Terry's Theatre, in London (1893), eleven years after Comyns Carr's version of *Far from the Madding Crowd* had been seen in Liverpool, and in the Globe Theatre, London. Another collection of short stories entitled *A Group of Noble Dames* (1891) preceded the publication of *Tess of the D'Urbervilles: A Pure Woman Faithfully Presented* (1891), through which Hardy became most widely known. Whatever may be said for or against the purity of the woman, there cannot be two opinions regarding the vividness of the presentation, although the art of *Tess* is marred at times by philosophic digressions that do not match the remainder of the literary fabric. Yet it is doubtful if any one of Hardy's stories holds the reader's interest more closely, or makes a stronger appeal to his sympathies, than does this tragedy of *Tess*. Nor is there anywhere in Hardy's writing more convincing insistence upon a logical connection and a consequent force of uncontrollable circumstance, or more relentless reiteration of the idea that man may be forced to reap where he has not sown. Whether here, and elsewhere when he writes in this vein, Hardy reveals himself a fatalist, or a rigid moralist, is a question which will be answered largely in accordance with the temperament of the reader. A dramatization of *Tess*, made by Lorrimer Stoddard (1897) and taking no more than the usual liberties with the original plot, gave Mrs. Minnie Maddern Fiske (q.v.) the means for defending, even more effectively than does the author, the subtle characterization of the heroine.

Whatever else may be said of *Jude the Obscure* (1895), it seems quite apparent that here Hardy gives the fullest expression to his genius for minute and merciless character analysis. There is even a feeling, at times, that the psychology is in danger of being refined into nothingness. The story of *Jude's* early discouragements in his efforts to get a university education is said to be autobiographical to a certain extent. The whole is a harrowing, and yet in the main convincing, study of the degradation of a character cursed from the outset with certain of the most dangerous moral weaknesses, which are steadily cultivated by cunningly conceived cir-

cumstances and plausibly arranged episodes. It can scarcely be denied that both of these books are literary masterpieces in their genre; and consideration of the remarkable fertility and resourcefulness of expression which each displays, makes the more inexplicable their author's occasional descent to the employment of indelicate metaphor and frankly indecent 'realism.'

Life's Little Ironies (1894) are short stories evidencing Hardy's grim sense of humor no less than his appreciation of values. He knows and shows how few among the coveted prizes of life are worth a struggle. *The Well-Beloved*, which was serially published in 1892, and in book form five years later, is of less importance. The reciprocal feeling of his native county found expression in his appointment as one of its magistrates (1894). Some of Hardy's earliest efforts were in verse, and the stray poetical productions of thirty years were collected in two volumes, *Wessex Poems* (1899) and *Poems of the Past and Present* (1901). They bear his mark in the saturnine flavor of some, the sympathy with the country and country-folk of others, the patriotic English sentiment of all; but the instrument is not his own. He is hampered by the requirements of rhyme and rhythm, and has but little to say which he might not have expressed at least more spontaneously in prose. Consult: W. Sherren, *The Wessex of Romance* (London and New York, 1902); and Windle, *The Wessex of Thomas Hardy* (London and New York, 1901); Macdonell, *Thomas Hardy* (London, 1894); and Johnson, *The Art of Thomas Hardy* (London, 1894).

HARDY, Sir THOMAS DUFFUS (1804-78). An English paleographer, born at Port Royal, Jamaica. He succeeded Petrie as editor of the *Monumenta Historica*, published in 1848. As deputy keeper of the new Record Office he did much to make all records accessible to the public, and brought to London the muniments of the three palatinates. He edited many of the rolls for John's reign: *A Descriptive Catalogue of MSS. Relating to the History of Great Britain and Ireland* (1862-71); *Registrum Palatinum Dunelmense* (1873-78); *Catalogue of the Lords Chancellors, etc.* (1843); and articles on the date of the Athanasian creed.

HARDYNG, JOHN (1378-c.1466). An English chronicler. He was page to Sir Henry Percy, whom Shakespeare has immortalized as 'Harry Hotspur,' and went to the wars with his master. His rhyming chronicle, a curious but entirely unreliable document, evidences the profundity of his historical knowledge and his adaptability in treating current events in a manner pleasing to his patrons. Ellis's modern edition of this *Chronicle of England unto the Reign of King Edward V.* was published in 1812.

HARE (AS. *hara*, Icel. *here*, OHG. *haso*, Ger. *Hase*, hare; connected with OPruss. *sasnis*, OIr. *ccinach*, Skt. *śvaśura*, for **svaśura*, hare). One of a genus of rodent quadrupeds, of which there are many species very similar to each other. The Linnaean genus *Lepus* now forms the family Leporidae, of which a peculiar characteristic is the presence of two small incisors immediately behind the ordinary rodent incisors of the upper jaw, so that these teeth seem to be double. This peculiarity is also found in the pikas (q.v.). The

1. COMMON EUROPEAN RABBIT (*Lepus cuniculus*).
2. LOP-EARED RABBIT (domestic variety).
3. VARYING HARE (*Lepus Americanus*).

4. BLACK-EARED JACK-RABBIT (*Lepus melanotis*).
5. COTTON-TAIL (*Lepus sylvaticus*).
6. ROCKY MOUNTAIN PIKA (*Ochotona princeps*).

molar teeth, six on each side above and five below, are transversely grooved, and are formed of two vertical plates soldered together. All the animals of this family feed exclusively on vegetable food, and chiefly on herbage, although they are also fond of grain, roots, and the bark of trees. Their fore feet have five toes, their hind feet four; the soles are hairy. Their fur is soft; the colors mostly gray or brown. The alpine and arctic species become white in winter; and all, except one Indian species, have white upon the under surface of the tail. As this is invariably upturned in flight, it is regarded by naturalists as a recognition mark by which the young or companions may keep in view and follow their flying leader. From this characteristic arises the name 'cottontail,' popularly given to one of the smaller American hares. The black markings which become so conspicuous upon the ears of several species when they are lifted serve a similar purpose, and all disappear when the animal squats, and it then presents to the eye of the searcher only a neutral-tinted back. Hares thus offer good illustrations of 'protective coloration' and 'recognition marks' (q.v.). The rabbit also belongs to this family, but it is so different in many ways that it is described by itself. It may be said, in passing, that although the term 'rabbit' is used generally for all kinds of leporine animals in North America, where the true rabbit does not exist, it belongs exclusively to the burrowing *Lepus cuniculus* of Europe; and all others of the family, including all the American species, should be called hares. About thirty species of *Lepus* are known, of which one is found in South America and some twenty in North America.

HARES OF THE OLD WORLD. The type of the family is the common hare (*Lepus Europæus*), which is found all over Europe, except in Ireland, Scandinavia, and the north of Russia. Its length is from 20 to 22 inches, and its usual weight seven or eight pounds. Another familiar Old World species is the mountain or Alpine hare (*Lepus timidus*). This occurs in Ireland, all over Northern Europe and Asia, and in the Pyrenees, Alps, Caucasus, and thence east to Japan; while the Polar hare of America is regarded by some naturalists as identical with it. It is considerably smaller than the common hare, and has a rounder head, with shorter ears, hind legs, and tail, and a lighter-colored coat, which, at least in the colder parts of its range, turns white in winter. In Central Asia are found several other species, some of which are confined to the higher slopes of the great mountain ranges. A remarkable species is the Indian or hispid hare (*Lepus hispidus*), of the foothills of the Eastern Himalayas. This hare has coarse, bristly ears, which are shorter than the skull, small eyes, a tail which is dark below and above, and hind legs only a little longer than the front ones. It is not a gregarious animal, but it is said to burrow as a rabbit does, and its young, therefore, are probably born naked and blind. It is reported that its flesh is white. Sumatra has an allied species. In Africa several species of hares inhabit the more open parts of the continent from the Sahara to the Cape. The habits of all these (except the hispid) are much alike.

The members of this family live among rocks and bushes, or in open country among the grass and brush. Each has a 'form' in the grass or sheltered by a rock, and sometimes returns to

this form every day for much of the year. Hares feed at night, are mainly nocturnal in their movements, and do not return to their forms until sunrise. Because of the greater proportionate length of their hind legs, they run up hill more easily than down, and they develop great speed. All the members of the genus are remarkable for their extreme timidity, yet they are often bold and courageous in defense of their young, and pugnacious toward others of their own race. Their angry stamping upon the ground with the hind feet is well known to all countrymen. With these hind feet they can deliver powerful blows, and this is their method in fighting. The hare never becomes fat, but its flesh is excellent food. Though shot and trapped, the ordinary method of hunting it, as a sport, is by coursing with greyhounds—a sport of classic antiquity. (See COURSING.) It is a prolific animal, although not nearly so much so as the rabbit. The female produces from two to five at a birth, and may begin to breed at six months of age, and produce two or three broods a year. The young (*leverets*) are born covered with hair, and with the eyes open. When, as in the case of the hares of California, their natural enemies—beasts and birds of prey, and serpents—are greatly reduced, this multiplication goes on with little to check it, while if the food-supply is yearly added to by enlarging plantations, the increase may be so rapid that the animals become a serious menace to agriculture, and special efforts must be made to keep them down.

AMERICAN HARES. The Canadian Polar hare is a variety (*arcticus*) of the European northern hare, and turns from its brownish grizzle in summer to pure white in winter. It comes little south of the Arctic Circle, except on the east coast, where it is to be found in Labrador and Newfoundland. Other American hares turn white in winter, however. The most conspicuous of these is the 'varying' hare (*Lepus americanus*), which is distributed from the middle parts of the United States throughout the northern parts of the continent wherever forests grow. It shows a great variety of reddish and brownish tints, always with the tips of the ears black behind, and in winter among northern specimens only these black ear-tips relieve the snowy white of the pelage; but southern specimens often make only a partial change of coat. On the Western plains and in California are found several species of large hares of gaunt form and immense ears, naturally called 'jack-rabbits' ('liebres' by the Mexicans). Just how many species and subspecies of these there are, naturalists are not yet agreed, but practically five may be recognized. These include the white-tailed hare and the various black-tailed rabbits. The white-tailed or prairie hare (*Lepus campestris*) is found all over the plains north of Kansas and throughout the Utah Basin. It is the only jack-rabbit whose coat turns white in winter, and it may be recognized in summer by the fact that its tail is entirely white. The tails of the other jack-rabbits are more or less black on the top—a fact easily seen, as none of this group of hares turns up its tail as do the wood-hares. Among the Western black-tailed rabbits are: (1) A buff-bellied species found in California and southwestern Oregon (*Lepus Californicus*); (2) a large, long-limbed species inhabiting southern Arizona and Sonora, known as Allen's hare (*Lepus Alleni*); (3) a

widely distributed white-bellied animal with long ears, occurring in the Great Basin, and commonly known as the Texan jack-rabbit (*Lepus Texanus*); and (4) the tall black-eared jack of the Great Plains (*Lepus melanotis*). It is doubtful whether any real distinction exists between the two last named, and the jack-rabbit of the southern plains may be said to extend westwardly to the Pacific Coast.

These hares of the plains do not burrow, nor seek the protection of holes or shelter of any kind, beyond that afforded by a thicket of brush which may shield them from the winter's wind or the equally dreaded rays of the midsummer sun. Some dwell in a region where the winter temperature may fall as low as 50° F. below zero; others where the noonday sun heats the air to 140° and makes the rocks unbearable to touch; some in rich valleys, others on the sourest of deserts; yet all thrive with that remarkable adaptability to varying conditions which must be reckoned with in any consideration of these animals as a pest. Their food consists of grass, herbage, and largely of bark. It is difficult to find any considerable extent of country which does not supply enough of this fodder for a population of hares, and as they drink but little, they do not suffer from the lack of water even in an almost desert land, for the moisture in the ordinary desert herbage seems to be all they require. They have comparatively few enemies, against which they are guarded by their invisibility when crouched in their 'forms'; by their senses of sight and smell; and by the remarkable acuteness of their hearing, for the augmentation of which the great ears have been developed. If danger comes too near they can usually escape it by flight—a word that approaches literal accuracy as a description of the series of high bounds, each 15 to 20 feet in length, with which their great hind legs carry them over the ground.

They multiply rapidly, yet are not so fecund as is frequently alleged. Those in the arid Southwest seem to produce only one to three at a birth, but have several broods a year, between January and September; while the Northern species breed no more than twice, as a rule, with four to six young in a litter. Most births fall in April, May, and June. The period of gestation is about thirty days. The young are born fully furred, with their eyes open, and often with several teeth in sight. They attain their full size (but not weight) in about two months. It will be seen that at this rate of increase, under such favorable conditions as are brought about in the West by irrigation, agriculture, and the diminution of serpents and birds and beasts of prey, the danger from an over-population of hares is very great; and for many years this has been a serious pest. Large sums have been spent on 'rabbit-proof' fences, and on various devices for excluding the animals from fields and orchards; and still larger losses have occurred through the absence or failure of protection. The principal measure has been that of the periodical 'drive.' All the men and boys and many women and girls of a given district gather in a circle about a square mile or more of space, and drive the hares into an inclosure, where they are slaughtered with clubs. These battues have been most numerous, systematic, and effective in southern California, though occasional wherever the necessity arises, and in

the San Joaquin Valley have so reduced the hares that they are no longer dangerous. Students of the problem have concluded, however, that 'driving' is only a partial and a demoralizing remedy; and assert that the only true safety for crops and orchards lies in the rabbit-proof fence. A complete discussion of this matter, with its history, statistics, and teachings, together with much information as to the utilization of the American hares as food and for their skins, hair, etc., may be found in Palmer, *The Jack-Rabbits of the United States* (Department of Agriculture, Washington, 1896); Beddard, *Mammalia* (London, 1902).

WOOD-HARES. Of the smaller hares, the wood-hare or 'cottontail' (*Lepus sylvaticus*) is the 'common rabbit' of the United States, where it is scattered from the Atlantic to the Pacific, but does not extend far north. It is about 18 inches long, gray, more or less varied with black above, and somewhat tinged with yellowish brown; white below; tail cottony white; ears two-thirds the length of the head. The little marsh-hare (*Lepus palustris*), whose tail is not grayish nor cottony, and the water-hare or 'swamp-rabbit,' are familiar Southern species, the latter large and yellowish brown, white below.

Consult Audubon and Bachman, *Quadrupeds of North America* (New York, 1856); Stone and Cram, *American Animals* (New York, 1902); Sharp, *Wild Life Near Home* (New York, 1901); Thompson, *Wild Animals I Have Known* (New York, 1898).

See RABBIT; PIKA; and Plate of HARES AND PIKA.

HARE KANGAROO. One of the small banded wallabies (q.v.) of the genus *Lagostrophus*, which resemble hares, and have habits singularly like that animal's. They inhabit swampy districts on the west coast of Australia, and make refuges for themselves by forming tunnels through the dense scrub, biting away twigs and branches until a clear passage and chamber are formed.

HARE. In point of law, one of the wild animals called game, which are specially protected by game laws. The close season for hares is regulated in this country by State legislation. See GAME LAWS.

HARE, AUGUSTUS JOHN CUTHBERT (1834-1903). An English author, the nephew of Julius and Augustus Hare. He was born in Rome, and educated at Harrow and at University College, Oxford. The results of his travels he has given in guide books and other works of the highest value. Among them are: *Walks in Rome* (1870); *Cities of Northern and Central Italy* (1875); *Walks in London* (1877); *Cities of Southern Italy and Sicily* (1882). His *Story of My Life* (6 vols., 1896-1900) is full of delightful reminiscences of many celebrated people; and his *Memorials of a Quiet Life* (1872-76) is a charming biography of his aunt and uncles. To him we are also indebted for the only good life of Maria Edgeworth (1894).

HARE, AUGUSTUS WILLIAM (1792-1834). An English clergyman, brother of Julius Charles Hare. He was born in Rome, and was educated at Winchester and New College, Oxford, where he attacked several ancient customs, and became founder of the Attie Society. He had been adopted (1798) by the widow of Sir William Jones, his godfather, but broke with her because

of his refusal to qualify for the valuable living of Hurstmonceaux, formerly held by his father, and in the gift of the Jones family. He was a tutor at New College for several years, and became rector of Alton-Barnes, a small rural community, where he lived from 1829 until poor health drove him to Rome, where he died. He wrote *Sermons to a Country Congregation* (1837), and, with his brother, *Guesses at Truth* (1827). Consult Augustus J. C. Hare, *Memorials of a Quiet Life* (London, 1872).

HARE, GEORGE EMLEN (1808-92). An American clergyman, born in Philadelphia. He graduated at Union College in 1825, became a priest of the Protestant Episcopal Church, was rector of Saint John's, Carlisle, Pa. (1830-34); of Trinity Church, Princeton, N. J. (1834-43); and of Saint Matthew's, Philadelphia (1845-52). He had had charge of the Episcopal Academy during a part of his pastorate at Saint Matthew's, and was made instructor in the diocesan training school and, after its development into the Philadelphia Divinity School, a professor of biblical learning, and then (1881) of New Testament literature in the latter institution. He wrote: *Christ to Return* (1840); and a volume of sermons, *Visions and Narratives of the Old Testament* (1889).

HARE, JOHN (1844—). A well-known English actor and manager. He was born in London; was educated in Yorkshire; and made his first stage appearance at the Prince of Wales Theatre, Liverpool. Soon afterwards (1865) he came to the London Theatre of the same name, where he was very popular in the comedies of T. W. Robertson, with some of which in later years he toured in America. In 1875 he became manager of the Court Theatre, where he brought out *Olivia, A Scrap of Paper*, and other pieces. With Mr. Kendal at the Saint James Theatre (1879-88) he produced *Still Waters Run Deep* and *The Ironmaster*. In 1889 he assumed the management of the Garrick Theatre, and afterwards appeared with several of A. W. Pinero's plays, notably *The Notorious Mrs. Ebbsmith* and *Lady Bountiful*. He took the Globe Theatre in 1897, producing *A Bachelor's Romance* there, and in 1899 Pinero's *The Gay Lord Quex*, which he brought to America in the season of 1900-01. Consult: Pemberton, *John Hare, Comedian* (London, 1895); Scott, *The Drama of Yesterday and To-day* (London, 1899).

HARE, JOHN INNES CLARK (1817—). An American jurist, born in Philadelphia. He was educated at the University of Pennsylvania, was admitted to the bar in 1841, was associate judge of the Philadelphia district court (1851-67), then its presiding judge (1867-75), and from 1875 to 1895 was presiding judge of the Court of Common Pleas in the same city. In 1868 he received the degree of Doctor of Laws at the end of ten years' service as a trustee of the University of Pennsylvania, in which he served for many years as professor of the institutes of law. He wrote: *American Leading Cases*, with Horace B. Wallis (1847); *The Law of Contracts* (1887); and *American Constitutional Law* (1889); and edited: *Smith's Leading Cases in Law* (1852); *White and Tudor's Leading Cases in Equity* (1852); *Hare on Contracts* (1887); and *The New English Exchequer Reports*.

HARE, JULIUS CHARLES (1795-1855). Archdeacon of Lewes, a well-known English writer.

He was born at Valdagno, 50 miles northwest of Venice, Italy, September 13, 1795. While still a boy he passed a winter at Weimar (1804-05), where he met Goethe and Schiller, and gained a knowledge of German literature which influenced his style and sentiments throughout his whole career. On the death of his mother in 1806, he was sent to the Charterhouse in London, where he remained until 1812, when he entered Trinity, Cambridge. There he became fellow in 1818, and after traveling abroad he began to read law in London in 1819. In 1822 he was appointed assistant tutor at Trinity College, which position he retained for ten years. Turning his attention from law to divinity, he was ordained in 1826. In 1827 appeared the *Guesses at Truth by Two Brothers*, written by Hare and his eldest brother, Augustus William (q.v.). On the death of his uncle in 1832 he succeeded to the rich family living of Hurstmonceaux, in Sussex, where he accumulated a library of 12,000 volumes, especially rich in German literature. Before taking up his residence in his parish, he once more went abroad. In 1840 Hare was appointed Archdeacon of Lewes, and in the same year preached a course of sermons at Cambridge, *The Victory of Faith* (3d ed. by Plumpton, 1874); followed in 1846 by a second, *The Mission of the Comforter* (3d ed. 1876). In 1853 he became a Queen's chaplain. He was eminently unfitted to be a country parson, but did much better as an archdeacon. His sermons and charges were unmercifully long because he considered not at all the patience and interest of his auditors. But withal he was a scholar and a conscientious worker. He died at Hurstmonceaux, January 23, 1855. For his biography, consult A. J. C. Hare, *Memorials of a Quiet Life* (London, 1872).

HARE, ROBERT (1781-1858). An American chemist, born in Philadelphia. As a boy he was employed in his father's brewery, and had little spare time for study, but he managed to gain a considerable knowledge of chemistry and physics, and in 1801 invented the oxyhydrogen blowpipe. For this the American Academy of Boston awarded him the Rumford medal. He was professor of chemistry at the University of Pennsylvania from 1818 until 1847, and subsequently was elected a life member of the Smithsonian Institution. He made many ingenious and practical inventions of laboratory apparatus, and wrote a number of papers on scientific subjects, in addition to which he published: *Brief View of the Policy and Resources of the United States* (1810); and *Chemical Apparatus and Manipulations* (1836). His collection of chemical and physical apparatus is preserved by the Smithsonian Institution.

HARE, WILLIAM HOBART (1838—). An American clergyman, bishop of the Protestant Episcopal Church. He was born at Princeton, N. J., and was educated at the University of Pennsylvania. He preached in Philadelphia until 1870; was for three years the general agent of the foreign committee of the Board of Missions, and was then elected Missionary Bishop of Niobrara. In 1883 his diocese was extended to include the State of South Dakota. He wrote several pamphlets on missionary work in the West.

HAREL, A'RAÏ', PAUL (1854—). A French poet and innkeeper, born at Echauffour. He suc-

ceeded his grandfather as host of the inn *A la Croix Saint-André*; early showed himself master of a simple and beautiful lyric style; was elected a member of the Academy of Caen; and in 1887 received a prize from the French Academy. He published: *Sous les pommiers* (1879); *Gousses d'ail, et Fleurs de serpolet* (1881); *Les vingt-huit jours du caporal Ballandard*, with Le Vavascur (1882); *Rimes de broche et d'épée* (1883); *Aux champs* (1886); *La hauteur* (1889); the less successful play, *L'herbager* (1891); and *Voix de la glèbe* (1895).

HARELIP. A deformity of the lip, frequently involving also the roof of the mouth, consisting of a cleft through these structures, to one side of the median line, or on each side of it. Median fissure occurs at times, but is very unusual. It exists at birth, and the lip should be repaired during early infancy by operation. The cleft palate should be left till the bones have fully developed with adult life, and may then be repaired, or the opening may be closed with an obturator. In the ordinary (single cleft) form, the mouth of the babe resembles that of a cat or hare. The double-cleft palate is rare. See DEGENERATION.

HARELIP, or CUTLIPS. An elongated sucker (*Lagocheila lacera*), common in clear streams of the central Mississippi Valley. It is remarkable for having the lower lip divided into three distinct lobes, and otherwise strangely modified. Hence many local names, as 'splitmouth,' 'rabbit-mouthed sucker,' and 'pea-lip sucker.'

HA'REM (Ar. *kharim*, forbidden, from *kharama*, to exclude). The name given in Mohammedan countries to the apartment in a dwelling set aside for the female members of the household. The term is also applied to the ground around a mosque, and particularly to the mosques at Mecca and Medina. The Koran enjoins that women shall be discreet in their association with the other sex, and forbids them to expose face or person except to a husband, father, son, or certain intimate male relatives (Sura xxiv. 31; xxxiii. 53-55). But such injunctions are not peculiar to Islam, and the extraordinary precautions observed by Mohammedans with respect to their women represent a deeply rooted Oriental idea much older than the rise of Islam. The setting aside of a special apartment for women in a house is but one of these precautions, and undoubtedly antedates the time of Mohammed. The excavations conducted at Susa by Dieulafoy indicate that the palaces of the Persian kings contained a separate wing for the women, a view which is in accord with certain allusions in the Book of Esther (v. 12; vii. 1). In other books of the Old Testament there are also allusions to a special woman's apartment, and from the fact that in Babylonian *kharimtu* is one of the names for woman, we may conclude that already in ancient Mesopotamia the women were kept in a greater or lesser degree of seclusion. It is, however, due to the influence of Islam that the harem as an institution has been so rigidly maintained in the East. It is at the risk of life that a non-believer or a male Mohammedan who does not fall within the prescribed category of husband, father, son, or other intimate relative enters the harem of a Mohammedan householder, to which there is always a separate entrance. While within the household the social intercourse

between husband and wife is quite free, the wife or the wives of a man, attended by servants, mostly females, lead to a large extent isolated lives. The women visit one another, and spend most of their time in each other's apartments. Restrictions of various kinds are imposed on them when they leave these apartments. They are to be veiled when appearing in the street, are accompanied by a male servant, and it is equivalent to loss of caste for a woman to be seen in company with a man unless veiled and in the presence of her husband. The harem as an institution is not necessarily connected with polygamy, for although a Mohammedan has by the law of the Koran the right to take four wives, there are comparatively few householders who avail themselves of this rather costly privilege. One wife or a wife and a concubine form the rule, and it is mostly in the case of persons occupying a high official position that several wives are gathered together under one roof. By an unwritten law the Sultan has the right to seven wives; and an indefinite number of concubines, but it should be added that the tales of an extensive harem maintained by the rulers of Turkey are largely exaggerated, and rest upon a confusion between actual wives (or concubines) and female attendants and slaves, of which there are of course large numbers in a royal household. The harem customs and the treatment accorded the women vary considerably in the various Mohammedan countries—Egypt, Syria, Arabia, Persia, Turkey, and India. In general more liberties appear to be allowed the women of the harem in Turkey and India than elsewhere; but it must be remembered that even where the women are under the strictest surveillance, long-standing custom has deprived the technical imprisonment of any sense of degradation; and from the Mohammedan point of view, it is not for the purpose of humiliating women that the harem as an institution has been introduced. Care is exercised to preserve the position of the 'chief' wife, who takes rank above the others. In case a man has several wives, the latter may exact of their husband that each be provided with a separate apartment, consisting of at least a bedchamber and a kitchen. Within the harem, however, the woman reigns supreme; there she entertains her female friends, and there, surrounded by attendants to look after her wants, she spends her days with her children. The most objectionable features of the harem from the sociological and moral point of view are the idleness and vacuity of the life there, and the time-honored employment in large and particularly in royal households of eunuchs as supervisors of the harem and as attendants. Most of the tales of cruelty, immorality, intrigue, and crime to be found in works descriptive of harem life in the past may be traced to these features. Consult: Lane, *Manners and Customs of the Modern Egyptians* (London, 1837); Emmeline Lott, *Harem Life in Egypt and Constantinople* (London, 1869). Lady Mary Wortley Montagu's letters may be consulted for descriptions of harem life in the Sultan's household in the eighteenth century, but the picture is only in a measure applicable to present conditions.

HAREN, hā'ren, WILLEM VAN (1710-68). A Dutch poet, born at Leeuwarden. He studied there, at Franeker under Hemsterhuys and Heineccius, and at Groningen in the home of Jean

Barbeyrac. In 1728 he succeeded to the Castle of Henkenshage, at Saint Anna Parish, after the death of his grandfather. The castle was burned four years later, with many valuable papers. It was rebuilt in 1734; but the fire seemed the beginning of misfortune for him, and in 1768 he committed suicide, discouraged by financial losses. He wrote: A lyric, *Leonidas* (1742), urging Holland to join in the War of the Austrian Succession; *Lierganzen* (1742), which with *Leonidas*, was republished in 1824; and an epos, *Friso* (1742 and 1758). His brother, ONNO ZWIER (1713-79), was a patriot and poet, too. He wrote *De Geuzen* (1772) and several dramas, of which *Agon* (1769) is the best. The collected works of the two brothers were published in 1854. Consult Van Vloten, *Leven en Werken van Willem en Onno Zwier van Haren* (Deventer, 1872-74).

HARFLEUR, är'flër' (called in the Middle Ages *Harefot*). A town in the Department of Seine-Inférieure, France, near the mouth of the Lézarde, about four miles east of Havre (Map: France, G 2). The chief building is a beautiful Gothic church with an elegant tower supposed to have been constructed by Henry V. of England. Population, in 1901, 2686. In former times, before the rise of Havre, Harfleur was a flourishing town, and the key to the entrance of the Seine. It was taken by the English under Henry V. in 1415, retaken by the French in 1433, again seized by the English in 1440, and ten years later recaptured by Charles VII. of France.

HARFORD, JOHN SCANDRETT (1785-1866). An English biographer, born in Bristol, of Quaker parents. He was educated at Cambridge, but received an honorary degree from Oxford in 1822. He gave financial aid in the restoration of the Llandaff and Saint David's cathedrals, while he and his brother gave the ground for the erection of Saint David's College, Lampeter, Wales. The friend of Wilberforce and Hannah More, who immortalized him as *Cælebs in Search of a Wife*, Harford was a philanthropist, but an anti-socialist, less of a hero than a hero-worshiper, and wrote such excellent biographies as *R. V. Pryor* (1808); *T. Paine* (1820); *T. Burgess, Bishop of Salisbury* (1840); and *Rev. Richard Chapple Whalley, Rector of Chelwood* (1846). Perhaps his most important work is contained in the *Memoirs of Michael Angelo, Savonarola, Raphael, and Victoria Colonna* (2 vols., 1857).

HARGOOD, Sir WILLIAM (1762-1839). An English admiral. His first voyage began when he was thirteen years old, at which time he went to Newfoundland on the *Romney*. After service on other vessels, including the *Hebe*, on board which he had Prince William Henry, afterwards William IV., for a shipmate, Hargood was made commander of the *Swallow* in 1789. Three years later he was captain of a frigate taken by the French, and was court-martialed for surrendering too easily, but was honorably acquitted. His next experience was with mutineers on the *Leopard* in 1797, and the following five years he spent in Chinese and East Indian waters. In 1804-05 he was acting under Lord Nelson and was present at Trafalgar, when his ship, the *Belleisle*, and her crew suffered severely, as she was one of the first in action. Hargood's further services in North America, the West Indies, the Mediterranean, the Adriatic, and elsewhere were

rewarded by his appointment to the command of the Channel Squadron, with the rank of admiral (1831), and subsequently to the chief command at Plymouth (1833-36). He was knighted by the King, who ever retained for him a friendly regard.

HARGRAVES, här'grävz, EDMUND HAMMOND (1816-91). The discoverer of the gold-fields of Australia, born at Gosport, England. He was engaged in sheep-farming at Sydney, Australia, from 1834 to 1849, and spent the years 1849-50 in California. From the similarity in geological structure of the California gold-bearing districts to the west side of the Blue Mountains, in New South Wales, he concluded that there might be gold deposits in the latter place also. Accordingly he returned to Australia in 1850, was instrumental in the discovery of the Australian gold-fields in February, 1851, and made the first announcement regarding them to the Colonial Secretary at Sydney. He acted for a time as a Commissioner of Crown lands, and in 1853 was awarded the sum of £10,000 by the Legislative Council of Sydney. In 1877 the New South Wales Parliament voted him a pension of £250. He published *Australia and Its Gold-Fields: A Historical Sketch of the Progress of the Australian Colonies . . . with a Particular Account of the Recent Gold Discoveries* (1855).

HARGEAVES, här'grëvz, JAMES (?-1778). Inventor of the carding-machine and the spinning-jenny. He was an artisan at Stanhill, in Lancashire, where probably he was born. Hargreaves was an illiterate man, and supported himself and family by weaving and spinning, which, according to the custom of the time, he carried on in his own house. In 1760 he invented the carding-machine as a substitute for the use of hand-cards, and four years later he produced the spinning-jenny. Hargreaves had frequently tried to spin with two or three spindles at once, holding the several threads between the fingers of his left hand; but the horizontal position of the spindles frustrated his attempt. One of his children, however, is said to have upset the spinning-wheel while he was at work, and as he retained the thread in his hand, the wheel continued revolving horizontally and the spindle vertically. The observation of these motions produced the thought that if a number of these spindles were placed upright and side by side, many threads could be spun at once. Hargreaves now put his idea into practice, and constructed the jenny, at which he and his family worked. A few of these machines were sold and served to increase eight times the work of the spinner. This success led his fellow-spinners, who were imbued with strong prejudices against machinery, to break into his house and destroy his frame. He then removed to Nottingham in 1768, where he erected a spinning-mill. Two years later he took out a patent for his machine; and discovering that it was in use by manufacturers in Lancashire without his permission, brought an action for £7000 damages. Pending the trial he was offered by a company £3000 for the use of the jenny, but refused; and it having been proved that he sold some of his machines before the patent was obtained, it was thereby declared to have been invalidated, and his claim for compensation fell to the ground. Hargreaves

continued to carry on business as a yarn manufacturer, with moderate success, till his death in April, 1778.

HAR'GROVE, ROBERT KENNON (1829—). An American ecclesiastic, Bishop of the Methodist Episcopal Church, South. He was born in Alabama in 1829, graduated at the State University in 1852, and was professor of mathematics there from 1852 to 1857. He was employed in pastoral work and teaching until 1882, when he was chosen bishop. In 1889 he was elected president of the board of trustees of Vanderbilt University.

HARICOT. See KIDNEY-BEAN.

HARI-KARI, hä'rè kä'rè. See HARA-KIRI.

HÄRING, hä'ring, WILHELM. A German novelist. See ALEXIS, WILLIBALD.

HAR'INGTON, Sir JOHN (1561-1612). An English author, born at Kelston, near Bath, in 1561. He was son of John Harington, author of the graceful *Verses on Isabella Markham*. Queen Elizabeth was his godmother. Educated at Eton and at Christ's College, Cambridge, he studied law at Lincoln's Inn; but he soon became attached to the Court. At the command of Elizabeth he translated Ariosto's *Orlando Furioso* (1591). For this easy and free rendering of an Italian classic Harington is best known. In 1596 he lost for a time the favor of the Queen by a series of tracts in the outspoken manner of Rabelais: *Metamorphosis of Ajax* (i.e. 'a jakes'), *Ulysses upon Ajax*, *An Anatomy of Ajax*, and *An Apology*. He served in Ireland under Essex, and was knighted on the field by the Earl, to the great annoyance of Elizabeth. After long striving for preferment under James I., he became at length one of the tutors of Prince Henry, for whom he wrote some shrewd sketches of the bishops of Elizabeth's reign, entitled *A Brief View of the Church of England* (first published 1653). He also composed many popular epigrams (complete ed. 1618). He died November 20, 1612. Consult the memoir by C. Markham, prefixed to *Tract on the Succession*, Roxburge Club (Edinburgh, 1880); *Nugæ Antiquæ*, miscellanies in verse and prose, ed. H. Harington (London, 1769; reëdited by Park, 1804); and *Metamorphosis*, etc., ed. by Singer (Chiswick, 1814).

HARIRI, hä-rè'rè, ABU MOHAMMED AL-KASIM IBN ALI (c.1054-1122). A celebrated Arabic philologist and poet. He was born at Basra, about 1054, and died there, 1122. Little is known of his life and circumstances save that he was the son of a silk-merchant (whence his name Hariri, from *harir*, silk). Hariri wrote several valuable grammatical works, of which two have been published: *Durrat al-gawwas*, edited by Thorbecke (Leipzig, 1871), and *Molhat al-ivab*, edited and translated into French by Pinto (Paris, 1885-89). The most famous of all his writings, and one of the most remarkable compositions of all times and countries, is his book entitled *Makamat*, 'Sittings.' It may be described as a novel, or a collection of fifty rhymed tales, loosely strung together, the centre of which is always a certain Abu Zaid from Seruj, who, witty, clever, amiable, of pleasing manners, well read in sacred and profane lore, but a thorough rogue, turns up under all possible disguises, and in all possible places—sermonizing, poetizing, telling adventures and tales of all kinds—always amusing and always getting money out of his

audience. It is witty, imaginative, dramatic, and displays a great command of language. There have been many translations and imitations, of which by far the best is by Rückert, *Verwandlungen des Abu Seid von Serug* (Frankfort, 1826); there are English translations by Chapelton (London, 1767), Preston (ib., 1850), and Chenery (ib., 1867). The text has been edited with notes by De Sacy (Paris, 1882; reëdited by Reinaud and Derenbourg, ib., 1847-53); and by Steingass (London, 1896). Consult Delabre, "Hariri, sa vie et ses écrits," in *Revue Orientale*, 1853.

HARISCHANDRA, hä'rish-chän'drà. A Hindu king of the solar dynasty, a descendant of Ikshvaku, and one of the more prominent personages in the legendary history of ancient India. The earliest mention is made of him in the *Āitareya Brāhmana*, 7, 13-18 (see VEDA), where he is the subject of one of the most interesting legends of the Vedic period. He is represented here as desirous of obtaining a son, and of making a compact with the god Varuna, by which he proposed to sacrifice to the god his son, if he were granted one. Varuna accepted his prayer, and a son, Rohita, is born to the King. The *Āitareya-Brāhmana* then proceeds to relate how Harischandra delayed, from time to time, the fulfillment of his part of the compact, until at last the son himself finds his own substitute in Sunahšepa, the child of another, who sells his son for 100 cows, to be offered in sacrifice to Varuna. Ultimately, however, Sunahšepa was released from his bondage through the intervention of the gods. The story is important in connection with early accounts of human sacrifices. According to the epic poem *Mahābhārata*, Harischandra was a type of munificence and piety, and after death became elevated to the Court of Indra; and some of the Puranas are still more explicit on his fate. Having given his whole country, his wife and son, and finally himself, to Viśvāmitra, in satisfaction of the demands made by this priest, Harischandra, in consequence of this act, became elevated with his subjects to the paradise of Indra; but, having been misled by Narada to boast of his merits, was again precipitated. The repentance of his pride, however, arrested his downward descent, and he and his train paused in mid-air, where his city is popularly believed to be at times still visible. Consult Wilson's translation of the *Vishnu-Purāna*, The *Mārkaṇḍeya-Purāna*, bks. vii.-viii., translated by Wortham in the *Journal of the Royal Asiatic Society* (London, 1881), is the source of an interesting Sanskrit drama which deals with the text or trial of Harischandra. This play, entitled *Caṇḍa-Kāuśika*, is accessible in a cheap and admirable translation, with introduction, by Fritze, published in the Reclam Series (Leipzig, 1894).

HARIVANŚA, hä'rè-vän'shā. A Sanskrit epic composition of some 16,000 couplets, and forming a supplementary book to the *Mahābhārata*, of which it professes to be a part. In many respects, however, it resembles a Purāna (q.v.). As its title, 'Race of Hari, or Vishnu,' implies, it is devoted largely to the life and adventures of Krishna as an incarnation of the god Vishnu. Its first part gives an account of creation, together with the legendary dynasties leading down to its main theme, the life of its hero;

its third or last part treats of the future age and decadence of the world. Some allusions in Sanskrit literature which connect it with the *Mahābhārata* show that it must have been as old as the fifth century A.D., in fact as old as certain portions of the great epic itself, although these are generally regarded as later portions. As a rule the *Harivansa* is not considered by scholars to be a work of great antiquity or value, although often quoted by later Sanskrit writers. There is a French translation by A. Langlois (Paris, 1834); and the best separate edition of the text was published in Bombay (1891).

HARKAVY, här'kāvī, AVRAAM (OR ALBERT) (1839—). A Russian Orientalist and Hebrew rabbi, born at Novogrudok in Lithuania, and educated at Vilna and at the University of Saint Petersburg. He studied in Berlin under Rödiger and Dümichen, and in Paris under Oppert, and would have been appointed docent in Saint Petersburg save for a personal enemy. As librarian of the Imperial Public Library of Saint Petersburg, which is especially rich in Semitic manuscripts, he wrote *Studien und Mitteilungen aus der Sankt Petersburger kaiserlichen Bibliothek* (incomplete, 1879-92); and published, in Hebrew, several works on the Jews in Russia (1865 and 1867); in French, *Les mots égyptiens de la Bible* (1870), and *Sur un passage des 'Prairies d'or' de Macoudi concernant l'histoire ancienne des Slaves* (1876); in German, besides the *Studien* already mentioned, contributions to *Stade's Zeitschrift für alttestamentliche Wissenschaft*, a *Katalog der hebräischen Bibelhandschriften der kaiserlichen-öffentlichen Bibliothek* (with Strack, 1875); *Alljüdische Denkmäler in der Krim* (1876); *Aus dem archäologischen Congress* (1882); and *Neugefundene hebräische Bibelhandschriften* (1884); and in Russian, works on Mohammedan writers concerning the Slavs and Russians (1870); on the original home of the Semites, Indo-Europeans, and Hamites (1872); and contributed to the Russian edition of Gustav Karpele's *History of Jewish Literature* (1890). He edited vols. vi. and x. in the Russian edition of Graetz, *History of the Jews* (Leipzig, 1883-1902).

HARKNESS, ALBERT (1822—). An American scholar and educator, born at Mendon, Mass. He graduated at Brown in 1842, was senior master of the Providence High School from 1846 to 1853, pursued studies in Germany at the University of Berlin and that of Bonn, and was the first American to obtain a degree from the latter (Ph.D., 1854). In 1855 he was appointed professor of Greek in Brown University. He visited Europe in 1870 and 1883, and there made investigation of educational questions, in particular of the methods of German and English universities. He assisted in founding the American Philological Association, of which he was a first vice-president in 1869-70, and president in 1875-76. As a member of the Archaeological Institute of America, he was appointed in 1881 to the committee on the expediency of establishing an American School of Classical Studies at Athens, an institution which was opened in 1882. In 1884 he was elected director of the school. He lectured extensively before learned societies, contributed valuable papers on original researches in philology to the *Transactions* of the Association, and from 1851 published a series of textbooks in Latin studies, of which it may be said

that from them dated the beginning of a new era in the Latin department of classical education in America. The volumes include: *First Latin Book* (1851); *Second Latin Book and Reader* (1853); a *Latin Reader* (1865); *Introduction to Latin Composition* (1868, 1888); annotated editions of (1870, 1886) *Cæsar's De Bello Gallico*, of (1873, 1882) select orations of Cicero, and of (1878, 1884) *Sallust's Catilina*; an annotated *Course in Latin Prose Authors* (1878); and a standard *Latin Grammar* (1881), published in a thorough revision with many additions as *A Complete Latin Grammar* (1898). Professor Harkness received the degree of LL.D. from Brown University in 1869.

HARKNESS, WILLIAM (1837-1903). An American astronomer, born at Ecclefechan, Scotland, a son of James Harkness (1803-78). He was educated at Lafayette College, Rochester University, and in New York City, where he studied medicine. He served as a surgeon in the Union armies during part of the war. From 1862 to 1865 he was an aid in the United States Naval Observatory, and then, after service on the monitor *Monadnock*, was employed in the Hydrographic Office. During the eclipse of August, 1869, he discovered the coronal line *K 1474*. Three years later he was made a member of the Transit of Venus Commission, had charge of the party at Hobart, Tasmania, in 1879, and at Washington in 1882, when he became its executive officer. But his greatest fame rests on his theory of the focal curve of achromatic telescopes and on his invention of the spherometer, caliper, and other astronomical instruments. He was astronomical director of the Naval Observatory (1894-99), and director of the *Nautical Almanac* (1897-99). He retired two days after attaining the relative rank of rear-admiral (December, 1899). He was president in 1893 of the American Association for the Advancement of Science. Of his works, the most important is *The Solar Parallax and Its Related Constants* (1891).

HARLAN. A city and the county-seat of Shelby County, Iowa, 45 miles northeast of Council Bluffs; on the West Nishnabotna River, and on the Chicago and Northwestern and the Chicago, Rock Island and Pacific railroads (Map: Iowa, B 3). It is the commercial centre for a farming section, and manufactures gas and gasoline engines, foundry products, agricultural implements, bricks, flour, etc. Population, in 1890, 1765; in 1900, 2422.

HARLAN, JAMES (1820-99). An American lawyer and legislator, born in Clarke County, Ill. He graduated at Indiana Asbury (now De Pauw) University in 1845, studied law, and, moving to Iowa, became State Superintendent of Public Instruction in 1847. In 1850 he was tendered the Whig nomination for Governor, but refused it on account of being under the required age. In 1853 he was chosen president of Iowa Wesleyan University. Two years later he was elected to the United States Senate, but after he had served until January, 1857, his seat was declared vacant on a technicality. He was immediately reelected by the Iowa Legislature, however, and was again reelected on the expiration of his original term in 1861. His recognized ability as a legislator attracted the attention of President Lincoln, who in 1865 appointed him Secre-

tary of the Interior. In 1866 he resigned from the Cabinet to reënter the Senate, to which he had been reelected for a third term, and he continued as one of the Republican leaders in that body until 1872, when he was defeated for reelection by William B. Allison. From 1882 to 1885 he was presiding judge of the Court of Commissioners of Alabama Claims at Washington.

HARLAN, JOHN MARSHALL (1833—). An American jurist, born in Boyle County, Ky. He graduated at Centre College in 1850, and at the law department of Transylvania University in 1853; practiced his profession for a time at Frankfort, and became judge of Franklin County in 1858. From 1861 to 1863 he served in the Federal Army as colonel of the Tenth Kentucky Infantry, and from 1863 to 1867 was Attorney-General of Kentucky. He was a Republican candidate for Congress in 1871 and 1875, but was each time defeated, and in 1877 was appointed by President Hayes a member of the Louisiana Commission, which was formed to inquire into and so far as possible remove the obstacles to regular procedures under the laws and Constitution of the State, so that a single Legislature might come to be recognized, and the Government be maintained with armed resistance. In November, 1877, he was appointed an associate justice of the United States Supreme Court, where his conduct was marked by legal capability and intellectual vigor. When the constitutionality of the Wilson Tariff Act of 1894, providing for an income tax, was questioned, and a test case was brought before the Supreme Court, he was one of the four justices who upheld the validity of the instrument.

HARLAND, HENRY (1861—). An American novelist, born at Saint Petersburg, Russia, March, 1861. He was educated at the College of the City of New York and at Harvard, and, after traveling in Europe as a correspondent and serving for a time in the Surrogate's Office in New York City, removed to London, where, among other labors, he edited *The Yellow Book*. Among his novels may be named *As It Was Written* (1885); *Mrs. Peixada* (1886); *The Land of Love* (1887); *The Yoke of the Thora* (1887); *My Uncle Florimond* (1888); *Mr. Somnenschein's Inheritance* (1888); *A Latin Quarter Courtship* (1889). Later he produced *Mea Culpa* (1893), and won deserved success with *The Cardinal's Snuffbox* (1900) and *The Lady Paramount* (1902). His earlier novels, which dealt with American Jewish life, were written under the name of 'Sidney Luska.'

HARLAND, MARION. The pseudonym of the American novelist Mary Virginia Hawes Terhune (q.v.).

HARLAW. A locality in Scotland, about 18 miles northwest of Aberdeen, noted as the scene of a battle fought July 24, 1411, between the Highlanders under Donald, Lord of the Isles, and the forces of the Lowlands under Alexander Stewart, Earl of Mar. The Highlanders were defeated with the loss of nearly 1000 men. The battle of Harlaw passed into legend as one of the most desperate attempts on the part of the Celtic tribes of Scotland to stem the tide of Anglo-Norman invasion.

HARLAY DE SANCY, de sän'sé', NICOLAS. See SANCY, NICOLAS DE HARLAY DE.

HARLEIAN (här-lé'an) **COLLECTION**. A valuable collection of manuscripts in the British

Museum (q.v.), consisting of 7639 volumes and 14,236 original rolls, charters, deeds, and other legal documents. The collection, made by Robert Harley, first Earl of Oxford (1661-1724), and by his son, Edward Harley (1689-1741), was purchased by the English Government from Lady Oxford in 1753 for £10,000, and deposited in the British Museum. The collection is indexed. Consult *Life and Times of Robert Harley, Earl of Oxford* (New York, 1902).

HARLEM. A town in the Netherlands. See HAARLEM.

HARLEM. A village in Cook County, Ill., nine miles from the Chicago court-house; on the Chicago and Northwestern, the Illinois Central, and other railroads (Map: Illinois, C 1). It is mainly a residential suburb of Chicago, and has the well-known Harlem race-track. There are several cemeteries here, among them Forest Home and Waldheim cemeteries, the latter of note as the site of a monument to the anarchists who were executed for complicity in the riots of 1886. (See CHICAGO.) Settled in 1854, Harlem was incorporated in 1883. It is governed by a president, annually elected, and a board of trustees, chosen on a general ticket. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1900, 4085.

HARLEM. A local name for that part of New York City above 106th Street between the East and Harlem rivers and Eighth Avenue. Originally a separate settlement, for many years it was a quaint Dutch village, mainly of private residences surrounded by gardens and farms. It was noted for abundance of shade-trees, and the sleepy quietness so quaintly described by Washington Irving in the *Kniekerbocker's History of New York*. The designation is often applied, in a loose sense, to the entire northern portion of the city.

HARLEM RIVER. A tidal channel about 500 feet wide, separating Manhattan Island, New York City, from the mainland, and extending from the Hudson at Spuyten Duyvil Creek seven miles southeast to the East River at Randall's Island (Map: Greater New York, D 4). A short ship-canal across the northern end of Manhattan Island, between the Hudson and the Harlem, was opened in 1895. The Harlem is spanned by a number of bridges, the finest being Washington Bridge and High Bridge, the latter an aqueduct bridge. A magnificent roadway, known as the Speedway, has been constructed along the western shore of the Harlem. On a lofty eminence on the opposite shore are the beautiful buildings of New York University.

HARLEQUIN (OF. *harlequin*, Fr. *arlequin*, Ital. *arlecchino*, from OF. *herlequin*, *herlekin*, *hellequin*, *hellekin*, demon, from the Germanic; cf. AS. *helle cynn*, folk of hell; scarcely from It. *il lechino*, plate-licker, in allusion to the gluttony of the primitive Harlequin). One of the most noted of the conventional personages in pantomime (q.v.). The character developed in the early popular comedies of Italy (*commedia dell'arte*). Attempts to trace him back to the Roman *Atellana* and the mimic *Sannio*, through the Italian word *zanni*, are inconclusive. When the persons in the extempore comedy represented local types, Harlequin stood for Bergamo, just as did his brother *zanni*, Scapino, commonly for

Naples, and Pantalone, the old man whom Arlecchino served, for Venice, while 'the Doctor,' Scapino's master, was supposed to be a pedant from Bologna. Harlequin is a suitor of Columbine, and gets her away from poor Pedrolino (the French *Pierrot*). Though full of amusing blunders, Harlequin combines his childlike capers with a good deal of mature *finesse*. He is represented with a tight suit of parti-colored patches, a black mask, and a wooden sword. When he was introduced into France in the sixteenth century, the witty side of his character was more fully developed, and he was speedily adopted by other nations. Famous among the Harlequins of France in the seventeenth and eighteenth centuries were Domenico Biancolelli, called from Vienna to Paris by Mazarin about 1660; Vizenini, known as Thomassin and Bertinazzi, called Carlin, who won the admiration of Garrick. The first English Harlequin is said to have been Joe Haines, in 1667. During the eighteenth century, when pantomime became so popular at Drury Lane in Rich's time, Harlequin's name was attached to numerous pieces, such as *Harlequin Dr. Faustus* (1723), and *Harlequin, a Sorcerer*, a little later. Two other noted English Harlequins were Joseph Grimaldi (q.v.), and Tom Ellar, who died in 1842. The modern Christmas pantomime preserves the elements of the legendary plot, the lovers Harlequin and Columbine being favored by fairy interference in despite of their persecutors, Clown and Pantaloon. The word harlequin has come to be commonly used, however, in a general sense almost synonymous with clown.

Consult: Moeser, *Harlekin oder Vertheidigung des Grotesk-Komischen* (Leipzig, 1771; trans. by Warnecke, London, 1766); Reynaud, *Quelques mots sur Arlequin, etc.*, in *Etudes romanes dédiées à Gaston Paris* (Paris, 1891); Broadbent, *A History of Pantomime* (London, 1901).

HARLEQUIN CABBAGE-BUG, or CALICO-BACK. A bug (*Murgantia histrionica*) noted as a very destructive enemy to cruciferous vegetables in the Southern United States. It is an oval, somewhat flattened black bug with bright red and yellow markings, whence the names 'harlequin' and 'calico.' It lives throughout the year on cabbage, radish, mustard, and other cruciferous plants, puncturing the leaves with its beak and causing them to wither and dry. The eggs, which resemble miniature white barrels with black hoops, are laid in a double row on the under side of the leaves. There are several generations in a year, and the adult bugs hibernate. It is the worst enemy of the Southern cabbage-growers on account of the difficulty of destroying it. Mixtures made strong enough to kill the bugs kill the plants also. The best method is to plant an early trap-strip of mustard, upon which the over-wintering bugs will cluster in the spring, and upon which they may be killed with pure kerosene. This is originally a Central American insect, and has been spreading toward the northeast for 40 years or more. It is now found in southern New Jersey and in most of the intervening territory southwest to the Rio Grande.

HARLEQUIN DUCK. A name given, in allusion to its variegated colors, to a rare duck (*Histrionicus histrionicus*) inhabiting the polar regions, and occasionally seen in Northern Europe

and Canada. It is a near relative of the now extinct Labrador duck. Several other sorts of birds have been called 'harlequins' because of their quaintly contrasted colors.

HARLEQUIN-SNAKE (so called from the coloring). The small red and black venomous coral-snake (*Elaps fulvius*) of Florida, also called 'candy-stick.' See CORAL-SNAKE.

HARLESS, här'lēs, GOTTLIEB CHRISTOPH ADOLF (1806-79). A German Protestant theologian, born in Nuremberg. He studied theology at Halle and Erlangen, and became professor of theology at the latter institution. For his opposition in the Bavarian Diet of 1842 to the order requiring persons in the army to kneel at the passing of the sacramental host, he was removed from his professorship. In 1845, however, he was chosen to the consistory of Bayreuth, professor of theology at Leipzig, and Court preacher. In 1852 he was made president of the Protestant Consistory of Munich. Among his many important works are: *Theologische Encyclopädie und Methodologie* (1837); and *Die christliche Ethik* (1842; English trans. 1868). His autobiography, entitled *Bruchstücke aus dem Leben eines süddeutschen Theologen*, was published in 1872.

HARLETH, GWENDOLEN. The heroine of George Eliot's *Daniel Deronda*.

HARLEY. The hero of Henry Mackenzie's *Man of Feeling*.

HARLEY, Sir EDWARD (1624-1700). An English Parliamentarian, born in Brampton-Bryan, Herefordshire. Educated at Shrewsbury, Gloucester, and Oxford, he studied law, but took up arms in the Parliamentary cause against the King in 1642, though disapproving of military supremacy in the nation. By 1646 he was a member of Parliament for his native county, but his opposition to Cromwell brought about his banishment from it for ten years, though he was rewarded at the Restoration by Charles II., who made him Governor of Dunkirk (1660). Despite his changes of front (for he was against the Stuarts once more at the Revolution of 1688), Harley was a conscientious upholder of the rights of the people, who showed their appreciation by sending him continuously to Parliament. Though a churchman himself, he fought against any form of persecution of the dissenters, was without party prejudice, and was remembered more for his practical benefactions than for such theoretical performances as *A Scriptural and Rational Account of the Christian Religion* (1695).

HARLEY, ROBERT, Earl of Oxford and Mortimer (1661-1724). An English statesman. The son of Sir Edward Harley, he belonged to an illustrious Herefordshire family. The father had been a military officer, a member of Parliament, and an opponent of Cromwell during the Civil War. Robert, elected to Parliament for the borough of Tregony, was at first a Whig, but gradually changed his politics till he became leader of the Tory and Church party. His cleverness and tact, however, retained for him the support of many Whigs and Dissenters. He shortly acquired a great reputation for his knowledge of Parliamentary law and practice, a study not much pursued in those days; and in the Parliament which met under the chieftainship of Rochester and Godolphin in February, 1701, he was elected Speaker by a large majority.

Harley retained his post, having been twice re-elected, till 1705. In 1704 he became a member of the Privy Council and Secretary of State. Assisted by his cousin, Abigail Hill—afterwards Lady Masham—he excited Queen Anne against her Whig ministers, Marlborough and Godolphin, who in turn plotted against him. By convicting Harley's secretary of treasonable correspondence with France, they caused Harley himself, though entirely exculpated, to resign his office in February, 1708. Harley, on his part, by persistently working on the Queen through Lady Masham during his two years of retirement, finally brought about the overthrow of the Whigs. In August, 1710, Godolphin was dismissed, and Harley, appointed to the post of Chancellor of the Exchequer, brought back the Tories. An event occurred in 1711 which raised him to the acme of popularity. A French priest and spy, who assumed the title of Marquis de Guisehard, when brought before the Council on March 8th, on the charge of treasonable correspondence with the French, rushed upon Harley, and stabbed him with a penknife. He fell dangerously ill from the wound; and when he recovered he was congratulated by Parliament on his escape, created Earl of Oxford and Mortimer, decorated with the Garter, and in the following May appointed Lord High Treasurer of Great Britain. From this point Harley's course was downward; he was not a man of business, and was destitute of decision of character. He was an astute political leader, but lacked sincerity, breadth of view, and, in brief, all other noble qualifications. The principal act of his administration was the Treaty of Utrecht. Harley ceased to pay court to Lady Masham, and Bolingbroke succeeded in getting him dismissed on July 27, 1714. Lord Oxford retired on Tuesday; Bolingbroke became Premier; and the Queen died on Sunday. George I. was proclaimed, and the period of Tory ascendancy came to an abrupt end. The conduct of both the Tory leaders in their relations with the Stuarts had been such as to render their impeachment possible as well as probable. In March, 1715, Bolingbroke fled to France, but Oxford remained to meet his fate. He was sent to the Tower, and after two years' imprisonment brought to trial on a charge of treason. The two Houses quarreled about the mode of procedure, and as the Commons in anger refused to take any part in the trial, he was acquitted by the Peers and released. He spent the remainder of his life in retirement. He was the founder of a collection of books and MSS., which perpetuates his name. Consult: Burnet, *History of His Own Time* (6 vols., London, 1838); Macaulay, *History of England* (London, 1855); Stanhope, *History of England, Comprising the Reign of Queen Anne Until the Peace of Utrecht* (London, 1870); Lecky, *History of England in the Eighteenth Century* (London, 1878-90); Manning, *Speakers of the House of Commons* (London, 1851); Lodge, *Portraits of Illustrious Personages of Great Britain* (London, 1850); Howell, *State Trials* (London, 1809-26); Boyer, *Political State of Great Britain* (London, 1724); Roscoe, *Robert Harley, Earl of Oxford, Prime Minister 1710-14* (London, 1902).

HARLEZ, är'lä', CHARLES DE (1832-99). A Belgian Orientalist who attained to special eminence in the fields of Iranian and Chinese philology. He was born at Liège, and was educated

at the university there, and afterwards took clerical orders, and rose to be a distinguished prelate in the Catholic Church, with the title of monsignor. His interest in the Orient early attracted him to the study of Sanskrit and Avestan; and in 1867 he became actively engaged in teaching these studies at the University of Louvain. His translation of the Avesta, *Livre sacré des sectateurs de Zoroastre* (1875-77; 2d ed. 1881), still holds a high rank among scholars. It was followed by a series of other studies in Zoroastrianism: *Études avestiques* (1878); *Des origines du Zoroastrisme* (1879); *L'exégèse des textes avestiques* (1883); and several grammars or manuals for the study of Sanskrit (1878; 2d ed. 1885); Avesta (1879; 2d ed. 1882); Pahlavi (1880), including one also on Manchu (1884).

About 1884, in connection with his researches into the language of Manchuria, he began to turn from Persia and India to China, and he devoted the remainder of his life to investigations connected with the literature, language, and life of China herself. A long series of monographs or volumes from his pen on the subject of Chinese was the result. These are to be found published in the *Annals of the Musée Guimet*, of Paris, and in the *Memoirs of the Royal Academy of Belgium*. In 1896 a large number of his pupils and friends issued a volume in honor of this distinguished scholar; it bears the title *Recueil de travaux d'érudition offert à Mgr. Charles de Harlez* (Leyden, 1896). The breadth of Harlez's studies and interest is shown likewise by his acquaintance with several of the American languages and also with Magyar literature.

HARLINGEN, här'ling-en (Frisian *Harns*). A seaport of the Netherlands, in the Province of Friesland, situated on the Zuyder Zee, 16 miles west of Leeuwarden, with which it is connected by rail and canal, about 65 miles north-northeast of Amsterdam (Map: Netherlands, D 1). The town is cut up by canals and is built on the site of a city which was swept away by an inundation in 1134. It has a school of navigation. Harlingen carries on an active trade with England and Norway, exporting the agricultural products of the Province of Friesland, and is connected by steamship lines with Amsterdam, Hull, and London. The harbor is an excellent one, reconstructed in 1870-77, and protected by enormous dikes. Population, in 1890, 10,110; in 1900, 10,267.

HARLOT'S PROGRESS, THE. A group of six paintings by Hogarth, representing the history of a fallen woman, from her first false step to her tragic end. They were completed late in 1731. Five of the paintings were burned at Fonthill in 1755; the remaining one is now at Gosford House, in the possession of the Earl of Wemyss.

HARLOW, GEORGE HENRY (1787-1819). An English artist, born and educated in London. He was instructed by Henry De Cort, the landscape painter, Samuel Drummond, a portrait painter, and by Sir Thomas Lawrence. As the result of a quarrel with Lawrence he began to work out his own theories in defiance of academical rules. He had remarkable power of close and rapid observation, and soon had a number of portraits on exhibition at the Royal Academy, although he outspokenly opposed that institution. He

was less successful in historical painting, though several of his pictures of this kind showed strong points. In 1818 he visited Italy to study the old masters, and was very cordially received in Rome, where he worked assiduously, and made great progress. Soon after his return to England in 1819 he was seized with an acute throat affection which caused his death in less than a month. Harlow was an artist of great promise, who died before the full development of his powers. His works, notwithstanding defects of judgment and immaturity, have vital qualities of excellence. Among them are a group of portraits of Charles Mathews, the actor; "Queen Elizabeth Striking the Earl of Essex," "The Earl of Bolingbroke Entering London," "The Trial of Queen Catherine," and "Wolsey Receiving the Cardinal's Hat in Westminster Abbey."

HAR'LOWE, CLARISSA. The heroine of Richardson's *History of Clarissa Harlowe*. To escape a distasteful marriage she puts herself under the protection of a lover, who proves unworthy of her confidence. He offers to marry her to atone for his crime, but she refuses, and dies of shame broken-hearted.

HARMACHIS, här'mä-kīs (Egyptian *Hortakh*, Horus in the two horizons). An Egyptian god, a manifestation of Horus (q.v.). According to certain inscriptions, the gigantic Sphinx (q.v.) near the pyramids of Gizeh, perhaps a work of Chephren (q.v.), represented this god, but he is usually represented in the form of a hawk.

HAR'MALIN AND HAR'MIN (from Neo-Lat. *harmala*, from Ar. *harmal*, Syrian rue). Two vegetable bases occurring in the husk of the seeds of the *Peganum harmala*, or Syrian rue, a plant that grows abundantly in the steppes of Southern Russia. *Harmalin*, $C_{13}H_{14}N_2O$, when pure, crystallizes in colorless prisms. *Harmin*, $C_{12}H_{12}N_2O$, crystallizes in delicate prisms. The red coloring matter known in commerce as *harmala red* is obtained from the seeds of the same plant. The *Peganum harmala* belongs to the natural order Zygophyllaceæ. It is a half-shrubby plant, with smooth linear pinnate or bipinnate leaves, and solitary white flowers. The seeds are used by the Turks as a spice.

HAR'MAR, JOSIAH (1753-1813). An American soldier, born in Philadelphia, Pa., and educated at the Quaker School of Robert Proud. At the outbreak of the Revolutionary War he entered the patriot army as captain in a Pennsylvania regiment. He became its colonel in 1777, was promoted in 1783 to be brevet colonel in the first United States regiment, became brevet brigadier-general in 1787, and on September 29, 1789, was made commander-in-chief of the United States Army. In order to punish the Indian tribes of the Northwest, who had been incited to hostilities by British agents, an expedition under the command of Harmar was sent out from Fort Washington, on the site of the present Cincinnati, in 1790. He inflicted considerable damage in desolating the country through which he passed; but in a battle with the Miamis, fought in September of that year, the main body of troops was left unsupported in consequence of an advance sortie of the cavalry and some militia, and after a severe defeat the expedition returned to Fort Washington. Harmar resigned his com-

mission in 1792, and from 1793 till 1799 was adjutant-general of Pennsylvania.

HARMAT'TAN (through the Arabic; probably from the native name). A very dry wind along the west coast of Northern Africa from the Gulf of Guinea to Senegambia. This wind blows from the interior of Northern Africa or the Desert of Sahara southward and westward, and is felt over the Atlantic Ocean to a considerable distance from the coast. It prevails especially during December, January, and February, with occasional occurrences in November and March. On the Gold Coast it blows from the northeast in the night-time, but from the southeast at mid-day. During its prevalence the sky is cloudless and the regular diurnal variations of temperature are large; the morning minimum temperatures are lower and the mid-day maximum temperatures slightly higher; the relative humidity is from 25 to 50 per cent. below the normal, and this dryness produces rapid evaporation and a profound sensation of coldness. The barometric pressure is slightly higher during the first part of the Harmattan, and the wind, when once started, lasts for several days, or in extreme cases for several weeks. Vegetation is dried up very much as in the case of the dry winds of California and the plains on the eastern slope of the Rocky Mountains. The natives, being thinly clad, can prevent the skin from cracking and keep it soft and pliable only by anointing the body with oils or fats.

A peculiar whitish haze usually accompanies the Harmattan; this is due to the presence of an immense number of fragments of the microscopic shells of diatoms, together with other foreign matter floating in the air. As seen through this haze the sun and moon have a reddish tint. This diatomaceous dust is undoubtedly brought by the wind from the interior, possibly from the desert itself. The Harmattan wind is usually cool and dry, but in a few localities it is warm and dry. Everything points to the fact that it is a descending wind blowing out from under the great area of moderately high pressure that prevails over the Sudan, and toward an area of moderately low pressure temporarily prevailing over the equatorial part of the Atlantic Ocean. This wind blowing from the Sudan northward toward Europe becomes the Sirocco of Italy. The same wind blowing over the desert itself and carrying great clouds of sand gives rise to the Simoom. The cool, dry, cloudless weather and hazy horizon that prevail occasionally in the eastern portion of the United States, and especially in the dry months of California are analogous to the African Harmattan.

HARMENOPULOS, här'mën-öp'ū-lōs, KONSTANTINOS (c.1320-c.1380). A Byzantine jurist, an Imperial counselor under Kantakuzenos and John Palæologus and later a judge in Thessalonica. His *Promptuarium Iuris* (edited by Heimbach, 1851) had much use through the Middle Ages and has a certain value still. Consult Dirksen, *Das Rechtsbuch des Harmenopulos* (1847).

HARMO'DIUS AND AR'ISTOGI'TON (Lat., from Gk. Ἄρμόδιος, Ἀριστογείτων). Two Athenian citizens, of the family of the Gephyræi. Harmodius was a beautiful youth who ardently loved his relative Aristogiton. Hipparchus, son of the tyrant Pisistratus, endeavored to separate the two friends and to secure the friendship of

Harmodius for himself, but, not succeeding, avenged himself by insulting publicly the sister of Harmodius. Thereupon the two laid a plot to slay both Hipparchus and his brother Hippias on the day of the great Panathenaic festival, B.C. 514. The plot miscarried by reason of a premature attack being made. Hipparchus was slain, but Harmodius was at once overpowered by the guards. Aristogiton fled, but was afterwards taken and executed; though put to the torture, he did not disclose the names of the real conspirators. Hippias was afterwards expelled (B.C. 510), and then and in all later times Harmodius and Aristogiton were honored as martyrs who had fallen in the cause of liberty. Their praises were sung in drinking songs, and they received almost divine honors. Two bronze statues, made by Antenor, were set up in their honor on the Agora; these were carried away by Xerxes at the time of the Persian War, but were afterwards brought back by Alexander the Great. Other statues by Critius and Nesiotes, however, in 477 replaced those carried away by the Persian king. The descendants of Harmodius and Aristogiton enjoyed freedom from taxation and from all public duties. Consult: Harrison and Ver-rall, *Mythologies and Monuments of Ancient Athens* (New York, 1890); p. 77 ff.; Frazer, *Pausanias* (Cambridge, 1898), vol. ii., p. 92 ff.; and the better histories of Greece and of Greek sculpture.

HARMON, JOHN. The hero of Dickens's *Our Mutual Friend*, who, under the respective aliases of Julius Handford and John Rokesmith, returns to England, escapes a charge of murder, and watches the use which his deceased father's steward makes of his inheritance until his disguise is accidentally discovered. He eventually marries Bella Wilfer.

HARMON, JUDSON (1846—). An American lawyer. He was born at Newtown, Ohio, and graduated at Denison University in 1866, and at the Cincinnati Law School in 1869. He was originally a member of the Republican Party, but left it in the Greeley-Grant campaign. In 1878 he was elected to the Superior Court of Cincinnati; but nine years later he returned to active practice, from which, in 1895, he was called to succeed Richard Olney as Attorney-General in President Cleveland's second Cabinet. In 1897, immediately after his retirement from the Cabinet, he was elected president of the Ohio Bar Association. Soon afterwards he became a lecturer on agency in the law department of the University of Cincinnati.

HARMONIA (Lat., from Gk. Ἄρμονια, from ἄρμος, *harmos*, joint, from ἀρῆν, *arēn*, to be about to join). In the Theban legend, the daughter of Ares and Aphrodite, and wife of Cadmus (q.v.), who received her after slaying the dragon. The wedding was attended by all the gods, and in the Theban cycle seems to have occupied as prominent a place as that of Peleus and Thetis in the tale of Troy. Among the gifts were a mantle and necklace, which played a large part in the later legend as bringing ruin to their possessors; with the necklace Polynices bribed Eriphyle to betray her husband, Amphiarus (q.v.), to his death. When Cadmus was introduced into the Samothracian mysteries, Harmonia became the daughter of Zeus and Electra, and sister of Dardanus and Iasion, and the marriage was cele-

brated at Samothrace. Another version told how Cadmus carried off Harmonia, who was sought during the mysteries, as Core at Eleusis. Harmonia seems originally to have been a goddess of love and the harmonizing power of nature. Different in origin is the Attic Harmonia, who joins in the chorus of Muses and Graces, as companion of Aphrodite, and even becomes mother of the Muses in Euripides. There she is simply a personification of order and harmony.

HARMONICA (Neo-Lat. nom. sg. fem., from Lat. *harmonicus*, Gk. ἁρμονικός, *harmonikos*, harmonious, musical, from ἁρμονία, *harmonia*, harmony). A musical instrument, invented by Benjamin Franklin. The instrument consisted of a series of glasses, each one in the shape of a cup, or half-globe, being put into a revolving motion on its centre, while the moistened rim was touched by the finger. Franklin, in a letter dated July 13, 1762, to Padre Beccaria, at Turin, mentions the history of his invention. An Irishman named Puckeridge was the first to hit on the idea of playing airs on a row of glasses, which he tuned by putting water into each. He performed publicly in London; but he and his glasses were burned in a conflagration in London in 1750. When Franklin finished his invention he found an excellent performer in a Miss Davis, to whom he made a present of his harmonica. Miss Davis, in 1765, performed on the harmonica in Paris, Vienna, and all the large cities of Germany with great effect. The compass of its notes was from C to F, including all the chromatic semitones. All attempts to make the harmonica, through means of keys, easier for amateurs, ended in failure, as no substance was found to act as a substitute for the human finger, which doubtless imparted an expression to the sound which no dead substance could possess.

HARMONIC CURVE. A curve formed by the vibration of a musical string. The curve of sines (q.v.) is a simple harmonic curve. The name harmonic was used in this connection by the Greek geometers in investigating the theory of music.

HARMONIC DIVISION. In geometry, a line-segment AB is said to be *harmonically di-*

vided when two points are taken, one in the segment and the other on the segment produced, as C and D, such that

$$AC : CB = AD : DB$$

Four quantities, a, b, c, d are said to be in *harmonic proportion* when their reciprocals $\frac{1}{a}, \frac{1}{b}, \frac{1}{c}, \frac{1}{d}$ are so related that $\frac{1}{b} - \frac{1}{a} = \frac{1}{d} - \frac{1}{c}$

The 'harmonic mean' of two numbers, a, b , is $\frac{2ab}{a+b}$.

It is the reciprocal of the arithmetic mean of the reciprocals of the two numbers.

HARMONICON (Neo-Lat., from Gk. ἁρμονικόν, *harmonikon*, neu. of ἁρμονικός, *harmonikos*, harmonious, musical), **CHEMICAL.** An apparatus consisting of an open glass tube, the air in which may be made to give a sound resembling a musical note when it is held over a jet of burning hydrogen. The sounds produced arise

HARMONIC STOP. An organ-stop, having pipes double the usual length, and pierced midway, so that the tone produced is an octave higher than the ordinary pitch. Harmonic stops are composed generally of more than a single rank of pipes, tuned in octaves, double octaves, and double or triple thirds and fifths above the natural pitch of the keys; they comprise the mixture, furniture, cornet, etc. Those which have only a single rank of pipes tuned in thirds, fifths, with their octaves above the pitch represented on the keyboard, are called 'mutation stops.' They were introduced to give additional power to the 'foundation stops,' and also to produce a more brilliant effect in the performance of certain styles of music. See ORGAN.

HARMONIOUS BLACKSMITH, THE. An old tune to which Handel wrote variations, and the composition of which, after his death, was ascribed to him. The composer of the original is unknown.

HARMONISTS. A communistic society, founded by George Rapp, who was born in Iptingen, Württemberg, in 1757. He became convinced that the churches around him were not truly representative of Christ's teachings, and in 1787 began preaching a higher spiritual life. Although Rapp and his followers demeaned themselves as peaceable and law-abiding subjects, they excited jealousy and opprobrium, suffered persecution, and were fined and imprisoned. In 1803 they determined to emigrate to America, where a tract of 5000 acres of land was bought in Butler County, Pa., in the valley of the Connoquenessing. Here the Harmony Society was formally organized, February 13, 1805, and its constitution was adopted, in signing which all the members agreed to throw all their possessions into a common stock, to live and dress simply, to hold all things in common, and to labor for the good of the whole body. In the spring of 1805 the community numbered about 125 families, or not quite 750 persons. In 1807 the society was stirred by a profound religious awakening. The members became convinced that it was their duty to give up marriage and adopt the principle of celibacy as being the higher and holier estate. But no marked formalities of separation were instituted. Those who had been husband and wife continued to occupy the same house, with their children, but thereafter treated each other simply as 'brother and sister in Christ.' At the same time the use of tobacco was given up. Although the settlement on the Connoquenessing prospered, the location in a few years proved unsuitable to the needs of the community, and in 1814 a new tract of 30,000 acres was bought in Posey County, Ind., at the site of the present town of New Harmony (q.v.), to which the Harmonists removed during the ensuing twelve months. At this place they increased and prospered, their enterprises flourished, and their membership rose to about one thousand souls; but they became again dissatisfied on account of unhealthy and other unfavorable local conditions. They sold their property to Robert Dale Owen (q.v.), and removed in 1825 to what became their permanent home in Beaver County, Pa. Here they built the village of Economy, on the Ohio River, about 20 miles north of Pittsburg, a place long celebrated as an example of neatness and industrial thrift. The

community has suffered one serious division: In 1832 250 members, having become alienated under the influence of a German adventurer, Bernhard Müller, who called himself the Count de Leon, determined to withdraw, and a separation and apportionment of property were agreed upon.

The management of the community was entirely in the hands of Rapp during his lifetime. After his death, in 1847, it passed to a board of elders, of whom Jacob Henrici was most prominent as trustee. Since 1891 John S. Duss has been the active manager. With not a few vicissitudes, throughout much of its career, the society has enjoyed great prosperity. In 1874 its property was valued between \$2,000,000 and \$3,000,000, and it had then 110 members, besides 25 or 30 children and hired laborers. The United States census in 1890 gave it 340 members. It was about that time heavily indebted, but has since been nearly freed from its obligations. The adoption of celibacy checked the growth of the society, and tended to repel converts. At present (November, 1902) the membership has fallen to eight. Plans for the restoration of the community are said to have been formed. Consult: Aaron Williams, *The Harmony Society at Economy, Pennsylvania, Founded by George Rapp, A.D. 1805, with an Appendix* (Pittsburg, 1876); Charles Nordhoff, *The Communistic Societies of the United States* (New York, 1874); William Alfred Hinds, *American Communities* (rev. ed., Chicago, 1902).

HARMONIUM (Neo-Lat., from Gk. *ἁρμόνιος*, *harmonios*, harmonious). A reed organ with bellows which are operated by the feet of the performer. The tone is produced by free vibrating reeds. The harmonium is a development from the older regal (q.v.). In 1810 Grenié exhibited the first harmonium, which he called *orgue expressif*, because this instrument was capable of greater expression, as well as of producing a crescendo and diminuendo. A. Debain, of Paris, improved it, and first gave it the name of harmonium when he patented his instrument in 1840. A complete revolution in the construction of the harmonium was begun in America when a mechanic who had worked in the factory of Alexandre in Paris emigrated to America. This man conceived the idea of a suction bellows, instead of the ordinary bellows which forced the air outward through the reeds. The firm of Mason & Hamlin, of Boston, in 1860 made their instruments with the suction bellows, and this method of construction soon superseded all others.

HARMONY (Lat. *harmonia*, Gk. *ἁρμονία*, *harmony*). The science which treats of chords, their structure, relation, progression, and resolution. As such it forms to-day the fundamental branch of the science of musical composition. All tones are regarded as elements of some fundamental chord, and for this reason the voices lose much of their individual freedom which they have in counterpoint, but are regarded more as affecting the relations of successive chords. As taught to-day, harmony comprises the study of intervals, chords, their structure, inversions, and chromatic alterations; progression of the various voices; suspensions, anticipations, and passing notes; modulation. Harmony, in our acceptation of the term, was unknown to the ancients. Only in the tenth century did a Flemish monk, Hucbald, conceive the idea of setting a second voice a fifth

below the original cantus. This crude experiment was the beginning of harmony. In the sixteenth century Zarlino, in his great work *Istituzioni harmoniche*, established the consonance of the third, and also discovered the polarity of major and minor. That this discovery did not bear fruit immediately is due to the invention of figured bass, which determines all intervals from the bass tone instead of the *fundamental*. Tartini, in the eighteenth century, tried to develop Zarlino's ideas, but failed because he could not get away from the theories of figured bass. Thus the idea of the polarity of major and minor fell into oblivion, until in 1853 Moritz Hauptmann (q.v.) established this relation on a firm scientific basis. But after the third was once recognized as a consonance, the basis for the construction of chords was given. Still, music could not free itself from the fetters of the church modes (q.v.). Hence the development of music took place along the lines of polyphony (q.v.) or contrapuntal writing. Only after the establishment of the major and minor modes in place of the church modes, and the subsequent introduction of equal temperament (q.v.), which rendered modulation into all keys possible, could music develop harmonically. Thus Bach, while marking the highest development of the polyphonic contrapuntal style, at the same time marks the beginning of homophonic harmonic writing. Since then the progress of harmony has been very rapid. Progressions that startled one generation by their dissonance and boldness were accepted as pleasing and natural by the next, until, in the works of the great masters of the nineteenth century, we have a wealth and variety of harmonies that their predecessors never dreamed of. To-day all music is conceived as resting upon a *harmonic* basis. All tones are regarded on the basis of consonant chords, so that dissonant chords are conceived not as independent formations, but as modifications of a fundamental consonant chord. That this view is the only rational one, and rests upon a natural basis, is conclusively proved by the fact that the works of the greatest writers of the polyphonic style can all be reduced to a simple harmonic basis.

The importance of harmony in modern music cannot possibly be overestimated. Emotional expression depends almost entirely upon the choice of harmonies. The same melody harmonized differently is capable of expressing widely different moods and emotions. This is strongly illustrated by the leading motives in the works of Wagner. The same melodic phrase occurs frequently in a different harmonic garb in accordance with the varying demands of the dramatic situation. The development sections of Beethoven's symphonies and sonatas afford innumerable examples of wonderful and surprising effects produced by different harmonization of the original themes. Simple folk-songs can be invested with a transcendent beauty by a judicious, refined harmonization. For example: The simple German folk-song, *Es ist bestimmt in Gottes Rath*, appeals to every one through its tender melody sustained only by the simplest harmonic chords. Mendelssohn has taken this simple melody, and, without altering even a note, has harmonized it so exquisitely that his version appears like a high-art song. Upon closer examination, we will find that the tender sadness of the original melody has been intensified by Mendelssohn's rich harmonies into

sorrowful resignation. It is highly interesting to compare the many harmonic settings of Luther's famous hymn, *Ein feste Burg ist unser Gott*. Bach's wonderful setting cannot be surpassed; (ex. 1) and yet what a different character does

EX. 1.

Wagner impart to this simple melody when he introduces it in his *Kaisermarsch* (ex. 2). The

EX. 2.

three notes constituting the melodic outline of the motive of Fate in the *Nibelungen* are surely insignificant enough in themselves. This motive derives its solemn and majestic character solely from the rich underlying harmony (ex. 3). One

EX. 3.

more example to prove the importance of harmony. The principal theme of the allegretto in Beethoven's A major Symphony is almost appalling in its meagre monotonous melody. Yet, by means of the most marvelous harmonic combinations, the master has transformed it into one of the most impressive and deeply emotional phrases to be found in the whole range of music (ex. 4).

In the great masters the gift of harmony is inborn. Wagner expressly declares that no melody ever occurred to him apart from its harmonic basis. Yet a talent for harmony can be cultivated to a certain extent. Every thorough musician is capable of harmonizing a given melody in several ways. Besides the choice of the chords there is another important factor, namely, the proper distribution to the different voices of the different tones composing a chord. This has to do with the leading of the voices and the rules to be observed in correct writing. It cannot be the object or purpose of an article like the present to attempt a technical exposition of so broad a subject as harmony. The following is, therefore, intended to give the general reader some idea of the scope and function of the various subjects comprised under the collective title of harmony.

INTERVALS. Under this heading the tones are treated in respect to the distance or difference in the degree of the scale that separates them one from the other. If two tones are sounded simultaneously they form *harmonic* intervals; if sounded successively, *melodic* intervals. All intervals are reckoned from the fundamental tone

of the scale. When the same tone is sounded on two different instruments the interval is called a *prime*, both tones being on the same degree of the scale. The tone upon the second degree forms the interval of the second with the fundamental tone, and so on, until the eighth degree is reached, which is the same as the first, one octave higher. Generally, all intervals are reckoned within one octave; thus C-c² is a third, although the two

tones composing a chord, a distinction is made between *close* and *open*, *spread* or *extended* har-

EX. 4.

tones are separated by more than three octaves. For theoretical purposes, however, the intervals of the ninth, tenth, eleventh, and twelfth are recognized. Intervals are classed as *consonant*

mony. In example 9 the first chord (a) is in *close* harmony because none of its tones can be transposed an octave, and still fall within the other tones of the chord. The second chord (b)

EX. 8.

and *dissonant*, and again as *major*, *minor*, *augmented*, *diminished*, and *perfect*.

CHORDS. Under this heading are treated the nature and formation of chords. The fundamental chord is the triad consisting of three tones, the prime, third, and fifth. According as the major or minor third is used, the chord itself is major or minor. The presence of an augmented or diminished interval renders the chord likewise augmented or diminished. All chords are constructed by means of thirds (ex. 5). By

TRIADS.

Major. Minor. Augmented. Diminished.

EX. 5.

adding the interval of a third to any triad a chord of the seventh is obtained, so called because the last added tone forms the interval of a seventh with the fundamental tone of the chord (ex. 6).

All chords can be inverted, i.e. any tone of a chord can be in the bass or lowest part. When the fundamental tone is in the

bass the chord is said to be in its fundamental position. With the third in the bass we obtain the first inversion; with the fifth in the bass we have the second inversion (ex. 7). Chords of the seventh admit three inversions (ex. 8). With respect to the relative position of the various

is in *open* harmony, because by transposing the E an octave, it falls between the tones C and G of the chord (ex. 9). Likewise, transposing the G an octave lower, it falls between C and E.

PROGRESSION OF CHORDS. Each tone composing a chord is regarded as belonging to a distinct voice or part. The rules governing the progression of chords are exceedingly few and simple, yet it requires long and constant practice to acquire the art of leading the voices correctly. (1) Parallel octaves and fifths are strictly forbidden. This means that two tones of one chord forming the interval of an octave or a fifth must not progress in such a manner as to form the same interval in the next chord (ex. 10). The example under (a) is bad because the progressions e-d and f-g produce fifths in both chords. The correct progression is given under (b). Octaves

EX. 10.

and fifths may be open or covered. They are open, as in example 10 (a), when the forbidden intervals occur in both chords; covered when they occur only in the second chord as the result of parallel motion, as in the following (a) (ex. 11). These covered fifths can be avoided by leading the

voices, as under (b). (2) The leading tone can never be doubled. As the leading tone always

EX. 11.

demands the progression of a semistep upward into the octave, it is clear that a doubling of this tone would necessitate the faulty progression of open octaves. (3) Chords must not progress so as to produce an inharmonic relation. This means that a tone of one chord cannot appear chromatically altered in the next chord, except in the same voice. For instance, if *g* appears in one chord in the tenor part, a *g#* or *gb* can be introduced in the succeeding chord *only* in the tenor part. In the following example the faulty progression under (a) is corrected under (b) (ex. 12). (4)

EX. 12.

The interval of the seventh is never to be doubled; neither is any augmented or diminished interval to be doubled, for all such intervals are dissonant, and hence are sufficiently prominent if they occur in only one voice.

With respect to one another, the different voices

EX. 13.

may proceed in *parallel*, *contrary*, or *oblique* motion. The motion is *parallel* if both voices either rise or fall together; *contrary* when one rises and the other falls; *oblique* when one remains on the same tone, while the other either rises or falls (ex. 13). With respect to the number of voices

often also the fifth, seldom the third. In two-part writing some interval must be omitted, and this is almost always the fifth. The number of parts is not restricted. There are compositions for as many as twenty-four, and even thirty-two parts. Of course it requires absolute mastery to handle such a number of parts.

place upon the weak beat, while the suspension itself occurs upon the strong beat (ex. 14).
PASSING NOTES AND CHANGING NOTES. By passing notes are meant notes of short duration that do not affect the harmony, but only serve as a connective element between chords, as in

EX. 14.

EX. 15.

EX. 16.

employed, a distinction is made between two-part, three-part, four-part, etc., writing. The kind most generally used is the four-part. As a triad contains only three tones, it is evident that in four-part writing one of the intervals must be doubled. This is generally the fundamental tone,

ex. 15 (passing notes marked*). A changing note is one that lies a second above or below a tone belonging to a chord. Whereas passing notes occur always in passages progressing by steps, changing notes generally proceed by skips, as ex. 16 shows (changing notes marked*).

ANTICIPATIONS, SUSPENSION, RESOLUTION. Tones may also appear in other chords than the ones to which they belong. When one or more voices proceed to tones of the next chord, while the remaining voices sustain the harmony of the first chord, *anticipation* occurs. *Suspension* takes place when one or more voices hold the tone of the previous chord when the other voices have already proceeded to the harmony of the next chord. As the tones thus held do not belong to the chord with which they are sounded, they cause a dissonance. All dissonances require reso-

In the above examples, only the soprano contains the passing and changing notes. It is possible, however, to have more or all voices move in notes of the same value as the soprano. The different tones of the different voices then form chords. All chords containing one or more of the notes marked * would then constitute *passing chords*.

CADENCES. It is important to pay attention to the closing of a piece. The two principal cadences are the *authentic* and the *plagal*. The authentic cadence is the resolution of the dominant chord into the tonic. When the soprano has the fundamental tone of the tonic, and the bass the fundamental tone of both the dominant and tonic chords, the close is called a *whole cadence*. It is at the same time a *perfect cadence*. The *whole cadence* is *imperfect* when the soprano has any other interval than the fundamental of the tonic, or the bass any other than the fundamental tone of the dominant chord. A *half cadence* is the resolution of the tonic into the dominant chord, the reverse of the *whole cadence*. Instead of the tonic chord other triads may be used, especially those of the second, fourth, or sixth degree. A half cadence that occurs very frequently and is very beautiful is the *Phrygian cadence*. It consists of the resolution of the sub-dominant into the dominant in the minor mode. The *plagal*

MODULATION. Although every composition is written in a certain key, wearisome monotony would result were the composer to restrict himself only to chords properly belonging to that key. Chords belonging to other keys are introduced with more or less frequency. Every such departure from the original key is a modulation. To modulate with artistic effect the relation of the keys and the chords belonging to each must be thoroughly understood.

While pursuing the study of harmony the student at the same time is trained in the science of figured bass. It is the rule followed in all modern treatises on harmony to write out the exercises in figured bass notation. This indicates the choice of chords, whereas the leading of the voices and the distribution of the tones is left to the student.

There is no dearth of excellent works on harmony. Among the most famous are: Fétis, *Esquisse de l'histoire de l'harmonie* (Paris, 1840); *Traité complet de la théorie et de la pratique de l'harmonie* (Paris, 1844); Dehn, *Theoretisch-praktische Harmonielehre* (Berlin, 1840); Hauptmann, *Die Natur der Harmonik und der Metrik* (Leipzig, 1853, 1873); Marx, *Die Lehre von der musikalischen Komposition* (Leipzig, 1847, new edition revised by Riemann, Leipzig, 1889); Richter, *Lehrbuch der Harmonik* (Leipzig, 1888);

Whole Perfect Cadences. Whole Imperfect Cadences. Half Cadences.

Phrygian Cadences. Plagal Cadences. Deceptive Cadences.

Mixed Cadences. Various Cadences.

The image displays three rows of musical notation, each with two staves (treble and bass clef). The first row shows three types of whole and half cadences. The second row shows Phrygian, plagal, and deceptive cadences. The third row shows mixed and various cadences. Each example is a short musical phrase illustrating the specific harmonic resolution.

EX. 17.

cadence is the resolution of the sub-dominant into the tonic chord. The cadences just mentioned are the ones most frequently used at the close of a composition. But at the end of a phrase or section a close known as the *deceptive* or *interrupted cadence* is frequently found. This consists of the resolution of the dominant into some chord other than the tonic. A *mixed cadence* is the succession of the sub-dominant, dominant, and tonic chords, thus constituting a mixture of the authentic and plagal cadences. Besides the cadences enumerated, others not specially classified also occur. Thus the chord of the diminished seventh sometimes takes the place of the dominant or sub-dominant (ex. 17).

translated into English by Morgan, New York, 1885); Jadassohn, *Harmonielehre* (Leipzig, 1883); H. Riemann, *Skizze einer neuen Methode der Harmonielehre* (Leipzig, 1880); *Die Natur der Harmonik* (Leipzig, 1882).

For detailed information of the various topics introduced in this article, compare the separate articles on ACOUSTICS; AUGMENTATION; ANTICIPATION; CADENCE; CHORD; FIGURED BASS; INTERVAL; KEY; LEADING TONE; LEADING OF VOICES; MAJOR; MINOR; MODULATION; MOTION; PASSING NOTES; PROGRESSION; SCALE; SUSPENSION; TONALITY.

HARMONY OF THE SPHERES, or MUSIC OF THE SPHERES. It was a common belief among,

the ancients that the motions of the stars and planets produce a kind of music, which they called the harmony of the spheres. They attributed this music to the various proportionate impressions of the heavenly bodies on one another acting at proper intervals.

HARMS, härms, FRIEDRICH (1819-80). A German philosopher, whose concept of philosophy as the science of the absolute approaches Fichte. He was born at Kiel, and educated there and in Berlin. In 1848 he was appointed professor at Kiel, and in 1867 at Berlin. His writings are critical and historical, rather than constructive, and, although marked by depth of thought, fail in clearness of style. Among them are: *Der Anthropologismus seit Kant* (1845); *Prolegomena zur Philosophie* (1852); *Die Philosophie Fichtes* (1862); *Schopenhauers Philosophie* (1874); *Die Philosophie seit Kant* (1876); *Ueber den Begriff der Wahrheit* (1876); *Die Formen der Ethik* (1878); *Metaphysik* (1885), *Logik* (1886), *Ethik* (1898), *Naturphilosophie* (1895), *Psychologie* (1897), all edited by Wiese; and *Begriff, Formen und Grundlegung der Rechtsphilosophie* (1889).

HARMS, KLAUS (1778-1855). A distinguished German theologian. He was born May 25, 1778, at Fahrstedt. In 1797 he went to the gymnasium at Meldorf, and in 1799 to the University of Kiel. After supporting himself as family tutor from 1802 till 1806, he was appointed Deacon of Lunden, whence he was called in 1816 to Kiel, as archdeacon and afternoon preacher in the Nikolai Church. Next year, shortly before the tricentenary of the Reformation in Germany, he issued, in defense of Protestant orthodoxy, ninety-five theses, under the title, *Das sind die 95 Theses oder Streitsätze Dr. Luthers* (Eng. trans. of most of them in *Lutheran Church Review*, 1889). These produced a deep impression throughout Germany, and brought him a call to be bishop of the consistory about to be instituted for the Protestant Church of Russia. This, as well as a call in 1834 to succeed Schleiermacher in Trinity Church, Berlin, Harms refused. In 1835 he was made chief pastor and provost in Kiel, but was compelled to resign in 1849, in consequence of an attack of almost total blindness. The rest of his life was spent in retirement, devoted to literary activity. He died in Kiel February 1, 1855. Harms's published works are chiefly sermons, which may be reckoned among the best specimens of modern pulpit eloquence in Germany. Of these, the most famous are his *Winterpostille* (1808, 6th ed. 1846), and *Sommerpostille* (1815, 6th ed. 1846), to which a new series was added—*Neue Winterpostille* (1826), and *Neue Sommerpostille* (1827). Consult: Dorner, *Blätter der Erinnerung an das Jubiläum von Harms* (Kiel, 1842); *Harms' Lebensbeschreibung verfasst von ihm selbst* (ib., 1851, 2d ed. 1852); and for his life, Volbehr (Kiel, 1878).

HARMSWORTH, ALFRED CHARLES (1865—). An English editor, born at Chapelizod, near Dublin. He was educated under a private tutor and at the Stamford Grammar School, and in 1882 joined the staff of the *Illustrated London News*. In 1888 he started the weekly journal *Answers*; in 1894 secured control of the *London Evening News*; and two years later founded the

London Daily Mail. In 1898 he began the publication of *Harmsworth's Magazine*. He is perhaps most widely known in connection with the Jackson-Harmsworth Arctic Expedition of 1894, which he equipped. In December, 1900, he visited the United States, and while there brought out a special issue of a New York newspaper to illustrate his theory of what a paper of the future would be. Its form was that of a 32-page quarto magazine.

HARNACK, här'nák, ADOLF (1851—). The foremost of living Church historians. He was born at Dorpat, Russia, May 7, 1851; educated at the university there (1869-72); became privat-docent at Leipzig (1874), professor extraordinary of Church history there in 1876; ordinary professor of Church history at Giessen (1879), at Marburg (1886), and at Berlin (1889). He is a man of strong and inspiring personality, and his lectures at Berlin are attended by hundreds of students from both Europe and America. His editorial activity has been great, as is attested by the facts that since 1881 he has edited with E. Schürer the *Theologische Litteraturzeitung*, a semi-monthly critical review (Leipzig, 1876, sqq.), and since 1882 with O. von Gebhardt the *Texte und Untersuchungen zur Geschichte der altchristlichen Litteratur* (Leipzig, 1882-1902), a series of learned monographs (22 volumes) to which he also contributes. He also joined Von Gebhardt and T. Zahn in bringing out *Patrum Apostolicorum Opera* (Leipzig, 1875-77, 3 vols.). But his fame chiefly rests upon his separate publications, some of which are: *Zur Quellenkritik der Geschichte des Gnosticismus* (1873); *Die Zeit des Ignatius* (1878); *Das Mönchtum* (1881, 5th ed. 1901; trans. *Monasticism: Its Ideals and Its History*, 1895; with article on *The Confessions of Saint Augustine*, 1901); *Martin Luther in seiner Bedeutung für die Geschichte der Wissenschaft und der Bildung* (1883, 3d ed. 1901); *Lehrbuch der Dogmengeschichte* (1886-90, 3d ed. 1894-97; Eng. trans., *History of Dogma*, 1895-1900); *Grundriss der Dogmengeschichte* (1889, 3d ed. 1898); *Das apostolische Glaubensbekenntnis* (1892, 27th ed. 1897; trans., *The Apostles' Creed*, 1901); *Geschichte der altchristlichen Litteratur bis Eusebius*: vol. i., *Die Uebersetzung und der Bestand der altchristlichen Litteratur* (1893); vol. ii., *Die Chronologie der Litteratur bis Irenäus* (1897); *Das Christentum und die Geschichte* (1895, 4th ed. 1897; trans., *Christianity and History*, 2d ed. 1901); *Das Wesen des Christentums* (1900; trans., *What is Christianity?* 1901); *Vorstudien zu einer Geschichte der Verbreitung des Christentums in den ersten drei Jahrhunderten* (1901).

HARNACK, AXEL (1851-88). A German mathematician, son of Theodosius Harnack (q.v.), and twin brother to Adolf Harnack. Born at Dorpat, he studied there (1869-73), and then at Erlangen and Munich. He was privat-docent at Leipzig in 1876, professor in the Polytechnic Institute at Darmstadt, and then at Dresden. Besides several contributions to the *Mathematische Annalen* (vols. ix., x., xii., xiii., xiv., xvii., xix., xxi.), he wrote: *Elemente der Differential- und Integralrechnung* (1881) and *Grundlagen der Theorie des logarithmischen Potentials und der Potentialfunktion in der Ebene* (1888). Consult

the biography by Voss, in the *Mathematische Annalen* (vol. xxxii., Leipzig, 1894).

HARNACK, THEODOSIUS (1817-89). A German Lutheran theologian, father of Adolf and Axel (q.v.). He was born at Saint Petersburg, Russia, January 3, 1817; was educated at Dorpat, and taught there (1843-53); at Erlangen (1853-66); Dorpat again (1866-75), when he retired. He died at Dorpat, September 11, 1889. His speciality was practical theology, and he wrote the well-known *Praktische Theologie* (1877-78), and other books in that department.

HARNED, här'nöd, VIRGINIA (1868—). An American actress, the wife of E. H. Sothern (q.v.), to whom she was married in 1896. She was born in Boston, and when about sixteen first became a member of a traveling company. Her New York debut was in *A Long Lane*, at the Fourteenth Street Theatre (1890). In 1895 she appeared as Trilby, in Paul Potter's dramatization. Prominent among her subsequent parts have been Lady Ursula in *The Adventure of Lady Ursula* (1897); Ophelia, to Mr. Sothern's Hamlet (1900); Alice Roussillon in *Alice of Old Vincennes* (1901); and Iris in A. W. Pinero's play of the same name (1902). Consult Strang, *Famous Actresses of the Day in America* (Boston, 1899).

HARNESS. See SADDLERY.

HARNESS, WILLIAM (1790-1869). An English author and divine, educated at Harrow, where he formed a life-long friendship with Byron, and at Christ's College, Cambridge (B.A. 1812; M.A. 1816). He entered holy orders and became known as one of the most eloquent preachers in London. By his efforts was built the Church of All Saints, Knightsbridge (1849), of which he was perpetual curate till his death. Many of his sermons were published; but he is now remembered chiefly for his edition of Shakespeare (8 vols., 1825). Consult L'Estrange, *Literary Life of Harness* (London, 1871).

HARNESS CASK. A large wooden cask, commonly shaped like the frustum of a cone, flattened at the sides, and used on board ship for the temporary stowage of salt provisions which are intended for issue to the crew within a day or two. Sailors call salt beef *salt horse*, and of course a *harness* is the most natural thing to be around a horse—hence the name.

HARNESSED ANTELOPE. A bushbuck of the genus *Tragelaphus*, so called because most of them have irregular stripings and spottings of white on a dark ground, suggesting a harness. Most of them belong to the jungles of West and South-Central Africa, and the list includes the bongo and guib (see *BUSHBUCK*), the nyala and sitatunga (qq.v.). See Colored Plate of ANTELOPES.

HAR'NETT, CORNELIUS (1723-81). An American patriot, born probably in Chowan County, N. C. He was among the first to oppose the Stamp Act; represented Wilmington in the Provincial Assembly from 1770 to 1771; served in 1774 on the Wilmington Committee of Safety; and was the temporary executive of North Carolina after the departure of the royal Governor. He was a delegate to the Continental Congress from 1777 to 1779, and was a signer of the Articles of Confederation. The proclamation of

general pardon, issued by Governor Clinton, excluded Harnett, and in 1780 he was made a prisoner of war, and died in captivity the next year.

HARNEY, JOHN HOPKINS (1806-67). An American journalist, born in Bourbon County, Ky. He graduated at Oxford University, Ohio, was professor of mathematics at the University of Indiana (1828) and Hanover College (1833), and then became president of a college in Louisville, Ky. (1839-43). He published an *Algebra* for school use in 1840. For twenty-three years (1844-67) he was editor of the *Louisville Democrat*, and made himself felt before and during the Civil War, while afterwards he played a conciliatory part.

HARNEY, WILLIAM SELBY (1800-89). An American soldier, born near Haysboro, Tenn. He entered the United States Army, and rose to be lieutenant-colonel of dragoons in 1836. He served in the Black Hawk War, in the Florida War, and in expeditions into the Everglades, and during the Mexican War was brevetted brigadier-general for gallantry at Cerro Gordo. In 1858 he was appointed to the command of the Department of Oregon, and subsequently to that of the Department of the West: In 1861, while journeying to Washington, he was taken prisoner by Confederates and brought to Richmond. Upon his release he issued proclamations to the people of Missouri, describing the evils certain to follow from secession. He was retired in 1863, and in 1865 was brevetted major-general. Consult Reavis, *Life and Military Services of Gen. W. S. Harney* (Saint Louis, 1878).

HAROËRIS, hä'rô-ë'rīs, or HARUËRIS (from *Hor, Horus* + *uër*, great, adult). An Egyptian god. Originally, he was merely a phase of the sun-god Horus, representing the sun in summer, or taking the daily course as the type of the yearly, the sun at its full height, at noon. He is regularly represented as a hawk-headed king, wearing the two crowns of Egypt. Originally he was the son of Osiris and his sister Isis, conceived while his parents were in the womb of their mother, Nuet (i.e. the sky). Later, however, when the two phases of the young and the adult sun were represented by two distinct deities, he became not only a brother of Harpocrates (q.v.), but even a brother of Osiris and son of Nuet, the sky, and Seb (or Geb?), the earth (Plutarch: Rhea and Kronos), while other inscriptions make him son of other forms of the old Sun (Rê or Atum). He was specially the god of Southern Egypt. See HORUS; HARPOCRATES.

HAR'OLD I., surnamed HAREFOOT (probably on account of his swiftness). King of England from 1037 to 1040. He is believed to have been the younger of Canute's two sons by his first wife, Ælfgifu. According to agreement on Canute's second marriage to Emma, widow of Ethelred II., his son by Emma was to inherit the English as well as the Danish throne; this son, Hardecanute (q.v.), was, however, in Denmark at the time of his father's death in 1035. Leofric, Earl of Mercia, favored the cause of Harold, while the powerful Earl Godwine espoused that of Hardecanute. Civil war was averted by a compromise, and the kingdom was divided. Harold took London, with all the provinces north of the Thames, while the possession of Wessex was

HARPALUS (Lat., from Gk. Ἄρπαλος) (c.330 B.C.). Kinsman and comrade of Alexander the Great. Made chief of the treasury in the expedition to Asia, he was found guilty of embezzlement. Alexander pardoned him and in 330 made him custodian of the immense Persian treasure at Ecbatana. After squandering enormous sums in the most reckless manner Harpalus fled to Athens (325) with 5000 talents, which he employed in purchasing the good-will of leading citizens, among them, it is said, Demosthenes. From Athens he went to Crete, where he was assassinated.

HARPER, JAMES (1795-1869). An American publisher, born at Newtown, L. I. In 1811 he removed with his brother John (1797-1875) to New York, where they learned the trade of printing and established the firm of J. & J. Harper, printing for booksellers and publishers. James Harper was said to be the quickest and best pressman in New York City, and the proofreading of John Harper had an equal reputation. They published on their own account from 1818 to 1833, when with two younger brothers, Joseph Wesley (1801-70) and Fletcher (1806-77), they formed the firm of Harper & Brothers. The keen business sagacity and sterling honesty of James Harper soon made the firm the largest and most respected publishing house in the United States. He was among the first to issue series of books grouped into so-called 'libraries,' covering topics ranging from juvenile fiction to the classics, and founded *Harper's Magazine* in 1850, which with the two publications suggested by Fletcher Harper, *Harper's Weekly*, established in 1857, and *Harper's Bazar*, established ten years later, soon took high rank in the field of periodical literature. The series was supplemented in 1881 by *Harper's Young People*, afterwards called *Harper's Round Table*. From 1844 to 1846 James Harper was Mayor of New York City, and was subsequently suggested for State Governor, but his distaste for public life led him to discountenance all efforts in his behalf. In March, 1869, he was thrown from a carriage and killed, and for many years after his death the business of the firm was conducted by younger members of the family. After the failure of the firm in 1899, it was entirely reorganized as a stock corporation.

HARPER, JOHN MURDOCH (1845—). A Canadian educationist. He was born at Johnstone, Renfrewshire, Scotland, emigrated to Canada, and graduated at Queen's University. His success as the head of several schools induced the Government of Prince Edward's Island to appoint him in 1887 superintendent of education for the province. Having declined this appointment, he became in 1880 rector of the Quebec High School, and subsequently inspector of superior schools for Quebec Province. His publications include many brochures and editions of textbooks.

HARPER, ROBERT GOODLOE (1765-1825). An American lawyer and politician, born near Fredericksburg, Va. He was early taken by his parents to South Carolina, and at the age of fifteen served in the volunteer militia of South Carolina during Greene's last campaign against Cornwallis in the South. After the close of the war he entered Princeton, where he graduated in 1785. The following year he was admitted to the

bar at Charleston, S. C., and removed into the interior of the State to practice. He was an ardent Federalist, and wrote and spoke in favor of the adoption of the Federal Constitution. After several terms in the State Legislature, he was, in 1795, elected to Congress, where he served until 1801. He was a fluent speaker and a ready debater, and his able advocacy of the measures of Washington and Adams won for him a high place in the councils of the Federalist Party. In 1799-1801 he was the recognized leader of his party in the House. After the expiration of his Congressional term he removed to Baltimore, Md., where he married the daughter of Charles Carroll of Carrollton, and became one of the leading lawyers in the country. He served in the War of 1812 as a major-general in the Maryland militia. In 1803 he was the principal counsel for Judge Pickering in the impeachment proceedings brought against him, and in 1806, with Luther Martin and others, successfully conducted the defense of Justice Chase in his impeachment trial. He was elected United States Senator from Maryland in 1816, but resigned in the same year because of his candidature for the Federalist nomination for Vice-President, in receiving which he was unsuccessful. He was one of the principal promoters of the scheme for the colonization of free negroes in Africa which resulted in the establishment of Liberia. He published: *An Address on Observations on the Dispute Between the United States and France* (1797); *Letters on the Proceedings of Congress*; and *Letters to His Constituents* (1801). A collection of his letters, pamphlets, and addresses was published under the title of *Select Works of Robert Goodloe Harper* (1814).

HARPER, WILLIAM RAINY (1856—). An American educator. He was born in New Concord, Ohio, July 26, 1856, of Scotch-Irish ancestry. He graduated at Muskingum College in 1870, and in 1875 received the doctor's degree from Yale. After teaching in the Masonic College, Macon, Tenn., and in the preparatory department of Denison University, Granville, Ohio, he became professor of Hebrew in the Baptist Union Theological Seminary in Chicago in 1879. While here he perfected a system of teaching Hebrew by correspondence. In 1886 he was elected professor of Semitic languages in the graduate faculty of Yale, and in 1889 also professor of biblical literature. From 1885 to 1891 he served as principal of the Chautauqua College of Liberal Arts, and in 1891 became principal of the Chautauqua system. In the last-mentioned year he was elected to the presidency of the newly founded University of Chicago, where he is also head professor of Semitic languages and literature. His published works include: *Elements of Hebrew* (2d ed. 1890); *Hebrew Vocabularies* (5th ed. 1890); *Hebrew Method and Manual* (1885); *Elements of Hebrew Syntax* (1888). He has been the founder and editor of several publications, among them *The Hebrew Student* and *Hebraica*, and is at present one of the editors of the *Biblical World*, the *American Journal of Theology*, and the *American Journal of Semitic Languages and Literature*—all published by the University of Chicago.

HARPER'S FERRY. A town in Jefferson County, W. Va., 55 miles northwest of Washington; on the Baltimore and Ohio Railroad (Map:

West Virginia, G 2). Its site, in a valley formed by Bolivar, Maryland, and Virginia or Loudoun Heights, and at the confluence of the Shenandoah River with the Potomac, is one of remarkable beauty. The town is the seat of Storer College (Free Baptist), a normal school for negroes. Population, in 1890, 958; in 1900, 896.

Harper's Ferry is chiefly notable from its connection with the raid of John Brown (q.v.), who, at the head of eighteen men, seized the armory here on October 16, 1859, and held it until captured on the following day by United States troops under Gen. Robert E. Lee. On April 18, 1861, immediately after Virginia had seceded from the Union, the small Union garrison, consisting then of only 45 men under Lieutenant Roger Jones, on the approach of a greatly superior force of Virginians under Gen. John Kenton Harper, abandoned the place, and fired the Federal arsenal, destroying about 20,000 rifles and pistols, and other property. The Confederates then gathered here a considerable force, which was first under Colonel Jackson, later known as 'Stonewall' Jackson, and afterwards under Gen. Joseph E. Johnston, both of whom energetically drilled and organized their troops. Johnston withdrew on June 15th, and soon afterwards another Union force took possession. The existence of a garrison here in September, 1862, compelled General Lee to divide the army of invasion which he was about to lead into Pennsylvania, and on the 15th General Jackson, after a prolonged bombardment, captured the place, securing about 12,500 prisoners and considerable material of war. Consult Johnson and Buel (editors), *Battles and Leaders of the Civil War*, vols. i. and ii. (New York, 1887).

HARPIGNIES, är'pè'nyé', HENRI JOSEPH (1819—). A French landscape painter. He was born at Valenciennes, July 28, 1819. He was a pupil of Achard in Paris, and made his début in the Salon of 1853. His first picture which commanded attention was "The Edge of a Wood on the Banks of the Allier," which he exhibited in the Salon of 1861. Harpignies was at first but little appreciated, but his seriousness of purpose, true love of nature, and force of drawing at length told on both artists and public. His landscapes evince a fine sense of the structure of the land, and many of his pictures are noted for the justice of their retreating planes. His foreground and distances sustain frankly their relative positions on his canvases. At times he displays a certain hardness of technique, but the observer is repaid by his faithfulness of drawing and his fidelity in both form and color. He is an officer of the Legion of Honor, and has received various medals, among them the medal of honor at Paris in 1897. Among his oils are "View of Capri" (1855); "A Storm" (1859); "Evening in the Campagna" (1866), in the Luxembourg Museum; "The Valley of Egérie" (1870, a decorative panel for the Opera); "Le Saut du loup" (1873), a view on the Allier, and "Moonrise" (1884), both in the Luxembourg; "Banks of the Sarthe" (1892), "Banks of the Rhone" (1897), and "Moonrise," in the Metropolitan Museum, New York. Harpignies is equally excellent in his water-colors, among which may be mentioned: "Garden of the Villa Medici," Rome; "Le Pont-Neuf" (a bridge in Paris); "L'heure de la bécasse."

HARPIN, är'pä'n'. An unscrupulous financier in Molière's *Comtesse d'Escarbaquas*. The character is a satire on a notorious class during the age of Louis XIV.

HARPOCRATES (Lat., from Gk. Ἄρποκράτης, *Harpokratēs*). The name given by the Greeks to a form of the ancient Egyptian god Horus. The Egyptian name, *Har-pekhrōd*, means 'Horus, the child,' in opposition to Haroëris (q.v.), 'the adult Horus.' Therefore, this god is usually depicted as a naked babe sucking his finger and wearing the plaited side lock, the sign of youth, at the right side of his head. Sometimes an amulet in the shape of a heart hangs around his neck; he usually wears one or both of the crowns of Egypt. Often he is represented as sitting on or emerging from a lotus-flower, the divine flower growing in the primeval, chaotic waters from which the sun-god first arose. Whether he was originally conceived as the young sun rising in the morning, as the sun at the winter solstice, or as the sun appearing in the primeval abyss, cannot well be determined; all three views are maintained. In Greek times the two forms of Horus, Harpocrates and Haroëris, were so strongly differentiated as to become two distinct deities, so that Harpocrates was understood as a posthumous brother of the 'elder Horus,' of weakly, immature form. The Greeks added the strange misconception of taking Harpocrates for a god of reticence, explaining his gesture with the finger as a sign demanding silence. Together with the other divinities of the Osirian circle, Harpocrates became very popular at Rome, but the continued misinterpretations of his cult (from a god of reticence he became a giver of oracles by dreams, etc.) seem to have led to abuses, and his worship was forbidden in the consulship of Gabinius, though it became very popular again in the days of Pliny.

As a distinctive divinity Harpocrates represents one of the youngest personalities of the Egyptian pantheon. He is often identified with *Har-sam-toui*, 'Horus, uniting both countries,' more rarely with Khonsu, Atum, etc. Harpocrates was worshiped at Denderah, Esneh, Thebes; he had seven differentiated forms at Hermonthis. See also HAROËRIS.

HARPOCRATION (Lat., from Gk. Ἄρποκρατίων, *Harpokratíōn*), VALERIUS. A Greek grammarian and lexicographer of Egypt, respecting whose personal history nothing is known. Some have considered him to be the Greek instructor of the Emperor L. Verus mentioned by Julius Capitolinus, while others suppose that he lived some time later, because several passages are found in his works taken from Athenæus, who is supposed to have flourished about A.D. 200. Harpocraton is the author of a valuable lexicon to the ten Attic orators, which contains much information on the law, history, antiquities, and general literature of Athens. The value of this work is enhanced by the fact that all the authorities from which it has been compiled are lost. Harpocraton is also the author of a lost work entitled *Collection of Flowery Extracts* (Ἀθηναίων Συναγωγή).

HARP-SHELL (so called because the ribbing of the shell resembles the strings of a harp). A gastropod mollusk of the family Harpidae, hav-

ing the last whorl of the shell very large, the shell ribbed longitudinally, the foot of the animal very large. The species, which are not very numerous, are found in the warmer seas, and particularly at Mauritius. The shells are much prized for their great beauty, but must be kept in drawers and not exposed to light, or their delicate and brilliant colors will fade.

HARPSICHOORD, härp'si-kôrd (OF. *harpe-chorde*, from *harpe*, harp + *chorde*, chord, cord). A keyed musical instrument, formerly in extensive use, but now little known. In shape it was exactly like a grand pianoforte, to which its internal arrangements were also similar. The sound from the strings was produced by a small piece of crow-quill, or a piece of hard leather, which projected out of a slip of wood, called the jack, that stood upright between the strings, and was pushed upward by the key till the quill, or leather, twitched the string, causing a brilliant but somewhat harsh sound, deficient of any

HARPSICHOORD.

means of modification in respect to loudness or softness. Specimens of the harpsichord, although now becoming more rare, are still to be found in good preservation, but rather as articles of virtu or curiosity than as useful musical instruments. Many Italian and Dutch harpsichords were highly ornamented by the most eminent artists with valuable oil paintings on the inside of the lid. The date of the invention of the harpsichord is uncertain. Before the fifteenth century there is no trace of its existence. It was introduced into England early in the seventeenth century. In the eighteenth century Kirkman, and later Broadwood and Sehudi, were the famous makers in London. After the invention of the pianoforte the harpsichord and all instruments of the same kind, such as the spinet, were in time entirely superseded. The harpsichord shown in the accompanying illustration was presented to Nelly Custis by George Washington. It was made in London, is eight feet long, three and a half feet wide, and has two banks of 120 keys. See PIANOFORTE.

HARPY (Lat. *harpyia*, from Gk. Ἄρπυια, from ἀρπάζειν, *harpazein*, Lat. *raperere*, Alban. *rjep*, to snatch). In Greek legend, a personification of the

swift destructive wind-storm, and hence also a symbol of death. In this character they are found on Lycian graves, monuments, and elsewhere, carrying away the departed. In legend they are the daughters of Thaumais (the personification of the wonders of the sea) and Elektra, and sisters of Iris. Commonly only two are mentioned, Ællo (Ἄελλώ) and Okypete (Ὠκυπέτη). In Homer the harpy Podarge is by Zephyrus, the mother of the horses of Achilles. Later writers mention other names, as Celeno, who in Vergil is their leader. The later writers also make them loathsome and filthy, bringing pollution to all that they approach. The harpies appear in the Argonautic legend as sent by the gods to punish the blind Phineus, whose food they carry off. They were pursued by the winged sons of Boreas, Zetes, and Calais, and either killed or, in the usual version, forced to promise to cease harassing Phineus. In the earlier art the harpies are represented as winged human beings. Later they appear regularly with the head, breasts, and arms of a woman, but the claws, wings, and tail of a bird. This is their form on the celebrated Harpy tomb from Xanthus in the British Museum.

HARPY BAT. Two different kinds of bats are called 'harpies.' One is a genus of fruit-bats (*Harpyia*), of which there are two species in the East Indies, one about four inches long, and the other much larger. The fur of both is pale buff in color, and both have the nostrils prolonged into divergent tubes, so that the genus is frequently called 'tube-nosed.' See Plate of BATS.

Another group of 'harpy' bats is found in the insect-catching vespertilionine genus *Harpyiocephalus*, which is closely allied to our common North American bats. Though so far removed otherwise, this group agrees with the frugivorous genus (*Harpyia*) above mentioned, in having tubular nostrils—a remarkable similarity in two so divergent groups. These bats, of several species, inhabit India, the Malayan Archipelago, and Japan, and include one, the white-bellied harpy of the Himalayas, remarkable for its brilliant coloration, the fur being golden orange on the head, varying rust-red on the back and outer surface of the membranes, and white on the chin, throat, and abdomen. All have large ears, and numerous and very strong teeth, and they are believed to catch and crush beetles as well as to seize smaller insects.

HARPY EAGLE. A huge, crested bird of prey (*Thrasaëtus harpyia*), allied to the eagles and found in South and Central America and Mexico, occasionally coming as far north as the Rio Grande Valley. See Eagle, and plate of EAGLES AND HAWKS.

HARQUEBUS, här'kwé-büs. See ARQUEBUS.

HARRADEN, BEATRICE (1864—). An English novelist, born at Hamstead and educated at Dresden, and in Cheltenham, Queen's, and Bedford Colleges, finally taking her degree, with honors in classics and mathematics, at the University of London (1883). She traveled on the Continent and in 1894-95 visited the United States, spending several months on a ranch in California. She created a sensation in 1893 by her novel *Ships that Pass in the Night*. Among her other novels are: *Things Will Take a Turn* (1891); *In Varying Moods* (1894); *Hilda Straf-ford* (1897); and *The Fowler* (1899).

HARRAR, HARAR, hä-rär', or **HURBUR**. The most eastern province of Abyssinia, bounded on the north and east by French Somaliland and British Somaliland, and on the southeast and south by Italian Somaliland and British East Africa. It is a plateau, reaching an altitude of about 11,000 feet. Nearly all the foreign commerce of Abyssinia passes through this province. (See **ABYSSINIA**.) Capital, Harrar (q.v.). Harrar belonged to the Egyptian Sudan before the uprising of the Mahdi. Having been taken by Italy in 1891, it became an Abyssinian province in 1896, after the Italian defeat at Adowa.

HARRAR. The capital of the Province of Harrar in Eastern Abyssinia, south of the port Jibutil, and about 180 miles from the coast (Map: Africa, J 4). It is the second city of the country in importance, is surrounded by walls, and has a palace and several mosques and barracks. It is situated in a fertile district which produces principally coffee. The commerce is growing, and includes coffee, cotton, gum, ivory, and fruit. Harrar is connected by telegraph with Addis Abeba. A railroad from Jibutil to Harrar is nearly completed. Population, in 1900, 40,000, nearly all Harraris and Abyssinians. See **HARRAR** (province), and **ABYSSINIA**.

HARRARIS, hä-rä'rëz. The people of Harrar, in Abyssinia. They are said to have been Himyaritic Semites in race and were formerly Christians, speaking a dialect of Ge'ez. Now the population is greatly mixed with Gallas and Somali, both of Hamitic stock. They are nearly all monogamists, allowing the women to go unveiled and relieving them of much hard work.

HARRIER. See **HOUND**.

HARRIER (from *harry*, AS. *hergian*, to ravage, from AS. *herc*, Goth. *harjis*, OIG. *heri*, *hari*, Ger. *Heer*, army; connected with OChurch *kara*, Lith. *kãras*, war, OPruss. *karjis*, army, OPers. *kãra*, army, people). The English name for the low-flying, meadow-haunting hawks of the subfamily *Circinæ*, called 'marsh-hawks' in the United States. See **MARSH-HAWK**.

HARRIER EAGLE. See **EAGLE**.

HARRIES, hä'rë-ës, HEINRICH. The author of the Prussian national hymn, "Heil dir im Siegerkranz" (q.v.).

HARRIGAN, EDWARD (1845—). An American actor and playwright, noted for his representations of types of low life. He was born in New York City, and as a young man had a somewhat desultory career, working as a calker in various cities, till finally, in San Francisco, about 1868 he made his appearance upon the stage. Soon afterwards in Chicago with Anthony Cannon (Tony Hart) he won his first theatrical success, and in New York a little later his truthful and amusing sketches of local character were promptly appreciated. These sketches gradually developed into plays, interspersed with songs which were set to music by David Braham, and have been whistled and sung all over the country. Among the best-known of Mr. Harrigan's pieces have been the *Mulligan series*, *McSorley's Inflation*, *Old Lavender*, *Pete*, *The Major*, *Squatter Sovereignty*, *Reilly* and *The Four Hundred*, *My Son Dan*, and *Marty Malone*. The partnership of Harrigan & Hart lasted till 1884; after which Mr. Harrigan conducted theatres in New York,

and made tours in different parts of the country. One of his favorite rôles revived in recent years is that of George Coggswell in *Old Lavender*. Consult McKay and Wingate, *Famous American Actors of To-day* (New York, 1896).

HAR'RILD, ROBERT (1780-1853). An English inventor, born in London. After learning the trade of a printer, he began the manufacture of printers' materials in 1809, a venture which subsequently was developed into a large and profitable business. He was noted as an inventor and manufacturer of composition rollers for inking type, a process without which the use of cylindrical or machine presses would have been practically impossible. Whether he was the first or exclusive inventor of that process is doubtful; but he seems to have been the first extensive manufacturer of the rollers, which were substituted for the leather balls by which type had been inked for nearly three centuries. The stupidity and obstinacy of workmen temporarily prevented the use of the invention, which, however, soon became almost universal. Harrild established factories in London, and was widely respected as an enterprising and benevolent citizen. He bought the printing-press with which Benjamin Franklin worked in London. In 1841 the press was brought to the United States, and it is now in the Patent Office at Washington.

HAR'RIMAN. A city in Roane County, Tenn., 50 miles west of Knoxville; on the Emory River, and on the Queen and Crescent Route, the Southern, the Tennessee Central, and other railroads (Map: Tennessee, G 5). It is the centre of a section rich in coal, iron, timber, and agricultural lands, and has farm-implement works, a cotton-mill, iron-works, a foundry and machine shops, a tannery, a flouring-mill, planing-mills, a metal-bedstead factory, and other industrial establishments. The city, which is a temperance town, is the seat of the American University, founded in 1893, and of an industrial school for negroes. Harriman was founded in 1890, and was granted a special city charter in 1891. The government, as provided by the revised charter of 1899, is vested in a mayor, chosen biennially, and a city council, elected on a general ticket. Harriman owns and operates its water-works and electric-light plant. Population, in 1890, 716; in 1900, 3442.

HAR'RINGTON, JAMES (1611-77). An English political writer, born at Upton, Northamptonshire. He entered Trinity College, Oxford (1629), but left without a degree, and traveled on the Continent. Although a Republican, he was attached to King Charles I., whom, it is said, he accompanied to the scaffold. Resuming his earlier studies, he published in 1656 his famous political romance, *The Commonwealth of Oceana* (i.e. England). Harrington's main principle is that power rests upon property, especially landed property. He further argues that rulers should be elected by ballot for terms of three years. The work led to a lively controversy, in which Harrington took an active part. After the Restoration he was committed to the Tower on the charge of conspiracy. Weakened in mind by his imprisonment, he died insane, September 11, 1677. Consult *Oceana*, in Morley's Universal Library (London, 1887), and Dwight, in the *Political Science Quarterly* for 1887.

HARRINGTON, MARK WALROD (1848—). An American astronomer and educator. He was born at Sycamore, Ill., and educated at Evans-ton, Ill., graduated at the University of Michigan in 1868, and was a member of the faculty there from 1868 to 1876, with an interval in 1870-71, when, as a member of the United States Coast and Geodetic Survey, he visited Alaska. He studied at the University of Leipzig in 1876-77, and in the latter year proceeded to China as professor of astronomy in the Cadet School of the Tsung-li-Yamen or Foreign Office in Peking. Ill health caused his return to the United States in 1878, and for a year he was professor in the Louisiana State University. In 1879 he was appointed professor of astronomy and director of the observatory at his *alma mater*, a position he held until 1891, when he became director of the United States Weather Bureau at Washington. He resigned in 1895 to become president of Washington State University. In 1897 he retired to private life. He is the author of numerous scientific articles, pamphlets, and works, and until 1892 was editor of the *American Meteorological Journal*, which he founded in 1884.

HAR/RIOT, or HARIOT, THOMAS (1560-1621). An English astronomer and mathematician, born at Oxford. He acted for some time as tutor to Sir Walter Raleigh, who, in 1585, appointed him surveyor to the Grenville's expedition to Virginia. Harriot published an account of this expedition in 1588, and the work was afterwards reprinted in Hakluyt's *Voyages*. On his return to England, after an absence of two years, he resumed his mathematical studies with zeal and success, but ill health prevented him from publishing his mathematical discoveries. He had an undoubted genius for algebra, as is shown by his posthumous work, *Artis Analyticæ Præxis ad Aequationes Algebraicas Noua, Expeditâ et Generali Methodo Resolvendas* (1631). In this treatise Harriot did for algebra in England what his friend Vieta, to whom he gives generous praise, had done in France—he put it on its modern basis. In the matter of symbolism he added the signs $>$ and $<$ to those which were just coming to be recognized as part of the universal language of algebra. He asserted the advantage, now fully recognized, of making the second member of an equation zero, although he did this only for particular cases, and he gave in substance the general theorem (often called by D'Alembert's name) that an equation of the n th degree has exactly n roots. Consult *Harriot Papers*, edited by Rigaud (Oxford, 1831). For his life, consult Stevens, *Thomas Harriot, the Mathematician, the Philosopher, and the Scholar* (London, 1900).

HARRIOTT, Mrs. F. C. See MORRIS, CLARA.

HARRIS, Sir AUGUSTUS HENRY GLOSSOP (1852-96). A noted English theatrical manager, lessee of Drury Lane, Covent Garden (the Opera), and other theatres. He was the son of Augustus Glossop Harris, who was also a well-known manager, and was born in Paris. In 1873 he made his debut as an actor at Manchester, and not long afterwards became stage manager at Covent Garden. He leased Drury Lane in 1879. Besides his subsequent productions, especially of melodrama and opera, both there and at Covent Garden, which he took in 1888, he became joint author of a number of plays, most frequently in

collaboration with Henry Pettitt; among them were *Pluck* (1882); *A Run of Luck* (1886); *A Million of Money* (1890); and *The Prodigal Daughter* (1892). He was a member of the London County Council, and was sheriff in 1891, when he was knighted. His death, which was ascribed to overwork, occurred at Folkestone.

HARRIS, CHAPIN A. (1806-60). An American dentist, born at Pompey, N. Y. In 1839 he procured the charter for the Baltimore Dental College, the first separate school of dentistry ever founded, and established the *American Journal of Dental Science*, which he edited for twenty years. Harris wrote: *Principles and Practice of Dental Surgery* (1839); *Diseases of the Maxillary Sinus* (1842); and a *Dictionary of Dental Science* (1849).

HARRIS, Lord GEORGE (1746-1829). An English soldier famous in India. Born at Brasted, Kent, he was educated at Westminster School and the Woolwich Military Academy. By 1765 he was lieutenant in an artillery regiment, and in 1774 went as a captain to America, where he fought at Lexington, Bunker Hill, and in many other battles of the Revolutionary War up to 1778, when he went to the West Indies. He had suffered from serious wounds, capture by the French, and shipwreck before he entered on the second stage of his career, which was in India (1790-1800). There he distinguished himself in the campaigns against Tipu Sahib, commanded Fort William as major-general, and was both civil and military Governor of Madras. For his victory at Seringapatam, ending in the conquest of Mysore, Harris was promoted to be lieutenant-general (1801). He was made general (1812), and a peer of the realm (1815), under the title Baron Harris of Seringapatam and Mysore. In 1824 he was made governor of Dumbarton Castle on the Clyde.

HARRIS, GEORGE WASHINGTON (1814-69). An American humorist, born at Allegheny City, Pa. He was a jeweler's apprentice and afterwards captain of a Tennessee River steamboat, then a political writer for newspapers, and finally the creator of "Sut Lovengood," whose papers, written for Nashville journals (1858-61), appeared as *Sut Lovengood's Yarns* (1867)—one of the raciest of Southwestern books of humor, ranking with J. J. Hooper's *Simon Suggs* (q.v.).

HARRIS, HOWEL (1714-73). The principal founder of Welsh Calvinistic Methodism. He was born at Trevecca in Wales; was brought up in the Established Church, and matriculated at Oxford in 1735. He was endowed with high oratorical powers, and his energy and enthusiasm carried his audiences by storm. He founded no fewer than 300 societies, and formed a sort of Protestant monastery, in which there lived about 120 persons. Both Wesley and Whitefield were his friends and preaching companions. He raised a regiment at the time when a French invasion of England was confidently expected, and moved about with his men, preaching in every encampment. His *Autobiography* was published in 1791. He also wrote *The Last Message and Testimony of Howel Harris, Esq., late of Trevecca in Wales, Found Among Some of His Papers* (1774), and other works in Welsh.

HARRIS, ISHAM GREEN (1818-97). An American politician, born near Tullahoma, Tenn.

After a very limited common-school education, he engaged in business, studied law at night, and was admitted to the bar in 1841. He served in the State Legislature in 1847, was a Democratic member of the House of Representatives from 1849 to 1853, was elected Governor of Tennessee in 1857, and was reelected in 1859 and 1861. At a special meeting of the State Legislature, called in January, 1861, to consider the condition of the country, he recommended that the question of calling a convention to take action for or against the secession of Tennessee be submitted to a popular vote, and asserted that in his view the existing evils could best be remedied by the adoption of amendments to the Federal Constitution favorable to slavery; and after the people decided on February 9th both in favor of the Union and against the calling of a convention, the secession majority in the Legislature on May 1st authorized him to enter into a military league with the Confederate States, to raise troops for State defense, and to issue State bonds. On May 7th the League, which had previously been negotiated, was formally ratified by the Legislature. At the election held in June a large majority of the people voted in favor of secession and the representation of the State in the Confederate Congress, eastern Tennessee, however, remaining steadfastly loyal. In connection with the election charges of corruption and fraud were brought by the loyalist minority against the Governor and his friends. The Federal generals Grant and Buell soon gained virtual control of the State, Buell occupying Nashville with a considerable force, and in March, 1862, Harris fled to Mississippi. Soon afterwards he joined the Confederate Army, and served as aide successively to Gen. A. S. Johnston, who died in his arms at the battle of Shiloh, and to other Confederate generals in command of the Army of the West. On March 3, 1862, President Lincoln appointed Andrew Johnson Military Governor of Tennessee, and Harris played no further part of any consequence in State affairs during the progress of the war. After the war he lived first in Mexico and then in England, but returned to Memphis in 1867, speedily regained his control of State politics, and was elected to the United States Senate in 1876, 1882, 1888, and 1894, where he was distinguished for his great powers as a debater. He served on important committees, acted as chairman of the Committee on the District of Columbia, and in 1893 was elected President *pro tem*.

HARRIS, JAMES (1709-80). An English philologist and classical scholar, born at Salisbury. He was educated at Wadham College, Oxford, and studied law at Lincoln's Inn, although he never intended to practice that profession. From his father, who died in 1734, he received an inheritance sufficient to enable him to devote himself henceforth to study. Harris's interests were mainly in the classics and especially in Aristotle's philosophy. He also took an active part in political life, serving first as a magistrate for his county, and then from 1761 until his death being the member for Christchurch in the House of Commons. In 1763 he was appointed a lord of the admiralty, and after three months a lord of the treasury. Eleven years later he became secretary and comptroller to the Queen. The works of Harris, which are now of historical interest merely, are a collection of three treatises, one on art,

a second on music, painting, and poetry, and a third on happiness (5th ed. 1794); *Philosophical Arrangements* (1775), dealing with the Aristotelian philosophy; *Philological Inquiries* (1781), on style and literary criticism, and the book for which he is chiefly remembered, *Hermes, or a Philosophical Inquiry Concerning Universal Grammar* (1751), an attempt to force language into the forms of logic. He has also been supposed to be the author of *Spring, a Pastoral*, which was produced at Drury Lane in 1762. In 1801 his son, James Harris, first Lord Malmesbury, published a collection of his father's works in two volumes, with a biographical sketch.

HARRIS, JAMES. An English diplomat. See MALMESBURY, JAMES HARRIS, first Earl of.

HARRIS, JAMES RENDEL. An English philologist, paleographer, and biblical scholar. He studied at Clare College, Cambridge, and was its fellow and librarian. He held professorships at Johns Hopkins University and Haverford College, and later became university lecturer in paleography at Cambridge University. Among his writings are: *The Teaching of the Apostles and the Sibylline Books* (1885); *The Teachings of the Apostles* (1887); *The Rest of the Words of Baruch* (1889); *The Diatesseron* (1890); *The Acts of Perpetua* (1890); *The Apology of Aristides* (1891); *Codex Sangallensis* (1891); *Popular Account of the Newly Recovered Gospel of Saint Peter* (1892); *Fragments of Ephrem Syrus* (1895); *Hermas in Arcadia* (1896); *Letters from Armenia* (1897); *Homeric Centones* (1898); *The Gospel of the Twelve Apostles and The Annotators of the Codex Bezae* (1901).

HARRIS, JOEL CHANDLER (1848-). An American writer of fiction, and journalist, born at Eatonton, Ga. His first occupation was that of a printer's apprentice. He studied law, and practiced at Forsyth, Ga., but also did editorial work, and in 1876 joined the staff of the *Atlanta Constitution*, of which he became editor in 1890. It was to this paper that he contributed the very successful studies of Afro-American folk-lore, collected in 1880 as *Uncle Remus, His Songs and His Sayings*, a volume which has become a classic of its kind, since it appeals alike to scientific students of popular tradition and to the general public, old and young. He continued to work the vein so happily discovered, in *Uncle Remus: His Songs and His Sayings* (1880); *Nights with Uncle Remus* (1884); *Mingo and Other Sketches* (1884); *Free Joe and Other Georgian Sketches* (1888); *Daddy Jake the Runaway and Short Stories* (1889); *Bataam and His Master* (1891); *Tales of the Homefolks in Peace and War* (1898), weaving into fiction frequent touches of folk-lore, as do the juveniles *Little Mister Thimblefinger* (1894), *Aaron in the Wildwoods* (1897), and several other volumes. Mr. Harris also made a memoir of Henry W. Grady (1890), and contributed to the history of his State a volume on *Georgia from the Invasion of De Soto to Recent Times* (1899). No one has more successfully portrayed the humorous side of negro character and imagination, but it would be an injustice to him to think that he has not also given an admirable picture of Georgia life in general, especially of the thrifty as well as the thriftless rural inhabitants.

HARRIS, JOSEPH (?-?). An English actor. His first recorded appearance was as Alphonso in

The Siege of Rhodes (1681), written by Sir William Davenant, to whose company he belonged. He also played Shakespearean rôles in the same cast as Betterton, was said to be nearly as clever in the creation of character and quite as versatile, his range extending from Romeo to Sir Frederick Frolic in *Love in a Tub*. He is mentioned in Pepys's *Diary* as a very airy gentleman, and it is also on record that he maimed a brother actor for life by fencing without a button on his foil.

HARRIS, JOSEPH (1828-92). An agricultural writer. He was born at Shawbury, England. A descendant of generations of farmers, he early evinced an interest in rural affairs. This led him into the study of agricultural chemistry, which he pursued with Lawes and Gilbert at Rothamsted, and which formed the basis of many of his writings. At the age of twenty-one he came to America and in 1864 began writing for the agricultural press. He continued for twelve years, and after a lapse of eight more years he wrote a series of articles, 171 in all, entitled "Walks and Talks on the Farm," the first of which appeared in the *Genesee Farmer*, of which he was editor, and the remainder in the *American Agriculturist*, to which the *Genesee Farmer* had been sold. Perhaps none of his other writings exercised so wide an influence in paving the way for improved farming and earned for him so high a place in American agriculture. They are actual talks with a neighbor, and not, as many suppose, with an imaginary person. Among his other writings may be mentioned his books: *Harris on the Pig* (New York, 1888); *Talks on Manures* (New York, 1883); and *Gardening for Young and Old* (New York, 1882). The last book, his final volume, is intended mainly to foster a love of plants and gardening in the hearts of a rising generation.

HARRIS, MRS. A mythical personage, frequently mentioned in Dickens's *Martin Chuzzlewit*, by Sairey Gamp (q.v.), who uses her as an authority to give her own opinions additional force.

HARRIS, ROBERT (1849—). A Canadian figure and portrait painter, born in Carnarvonshire, Wales. He began his artistic career by illustrating, and then went to Europe (1877), and studied in London at the Slade School, and in Paris under Bonnat, and exhibited at the Salon and Academy. Afterwards he settled in Montreal, and became a popular portrait painter. His works include "Fathers of the Confederation" (1883) and "Meeting of the School Trustees," the first painted for and the second purchased by the Canadian Government. In 1893 he was elected president of the Royal Canadian Academy of Arts.

HARRIS, SAMUEL (1814-99). An American Congregational theologian, born in East Machias, Maine. He graduated at Bowdoin College in 1836, and at Andover Theological Seminary three years later. He taught, and occupied Congregational pulpits until 1855, when he was chosen professor of systematic theology in the Bangor Seminary. He was president of Bowdoin from 1867 to 1871, and then became professor of systematic theology in the Yale Divinity School. Among his publications the most important are: *The Philosophical Basis of Theism* (1883); *The Self-*

Revelation of God (1887); and *God, Creator and Lord of All* (1897).

HARRIS, THADDEUS WILLIAM (1795-1856). An American entomologist, born at Dorchester, Mass. He graduated at Harvard in 1815, and became a practicing physician, but devoted a great part of his time to the study of natural history. In 1831 he became librarian of Harvard. He was a member of the State Commission appointed in 1837 to make a botanical and zoölogical survey of Massachusetts, and devoted himself particularly to the preparation of a *Systematic Catalogue of the Insects of Massachusetts*. He founded the Harvard Students' Natural History Society and the Massachusetts Horticultural Society, and published a valuable report on *Insects Injurious to Vegetation* (1841; new ed. 1852).

HARRIS, THOMAS LAKE (1823—). An American spiritualist, born at Fenny Stratford, England. In 1827 his parents settled in Utica, N. Y. His father failed in business, and the son began to write for the press at an early age. He became a Universalist preacher at Minden, N. Y., in 1844. Soon afterwards he organized a 'Christian Society' in New York; and then embraced spiritualism, and joined a community at Mountain Cove, Va. From the common spiritualistic doctrine he soon broke away, and in 1861 organized a community, which was settled successively at Amenia and Brocton, N. Y., and then at Santa Rosa, Cal. Harris wrote: *Truth and Light in Jesus* (1860); *The Millennial Age* (1861); and an historical sketch, *The Trent Affair* (1896). On his *Brotherhood of the New Life*, consult Allen, *T. L. Harris, the Secer* (London, 1897).

HARRIS, TOWNSEND (1804-78). The first representative of the United States in Japan. He was born at Sandy Hill, N. Y. Educated at home, he moved at the age of fourteen to New York City, and entered upon a business life as a leather-merchant. He was strict and diligent in self-culture, and much interested in popular education. While serving two terms as president of the Board of Education, he succeeded in spite of much opposition in getting established the New York Free Academy, now the College of the City of New York. In 1848 he projected and entered upon a trading and exploring voyage on the Pacific, and during the five years spent in it he gained much information in regard to Orientals and their ways. He served as consul at Ningpo in 1854, and in 1855, on the nomination of William H. Seward and Commodore Perry, he was appointed by President Pierce to be the first Consul-General to Japan, in accordance with the provisions of the treaty which Commodore Perry had made with the Shōgun's Government in 1854. On his way out he negotiated a treaty with Siam. On September 4, 1856, he raised at Shimoda the United States consular flag—the first foreign flag to float over any part of Japan. Refusing to deliver the letter of the President of the United States to the Shōgun, except in personal audience, he succeeded, after eighteen months' parleying, and entering Yedo November 30, 1857, he had audience with the Shōgun in his palace on December 7th. The next four months were spent in treaty negotiations, and after much opposition and many delays, he secured the signature of Premier Ii to a treaty which became the model for twenty subsequent

treaties between Japan and other nations. On July 7th he was made Minister Resident, and at once established his legation at Yedo. Resigning office October 21, 1861, he returned to New York and was active in many societies until his death there.

Consult: Griffis, *The First American Envoy to Japan* (Boston, 1895); and Satoh, *Agitated Japan* (London, 1896).

HARRIS, Sir WILLIAM SNOW (1791-1867). An English electrician, born at Plymouth and educated at Edinburgh. He practiced medicine for a few years, but after his marriage (1824) devoted himself to electricity. His system of lightning conductors for ships, patented in 1820, was introduced in the British Navy after more than twenty years' consideration. He was knighted in 1847, and in 1860 was made Government referee on electrical cases. Besides many publications on his method of fixed conductors, Harris wrote the excellent handbooks: *Electricity* (1848), *Magnetism* (1850-52), and *Galvanism* (1856); and a *Treatise on Frictional Electricity*, edited, with a biographical memoir, by Tomlinson (1867).

HARRIS, WILLIAM TORREY (1835—). An American educator and philosophical writer, born at Killingly, Conn., and educated at Phillips Andover Academy and at Yale College. In 1857 he began teaching in the Saint Louis public schools, of which he was superintendent from 1867 to 1888. In 1867 he established and became editor of the *Journal of Speculative Philosophy*, the first periodical of its kind in the English language. He was received with distinction at the Paris Exposition of 1878, represented the United States Bureau of Education at the Brussels Educational Conference, and at the Paris Exposition of 1889, where he received from the French Government the honorary title 'Officier de l'Instruction Publique,' and in the same year was appointed United States Commissioner of Education. As commissioner he rendered eminent service in formulating a statement of American educational theories and in giving practical definition to pedagogic principles. He was the founder of the Saint Louis Philosophical Society, and in 1875 was president of the National Educational Association. He was a prominent member of the Concord School of Philosophy, and his writings stamp him as one of the clearest expositors in America of German philosophical thought. He received the degree of LL.D. from Yale (1895); the University of the State of Missouri (1870); the University of Pennsylvania (1894); Princeton (1896); and the University of Jena, Germany (1899). Besides voluminous reports on educational matters, many papers contributed to the *Proceedings of the American Social Science Association*, and various compilations edited by him, his publications include: *Introduction to the Study of Philosophy* (1889); *The Spiritual Sense of Dante's Divina Commedia* (1889); *Hegel's Logic: A Critical Exposition* (1890); and *Psychologic Foundations of Education* (1898).

HARRIS, WILLIAM VICTOR (1869—). An American song composer, born in New York. He was a pupil of Charles Blumm, William Courtney, F. K. Schilling, and Anton Seidl. He was a successful organist, and from 1889 to 1895 held important appointments in Tuxedo Park, Brook-

lyn, and New York. He was for three years a teacher and coach at the Metropolitan Opera, New York; for one season was conductor of the Utica Choral Union, and served as assistant conductor under Seidl at the Brighton Beach summer concerts (1895-96). He afterwards took up his residence in New York, and established himself as a vocal instructor and composer. He published compositions for piano, organ, and chorus, but is principally known for his songs, which have been remarkably successful.

HARRIS BUCK. The sable antelope (q.v.), so called because discovered by Sir W. C. Harris, author of *Portraits of the Game and Wild Animals of Southern Africa*, issued in London in 1840 as a magnificent folio book, with colored plates.

HARRISBURG. A city and the county-seat of Saline County, Ill., 70 miles northeast of Cairo; on the Cleveland, Cincinnati, Chicago and Saint Louis Railroad (Map: Illinois, D 6). It is surrounded by an agricultural district in which are valuable mineral deposits, especially coal, and has flour and saw mills, brick-works, carriage and wagon shops, etc. Population, in 1890, 1723; in 1900, 2202.

HARRISBURG. A city, the capital of Pennsylvania, and the county-seat of Dauphin County, 105 miles west by north of Philadelphia; on the Susquehanna River, the Pennsylvania Canal, and the Pennsylvania, the Philadelphia and Reading, the Cumberland Valley, and the Northern Central railroads (Map: Pennsylvania, E 3). The river, a mile wide at this point, is spanned by five bridges, including three iron and steel railroad bridges and the historic 'Old Camel-Baek Bridge,' a wooden structure, one-half of which was burned about forty years ago. The city has a most picturesque location, and there are a number of notable structures. The State buildings are in a beautiful park of 16 acres, the Capitol occupying a conspicuous site. The new Capitol building, the former having been destroyed by fire in 1897, is being built on a more substantial and imposing scale. The structure is of brick and steel, and will be veneered with marble or granite, and the interior finished in marble, the estimated cost being not less than \$5,000,000. The State library, founded in 1790, contains over 100,000 volumes. In Capitol Park is a monument to the soldiers who fell in the Mexican War, and also, on the west side of the Capitol, a statue of Gen. John F. Hartranft. The Dauphin County Soldiers' Monument, a shaft 110 feet high in honor of the soldiers of the county who died in the Civil War, stands in State Street. Other prominent buildings besides the Capitol are the court-house, Governor's residence, State arsenal, State Insane Hospital, county prison, Grand Opera House, high school, public library, Conservatory of Music, City Hospital, Home for the Friendless, and the Children's Industrial Home. Harrisburg is the seat of a Roman Catholic bishop.

Owing to its excellent transportation facilities, both by rail and by water, Harrisburg occupies a position of considerable importance in the industrial and commercial world. It has a large trade in lumber; extensive iron and coal mines are in the vicinity; and its iron and steel interests are worthy of particular mention. There are roundhouses and repair-shops of the Penn-

sylvania Railroad; also foundries and machine-shops, tin-mills, rolling-mills, nail-works, furnaces, typewriter-works, boot and shoe factories, breweries, pipe-bending works, and extensive manufactures of beds and mattresses, women's hats, coffins, clothing, silk goods, carriages and wagons, flour, brooms, brick and tile, galvanized iron cornices, marbled slate, and various lumber products.

The government is vested in a mayor, who holds office for three years, and is ineligible for reelection, a bicameral council, and administrative officials, who are chosen as follows: by the executive with the consent of the select council—highway commissioner, building inspector, police department, including the chief, fire department, including the chief and assistant, and sanitary officers; by the council—solicitor, board of tax revision and appeals, three water commissioners, city engineer, city clerk, sanitary committee, three members of the board of public works, and five members of the board of park commissioners; by popular election—treasurer, controller, school directors, supervisors, and assessors (ward and city). The municipal income and expenditures amount to about \$600,000 and \$530,000, respectively, the principal items of expense being \$15,000 for the fire department, \$30,000 for operation of the water-works, \$30,000 for street lighting, \$35,000 for the police department, and \$185,000 for schools. Public improvements have been begun (1902) involving an expenditure of \$1,090,000 for the construction of a new sewer system, for filtration of water, development of parks, and street paving. Population, in 1850, 7834; in 1870, 23,104; in 1880, 30,762; in 1890, 39,385; in 1900, 50,167. Of the total population for 1900, 2500 were foreign born, and 4100 were of negro descent.

In 1726 John Harris, an English trader, settled here, and seven years later secured grants of 800 acres in this vicinity. In 1753 his son established a ferry, and the place was long known as Harris's Ferry. In 1785 a town was laid out and named Harrisburg, but in the following year it was renamed Louisburg, in honor of Louis XVI. In 1791 it was incorporated as Harrisburg; in 1812 it became the capital of the State, and in 1860 it was chartered as a city. The assembling here of the Harrisburg Convention in 1828, which was attended by representatives of the radical protectionists of New England and the Middle States, led to the passage of the high protective-tariff bill of that year. In 1839 Harrison and Tyler were nominated at Harrisburg. Consult Egle, *Centenary Memorial of the Erection of the County of Dauphin and the Founding of Harrisburg* (Harrisburg, 1886).

HARRISON. A town and the county-seat of Boone County, Ark., 45 miles southeast of Eureka Springs; on the Saint Louis and North Arkansas Railroad (Map: Arkansas, B 1). It has a collegiate and normal institute for women, and a Government building (\$75,000) in process of construction (1902). The town is in a fertile district adapted to fruit-growing, and interested in lead and zinc mining. There are several flour-mills and other industrial establishments. Population, in 1890, 1438; in 1900, 1551.

HARRISON. A city in Hudson County, N. J., on the Passaic River, and on the Pennsylvania, the Lackawanna, and the Erie railroads

(Map: New Jersey, D 2). It is a suburb of Newark, with which it is connected by three steel bridges, and is the seat of the State Soldiers' Home. The city has extensive manufacturing interests, which include a large steel plant, tube-works, marine-engine works, wire-cloth factories, electric works, machine-shops, trunk and refrigerator factories, a tannery, breweries, ink-works, etc. Settled as early as 1668, Harrison was incorporated in 1873, the charter of that date being still in operation and providing for a government vested in a common council, which is elected by wards. The city owns and operates its water-works. Population, in 1890, 8338; in 1900, 10,596.

HARRISON, BENJAMIN (c.1740-91). An American Revolutionary patriot, one of the signers of the Declaration of Independence, born at Berkeley, Va. As a member of the Virginia House of Burgesses, in 1765, he opposed the Stamp Act Resolutions of Patrick Henry, which he considered to be impolitic and premature. From 1774 to 1777 he was one of Virginia's representatives in the Continental Congress, and was a member of many important committees, though he rendered the greatest service as president of the Board of War. From 1777 to 1782 he was Speaker of the House of Burgesses, and from 1782 to 1785—for two terms—was Governor of the State. In 1788 he was a member of the Virginia convention which ratified the Federal Constitution, though he, along with Patrick Henry and other men of prominence, opposed it—largely because of the absence of a bill of rights. He was the father of William Henry Harrison (q.v.). Consult Sanderson, *Biography of the Signers of the Declaration of Independence*, ed. by Brotherhead (Philadelphia, 1865).

HARRISON, BENJAMIN (1833-1901). The twenty-third President of the United States, born at North Bend, Ohio, August 20, 1833. His father, John Scott Harrison (1804-78), a son of President William Henry Harrison, represented the Whigs in Congress from 1853 to 1857. Benjamin passed his early years on his father's farm, studied two years at Farmers College, at College Hill, near Cincinnati; graduated at Miami University in 1852 as fourth in his class, and after studying law in Cincinnati, married the daughter of Rev. J. W. Scott, and settled in Indianapolis in 1854. In 1860 he was elected reporter of the Supreme Court of Indiana, and in a political debate with Thomas A. Hendricks soon afterwards acquired reputation as a speaker. He entered the Federal Army as second lieutenant in July, 1862, assisted in organizing the Seventieth Indiana Regiment, was promoted in August, 1862, to be colonel, served in Kentucky and Tennessee, led a charge at Resaca, Ga., May 15, 1864, in which one-third of his command was killed or disabled; commanded his brigade with signal bravery at Kennesaw Mountain, June 29, to July 3, 1864, and at Peachtree Creek, July 20th; took part in the operations around Nashville, and on January 23, 1865, was brevetted brigadier-general of volunteers "for ability and manifest energy and gallantry in command of brigade." Returning to civil life, he resumed his occupation of reporter of the Supreme Court, but in 1868 declined reelection. In 1876 he was the Republican candidate for Governor of Indiana, but was defeated, though running 2000 votes ahead of his ticket. In 1878

he was appointed a member of the Mississippi River Commission. In 1880 he was elected United States Senator, taking his seat March 4, 1881, and during his term of office opposed alien ownership of large tracts of land and the Blair Educational Bill; favored civil-service reform; and was one of a committee to perfect and report a bill restricting Chinese immigration. In 1888, at the Republican Convention in Chicago, he was nominated for the Presidency, receiving 84 votes on the first ballot, 217 on the fourth, and 544 on the eighth. In the ensuing election he received 233 electoral votes to Cleveland's 168, Levi P. Morton, of New York, being elected Vice-President. His administration was marked by no especially conspicuous features; but during it the Pan-American Congress, the initiation of the policy of commercial reciprocity (q.v.), and the attempt to annex Hawaii to the United States attracted much attention. The industrial situation was altered by the McKinley Tariff (q.v.) of October 1, 1890; the public debt was reduced, and a stable national currency maintained; civil-service reform was extended; the Louisiana Lottery was abolished; the condition of both the army and the navy was improved; and many highly creditable appointments to office were made, especially in the Federal judiciary. In the summer of 1892 Harrison's Secretary of State, Mr. Blaine (q.v.), resigned and became an avowed candidate for the Presidential nomination; but Harrison was again nominated, only to be defeated in the election by his predecessor, Grover Cleveland (q.v.), receiving 145 electoral votes. After leaving office he accepted a professorship of international law at the Leland Stanford University, California. During the remaining years of his life he devoted himself to the practice of law, being retained in several cases of national importance, and in 1899 appearing as counsel for Venezuela before the commission appointed to arbitrate the boundary dispute with England. He was the principal representative of the United States at The Hague Conference (1899). His death occurred after a brief illness, at Indianapolis, March 13, 1901. He wrote numerous magazine articles, made a number of able speeches on public occasions, and published *This Country of Ours* (1897), in which he gave an interesting description of the practical workings of the National Government. Another book, *Views of an Ex-President*, was published posthumously in 1901. Consult: Wilson (editor), *The Presidents of the United States* (New York, 1894); and the campaign biography by Lew Wallace, *Life of General Benjamin Harrison* (Philadelphia, 1888). For an account of Harrison's Administration, see the article UNITED STATES.

HARRISON, CARTER HENRY (1825-93). An American politician. He was born near Lexington, Ky., and, like William Henry and Benjamin Harrison, was a descendant of the Virginia Harrisons. He graduated at Yale in 1845, studied law at Transylvania University at Lexington, and after two years' travel and desultory study in Europe, returned to Kentucky to practice his profession. He soon began to take an active interest in politics, and became an opponent of disunion and the extension of slavery. In 1855 he removed to Chicago, where faith in the future of the city led him to make profitable

investments in real estate. In 1871 he was elected County Commissioner of Cook County, and from 1874 to 1878 was a Democratic member of Congress. In 1879 he was chosen Mayor of Chicago, and was reelected for biennial terms in 1881, 1883, and 1885. In 1884 he was the Democratic candidate for Governor of Illinois, but was defeated by Governor Oglesby by 14,500 votes. In 1891 he was an independent candidate for Mayor, and drew so largely from the vote of the Democratic candidate that the Republican was elected. The year 1893 was the year of the World's Fair at Chicago, and it was deemed by the business community as well as by the reformers and promoters of the great enterprise particularly necessary to have an able, high-minded administrator in the Mayor's office. These elements joined with the Republicans, and secured the nomination of Samuel W. Allerton, a man of acknowledged fitness. Harrison, however, after a long and bitter contest, in which there were frequent charges of fraud and intimidation, secured the Democratic nomination, and in April was triumphantly elected. He was assassinated on October 29th following, one of the closing days of the great Exposition. Although a political demagogue, Harrison differed from the modern political boss in that he relied on his personal popularity rather than machine organizations to win his victories, and despite the fact that his methods of obtaining and maintaining power were somewhat open to question, it was never charged that he himself derived pecuniary gain from his office.

His son, CARTER HENRY (1860—), was born in Chicago. He was educated at Altenburg, Germany, and at the Law School of Yale, where he graduated in 1883. He was elected Mayor of Chicago in 1897, and again in 1899.

HARRISON, CONSTANCE CARY (1846—). An American novelist, born at Vaclause, Va. In 1867 she married Burton Harrison, a Virginia lawyer and private secretary to Jefferson Davis, and with him removed later to New York City, where she wrote many books and contributed to periodicals. Among her more noteworthy volumes of fiction are: *Golden Rod* (1880); *Helen Troy* (1881); *Bar Harbor Days* (1887); *The Anglomaniacs* (1887); *Sweet Bells Out of Tune* (1893); *A Daughter of the South* (1892); *An Errant Wooing* (1895); *A Merry Maid of Arcady and Other Stories* (1897); *A Son of the Old Dominion* (1897); *Good Americans* (1898). For children she wrote: *Old-Fashioned Fairy Book* (1884); and *Folk and Fairy Tales* (1885). Worthy of mention also is *Externals of Modern New York* (1896). Her dramatic work consists chiefly of adaptations from the French.

HARRISON, FREDERIC (1831—). An able English essayist, born in London. He was educated at King's College School, London, and at Wadham College, Oxford. He became fellow and tutor at Wadham, and was called to the bar in 1858. After practicing in the courts of equity, he was appointed a member of the royal commission upon trades unions (1867-69), secretary of the royal commission for digesting the law (1869-70), and professor of jurisprudence and international law at Lincoln's Inn Hall (1877-89). In 1889-92 he was alderman in the London County Council. In politics he supported the Liberal Party. As a philosopher he is one of the

most brilliant followers of Comte, whose ideas, much modified, he has widely diffused in essays and reviews. Among his works are: *Meaning of History* (1862; enlarged, 1894); *Order and Progress* (1875); *The Choice of Books* (1886); *Oliver Cromwell* (1888); *Annals of an Old Manor House* (1893; new ed. 1899); *Victorian Literature* (1895); *William the Silent* (1897); *The Millenary of King Alfred* (1897); *Tennyson, Ruskin, Mill, and Other Literary Estimates* (1900); *John Ruskin*, in English Men of Letters series (1902); and *Washington* (1902).

HARRISON, GABRIEL (1825-1902). An American author and artist, born in Philadelphia, Pa. For several years he was an actor, and at one time supported Charles Kean. Afterwards he became the manager of several theatres, and produced, among other plays, a dramatization of Hawthorne's *Scarlet Letter* (1878). He is also the author of a *Life of John Howard Payne* (1873), and a number of critical articles, notably *Edwin Forrest, the Actor and the Man*, *Critical and Reminiscent* (1889). He did much for the encouragement of the free art schools in connection with the Brooklyn Academy of Design, and was also a portrait and landscape painter.

HARRISON, JAMES ALBERT (1848—). An American philologist, born at Pass Christian, Miss., and educated at the University of Virginia. In 1871 he was appointed professor of Latin and modern languages in Randolph Macon College, and in 1876 was chosen professor of English in Washington and Lee University. He left this chair in 1895 to become professor of English and Romance languages at the University of Virginia. He was an editor of the *Century* and the *Standard Dictionaries*; and edited (with W. M. Baskerville) *Dictionary of Anglo-Saxon Poetry* (1883); *Library of Anglo-Saxon Poetry* (1883); *Beowulf* (1883); Mme. de Sévigné's *Letters* (1898); and Corneille's *Nicomède* (1901). Among his other works are: contributions to *Anglia* on "Negro English;" *Group of Poets and Their Haunts* (1874); *Greek Vignettes* (1877); *Spain in Profile* (1879); *Story of Greece* (1885).

HARRISON, JANE E. (1850—). An English archaeologist and Hellenist, born in Yorkshire. She studied at Newnham (Cambridge) and at the British Museum, visiting also the museums of Berlin, Munich, Rome, and Athens. Since 1882 she has lectured at the British Museum, South Kensington Museum, Cambridge, and Oxford. She has received the honorary degrees of Litt.D. (Durham) and LL.D. (Aberdeen). She has written: *Myths of the Odyssey* (1882); *Introductory Studies in Greek Art* (1885); *Mythology and Monuments of Ancient Athens*, with Mrs. A. W. Verrall (1890); *Greek Vase-Painting*, with D. S. MacColl (1894).

HARRISON, JOHN (1693-1776). An English inventor, who became celebrated as 'Longitude Harrison.' He was born at Foulby in Yorkshire, where his father was the village carpenter and clock-repairer. After the most meagre education, he learned carpentering from his father, and with a natural inclination for mechanics that amounted to genius, in the intervals of his work studied the construction of clocks and watches, with a view to their improvement. His experiments resulted in the invention of the 'gridiron pendulum' for clocks, which, by an arrangement of

compensating steel and brass rods, allows for the expansion caused by variations of temperature; a 'recoil escapement' to prevent the constant oiling and clogging of the pallets; and the 'going ratelet' universally used to prevent a timepiece losing while being rewound. When the British Government offered successively £10,000, £15,000, and £20,000 for the discovery of a method for determining the longitude at sea within sixty, forty, and thirty geographical miles, he made four chronometers, now in the Greenwich Royal Observatory, each with a 'compensation curb' to the balance wheel. All qualified for the first prize, the fourth, on a voyage to Barbadoes and return, determining the longitude within ten miles. After much vexatious delay and petitions to Parliament, the prize was paid to him in installments, it being stipulated that he should publish particulars of his invention *pro bono publico*. He wrote *A Description Concerning such Mechanism as Will Afford a Nice or True Mensuration of Time* (1767), and other pamphlets in connection with his discoveries. In 1897 his tomb in Hampstead Church was restored by the London Company of Clockmakers. Consult Smiles, *Men of Invention and Industry* (London, 1884).

HARRISON, JOSEPH, JR. (1810-74). An American engineer, born in Philadelphia. He was conspicuously successful as a locomotive-engine builder in the early days of that industry, and in 1840 his 'Gowan and Marx' locomotive attracted the attention of two Russian engineers, who had been ordered by Emperor Nicholas to examine the systems of railroads and railroad machinery in Europe and America. As a consequence he and his partner, A. M. Eastwick, together with Thomas Winans, of Baltimore, secured a contract to build the locomotives and other machinery for the railroad from Saint Petersburg to Moscow, and later another contract, which continued until 1862, to repair the rolling stock of the railroad. On the expiration of these contracts he returned to Philadelphia, where he collected a gallery of paintings. In 1869 he published a volume containing a poem entitled *The Ironworker and King Solomon*, his autobiography, and numerous incidents of his life in Russia; and a few years later another, entitled *The Locomotive Engine, and Philadelphia's Share in Its Early Improvements* (1872).

HARRISON, (LOWELL) BERGE (1854—). An American genre and landscape painter, brother of Alexander Harrison. He was born in Philadelphia, November 28, 1854. He was a pupil of Carolus Duran (q.v.) and studied at the Ecole des Beaux-Arts under Cabanel. In 1881 he exhibited at the Salon; and in 1882 he returned to America, spending a year painting and sketching in New Mexico. He received a medal at the World's Fair, Chicago, 1893; and his picture entitled "November," exhibited at the Exposition of 1889, was purchased by the French Government for the Museum of Marseilles. Some of his principal works are: "Waif from the Sea," "Return from the First Communion," "Little Gooseherd," "Motherless," "Summer Idyl," "Calling Home the Cows," "Milkmaid," "Modern Pompeiiian," "Friends or Foes."

HARRISON, MARY SAINT LEGER (pen-name LUCAS MALET) (1852—). An English novelist, daughter of Charles Kingsley (q.v.). She was

born at Eversley rectory, and was educated at home and at University College, London. In 1876 she married William Harrison, a young clergyman in whom her father had been much interested, and afterwards settled at Clovelly, in Devonshire, amid the scenes of her father's boyhood. Her husband died in 1897, after which she visited the Continent, America, and India in search of health. Her popular novels of English life are written with an ethical purpose. Among them are: *Mrs. Lorimer* (1882); *The Wages of Sin* (1891); *The Carissima, a Modern Grotesque* (1896); *The Gateless Barrier*, a ghost story (1900); and *Sir Richard Calmady* (1901), a painful but powerful novel.

HARRISON, SUSAN FRANCES (pen-name **SERANUS**) (1860—). A Canadian author, born of Irish parents at Toronto. In 1879 she married J. W. T. Harrison, an English musician and musical critic. She contributed numerous sketches, stories, and songs to newspapers and periodicals in Canada, the United States, and England. In her short stories, as *Crowded Out* (1888), she did for French Canada a work similar to that of George W. Cable for the Creoles of Louisiana. Some of her verse was collected in *Pine, Rose, and Fleur-de-Lis* (1891). She also edited a Canadian anthology entitled *The Canadian Birthday Book* (1887). Consult Stedman, *Victorian Anthology* (New York, 1895), and Rand, *Treasury of Canadian Verse* (ib., 1900).

HARRISON, THOMAS (1606-60). An English regicide and religious fanatic. He was born at Newcastle-under-Lyme, Staffordshire, and although of humble parentage received a good education. He studied for the law in an attorney's office in Clifford's Inn, London, but at the opening of the Civil War in 1642 joined the regiment of life guards raised by Essex. He distinguished himself in several actions and rose to the rank of major-general. In 1646 he was elected member of Parliament for Wendover. He was in command of the escort that conveyed King Charles from Hurst Castle to London, and was one of the most energetic advocates of the King's trial and execution. In 1650, during Cromwell's absence in Ireland, he was commander-in-chief of the military forces in England, and the following year was elected a member of the Council of State, to which he had been nominated two years previously. His connection with the Fifth Monarchy Men (q.v.) and his conspiracies against Cromwell resulted in imprisonment and the loss of his commission and offices. At the Restoration he refused to save himself by flight, and as one of the seven regicides excluded from the Act of Indemnity was arrested and condemned to death. Justifying his actions and bearing himself bravely on the scaffold, he was executed on October 13, 1660.

HARRISON, (THOMAS) ALEXANDER (1853—). An American genre and landscape painter. He was born in Philadelphia, January 17, 1853. He was a pupil of Gérôme (q.v.), at the Ecole des Beaux-Arts, and has been strongly influenced by the works of Cazin and Bernard. His work is characterized by grace of line and by luminous color, delicate in its effect. He is especially noted for his marines, which are rendered with broad surfaces that well express the transparency of the ever-changing color of water and sky. He received medals at the exhibition of the Pennsylvania Academy of Fine Arts in 1887; a gold

medal at the Paris Exposition in 1889; the second medal of honor at Brussels and Ghent in 1891; the gold medal of honor at Pennsylvania Academy of Fine Arts in 1894.

His chief works are as follows: In 1881, "Au Bords de la Mer," "Shipwrecked," "Coast of Brittany"; 1882, "Chateaux en Espagne" (Castles in Spain); 1883, "The Amateurs," "Little Slave"; 1884, "Breton Garden," "Twilight," "Seashore"; 1885, "The Wave." He exhibited at Buffalo in 1901, "The Golden Mirror," "Le Crepuscule" (Twilight), "Autumn," "Child with Doll." He was made Chevalier of the Legion of Honor and Officer of Public Instruction by the French Government; is a member of the Society of American Artists, New York; of the Royal Institute of Painters in Oil Colors, London, and a corresponding member of the Societies of Secessionists, Berlin and Munich.

HARRISON, WILLIAM (1534-93). An English divine and historian, born in London. He was educated in the Saint Paul and Westminster schools, took art courses at Oxford and divinity at Cambridge, became chaplain to Lord Cobham of Kent, and afterwards rector of Radwinter, Essex. He was also canon at Windsor, where he died; but he is most widely known by his work in the *Chronicles* of Holinshed, the source whence Shakespeare drew the material for his historical plays. Harrison's share therein is invaluable for the local color of the sixteenth century, being *An Historical description of the Iland of Britaine, with a brief rehearsal of the nature and qualities of the people of England and such commodities as are to be found in the same comprehended in three books and written by W. H.* The New Shakespeare Society brought out a modern edition of this work in 1877-81.

HARRISON, WILLIAM HENRY (1773-1841). Ninth President of the United States. He was the son of Benjamin Harrison (1740-91); was born at Berkeley, Charles County, Va., February 9, 1773; was educated at Hampden-Sidney College, and although the profession of medicine had been chosen for him, entered the army as an ensign in 1791, became a lieutenant in June, 1792, and served against the Indians as an aide-de-camp on the staff of General Wayne, taking part in the battle of the Maumee and in other engagements, and becoming a captain in May, 1797. Resigning in June, 1798, he was soon afterwards appointed Secretary of the Northwest Territory under Gen. Arthur Saint Clair, but in October, 1799, resigned that position to become a Territorial Delegate in Congress. In 1801 he was made Governor of the so-called Indiana Territory, which then comprised the region later embraced in the States of Indiana, Illinois, Michigan, and Wisconsin, and for a time subsequent to the treaty of 1803 his jurisdiction also extended over that part of the lands then acquired from France by the Louisiana Purchase (q.v.), which was known as the District of Louisiana. Harrison's executive work in the Northwest continued until 1813, and was marked by conspicuous success in a variety of difficult undertakings, in which he secured the hearty appreciation of the people affected by his administration and the marked approval of the National Government. He was largely instrumental in effecting a change of the organization of Indiana from a Federal district to a Territory with representative government and

with a Delegate in Congress, although by this arrangement his own power was appreciably diminished. He rendered effective and important service to the nation by early establishing friendly relations with a number of the Indian tribes, and by thus lessening the possibility of a continuation of British influence in that region. On September 17, 1802, he concluded a treaty at Vincennes, and in July of the following year negotiated the more important treaty of Fort Wayne. But while in some regions the questions of land rights and the allied problems arising from the ill-defined relations between the tribes and the newly organized government were being adjusted amicably, Harrison's force and ability were also tested by the necessity of meeting successful conditions which required the use of arms. In this branch of the public service he was also active, his most important military campaign being that against Tecumseh's brother, the Prophet, in the region of the Wabash, culminating in his victory at the battle of Tippecanoe (q.v.), November 7, 1811. Upon the outbreak of the War of 1812 he became a major-general of Kentucky militia, and in August, 1812, was made a brigadier-general in the Regular Army, and soon afterwards was appointed to the chief command in the Northwest, in which capacity, with the rank, after March, 1813, of major-general, he was actively engaged during the Western campaigns of the war, becoming again conspicuous by his brave defense of Fort Meigs (q.v.) and by his complete victory over the British at the battle of the Thames, October 5, 1813. Harrison had thus repeatedly shown marked military talent, and the end of the war left him, next to Jackson, the most prominent military figure in American public life. Withdrawing, however, from the army, Harrison entered Congress as the representative of the district embracing Cincinnati, and served from 1816 to 1819, when he was elected to the State Senate, where he remained until 1821. In 1825 he returned to Washington as Senator from Ohio, retaining this position until 1828, when he was sent as Minister to Colombia. Upon returning from that post in the following year, he retired for several years from public life. In 1835 he was nominated for the Presidency by Whig conventions in Indiana, Ohio, and Maryland, and by an Anti-Masonic convention at Harrisburg, Pa., and in the ensuing election succeeded in carrying seven States, Vermont, New Jersey, Delaware, Maryland, Kentucky, Ohio, and Indiana, securing 73 electoral votes, as against 170 given to Van Buren and 51 divided among the three other candidates. Moreover, the popular vote for Harrison in Connecticut, Rhode Island, and Pennsylvania approached very closely, and in Illinois and New York compared favorably with that of Van Buren. When, finally, the financial policy of Jackson and Van Buren brought such disastrous results as to turn against the Administration a large portion of the people, the situation became particularly favorable for whoever might be nominated by the Whig Party in 1840. Although in many respects Henry Clay appeared as the leader of the party, he could not command its complete support as a Presidential candidate, and, accordingly, in the interest of harmony, he refrained from an active contest and left Harrison as the leading candidate for the nomination.

The Whig Convention met at Harrisburg, December 4, 1839, and comprised 254 delegates. The 'unit rule' was introduced, and upon the first ballot Henry Clay received 103 votes, General Harrison 94, and General Scott 57. On the fifth ballot, during the third day of the convention, Harrison received 148 votes, Clay 90, and Scott 16, and Harrison was accordingly declared the nominee of the party. There forthwith began a political campaign which for popular enthusiasm and widespread activity has probably never been equaled in American politics. Throughout the country, meetings, processions, and a great variety of 'demonstrations' were held, and the general public took an energetic share in the contest. New campaign methods were introduced, and the log cabin and hard cider became especial emblems of the party of 'Tippecanoe and Tyler too.' The 'stump speaker' was a prominent feature of this new method of campaigning, even General Harrison himself making a series of addresses. The early State elections in some of the New England States and in Ohio and Kentucky resulted in Whig victories, and in the Presidential election Van Buren carried only seven States, of which only two were Northern States, with a total electoral vote of only 60, as against the 234 votes secured by Harrison. Although in good health at the time of his inauguration, General Harrison was taken ill, and died on April 4, 1841, the whole political situation being thus suddenly altered, and the Whig President being succeeded by John Tyler (q.v.), a former Democrat. William H. Harrison was the grandfather of President Benjamin Harrison. A *Historical Narrative* of Harrison's services was prepared by Moses Dawson (Cincinnati, 1824), a *Memoir* was written by James Hall (Philadelphia, 1836), and campaign biographies by C. S. Todd, S. J. Burr, Richard Hildreth, and I. R. Jackson were issued in 1840; but there is no adequate biography. Consult the sketch by Bostwick, in Wilson, *Presidents of the United States* (New York, 1894).

HARRISONBURG. A town and the county-seat of Rockingham County, Va., 122 miles northwest of Richmond; on the Baltimore and Ohio, the Chesapeake and Western, and the Southern railroads (Map: Virginia, F 3). It is in the picturesque and fertile Shenandoah Valley, is of considerable importance as the commercial centre for this agricultural region, and has foundries and machine-shops, potteries, stave and heading works, saw and planing mills, flouring-mills, etc. The water-works are owned by the municipality. Population, in 1890, 2792; in 1900, 3521.

HARRISONVILLE. A city and the county-seat of Cass County, Mo., 45 miles south by east of Kansas City; on the Missouri Pacific, the Missouri, Kansas and Texas, and other railroads (Map: Missouri, B 3). It has a county building that cost \$50,000 and a public school library. There are some manufactures, and considerable trade in grain, agricultural produce, live stock, lumber, etc. Population, in 1890, 1645; in 1900, 1844.

HARRISSE, à'rès', HENRY (1830—). A French bibliographer and historian, born in Paris, of Russian-Hebrew parentage. Through long years of investigation in the archives of different European countries, he was enabled to collect material for such works as *Bibliotheca Americana Vctustissima* (1866), a bibliography

of publications about America from 1492 to 1551, invaluable to modern students of that period. M. HARRISSE prepared perhaps the best biography yet published of Columbus, made a uniquely important collection of the early maps of America, and while shut up in Paris during the siege of 1870 compiled *Notes pour servir à l'histoire, à la bibliographie et à la cartographie de la Nouvelle-France et des pays adjacents* (1872). He published also *Fernand Colomb, sa vie et ses œuvres* (1872); *Les Colomb de France et d'Italie* (1874); *Christophe Colomb, son origine, sa vie, ses voyages, sa famille* (1884-85); *Jean et Sébastien Cabot* (1882); *Les Corte-Real* (1883); *Excerpta Colombiniana* (1887); *Découverte de l'Amérique du Nord* (1892); *Auto-graphes de Christophe Colomb* (1893); *Découverte de Terre-Neuve* (1900).

HARRODSBURG. A city and the county-seat of Mercer County, Ky., 30 miles south of Frankfort; on a branch of the Southern Railway (Map: Kentucky, G 3). It is a summer resort, visited for its mineral springs, and has a public library and Beaumont College for women, opened in 1894. There are a large distillery, flour-mills, planing-mills, and other industrial establishments. Under a general law of 1894 the government is vested in a mayor, elected every four years, and a municipal council. Population, in 1890, 3230; in 1900, 2876. Harrodsburg was founded in June, 1774, by James Harrod, and is the oldest permanent settlement in the State. In 1776, when Kentucky was organized as a county of Virginia, Harrodsburg became the county-seat. It was incorporated in 1875. Consult an article, "Kentucky's Pioneer Town," *New England Magazine*, vol. xiii. (Boston, 1891).

HARROGATE. A fashionable inland watering-place and municipal borough in the West Riding of Yorkshire, England, 19 miles west of York (Map: England, E 3). Its importance dates from the discovery of its chalybeate, sulphur, and saline springs in 1596. The town consists of High and Low Harrogate, connected by rows of handsome residences encircling a public park of 200 acres. The royal baths and springs, with their fine buildings, the electric lighting plant, water-works, markets, and a remunerative sewage farm are the property of the municipality, which maintains a free library, the Royal Spa concert rooms and gardens, a kursaal, winter garden, theatre, and recreation grounds. Population, in 1891, 15,700; in 1901, 28,400. Consult Grainge, *History of Harrogate* (London, 1882).

HARROW. See HARROW-ON-THE-HILL.

HARROW (AS. *heargc*, Dutch *hark*; connected also with Icel. *herfi*, harrow; possibly akin to Skt. *kharj*, to scratch). An agricultural implement, used for smoothing and pulverizing plowed land and for covering seeds previously sown. It consists of a frame of a square or rhombic form, in which are fixed rows of teeth, or tines, projecting downward. The harrow was in use before the dawn of history; but since only the lighter soils were cultivated in ancient times, it often consisted of bushes, or branches of trees, which merely scratched the ground. In the various stages of its development the harrow has consisted of a wooden frame with wooden teeth, a wooden frame with iron teeth, or wholly of iron. The second is still used to a considerable extent,

but iron harrows are most commonly employed. Of a very different character from those mentioned above are the chain harrows, which consist of a congeries of iron rings, and the disk harrows, which pulverize the soil by means of a series of obliquely set revolving disks.

HARROWBY, DUDLEY FRANCIS STUART RYDER, Earl of (1831—). An English politician, born at Brighton. He was educated at Harrow and Oxford, and took an Eastern sojourn, followed by military service at home during the Crimean War, but entered Parliament in 1856, and while Viscount Sandon was three times member for Liverpool. He succeeded to his father's title in 1882, and became prominent in matters relating to education and social reform brought before the House of Commons. Under the Conservative Government he held such offices as president of the Board of Trade (1878-80), and Lord Privy Seal (1885-86).

HARROW-ON-THE-HILL. A town in Middlesex, England, 12 miles northwest of London. Its celebrity is derived from its famous school, Harrow. The town is finely situated on a hill 200 feet high, which is conspicuously crowned by the archaeologically interesting Church of Saint Mary with its lofty spire. This church, founded by Archbishop Lanfranc in the reign of William I., was rebuilt in the fourteenth century, and has a view of thirteen shires. Population, in 1891, 6200; in 1901, 10,200. Consult: Rimmer, *Rambles Round Eton and Harrow* (London, 1882); Bushell, *The Harrow Octocentenary Tracts* (Cambridge, 1894).

HARROW SCHOOL. One of the great public schools of England, founded in 1571 by John Lyon (q.v.). Its charter was granted by Elizabeth in the same year, and in 1590 the laws to govern its operation were duly framed by Lyon himself, but students were not admitted until the opening of the first building in 1611. Originally intended for the education of thirty poor youth from the parish of Harrow-on-the-Hill, its statutes nevertheless provided for the admission of "so many foreigners over and above the youth of the parish as the whole number may be well taught and the place can contain." The founder bequeathed two-thirds of his property for its maintenance, but the school did not thrive until 1660, when the headmaster availed himself of the statute admitting such as lived beyond the parish. This act assured its prosperity, though the enrollment has at times been very low. Now there are more than six hundred in attendance. Long purely classical, the curriculum was extended by the introduction of mathematics in 1837, of modern languages in 1851, of English history and literature in 1869, and subsequently of drawing, music, and science. The school was formerly administered by six prominent parishioners, themselves empowered to fill any vacancies, but by the Public Schools Act of 1868, though the survivors of the old board remained, an additional six were elected, severally, by the Lord Chancellor, the universities of Cambridge, London, and Oxford, the Royal Society, and the under-masters. Students are admitted at the age of twelve to fourteen. Though free tuition was originally intended, there is now no gratuitous instruction, but the foundationers have some slight advantage of the foreigners in rates. There are about six entrance

scholarships varying from £30 to £80, and the best of the exhibitions are the three by Baring, of a value of £100 each for five years, to Hertford College, Oxford. To the first building have been added a chapel (1839, replaced by another in 1857), the Vaughan Memorial Library (1861-63), and the hospital (1865). The Tercentenary Lyon Fund has provided a gymnasium, laboratories, and a new speech-room (1877). Among the names associated with Harrow the most noteworthy are James Bruce, the African traveler, Charles Buller, Colonel Burnaby, Byron, Calverley, Theodore Hook, Sir William Jones, Cardinal Manning, Merivale, Palmerston, Dr. Parr, Sheridan, Archbishop Trench, Anthony Trollope, and Sir George Trevelyan. Consult: Rimmer, *Rambles Round Eton and Harrow* (London, 1882); Thornton, *Harrow School and Its Surroundings* (ib., 1885); *Harrow School Register, 1801-93* (ib., 1894); Minchin, *Old Harrow Days* (ib., 1898); and Williams, *Harrow* (ib., 1901).

HARRY AL/LIS. The pseudonym of the French author Jules Hippolyte Percher (q.v.).

HARRY, BLIND. See HENRY THE MINSTREL.

HARRY LOR/REQUER. Charles Lever's first novel, and one of his most successful works. It appeared in the *Dublin University Magazine*, and was published in 1840. It is a rollicking tale of adventure.

HARSDÖRFER, härs'dër-fër, GEORG PHILIPP (1607-58). A German poet and scholar. He studied law at Altdorf and Strassburg, and, in 1644, with Johann Klaj, founded at Nuremberg a poetical society called the *Pegnitzorden*. He was a prolific writer, publishing about fifty volumes in German and Latin. His style is ornate and artificial; his material shows strong influence of Italian and Spanish literature. He made a strong effort to purify his native tongue. His works include: *Frauenzimmersgesprächspiele* (second edition, 1642-49), a sort of encyclopædia in dialogue of curious knowledge; *Nathan, Jothan, und Simson*, a collection of fables and allegories; and *Poëtischer Trichter, die deutsche Dicht- und Reimkunst, ohne Behuf der lateinischen Sprache in sechs Stunden einzuzugessen* (1647-50). Selections from his poems are in Müller, *Bibliothek deutscher Dichter des 17. Jahrhunderts* (Leipzig, 1826).

HAR/SHA, or SRĪ-HARSHA-DEVA. The name of a renowned King of India, known also as Harsha-vardhana, or Harsha-Silāditya. He reigned over Thanear and Kansj (A.D. 606-648), and was monarch of all Northern India, as we know from the Chinese pilgrim Hiouen Tsang (q.v.). He was a noted patron of literature, and is named as the author of three Sanskrit dramas: the *Ratnāvalī*, or Pearl Necklace; the *Priyadarśikā*, or Lost Princess; and a play with a Buddhist plot, the *Nāgānanda*, or Joy of Serpents. The question of his actual authorship has often been discussed. It was under his royal favor that Bāna wrote the historical romance *Harsha-carita*, or *Adventures of Harsha*, translated into English by Cowell and Thomas (London, 1897). There are English, French, and German translations of the three dramas: *Ratnāvalī*, by Wilson (London, 1871) and Fritze (Chemnitz, 1878); *Priyadarśikā*, by Strehly (Paris, 1888); *Nāgānanda*, by Boyd (London, 1872) and Bergaigne (Paris, 1879). Consult also: S. Lévi,

Théâtre Indien (Paris, 1890); Lévi, *Une poésie inconnue du roi Harsha Çilāditya* (Leyden, 1895); Jackson, "Time Analysis of Harsha's Play," in the *Journal of the American Oriental Society*, xxi. (New Haven, 1901).

HARS'NETT, SAMUEL (1561-1631). An English ecclesiastic, Archbishop of York. Born in the parish of Saint Botolph, Colchester, Essex, he was educated at Cambridge, and began his career as a preacher in 1584, with a sermon at Saint Paul's Cross, London, directed so strongly against the doctrine of predestination that he was then and afterwards accused of leaning toward Popery. He was archdeacon at Essex from 1602 until 1604, and the following year was made master of Pembroke Hall, Cambridge, Bishop of Chichester (1609), and of Norwich (1619). He was undoubtedly an extreme high churchman, most arbitrary in his dealings with the subordinate clergy and Puritan laity, but when summoned to appear before the House of Lords and refute the charges of Romanism brought against him, his defense was so eminently satisfactory that he was made Archbishop of York (1628). He is the author of *A Discovery of the Fraudulent Practices of John Darrell* (1599), and *Declaration of Egregious Popish Impostures*, etc. (1603).

HART (AS. *heort*, *hcorot*, OHG. *hiruz*, *hirz*, Ger. *Hirsch*, hart; connected with Lat. *cervus*, Welsh *carw*, Lith. *kárve*, stag, Ochurch Slav. *krava*, cow, Gk. *κεράς*, *keras*, horned; also related to Lat. *cornu*, Ir., Welsh *corn*, Galatian *κάρων*, *karnon*, horn, and to Gk. *κέρας*, *keras*, Skt. *srnga*, horn). A stag or male of the red deer, from the age of six years, when the crown or *surroyal* of the antler begins to appear. Great importance was formerly attached to the distinction of names proper to deer at different ages. See ANTLER; DEER.

HART, ALBERT BUSHNELL (1854—). An American historian, born at Clarkesville, Mercer County, Pa. He prepared for college in Cleveland, Ohio, and in 1880 graduated at Harvard. He continued his historical studies in Paris, at the Ecole des Sciences Politiques, at the University of Berlin, and at the University of Freiburg, where he received his Ph.D. degree in 1883. In the fall of that year he returned to America to accept an appointment as an instructor in history at Harvard, and a year later became an assistant professor. In 1897 he was appointed a full professor. He has been particularly identified with the introduction and development of the method of studying history from the original sources, both in secondary schools and in colleges, and his influence has been felt, not only at Harvard, but in other universities as well. He is an editor of the *Harvard Graduates' Magazine* and the *American Historical Review*, and has been a frequent contributor to magazines and reviews. He has published: *Introduction to the Study of Federal Government* (1890); *Epoch Maps, Illustrating American History* (1891); *Formation of the Union* (1892), in "Epoch Series;" *Practical Essays on American Government* (1893); *Studies in American Education* (1895); *Revised Suggestions on the Study of History and Government of the United States* (1895); *Guide to the Study of American History* (with Edward Channing) (1897); *American History Told by Contemporaries* (4 vols., 1898-

1901); *Source Book of American History* (1899); *Life of Salmon P. Chase* (1899, in the "American Statesmen Series"); *Foundations of American Foreign Policy* (1901). He was a member of the committee of seven of the American Historical Association, appointed to consider the subject of history teaching in the secondary schools, and was one of the authors of their *Report* (1899). In 1902 he was chosen editor-in-chief of the coöperative history of the United States projected under the auspices of the American Historical Association.

HART, CHARLES HENRY (1847—). An American author, born in Philadelphia. He was admitted to the bar in 1868, and graduated at the University of Pennsylvania the next spring. He practiced law until 1894, when he met with an accident, after which he gave his attention entirely to literature. In 1884 he was elected director of the Pennsylvania Academy of Fine Arts, and afterwards chairman of the committee on retrospective American art at the World's Columbian Exposition (1893). His publications include: *Bibliographia Lincolniana*, reprinted under the title *Biographical Sketch of Abraham Lincoln* (1870); *Life Portraits of Great Americans*; *Gilbert Stuart's Portraits of Women*; and *Engraved Portraits of Washington*.

HART, ERNEST ABRAHAM (1835-98). An English physician and reformer, born of Jewish parentage at Knightsbridge, London. He became a student at Saint George's Hospital, receiving part of his medical education at Lane's School of Medicine in Grosvenor Place, where he was appointed a demonstrator in his third year. He was admitted to the Royal College of Surgeons in 1856, and was house surgeon at Saint Mary's Hospital after being associated with William Coulson in general practice. In 1860 he became surgeon to the West London Hospital, but returned to Saint Mary's in 1863 first as ophthalmic, then as aural surgeon, and finally as dean of the medical school.

In 1863 he became coeditor of the *London Lancet*, and in 1866 he was made the editor of the *British Medical Journal*, a position which he filled until his death. He also edited the *Medical Record* from 1873, and the *Sanitary Record* from 1874. He was president of the Harveian Society of London in 1868 and 1893. Hart was above all a reformer. In 1854 he led the agitation which compelled the Admiralty to remove naval assistant surgeons from the cockpit to more fitting quarters; in 1888 he made strenuous efforts to ameliorate the position of military medical officers; and in 1892 he called attention to the grievances of Irish dispensary doctors. Sanitary reforms occupied him throughout all his life. His earliest sanitary investigations were carried out in connection with the *Lancet* commission for the nursing of the sick poor in the Metropolitan Workhouse infirmaries. His exposure in 1872 of the evils of the system of baby-farming was instrumental in leading to the passage of an act for the protection of infant life. Coffee-taverns, the National Health Society, and the abatement of the smoke nuisance in large towns had his strong support. In 1894 he engaged in a campaign against the system of barrack schools, where hundreds of pauper children herded together till they became subject to chronic dis-

eases, and were drilled until they were little better than automata.

His most important publications include: *On Diphtheria* (London, 1859); *On Some of the Forms of Diseases of the Eye* (London, 1864); *A Manual of Public Health* (London, 1874); *Hypnotism, Mesmerism, and the New Witchcraft* (London, 1893 and 1896); *Essays on State Medicine* (London, 1894). He also originated the series of biographies known as *Masters of Medicine*.

HART, JAMES McDUGAL (1828—). An American landscape painter. He was born at Kilmarnock, Ayrshire, Scotland, May 10, 1828, and came to America in 1831. He was a pupil of his brother, William Hart, also of Schirmer, at Düsseldorf, in 1851. He established a studio in New York, and was elected member of the National Academy in 1859. His favorite subjects are American forests with autumnal effects. Among his principal works are: "On the Croton;" "Summer on the Bouquet River;" "Morning in the Adirondacks;" "Summer Memory of Berkshire;" "Adirondacks" (1858), Walters Collection, Baltimore; "Through Dust Clouds" (1879); "Princess Lily" (1882); "Boughs for Christmas;" "In the Old Orchard;" "Oaks in Autumn;" "Landscape with Cattle," Metropolitan Museum, New York.

HART, JAMES MORGAN (1839—). An American scholar and educator, born at Princeton, N. J. He studied at Princeton University, where he graduated in 1860, and further at Göttingen, Germany; was assistant professor of modern languages at Cornell from 1868 to 1872, and at the University of Cincinnati, Ohio, held the chair of modern languages and English literature in 1876-90. In the latter year he returned to Cornell as professor of rhetoric and English philology. His publications include translations from the German and French; very serviceable editions, with brief notes, of Goethe's *Hermann und Dorothea* (1875) and *Faust* (part i. 1876), and Schiller's *Piccolomini* (1875); an informing and interesting work on *German Universities* (1874); and a *Handbook of English Composition* (1895).

HART, JOEL (1810-77). An American sculptor. He was born in Clark County, Ky. He received but little education, and at the age of twenty he worked with a stone-cutter. The talent which he displayed in clay-modeling attracted attention, as did especially his marble bust of Cassius M. Clay, and in 1849 he went to Florence to execute a commission for a statue of Henry Clay, given him by the Ladies' Clay Association of Virginia. His first model was lost during the voyage by shipwreck, and the statue itself, which is now in Richmond, Va., was not completed till 1859. Hart executed two other statues of the same statesman—one of marble, in the court-house at Louisville, Ky., and a colossal bronze statue at New Orleans. He resided at Florence, producing many statues and busts. The most important of these are: "Angelina," "Il Penseroso," and "Woman Triumphant." He also invented a mechanical device for obtaining the outlines of a head from life, the application of which gave some vogue to his portrait busts. He died at Florence, Italy, March 2, 1877.

HART, JOHN (1708-80). A signer of the Declaration of Independence, born in New Jersey.

His father raised and commanded the company known as 'The Jersey Blues,' which he led to Quebec just in time to share in Wolfe's victory. John took an active part in the pre-Revolutionary agitation, and was several times elected to the Provincial Legislature. In 1776 he was elected to the Continental Congress. During the British invasion of New Jersey his farm was ravaged, and he himself became a fugitive until the battle of Trenton, when the British withdrew and he was able to return to his home.

HART, JOHN SEELEY (1810-77). An American educator. He was born in Stockbridge, Mass.; graduated at Princeton in 1830, and four years later became adjunct professor of ancient languages there. From 1836 to 1841 he was in charge of the Edge Hill School, Princeton. He was principal of the Philadelphia High School from 1842 to 1859, and of the New Jersey State Normal School from 1863 to 1871. In 1872 he became professor of rhetoric and the English language at Princeton. He founded the *Sunday-School Times* in 1859, and edited it until 1871, and for a time edited the publications of the Sunday-School Union. He also prepared several text-books, including a *Manual of Composition and Rhetoric* (1870); *Manual of English Literature* (1872); and a *Manual of American Literature* (1873).

HART, JULIUS (1859—). A German author. He was born at Münster, and was educated at Berlin. In addition to translations from English, American, Spanish, and Persian poets, his publications include: *Sansara*, poems (2d ed. 1887); *Homo Sum*, poems (1888); *Don Juan Tenorio*, a lyrical tragedy (1881); *Der Sumpff*, a tragedy (1885); *Geschichte der Weltliteratur und des Theaters* (1894-96). The last-mentioned work is profusely illustrated, and embraces the history of literature from its earliest beginning to the present day.

HART, Sir ROBERT (1835—). An Englishman, inspector-general, and director of the Chinese Imperial Customs Service. He was born at Portadown, Armagh, Ireland; was educated at Queen's College, Belfast, where he graduated in 1854, and in the same year entered the British consular service in China. In 1858 he was secretary to the Commission of the Allies at Canton, and in the following year entered the Chinese Maritime Customs service as a deputy commissioner. Advanced in 1863 to the post of Inspector-General, he reorganized the service practically on the lines on which it is now administered. He also organized and maintains in connection with the service a large fleet of steamers for the suppression of piracy and smuggling, and established a splendid system of lighting the coast. A fine postal system, which is now being extended to all parts of the country, was also inaugurated by him. In 1885, when Sir Harry Parkes, British Minister at Peking, died, Sir Robert was asked to succeed him; but, yielding to the entreaties of the Empress Dowager, he declined. He received the highest honors from the Chinese Government, among them the Red Button, and the decorations of the Double Dragon and the Peacock's Feather. His ancestors have been ennobled for three generations, and after the settlement of the Boxer troubles he was appointed to high office in the Imperial Government, and the whole Customs

Department, native and foreign, was placed under his control. He was also decorated by all the European governments; was made a C.M.G. by the British Government in 1880, K.C.M.G. in 1882, G.C.M.G. in 1889, and in 1893 was created a baronet. In 1900 he had about 5000 men under his control, of whom about 900 were foreigners, all chosen and governed in accordance with the strictest civil-service rules. He was with the other foreigners in the British Legation when it was besieged by the Boxers and the Imperial troops.

HART, SAMUEL (1845—). An American clergyman, born at Saybrook, Conn. He graduated at Trinity College in 1866; after 1868 taught at that institution, and was made professor of Latin in 1883. He was ordained priest of the Protestant Episcopal Church in 1870, and in 1893 he was elected Bishop of Vermont, but declined the office. In 1886 he became custodian of the *Standard Prayer-Book* of his Church, and in 1892 secretary of the House of Bishops. In 1899 he became vice-dean and professor of doctrinal theology and the Prayer-Book at the Berkeley Divinity School. His publications include editions of Juvenal (1873), of Persius (1875), and of Bishop Seabury's *Communion Office* (1874), and *Historical Sermons of Bishop Seabury* (1883-86).

HART, SOLOMON ALEXANDER (1806-81). An English painter, of Jewish origin. He was born at Plymouth, Devonshire. He studied at the Royal Academy, London, and exhibited his first oil picture, "Instruction," in 1828. In 1830 he exhibited the "Elevation of the Law," originally called the "Interior of a Polish Synagogue," which brought him reputation, and is now in the National Gallery. Among his other works are: "Isaac of York in the Donjon of Front-de-Bœuf" (1830); "English Nobility Privately Receiving the Catholic Communion" (1831); "Lady Jane Grey on Tower Hill;" "Milton Visiting Galileo in Prison" (1847); and "The Three Inventors of Printing" (1852). In 1835 Hart became an associate; in 1840, an Academician; in 1854 professor of painting in, and in 1865 librarian of, the Royal Academy. His last paintings show decline. He died in London, June 11, 1881. Consult his *Reminiscences* (London, 1882).

HART, WILLIAM (1823-94). An American landscape and animal painter, born in Paisley, Scotland, March 31, 1823. He came to New York in early youth, and was apprenticed to a coach-maker, for whom he painted carriage decorations. He was self-taught, and first exhibited at the National Academy in 1848. His work being favorably received, he went to Scotland in 1849, studying and painting for three years; on his return to New York he opened a studio, and was elected a member of the National Academy in 1858. In 1865 he was elected president of the Brooklyn Academy of Design, and he was also president of the American Society of Water-Colorists from 1870 to 1873. He died at Mount Vernon, New York, June 17, 1894. Among his principal works are: "Peace and Plenty" (1855); "Close of Day," Mount Desert (1856); "Lake in the Hills" (1858); "White Mountains," owned by C. B. Warren, Philadelphia; "Joy of Autumn" (1865); "Golden Hour" (1872); "Morning in the Mountains" (1874); "Keene Valley" (1875); "Jersey

Cattle" (1879); "Hillside Pasture" (1880); "Landscape and Cattle;" "Path by the River;" "Group of Cattle;" "After a Shower."

HARTBEEST (Boer Dutch *hartebeest*, hart-beast, from *harte*, Dutch *hart*, hart + *beest*, beast). A large antelope of South Africa, the type of a genus (*Bubalis* or *Alcelaphus*) containing several similar species, all African except one, the titel (see *BUBALIS*), which also inhabits Arabia and Syria. The genus is characterized by its long, pointed head terminating in a narrow muzzle, ringed, compressed, and often lyrate horns, and a comparatively short, cow-like tail. As is the case with most antelopes of the plains, the fore quarters are heavy and higher than the hind quarters, which are narrow and drooping. The reverse is the case with the bushbucks and others inhabiting a bushy or forested country.

The typical or common hartbeest (*Bubalis cama*) formerly ranged from Cape Colony to Mashonaland, and gathered in great herds; but it has been slaughtered until now it is found only in remote regions. It stands about four feet high at the withers, and is grayish-brown, with a yellowish patch on the buttocks and black markings on the face. The heavily ringed, divergent horns are bent sharply back at the tips. The animal was noted among hunters as one of the swiftest of African antelopes, and easily distanced greyhounds. Near the Victoria Nyanza lives a similar but pale-faced species (*Bubalis Jacksoni*). German and British East Africa and Western Abyssinia are the home of three reddish species, having widely expanding horns, and these are still fairly numerous there on the bushy plains. One is the red or Cooke's hartbeest (*Bubalis Cookei*), another the tora (*Bubalis tora*), and the third Swayne's, or the 'sig' (*Bubalis Swaynei*). Sir H. Johnston found the first-named extremely numerous in the plains about Kilimanjaro in 1885.

The konzi (*Bubalis Lichtensteini*) of all the Zambesi region and Nyassaland; Hunter's hartbeest (*Bubalis Hunteri*) of the Tana River Valley, marked with a conspicuous white chevron on the forehead; the black-faced korrigum (*Bubalis Senegalensis*) of the whole Sudan; and the large Tunisian hartbeest (*Bubalis major*) of the western Sahara, are allied species of the North. In South Africa there formerly ranged in great herds, and still sparingly exist, three other well-known species. One, the sassaby, or bastard hartbeest (*Bubalis lunata*), was one of the most numerous and well-known antelopes of the plains of Cape Colony and northward; it is about three feet ten inches high, and dark purplish red, nearly black on the face and along the spine. Like all of this group, their flesh is excellent food. The blesbok (*Bubalis albibrons*) and bontebok (*Bubalis pygargus*) are smaller, and remarkable for their brilliant purple-red color and white legs, and each has a white blaze on the face. In the bontebok this mark continues to the base of the horns, while in the blesbok it is divided by a dark cross-bar between the eyes. See ANTELOPE; and Plate of ANTELOPES.

HART'-DYKE', Sir WILLIAM (1837—). An English landowner and politician, born in Kent. He was educated at Harrow and Oxford, was elected to Parliament for his native shire in 1865, was Chief Secretary for Ireland (1885-86), and

vice-president of the Council on Education (1887-92).

HARTE, FRANCIS BRET (1839-1902). An American humorous poet and novelist, born at Albany, N. Y., August 25, 1839. At fifteen he wandered to California, where he spent three years digging for gold and teaching school. In 1857 he entered the office of the *Golden Era* as a compositor, and presently began to write for that paper sketches which attracted favorable notice. He became its assistant editor, and soon afterwards editor-in-chief of the *Weekly Californian*, in which he published his parodies of novels. Meanwhile, from 1864 to 1867, he was secretary of the United States Mint in San Francisco, and was writing for newspapers poems that won him great popularity, e.g. "The Society upon the Stanislaus." His first book of verse, *The Lost Galleon and Other Poems*, was gathered in 1867; his first prose book, *Condensed Novels*, appeared in 1867. From 1868 till 1870 he edited the *Overland Monthly*, which he had helped to organize, and in it he published *The Luck of Roaring Camp* (1868) and *The Outcasts of Poker Flat* (1869)—perhaps his best short stories—and also many others. His most popular poem, "Plain Language from Truthful James," better known as "The Heathen Chinese," made Bret Harte famous in 1870. In this year he was made professor of recent literature in the University of California, but he went to New York in 1871 to continue writing. After 1878 he held consular appointments at Crefeld in Germany (1878-80), at Glasgow, Scotland (1880-85), and after 1885 he dwelt in England. During the last years of his life he had his home near London, and a new volume, chiefly of short stories, appeared nearly every year. He died in Camberley, near London, May 5, 1902.

Most of Bret Harte's works depict life on the Pacific Slope in the early days, but he describes life also in the Atlantic States and in England. The more noteworthy among his works are: *Poems* (1870); *East and West Poems* (1871); *The Luck of Roaring Camp and Other Sketches* (1871); *Poetical Works* (1873); *Tales of the Argonauts* (1875); *Gabriel Conroy* (1876); *Two Men of Sandy Bar* (1876); *The Story of a Mine* (1878); *The Twins of Table Mountain* (1879); *Flip* (1882); *In the Carquinez Woods* (1883); *On the Frontier* (1884); *By Shore and Sedge* (1885); *Snowbound at Eagle's* (1886); *A Millionaire of Rough and Ready* (1887); *The Argonauts of North Liberty* (1888); *A Sappho of Green Springs* (1891); *Sally Dows* (1893); *In the Hollow of the Hills* (1895); *Clarence Barker's Luck* (1896); *Bulger's Reputation* (1896); *The Three Partners* (1897); *A Protégé of Jack Hamlin's* (1899); *From Sandhill to Pine* (1900); *Under the Redwoods* (1901). Bret Harte's collected works appeared in London (1881) and in Boston (1891), with supplementary volumes up to 1902.

Of those American authors whose charm lies mainly in their manner of emphasizing the characteristics of a highly flavored community, Bret Harte is one of the best. He was open-eyed and sympathetic in his delineation of adventurers. His story of the gambler who sacrificed himself for his snow-bound companions bears witness to Harte's first-hand acquaintance with perverse humanity. All his strongest tales of the Forty-

miners and of their followers give a view of early California that, in spite of an exaggeration perceptible to contemporary Californians, supplies an interesting supplement to formal history. Whether he tells of the rough Caucasian or of the mysterious Asiatic, Bret Harte has the knack of catching representative traits so admirably that we can see the whole of an almost lawless society. His stuff was romantic, melodramatic, and mostly disreputable. He handled it with humor, irony, pathos, or with a cynical lack of a superior point of view. He was imaginative in that he could cull the essence of things, but he was neither a dreamer nor a deep or far-seeing thinker. What was close to him he saw marvelously, and few writers have ever given a more distinct impression of being a part of what they have described. But Bret Harte is as impersonal as Maupassant. He assumes no responsibility, preaches no sermon, for his whole mind is absorbed in the portrayal of facts. The facts he coordinates with the genius of a born story-writer. Visible physical nature, wild cañons and mountains furnish him a setting. But Bret Harte admits nature only as a background. He delights in what is dazzling, spectacular, or dreadful. Yet his characters never pose. Many of them are even epically molded; but they are no heroes, or sorry ones at best. What one remembers most vividly is the gambler, the adventurer, the desperado, or the bedraggled woman. And these characters constitute a gallery of vagrants, sordid unfortunates, or downright rogues. Bret Harte wrote and wrote abundantly till the end. In his early work one may feel a quick intelligence, keenly interested in a new world. He is, through his subjects, and perhaps through his manner, an American author otherwise than by mere birth. His American qualities endeared him not only to his readers at home, but to many in Europe; for Europeans found and still find in him what in much American literature is too often faint or absent—an artistic portrayal of a phase of American life. Consult Pemberton, *Bret Harte* (London, 1901).

HARTE, WALTER (1709-74). An English poet and historian. Educated at Marlborough and Oxford, he entered the Church, was preacher and teacher at his alma mater, and became vice-principal of Saint Mary Hall. His first poems, published at the age of eighteen, brought him the notice of Pope, whose stanch friend he afterwards became, and also his imitator in an *Essay on Reason* (1735). From 1745 to 1749 he was traveling tutor to the recipient of the famous Chesterfield Letters, and on his home-coming was made canon at Windsor, and afterwards rector in a Cornwall parish. His most pretentious work, a mine of information, *Life of Gustavus Adolphus, King of Sweden* (2 vols., 1759), was pronounced a very good book—in a German translation—but Harte's English was much better in his *Essays on Husbandry* (1764), approved both by Lord Chesterfield and Dr. Johnson.

HARTEL, HIRTEL, WILHELM VON (1839—). An Austrian philologist. He was born at Hof, in Moravia, and studied at the University of Vienna. He was appointed professor of classical philology at Vienna in 1872, made a member of the Vienna Academy in 1875, of the Berlin Academy in 1893; and became a life member of the Aus-

trian House of Peers in 1890. In 1899 he was for a short time Minister of Education and Public Worship, to which post he was reappointed in 1900. His principal works are: *Homerische Studien* (1871-74; 2d ed. 1873); *Demosthenische Studien* (1877-78); *Studien über attisches Staatsrecht und Urkundenwesen* (1878); and various editions of classical authors, including the *Breviarium* of Eutropius (1872); Cyprian's *Opera Omnia* (3 vols., 1868-71); and Ennodius's *Opera* for the *Corpus Scriptorum Ecclesiasticorum*, published by the Vienna Academy of Sciences. He was made editor of the *Zeitschrift für Oesterreichische Gymnasien* in 1874; and with Schenkl founded the *Wiener Studien*, a journal on classical philology, in 1879.

HARTENSTEIN, HÄR'TEN-STIN, GUSTAV (1808-90). A German philosopher and author, born at Plauen, Saxony, and educated at Grimma and Leipzig, where in 1834 he was appointed professor of philosophy. He was one of the most gifted followers of Herbart, to whose philosophical views he gave wide extension in the works entitled *Die Probleme und Grundlehren der allgemeinen Metaphysik* (1836), and *Die Grundbegriffe der ethischen Wissenschaften* (1844).

HARTFORD. A city and port of entry, the capital of Connecticut, and the county-seat of Hartford County, 124 miles west by south of Boston, 32 miles north-northeast of New Haven, and 111 miles northeast of New York; on the Central New England, the New York, New Haven and Hartford, and the Connecticut Valley railroads (Map: Connecticut, E 2). It is situated at the head of navigation for large vessels on the Connecticut River, 50 miles from Long Island Sound, and at the mouth of Park River, a narrow stream that flows through the city, being crossed by several bridges. Hartford has a fine site, its more elevated sections commanding grand views of the Connecticut Valley, and is regularly laid out over an area of about 17 square miles. Much historical interest attaches to the city, the memory of its prominence in Colonial as well as in later times being preserved in several of its churches and houses, in its localities, and in its interesting collections of relics. The old State House, in which the Hartford Convention (q.v.) met, now serves as the city hall; and the new Capitol is a large and beautiful structure of white marble, with portraits and statues of famous persons. Several of the insurance companies for which Hartford is noted occupy fine offices, and among other pretentious buildings are the high school, Young Men's Christian Association building, State Arsenal, post-office, Wadsworth Athenæum, and Saint Joseph's Cathedral, the seat of the Bishop (Roman Catholic) of Hartford. Among the charitable institutions are Hartford and Saint Joseph's hospitals, Hartford Orphan Asylum, Old People's Home, Retreat for the Insane, American Asylum for the Deaf, and Asylum for the Blind. Hartford is the seat of Trinity College (q.v.) and of the Hartford Theological Seminary (Congregational) founded in 1834. Besides the libraries of these educational institutions, there are the State, Public, Watkinson, and Historical Society libraries. The city has a number of parks: Bushnell Park (46 acres), the site of the State Capitol, and Charter Oak Park, famous for its fair-grounds and trot-

CAPITOL
CONNECTICUT CAPITOL AT HARTFORD; SOLDIERS' MEMORIAL ARCH ON LEFT

ting track; also Keney, Elizabeth, South, Riverside, Pope, and other parks.

In 1887 Hartford was made a port of entry. It has considerable commercial importance, but is most widely known as the centre of vast insurance interests and for its manufacturing concerns. The principal manufactures are bicycles, firearms, Gatling guns, woven wire, mattresses, screws, nails, pins, envelopes, steam boilers and engines, machinery, car-wheels, hosiery, knit goods, furniture, carriages, and electric vehicles. The city also controls an extensive trade in Connecticut tobacco. The government, as provided by the charter of 1856, revised in 1880, is vested in a mayor, elected biennially, a bicameral council, and subordinate administrative officials, as follows: Fire, street, health, charity, police, and water commissioners, building inspector, and city attorney, appointed by the executive with the consent of the board of aldermen, and city clerk, collector, auditor, treasurer, marshal, and school board, chosen by popular election. The park commissioners make appointments to fill vacancies on their own board. The annual income and expenditures of the city amount to about \$2,300,000 and \$2,215,000 respectively, the principal items of expense being \$55,000 for street-lighting, \$95,000 for charitable institutions, \$100,000 for the fire department, \$125,000 for the police department, and \$315,000 for schools. The city owns its water-works, which are operated at a yearly cost of \$55,000. Population, in 1800, 5347; in 1850, 17,966; in 1870, 37,180; in 1880, 42,015; in 1890, 53,230; in 1900, 79,850, including 23,800 persons of foreign birth, and 1900 of negro descent.

In 1633 the Dutch built on what is still known as Dutch Point a fort which they called the 'House of Hope.' A number of Massachusetts colonists, mostly from Newtown (Cambridge), left their homes in 1635 and 1636, partly because of a dispute over the civil rights of non-church members, and, led by their pastors, Thomas Hooker (q.v.) and Samuel Stone, settled at Hartford. The name Newtown was at first adopted, but in 1637 it was discarded for Hartford—Hertford, England, being the birthplace of Stone. On January 14, 1639, the freemen of Windsor, Hartford, and Wethersfield met at Hartford and, influenced by Hooker, adopted the famous 'Fundamental Orders of Connecticut,' the first written constitution adopted by a people that ever organized a government. For this reason Hartford is frequently called the 'birthplace of American democracy.' On September 19, 1650, Peter Stuyvesant and commissioners from the 'United Colonies' signed a treaty at Hartford by which boundary disputes were adjusted, and the Dutch confirmed in possession of their fort. In 1654, however, this fort was seized, and the Dutch expelled from Connecticut. In 1687 Governor Andros came to Hartford and made an attempt to seize the Connecticut charter. (See CHARTER OAK.) Washington and Rochambeau met here in 1780 to plan the Yorktown campaign, and in 1814-15 the Hartford Convention (q.v.) was in session here. Until 1701 Hartford was the capital of Connecticut; from 1701 to 1873 it shared that honor with New Haven; and since 1875 it has been sole capital. Noah Webster, Henry Barnard, John Fiske, Richard Burton, and Frederick Law Olmsted

were born in Hartford, and among the notable writers who have made it their home are Harriet Beecher Stowe, Whittier, Lydia Huntley Sigourney, John Trumbull, Joel Barlow, Horace Bushnell, Charles Dudley Warner, and Samuel L. Clemens. Consult: Trumbull, *The Memorial History of Hartford County* (Boston, 1886); and sketches in Powell, *Historic Towns of the New England States* (New York, 1898), and *Connecticut Magazine*, vol. v. (Hartford, 1899).

HARTFORD, THE. The flagship in which Admiral Farragut made his attack on New Orleans, in April, 1862. She was also his flagship in the attack on Mobile.

HARTFORD CITY. A city and the county-seat of Blackford County, Ind., 72 miles northeast of Indianapolis; on the Lake Erie and Western and the Pittsburg, Cincinnati, Chicago and Saint Louis railroads (Map: Indiana, D 2). It is supplied with natural gas, and oil interests are being developed; there are manufactures of paper and pulp, strawboard, glass, iron, flour, hubs and spokes, etc. The water-works are owned by the municipality. Population, in 1890, 2287; in 1900, 5912.

HARTFORD CONVENTION. In American history, a political assembly representing the Federalists of New England States, which met at Hartford, Conn., December 15, 1814, and adjourned *sine die*, January 5, 1815. Its members numbered twenty-six, twelve coming from Massachusetts, seven from Connecticut, four from Rhode Island (all appointed by the Legislatures of their respective States), two from counties in New Hampshire, and one from Windham County, Vt. The convention grew out of the opposition of the Federalists in New England to the War of 1812, and its members all belonged to that party. George Cabot, of Massachusetts, was elected president, and Theodore Dwight, of Connecticut, secretary. The members were as intelligent and as high-minded men as could have been found in the country, but Federalism was exceedingly unpopular, and the fact that the sessions were held with closed doors, and that the members were pledged to secrecy, gave rise to a report that the secession of the New England States was contemplated. The extreme stand thus attributed to the leading Federalists (q.v.), as well as their pronounced opposition to the war, hastened the movement which resulted in the complete overthrow of the Federalist Party. The object of the convention was to devise means not only of security and defense against foreign nations, but also for safeguarding the privileges of the separate States against the alleged encroachments of the Federal Government; and no treasonable intention could be proved. The act of Massachusetts calling the convention stated that the steps taken by the consulting body were to be "not repugnant to their obligations as members of the Union;" and the resolutions of Connecticut and Rhode Island were to the same effect. The main propositions were stated in the form of amendments to the Federal Constitution, which the convention recommended to the several States. The suggested changes were that direct taxes and representatives be apportioned among the States according to the number of free persons therein; that no new State should be admitted to the Union except upon a two-thirds vote in each House of Con-

gress; that Congress should have no power to lay an embargo on ships of American citizens for more than sixty days; that Congress should not interdict foreign commerce or declare offensive war except by a two-thirds vote; that no person thereafter naturalized should be capable of sitting in Congress or of holding any Federal civil office; that no person should serve as President more than one term; and that the President should never be chosen twice successively from the same State. The delegates further resolved that, if their recommendations should not be heeded and if the defense of their respective States should still be neglected, a further convention should be created "with such powers and instructions as the exigency of a crisis so momentous may require."

The war was practically over before the convention finished its work, the Treaty of Ghent (q.v.) having been concluded on December 24th, though the fact was unknown to the members of the convention. The battle of New Orleans, January 8, 1815, and the ratification of the Treaty of Ghent (February 17th) increased the popularity of the Government and hastened the downfall of the Federalist Party; and 'Hartford Convention Federalist' was for many years a term of reproach. The controversy over the absolute obligation of a Governor to respond to the President's call for the militia presented a problem in constitutional law, and in the relations of the States to the Union, which was not fully settled even at the outbreak of the Civil War. For an authoritative and complete work, consult the *History of the Hartford Convention* (New York, 1833), by Theodore Dwight, secretary of the convention; also consult: Lodge, *Life and Letters of George Cabot* (Boston, 1877); and Henry Adams, *Documents Relating to New England Federalism* (Boston, 1877). See FEDERALIST PARTY.

HARTFORD THEOLOGICAL SEMINARY. A Congregational institution, founded in 1834 at East Windsor Hill, Conn., under the name of the Theological Institute of Connecticut, and removed in 1865 to Hartford, with a change of name. The legal constitution of the seminary vests its control in a board of trustees, who are elected by the Pastoral Union—an association of nearly 200 ministers, all of whom give assent to the creed of the Union, a statement of doctrine drawn up in 1834, with singular breadth of view. Although the seminary was established at a time of theological controversy, the occasions of dispute then have long ago ceased to exist, and the institution now is concerned simply with the problem of training ministers for present-day work on the broadest lines of intellectual and spiritual development. In the reconstruction of theological pedagogy in America during the last twenty-five years, the seminary has been often the pioneer and always abreast of the most enterprising progress. The faculty in 1903 numbered twelve professors and twelve regular lecturers, and the student body was about eighty-five. At that time the library contained over 81,000 volumes and nearly 45,000 pamphlets—being unsurpassed in this country in several of its special collections. The main buildings are Hosmer Hall, valued at \$150,000, erected in 1880 by James B. Hosmer, and the Case Memorial Library, erected in 1902 by Newton Case at a cost of \$100,000. Since 1890 the faculty

has issued *The Hartford Seminary Record*, a quarterly magazine.

HARTIG, här'tik, FRANZ, Count (1789-1865). An Austrian statesman. He held a number of important posts under the Government until the appearance of his book, *Genesis der Revolution in Oesterreich* (3d ed. 1851), describing the beginning of the liberal movement in Austria, forced him into retirement. In 1860 he was elected to the Reichsrat, where he played a prominent part as a member of the Liberal Centralist Party. In 1861 he was called to the Austrian House of Lords, of which he remained a member until his death.

HARTIG, GEORG LUDWIG (1764-1837). A German forester. He was born at Gladenbach, and was educated at Giessen, where he studied mathematics, political economy, geodesy, and physics. While in the service of Prince Solms-Braunfeld at Hungen, Hartig established a school of forestry which became the model for future institutions of this kind. In 1811 he was appointed chief of the department of forestry at Berlin; and it was due to his firmness that a large part of the German forests was not sacrificed to meet the financial exigencies of the time. He wrote in all thirty-one works, such as: *Anweisung zur Holzzucht für Förster* (8th ed. 1818); *Lehrbuch für Förster* (11th ed. 1877); *Lehrbuch für Jäger* (11th ed. 1884); and *Kubiktabellen* (10th ed. 1871).

HARTIG, ROBERT (1839—). A writer on forestry, born at Brunswick, a son of Theodor Hartig (q.v.), and educated at the Collegium Carolinum, of Brunswick, and at Berlin. In 1878 he was appointed professor of botany at Munich. The scientific labors of Hartig in the department of vegetable pathology have contributed greatly to the development of that branch of science. Prior to his investigations on the progressive stages of disease in trees, little or nothing had been done in this department of scientific inquiry; so that Hartig may be considered the founder of arboreal pathology. His more important works include: *Die Unterscheidungsmerkmale der wichtigern in Deutschland wachsenden Hölzer* (3d ed. 1890); *Lehrbuch der Baumkrankheiten* (2d ed. 1889; Eng. trans. by W. Somerville, 1894). In this work the author reviews the development of the study of vegetable pathology; the causes of vegetable disease; the injuries induced by such plants as cryptogams, fungi, and phanerogams; and wounds, and diseases due to conditions of the soil.

HARTIG, THEODOR (1805-80). A German forester and naturalist. He was born at Dillenburg, was educated at Berlin (1824-27), and was successively lecturer and professor of forestry at the University of Berlin (1831-38) and at the Carolinum, Brunswick. His works include: *Die Aderflügler Deutschlands* (2d ed. 1860); *Vergleichende Untersuchungen über den Ertrag der Rotbuche* (2d ed. 1851). In collaboration with his father, Georg Ludwig Hartig, he also published the work entitled, *Forstliches und naturwissenschaftliches Konversationslexikon*. The eleventh edition of his father's *Lehrbuch für Förster*, the later reprints of which he had revised, was published in 1877.

HARTINGTON. A city and the county-seat of Cedar County, Neb., about 20 miles south by

east of Yankton, S. D.; on the Chicago, Saint Paul, Minneapolis and Omaha Railroad (Map: Nebraska, G 1). It is the centre of a farming and stock-raising district, and has some manufactures. Population, in 1900, 971.

HARTINGTON, MARQUIS OF. See DEVONSHIRE, EIGHTH DUKE OF.

HARTLAUB, härt'loup, GUSTAV (1814-1900). A German ornithologist, born in Bremen, and educated at Berlin, Bonn, and Göttingen. In addition to his contributions on ornithology to Troschel's *Archiv der Naturgeschichte* during a period extending from 1846 to 1871, he published several valuable scientific works chiefly on the birds of Africa. These include: *System der Ornithologie Westafrikas* (1857); *Beitrag zur Fauna Centralpolynesiens* (jointly with Finsch, 1867); "Die Vögel Ostafrikas" (also with Finsch, in vol. iv. of Deeken's *Reisen in Ostafrika*, 1870); and *Die Vögel Madagaskars und der benachbarten Inselgruppen* (1877).

HARTLEBEN, härt'lä-ben, OTTO ERICH (1864—). A German writer, born in Clausthal. He studied at Berlin, Tübingen, and Leipzig, and in 1889-90 was in the Government service as referendary successively in the district court of Stolberg-am-Harz and the criminal court of Magdeburg. His literary work includes some earlier verse, but consists of dramas principally, ranging from the satiric to the tragic. Of these *Roscmontag* (1900) was perhaps best received. Some of them have found presentation in the United States.

HARTLEPOOL, härt'l-pool. An ancient seaport, market-town, and municipal borough, in Durham County, England, on a small peninsula in the North Sea, 18 miles east-southeast of Durham (Map: England, E 2). Sea fisheries, iron shipbuilding, marine engineering, cement manufacture, and coal trade are its chief industries. Its principal buildings are the borough hall, and Saint Hilda's Church of the thirteenth century, with its lofty embattled tower. Its lighthouse is visible 15 miles. A substantial sea-wall and esplanade are attractive features on the seaward side. The town maintains cemetery, markets, and free public library. It grew up around a monastery of which Saint Hilda was abbess, and its harbor was of importance in 1171. Its first charter was granted by King John. Population, in 1891, 21,300; in 1901, 22,700. Consult Sharpe, *History of Hartlepool* (1806; new ed. 1851).

HARTLEPOOLS, THE. A Parliamentary borough and port of Durham County, England, comprising the municipalities of Hartlepool (q.v.) and its extension, West Hartlepool (q.v.).

HARTLEY, Sir CHARLES AUGUSTUS (1825—). An English engineer and railroad-builder. He served through the Crimean War as captain of engineers in the Turkish contingent; was made engineer-in-chief of the European Commission of the Danube in 1856, and in 1862 was knighted. In 1867 he drew up plans for the enlargement of the harbor of Odessa, and won with them the competitive prize of 8000 silver rubles offered by the Emperor of Russia. In 1875 he was a member of the board of engineers appointed by the President of the United States to report on the practicability of J. B. Eads's plan for improving the south pass of the Mississippi River by means of jetties. The British Govern-

ment named him a member of the International Technical Commission on the Suez Canal in 1884. As a consulting engineer he was employed by several governments, notably on the harbor and river improvements of the Hugli, the harbor of Trieste, the Nile Barrage below Cairo, and the harbor of Varna. Among his published works are: *Delta of the Danube*; *Public Works in the United States and Canada*; *Inland Navigation in Europe*; and *History of the Engineering Works of the Suez Canal*.

HARTLEY, DAVID (1705-57). A celebrated English philosopher. His father was Vicar of Armley, in Yorkshire. At fifteen he entered Jesus College, Cambridge, and afterwards became a fellow of the college. He studied at first for the Church, but dissented from some points in the Articles, and in consequence had to abandon his original intention. He finally chose the profession of medicine, in which he attained considerable eminence. He practiced as a physician successively in Newark, Bury Saint Edmunds, London, and Bath, where he died. His chief work, entitled *Observations on Man, His Frame, His Duty, and His Expectations*, was begun when he was about twenty-five, and occupied him for sixteen years. It was published in 1749, and was translated into French and German. The first part relates to the constitution of the human mind, and is the really important and original part. The second part treats of religion and morals.

His handling of the mind turns throughout upon two theories. The first is called the doctrine of vibrations, or a theory of nervous action analogous to the propagation of sound, the suggestion of which he owed to Newton, of whose writings he was a student. The second theory was that the higher activities of the mind might be explained to a very wide extent by the principle of the association of ideas (see ASSOCIATION OF IDEAS)—a principle far from new in the statement of it, but never before appreciated in anything like the range of its bearings upon the phenomena of mind.

The doctrine of vibrations supposed that when any one of the senses was affected by an outward object, the effect was to set the particles of the nerve in a vibratory motion, which ran along to the brain, and produced corresponding vibrations in the cerebral substance. In like manner, when an active impulse proceeded outward to the muscles, the manner of communication along the nerves was of the same kind. He even extended these molecular vibrations to the other tissues. All conscious processes were regarded as having physiological correlations in brain processes. The opposition that immediately manifested itself against this part of Hartley's speculations arose from a mistaken notion that it favored materialism.

As regards the second doctrine of Hartley, the doctrine of association, he has the right to be regarded as the founder of the English school of association, although thinkers before him, among whom were Locke and Hume, had used the principle of association to explain many of the more developed mental contents. But it seems that Hartley was the first to make association a principle for the explanation of all complex psychical phenomena. He maintains that it is involved in the conversion of our sensations into ideas, and

also in the first origin of voluntary power, which he truly regards as essentially an acquired power. He then treats of the commonly recognized intellectual faculties, memory, imagination, reason, etc. Lastly, the emotions, which he classifies under six heads, imaginative emotions, ambition, self-interest, sympathy, theopathy (the religious sentiment), and the moral sense, may, according to him, be readily seen to be the products of association of certain elementary feelings that unite among themselves, and pass into new connections, and give birth to complex feelings, under the general law. Many of those explanations would be considered now as faulty or defective; but at the time Hartley's attempt was a great step in advance. In logic he seems to have been the forerunner of the algebraical theory of that science. (See LOGIC.) In addition to the work mentioned above, Hartley published in 1746 *Conjecturæ Quædam de Motu, Sensus et Idearum Generatione*. Consult: Bower, *Hartley and James Mill* (London, 1881); Schönlanck, *Hartley und Priestley, die Begründer des Associationismus in England* (1882).

HARTLEY, DAVID (1732-1813). An English politician. He studied at Corpus Christi College, Oxford, and afterwards entered politics as a Liberal. Among his friends was Benjamin Franklin, whom he met during Franklin's stay in London, and with whom after his departure began a correspondence which continued through the years of the Revolution. He strongly opposed the policy of Lord North's Ministry in forcing a war with America, and labored to effect an exchange of prisoners, believing that any amelioration of hardships or acts of generosity would tend to lessen the bitter feelings of the combatants. He was a zealous supporter of Rockingham; and this, together with his friendship for Franklin, probably led to his selection as Plenipotentiary to sign the treaty of peace with the United States (Paris, September 3, 1783). His writings were nearly all of a political character, such as: "Two Letters from David Hartley, Esq., M.P.," in *Tracts Concerning County Petitions* (1780); and *An Address to the Committee of Association of the County of York* (1781). Consult: *The . . . Memoirs of Sir Nathaniel William Wraxall, 1772-84* (1884); *The Complete Works of Benjamin Franklin*, edited by John Bigelow (New York, 1887-88); and Hale, *Franklin in France* (Boston, 1888).

HARTLEY, JONATHAN SCOTT (1845—). An American sculptor, born in Albany, N. Y. He was educated at Albany, and afterwards went to England, where he studied at the Royal Academy, London. From 1876 to 1884 he was professor of anatomy at the schools of the Art Students' League, and from 1879 to 1889 president of the League. His works include the bas-relief on the monument at Saratoga erected to commemorate the defeat of Burgoyne, a statue of Miles Morgan at Springfield, Mass. (1882), and a number of ideal figures, among them the "Young Samaritan" and the "Whirlwind."

HARTLIB, SAMUEL (c.1600-c.1670). An English social reformer. He was born at Elbing, West Prussia, of Polish ancestry, and went to London in 1628. He is said to have introduced the earlier writings of Comenius into England (1637 and 1639), and to have taken an active part in the movement for the unification of the

various Protestant sects. He was an intimate friend of Milton, and is said to have been very charitable. His publications, which are devoted chiefly to educational and economic reforms, include: *Considerations Tending to the Happy Accomplishment of England's Reformation in Church and State* (submitted to Parliament in 1647); *Macaria* (1641), containing the outlines of an ideal State; and *The Reformed Husbandman* (1651).

HARTMANN, härt'män, JAKOB, Freiherr von (1795-1873). A German soldier, born at Maikammer, in the Palatinate. He was trained in the French military institutes of Bonn and Saint Cyr; in the campaigns of 1814-15 served in the French ranks against the Allies, and, having entered the Bavarian Army in 1816, rose to be lieutenant-general in that organization (1861). As such, he fought against Prussia in 1866. Promoted to be general (1869), he commanded the Second Army Corps of Bavaria in the Franco-German War, during which he captured the fortress of Marsal, and took a noteworthy part in the battle of Sedan. Subsequent to the war he retained command of the corps, with headquarters at Würzburg.

HARTMANN, JOHAN PEDER EMILIUS (1805-1900). A Danish composer, born at Copenhagen. He was one of a family of German-Danish musicians, a grandson of Johan Hartmann, the composer, and the son of August Wilhelm Hartmann, who was an organist at Copenhagen (1800-50), and the teacher of his more distinguished son. Young Johan became a teacher in the Conservatory in 1827, director in 1840, and royal chapel-master in 1849. He composed a number of works, among which are the operas: *The Raven, or Brotherly Proof* (1832); *The Golden Horns* (1834); *The Corsairs* (1835); *Little Christina* (1846); music for dramas by Anderson, Oehlenschläger, and Heiberg; song cycles, and instrumental music for piano and violin, etc. From 1839 to 1892 he was president of the Musical Association of Copenhagen. He ranks among the first of Danish composers.—His son, **EMIL HARTMANN** (1836—), born at Copenhagen, was at first an organist, and afterwards gave himself entirely to composition. His works consist of ballets, overtures, songs, several operas, and much instrumental music.

HARTMANN, Sir JULIUS VON (1774-1856). A German general, born in Hanover. He served in the Hanoverian artillery against France in the Netherlands (1793-94), and from 1803 in the German Legion, in which, as commander of artillery, he fought under Wellington in the Peninsular campaign and at Waterloo. In 1833 he was appointed to the command of the entire Hanoverian artillery, which he efficiently organized, in 1836 was promoted to be lieutenant-general, and in 1850 was retired.

HARTMANN, KARL ROBERT EDUARD VON (1842—). A German philosopher. He was born in Berlin, February 23, 1842, educated at the school of artillery, and held a commission from 1860 to 1865, when he resigned it because a serious knee trouble, brought on by an accident, made it impossible for him to perform his duties. In 1867 he took his degree at Rostock and returned to Berlin, where he has lived ever since, devoted to literary pursuits, and doing most of

his work in bed, while suffering great pain. This circumstance has, however, not diminished his literary activity. The titles of some of his works will show his versatility: *Aphorismen über das Drama* (1870); *Shakespeares Romeo und Juliet* (1875); *Die Selbstzersetzung des Christenthums und die Religion der Zukunft* (1874); *Wahrheit und Irrthum im Darwinismus* (1875); *Zur Reform des höheren Schulwesens* (1875); *Beiträge zur Naturphilosophie* (1876); *Zur Geschichte und Begründung des Pessimismus* (1880); *Die Krisis des Christenthums in der modernen Theologie* (1880); *Der Spiritismus* (1885); *Ästhetik* (1836-87); *Zwei Jahrzehnte deutscher Politik und die gegenwärtige Weltlage* (1888). But these are not his most important works. His first book, *Philosophie des Unbewussten* (1869; Eng. trans. by E. C. Coupland, under the title *The Philosophy of the Unconscious*, London, 1884), went through edition after edition, and gave rise to a very copious controversial literature. Höffding says that between the years 1870 and 1875 fifty-eight works appeared treating of Hartmann's philosophy. Its peculiar combination of optimism with pessimism is no doubt the cause of its popularity.

In opposition to Schopenhauer (q.v.), Hartmann maintains that idea is indispensable to will. "No one can in reality merely *will*, without willing *this or that*: a will which does not will something, is not; only through the *definite content* does the will obtain the possibility of existence, and this content is *idea*. Therefore *no volition without mental object*, as Aristotle said long ago." Against Hegel, whom Hartmann mistakenly conceives as advocating a doctrine of non-willing idea, he maintains that it is necessary "to recognize will in the idea, whenever the latter displays an outward causality." The world, as being a process, must therefore be the product of will; and as will implies idea, it must be the product of will realizing an idea. But, according to Hartmann, an idea need not be conscious. Indeed, consciousness "cannot at all lie in the idea as such, but must be an accident; which comes to the idea from elsewhere. The action of unconscious will is clearer in itself, and appears less paradoxical;" indeed, will must be unconscious if the idea is unconscious. The term 'the Unconscious' is used by Hartmann to "designate the united unconscious will and unconscious idea," or the subject of which unconscious will and unconscious idea are the two attributes inseparably united. Will and idea "are not two drawers in the Unconscious, in one of which lies the irrational will, in the other the powerless idea, but they are two poles of a magnet with opposite qualities, on whose opposition the world rests." They "contradict one another as little as say the redness and the perfume of the rose." But though thus compatible, "the one is what the other is not (the will is not logical, and the idea not endowed with will)." "The Unconscious," thus defined, is an individual, "an unconscious world-soul," which is "simultaneously present and purposively efficient in all organisms and atoms, the bodily life and the human mind." It is one in all space and in all time, space and time being its creations, not its conditions. It can properly be defined as "pure, unconscious (impersonal but indivisible, therefore individual) Spirit," and in accordance with this definition

Hartmann says that "our Monism may be more precisely characterized as spiritualistic Monism." Consciousness arises out of the 'unconscious' by "the emancipation of the idea from the will." "The essence of the consciousness of the idea is the extrication of the same from its native soil, the realizing will, and the opposition of the will to this extrication." The conscious idea "is idea preëminently free from every effort at self-realization, but without prejudice to the possibility of afterwards becoming itself again content of will." This emancipation of idea from will arises when organized matter suddenly breaks in upon this self-contained peace of the Unconscious and thrusts upon the astonished individual spirit an idea which falls upon it as from the skies, for it finds in itself no will to the idea. "The idea has been sent from the will, to confront it in future as independent power, in order to bring under subjection to itself its former lord." The will endeavors to negate the idea but cannot, and this failure is the cause of pain, which is "the vexation of the unconscious individual mind at the interloping idea." This break-up of the original unity of will and idea is itself the work of 'the Unconscious,' which "can never err—nay, not even doubt or hesitate;" it "occurs precisely at the most suitable moment, when the whole purpose frame of the world requires it." Indeed, "the world is contrived and guided as wisely and as well as is possible." "The existing world is the best of all possible ones," and yet "it may still be thoroughly bad," its non-existence may be preferable to its existence. An empirical examination of the facts proves this to be the case. The contrary belief is an illusion of which there are three stages. The childhood of the individual and the race is spent in the illusion that the individual can attain happiness now; the youth of the race (mediævalism) is spent in the belief that happiness is attained by the individual in a transcendent life after death; and the manhood of the race is spent in the illusion that happiness is attainable by others in this world in the remote future. The true view is that of "the final redemption from the misery of volition and existence into the painlessness of non-willing and non-being." But this redemption can be won only by making "the ends of the Unconscious ends of our own consciousness." And the end of the unconscious is the elimination of misery. Positive happiness is unattainable. But "only in complete devotion to life and its pains, not in cowardly renunciation and withdrawal, is anything to be achieved for the world-process. This devotion to life is necessary for the time being, since only by contributing to the advance of intelligence can we hope to bring about a state of affairs in which the major part of the actual volition or of the functioning Unconscious Spirit shall be under the control of intelligence. When this consummation is achieved, then volition will resolve upon its own non-continuance, seeing that continuance involves a surplus of misery. This resolve will be a simultaneous common resolve of individuals in whom the larger half of the active Spirit of the universe is manifest." For a survey of the controversial literature on Hartmann's teaching, consult: Plumacher, *Der Kampf ums Unbewusste* (2d ed., Leipzig, 1890); also in general Kober, *Das philosophische System Eduard von Hartmann* (Breslau, 1884); Drews, *Eduard*

von Hartmanns Philosophie und der Materialismus in der modernen Kultur (Leipzig, 1890).

HARTMANN, MORITZ (1821-72). An Austrian poet and novelist, born of Jewish parents at Duschnik, Bohemia. He studied at Prague and Vienna, traveled in Italy, Switzerland, and Germany, and afterwards taught in Vienna till 1844, when he felt it wise to leave his native country in order to publish *Kelch und Schwert* (1845), radical in its religious and patriotic sentiment. *Neuere Gedichte* (1847) followed a residence in Belgium and France. He then returned to Austria and was imprisoned, but was freed by the Revolution of March, 1848. He became the leader of the German Party at Prague, was chosen Deputy to the National Assembly at Frankfort, fled from Vienna in time to escape imprisonment, and took part in the 'Rump Parliament' at Stuttgart. From 1849 to 1868 he lived in voluntary exile in Switzerland, England, Ireland, and the East, residing longest in Paris, Geneva, and Stuttgart. He was Paris correspondent of the *Kölnische Zeitung*, and represented it in the Crimea during the Russo-Turkish War. In 1865 he settled in Vienna as one of the editors of the *Neue Freie Presse*. One of his best-known works is a political satirical poem, the *Reimchronik des Pfaffen Maurizius* (1849). He also published volumes of tales (1863-66), under the titles *Novellen* and *Nach der Natur*. Hartmann's select poems were edited in 1874; his *Works*, in 10 vols., 1873-74. Consult Brandes, *Das junge Deutschland* (Leipzig, 1891).

HARTMANN, ROBERT (1832-93). A German anthropologist, born at Blankenburg. He was educated at Berlin, and was made professor of anatomy there in 1867. He wrote: *Reise des Freiherrn A. von Barmim durch Nordafrika* (1863), a description of an expedition in which he had taken part in 1859 and 1860; *Naturgeschichtlich-medizinische Skizze der Nilländer* (1865); *Die Völker Afrikas* (1879); *Handbuch der Anatomie des Menschen* (1881); *Der Gorilla* (1881); *Die menschenähnlichen Affen* (1883); and the anthropological part of the report of the cruise of the man-of-war *Gazette*. With Bastian he founded the *Zeitschrift für Ethnologie*.

HARTMANN VON AUE, fön ou'e. A German poet. See AUE, HARTMANN VON.

HARTNACK, härt'nák, EDMUND (1826-91). A German optician, born at Templin. He worked under Ruhmkorff in Paris, and with Oberhäuser, whose establishment he bought. After 1870, when he was forced to leave Paris, he sold the factory and established a new one at Potsdam. He made many improvements in the microscope, especially by his extension of Amici's system of immersion, and by his work on the Nicol prism.

HARTO'GIA (Neo-Lat. nom. pl., named in honor of John Hartog, an early traveler). A genus of trees, or shrubs, of the natural order Rutaceæ. *Hartogia capensis*, now known as *Agathosmia hispida*, a native of the Cape of Good Hope, is only 10 or 15 feet high, but the trunk is a foot to a foot and a half in diameter. The wood, which is hard, fine-grained, close, and tough, is much valued as veneer, and when polished is equal to the finest mahogany. The Dutch colonists call it ladlewood, probably from one of the first uses to which they found it convenient to apply it.

HART'ANFT, JOHN FREDERIC (1830-89). An American soldier and politician, born in Pennsylvania. He graduated at Union College in 1853, and was admitted to the bar in 1859. He was among the first to answer President Lincoln's call for volunteers in the spring of 1861, and took part in the first battle of Bull Run as aide-de-camp on the staff of Gen. William B. Franklin. He then raised the Fifty-first Pennsylvania Regiment, which he led in a brilliant and successful charge at Antietam. He commanded a brigade at Vicksburg, and afterwards was with Sherman in the advance to Jackson, Miss. He recaptured Fort Stedman before Richmond, displaying great bravery, for which he was brevetted major-general. After the war he was twice chosen Auditor-General of Pennsylvania, and served as Governor for two terms, during which he reorganized the militia of the State and put it upon a strictly military basis.

HARTSHORN. The name given in pharmacy to the antlers of the *Cervus elaphus*. Its composition is very different from that of persistent horns, as those of the ox, for example, and is identical, or nearly so, with that of bone. The products of its distillation were formerly much used in medicine, under the titles of oil of hartshorn, volatile salt of hartshorn, spirits of hartshorn, etc.; but they are now replaced by simpler preparations of the active ingredients of these substances, namely, ammonia and carbonate of ammonia. See also AMMONIA.

HARTS'HORNE, EDWARD (1818-85). An American physician, born in Philadelphia. In 1843, and again in 1844, he published reports in favor of the separate system of prison discipline, which attracted considerable attention, as they were the first written by one who had had experience with the practical workings of the system. In 1847 he was the secretary of the first prison discipline convention which met in Philadelphia, and ten years later acted in the same capacity to the first sanitary convention in the United States.

HARTSOEKER, härt'sōō-kēr, NIKLAAS (1656-1725). A Dutch physicist and histologist, born at Gouda. He early showed a taste for mathematics and physics; studied these subjects without the permission or knowledge of his father, a Reformed clergyman, who wished his son to become a clergyman; and at the age of eighteen made a powerful microscope, with which he made striking discoveries regarding spermatozoa. His father finally consented to his going to Leyden, and later to Amsterdam, where he met Huygens, and confided to him his discoveries. In 1678 he went to Paris and studied under Cassini; from 1684 to 1696 he lived in Paris, and then returned to Holland to become the instructor of Peter the Great. He went to Düsseldorf, in 1704, on the urgent invitation of the Elector of the Palatinate, and was appointed honorary professor at Heidelberg. In 1717, after the Elector's death, he moved to Utrecht, where his continued application to work broke his health. His works include: *Essai de dioptrique* (1694), in which his independent discovery of many of Newton's observations on light appeared, as well as a well-defined theory of general physics; *Principes de physique* (1696), developing this theory; *Conjectures physiques* (1707-08); and *Cours de physique* (1730).

HART'S-TONGUE FERN. A name applied to ferns of the genus *Scelopendrium*, or *Phyllitis*, as it is sometimes designated. They are large ferns with oblong, strap-shaped leaves or fronds. *Scelopendrium vulgare* is common in Europe and Asia, but, so far as is known, is rare in America. It occurs in damp ravines or under limestone cliffs in a few localities in New York, Tennessee, and Canada. The fronds are 10 to 15 inches high and 1 to 2 inches broad, with heart-shaped bases, and entire or undulate margins. The fruit-dots are linear and occur by twos almost at right angles to the midrib, one occurring on the upper side of a veinlet and its mate on the lower side of the next veinlet; thus they appear to be arranged in pairs.

HARTSUFF, GEORGE LUCAS (1830-74). An American soldier, born at Tyre, N. Y. He graduated at West Point in 1852, and served on the frontier and in Florida, where, during a fight with the Seminole Indians, he received a wound which eventually caused his death. In March, 1861, he was appointed assistant adjutant-general with the brevet rank of captain, and was assigned to duty under Rosecrans in West Virginia. Later he was severely wounded at Antietam, and immediately after the battle was made brevet colonel for gallant and meritorious services. On March 13, 1865, he was given the brevet rank of major-general in the Regular Army, and from April 3d to May of the same year was in command of City Point and Petersburg. He was mustered out of the volunteer service on August 24, 1865, and resigned from the Regular Army on June 29, 1871, because of disability resulting from wounds received in battle.

HARTT, CHARLES FREDERICK (1840-78). An American geologist, born at Fredericton, N. B. He studied under Agassiz for a number of years, and then accompanied him as geologist on an expedition to Brazil in 1865. After his return he was appointed professor of geology and physical geography at Cornell University, but interrupted his university duties to make three more expeditions to Brazil, where he finally settled in 1875 to enter upon his great work as chief of the geological commission appointed to make a survey of the entire empire. Scarcely more than two years later, however, he contracted a fever and died. His principal publication is *The Geology and Physical Geography of Brazil* (1870). Consult Hay, "The Scientific Work of Prof. Charles Frederick Hartt," in the *Proceedings and Transactions of the Royal Society of Canada*, series 2, vol. v. (Ottawa, 1899).

HARTWICH, härt'vîk, EMIL HERMANN (1801-79). A German engineer, born at Bendorf, near Brandenburg. He was inspector of water-works in Steinau and commissioner of buildings at Danzig, where he undertook the completion of the moles in the Baltic near Neufahrwasser. He built the bridge over the Rhine at Coblenz, and introduced many English methods in German railroads, especially a central switch apparatus. Among his writings are: *Erweiterungsbauter der rheinischen Eisenbahn* (1864-67); *Denkschrift, betreffend die Herstellung einer Eisenbahn welche Berlin durchschneidet* (1872); *Aphoristische Bemerkungen über das Eisenbahnwesen* (2d ed. 1874); and many contributions to the *Zeitschrift für Bauwesen*.

HARTWIG, härt'vîk, or **HARTWICK**, JOHN CHRISTOPHER (1714-96). A German-American Lutheran clergyman. He was born in Saxe-Gotha, and is said to have studied at the University of Halle. In 1745, after having been ordained in the German Lutheran Church in London, he came to America to take charge of several churches in Albany and Dutchess Counties, N. Y. Two years later he assisted at the organization of the First Lutheran Synod in Philadelphia. Besides his work in New York, his clerical labors extended also to Pennsylvania, Maryland, Virginia, and New England. In 1761 he obtained the title to 21,500 acres of land in Otsego County, N. Y., which he had bought from the Indians. This was employed, in accordance with his directions, to establish a theological and classical seminary. This institution, known as the Hartwick Seminary, was opened at Hartwick, N. Y., in 1815.

HARTWIG, OTTO PETER KONRAD (1830—). A German historian, born at Wichmannshausen. He studied theology and linguistics at Marburg, Halle, and Göttingen, and in 1867 became a member of the staff of the Marburg University library, from which he went to the University of Halle as librarian-in-chief, a post he resigned in 1898. In 1884 he founded, with Schulz, the *Centralblatt für Bibliothekswesen*. Among Hartwig's works are: *Henricus de Langenstein* (1857); *Aus Sicilien* (1867-69); *Sicilianische Märchen*, with the notes of Pauli, and a biographical sketch of him (1870); *Die Uebersetzungslitteratur Unteritaliens in der normannisch-staufischen Epoche* (1886); *Sulla data degli sponsali di Arrigo VI. con la Costanza*, etc., with Amari (1878); *Quellen und Forschungen zur ältesten Geschichte der Stadt Florenz* (1875-80); and *Festschrift zum 500 jährigen Geburtstage Gutenbergs* (1900).

HARTZENBUSCH, härts'en-bush, JUAN EUGENIO (1806-80). A Spanish dramatist of the Romantic movement, born at Madrid, of a German father and a Spanish mother. He first studied theology, and then took to painting, but was forced by his father's illness to follow for some years his profession, that of a cabinet-maker, training himself meanwhile for the work of a playwright by preparing versions of domestic and foreign dramas. His success was assured from the time of the first performance of the *Amantes de Teruel*, his best-known production, and one of the most important plays of the Romantic period of Spanish literature in the nineteenth century. Highly sentimental, it brings once more upon the boards a story of sad loves which had already been treated by Artieda, Tirso de Molina, and Montalvan. Later dramas of Hartzenbusch, most of them of an historical nature, are: *Doña Mencía; Alfonso el casto* (1841); *La jura en Santa Gadea* (1845), dealing with the history of the Cid; *La madre de Pelayo* (1846); *La ley de raza*, relating to the history of the Visigothic Empire; *Vida por honra* (1858), a statement of the tragic love of the Conde de Villamediana; *El mal apóstol y el buen ladrón* (1860), a play with some of the characteristics of the *Auto sacramental*; his comedies of a Moretinian type are: *Un sí y un no; La visionaria; Juan de las Viñas; La redoma encantada; Los polvos de la madre Celestina; Las Batuecas*. Hartzenbusch also published *Ensayos poéticos y artículos en prosa*, etc. (1843), and *Cuentos y fábulas* (1861). He was a lyric poet of but modest pretensions. As editor

of the dramas of Lope de Vega, Calderon, and other masters of the *siglo de oro*, he did not possess the proper scientific and critical ability. Associated with the staff of the *Biblioteca Nacional* at Madrid, after 1844, he became chief librarian in 1862, and retained this post till his death. He was a member of the Academy since 1847. Consult his works in the *Colección de escritores castellanos* (Madrid, 1887 et seq.); Fernández-Guerra's essay on Hartzenbusch in *Novo y Colón, Autores dramáticos contemporáneos*.

HARTZ (häirts) **MOUNTAINS**. See **HARZ MOUNTAINS**.

HARUGARI, hä'róō-gä'rè. A German order in the United States, named after an old Teutonic tribe. It was founded in 1847 as a protest against the anti-German sentiment then existing in the country, and had as its special objects the preservation of the German language, customs, and traditions. It was also a social, benevolent, and altruistic organization. It has at present some 300 lodges, with a total membership of about 30,000.

HARUN AL-RASHID, hä'róōn' ál rá-shēd' (?-809). The fifth of the Abbasside caliphs. He was born either on the 20th of March, A.D. 763, or the 15th of February, A.D. 766, and in 786 succeeded his elder brother, Al-Hadi in the caliphate. The administration during a considerable part of the brilliant reign of Harun was intrusted to the Grand Vizier Yahya, head of the powerful Barmek or Barmecide family; and the energy of the administration, the enforcement of order, and the general prosperity of the country proved that Harun's confidence was not misplaced. Rebellions were suppressed, and the integrity of the Empire was preserved, saving the loss of a portion of North Africa occasioned by the rise of the Idrisites (q.v.). The capital, Bagdad, became the most flourishing city of the period. Tribute was paid to Harun from all quarters, and splendid edifices were erected by him at an enormous cost. Harun loved luxury and pleasure, was a patron of learning, poetry, and music, and his Court was the resort of the most eminent Mohammedans of the age. He was celebrated in countless songs and narratives; and is perhaps best known in the West as the caliph around whom centre the tales of the Arabian Nights. Toward the end of his reign he conceived a hatred toward the Barmecides (q.v.), due, perhaps, to jealousy of their growing influence and power; yet he suffered the reins of government to remain in their hands for some years. In 803 he caused the Vizier, his four sons, and all their descendants, one only excepted, to be executed, not even excepting his favorite Ja'afar, who had been his companion in his nocturnal rambles through the streets of Bagdad. The affairs of the Empire felt the change; disorders broke out in every part of the caliphate, and treason and rebellion led to civil war. A formidable insurrection broke out in Khorassan, and Harun marched in person against the rebels. But an attack of apoplexy obliged him to remain behind in Tus, where he soon afterwards died in the month of March, 809. While Harun was an enlightened monarch, he was a thorough Oriental despot, who has been somewhat idealized in popular tradition. Consult: Muir, *The Caliphate* (London, 1891); Osborn, *Islam Under the Khalifs of Bagdad* (London, 1878); Palmer, *Haroun Alraschid* (London,

1881); Weil, *Geschichte der Chalifen* (Mannheim and Stuttgart, 1846-62).

HARU NO MIYA, hä'rū nō mē'yā, YOSHIMITO (1879—). The Crown Prince of Japan. He was named heir apparent on November 3, 1889, and in 1900 married the Princess Sada Fudshiwara.

HARUSPICES (Lat., 'inspectors of entrails'). Roman soothsayers. They seem to have come originally from Etruria, whence the Romans derived many of their religious institutions. Their art, *haruspicina*, which in many respects was like that of the augurs (see **AUGURIES AND AUSPICES**), consisted in interpreting the will of the gods by inspecting the entrails of the animals offered in sacrifice (hence they are also called *extispices*), and by observing other circumstances connected with the offerings, such as the willingness or unwillingness of the victim to come to the altar, the flame, the smoke, etc. They took indications also from earthquakes, lightning, and all other extraordinary phenomena of nature called *portenta*. The *haruspices* did not equal the augurs in dignity and respect; they were regarded rather as media of communication with heaven than as possessing any independent religious authority. They had no organization, like the augurs; they did not, in earlier times, at least, form a *collegium*, nor had they a *magister*. They were, however, at one time considered of great importance; but in later times their art fell into disrepute with the more intelligent portion of the Roman citizens. Some of the later emperors, especially Alexander Severus, endeavored to revive and encourage the art of the *haruspices*, but it was finally abolished by Constantine. Their sacred books were called *libri haruspicinū, fulgurales, and tonitruales*. Consult Bouché-Leclercq, *Histoire de la divination dans l'antiquité* (Paris, 1879-82).

HARVARD, JOHN (1607-38). An English clergyman in New England, the principal founder of Harvard College, born in Southwark, London. His father, Robert Harvard, was a butcher. His mother, who married twice after her first husband's death, became possessed of considerable property, which enabled her to give John Harvard a good education, and he was accordingly sent to Emmanuel College, Cambridge University, where he graduated in 1631, studied theology, and took his master's degree in 1635. In 1637 he married Ann Sadler, the daughter of a clergyman of Sussex, and removed to New England. There he settled at Charlestown, on Massachusetts Bay, where he was admitted a freeman in August, and where he became an assistant pastor of the First Church, of which the Rev. Z. Symmes was in charge. His health soon gave way, however, and he died of consumption on September 18, 1638, after a residence in the Colony of little more than a year. By his will he left his library of 260 volumes and a sum of about £400 to the college at 'New Towne,' later Cambridge, for which the General Court of the Colony had made an appropriation of £400 in 1636. A year after the young clergyman's death, in commemoration of his benefaction, the name of Harvard was conferred upon the institution. Consult Rendle, *John Harvard* (London, 1885).

HARVARD UNIVERSITY. The oldest institution of higher education in the United States, situated at Cambridge, Mass. It had its incep-

tion in a desire of the early settlers of the Colony of Massachusetts Bay to preserve and perpetuate in their new home the classical and theological learning acquired by many of them at the University of Cambridge, and to educate the "English and Indian youth in knowledge and godliness." To this end the General Court of the Massachusetts Bay Colony voted £400 in 1636, and in the following year appointed twelve eminent men of the Colony, including Governor John Winthrop, "to take order for a college at New-Towne," which was afterwards renamed Cambridge, in honor of Cambridge University. While the organization of the institution was in progress, Rev. John Harvard, an English non-conforming clergyman, died in 1638, bequeathing to the new school his library, consisting of 260 volumes, together with half of his estate, valued at about £400. In recognition of this gift—munificent in those days—the new school was named Harvard College. The Colonial magistrates and many private persons, emulating Harvard's generosity, also contributed books, funds, and gifts in kind. The first building was erected in 1637 by Nathaniel Eaton, who also taught until 1639, when he was dismissed for misconduct. The Rev. Henry Dunster was elected president in 1640, and in 1642 the first class, consisting of nine students, was graduated. The government of the college was the same year vested in a board of overseers, consisting of the Governor, the Deputy Governor, the magistrates, the teaching elders of the "six next adjoining towns" (Cambridge, Watertown, Charlestown, Boston, Roxbury, and Dorchester), and the president of the college. In 1650 the college was formed into a corporation, consisting of the president, five fellows, and the treasurer, for the immediate administration of the financial and educational affairs of the institution, and in 1657 the charter of the corporation was so amended as to dispense with the positive assent of the overseers in matters relating to the internal management of the college, leaving, however, final jurisdiction to that body if necessary. These two governing bodies acted as checks upon each other throughout the earlier history of Harvard, and though at times their antagonism was productive of some good, restraining the too rapid advances proposed by the liberal corporation on the one hand, and preventing the overseers from using the college for partisan purposes, yet the progress of the college was much retarded by these controversies. The character of the board of overseers has been fundamentally changed by successive legislative acts, concurred in by the corporation and overseers. According to the State Constitution of 1780 it was composed of the Governor, Lieutenant-Governor, Council and Senate of the Commonwealth, the president of the college, and the ministers of the Congregational churches of the towns mentioned above. In 1810 fifteen laymen and fifteen Congregational ministers, with the president of the Senate and the Speaker of the House, all inhabitants of the State, were substituted in place of the Senate and the ministers of the six towns. In 1814 the members of the Senate were restored to membership; the act of 1834 made clergymen of all denominations eligible for membership on the board; but it was not ratified by the corporation and overseers until 1843; the act of 1851 secularized the board by containing no reference to clergymen; the act of 1865 trans-

ferred the election of members of the board from the State Legislature to persons holding the B.A., M.A., and honorary degrees from the college, who were to vote on commencement day at Cambridge; in 1880 eligibility to election as overseer was extended to non-residents of the State. Nominations are made by postal ballot, while the election is held in Cambridge on commencement day. Thus Harvard was successively freed from Church, State, and sectional control.

The administrations of Presidents Dunster, Chauncy, Hoar, and Mather, covering a period of nearly seventy years, were characterized by a constant struggle for existence on the part of the college, due to the parsimony of the government, and to the religious controversies of the liberals and orthodox. Rev. Increase Mather, who was president of the college for fifteen years, actually secured, in 1692, the passage of an act granting a new charter, placing the institution under control of the Calvinists, but the royal sanction to the instrument was withheld. In 1707 the struggle for the control of the college culminated in the confirmation of the charter of 1650, the liberals gaining control of the corporation, while the orthodox retained their influence in the board of overseers. In 1721 Thomas Hollis, an English merchant, endowed a divinity chair, expressly stipulating that the incumbent should not be subjected to any particular religious tests. The overseers at first refused to accept the gift; and when, at the instance of the corporation, they finally did accept it, the founder's wishes were disregarded by the exaction of a number of confessions from the first appointee. In 1762 an attempt was made by the orthodox party to establish a rival college in the Colony, but this was stoutly resisted by the overseers, and they succeeded in dissuading Governor Bernard from granting a charter. Fire destroyed, in 1764, the first Harvard Hall, containing the library and apparatus. The greatest loss was the founder's library, one book being rescued out of his entire collection. Sympathy for the college was awakened throughout the Colonies, which generously aided to repair the loss.

The liberal tendencies of Harvard manifested themselves on the political as well as on the religious side. The class of 1768 voted to take their degrees dressed in homespun, and the degree of LL.D. was conferred upon George Washington in 1776. Throughout the critical period of the Revolution, Harvard loyally supported the patriotic cause by converting its funds into currency, whereby its finances greatly suffered. In 1780 the new State Constitution confirmed the college charter with slight modifications, and by 1793 the college had partially recovered from its financial difficulties, its funds being then estimated at \$182,000. The college after the close of the Revolution assumed its normal growth; the standard of scholarship was somewhat raised, and in 1782 a medical department was established. Under President Kirkland's vigorous administration, 1810-28, the college grew considerably. At the instance of Prof. George Ticknor, who had studied at Göttingen, a committee, with Hon. Joseph Story as chairman, was appointed to inquire into the methods of discipline and instruction at the college. The committee reported in 1824, recommending the division of the college into departments and the instituting of two classes of studies; those necessary for a degree and those which

might be taken by students merely wishing "to pursue particular studies to qualify them for scientific and mechanical employment and the active business of life." These suggestions met with strong opposition from the conservatives. A new code of laws was nevertheless drawn up the following year, organizing the 'faculty of the university,' systematizing the college administration, creating departments, and admitting special students. This marks the transition period of Harvard from a classical college modeled after the traditions of Oxford and Cambridge to a university based on the principles of European universities. The attempt at expansion, which involved an increase in expenditure, received a temporary check when, in 1824, the Legislature refused to renew the grant of the bank tax, which had netted the college, since 1814, about \$10,000 annually. In 1825 the disbursements exceeded the income by about \$4000, and the attendance, owing to the enforced economy and the withdrawal of aid from needy students, decreased from over 300 in 1824, to about 200. Nevertheless, the policy of expansion was continued under President Josiah Quincy, private benefactions, as usual, supplying the want of State aid. The law department, which had been established in 1817, was greatly strengthened by Mr. Nathan Dane's endowment of an additional chair, to which Joseph Story, whose works on equity and constitutional law form such an important part of the legal literature of this country, was appointed. In the modern-language department Professor Ticknor and his successor, Henry W. Longfellow, successfully offered a number of elective courses, but in other departments the attempt gradually to introduce electives did not meet with equal success. It has always been Harvard's tendency to encourage freedom of thought, and on that account it was formerly considered the nursery of Unitarians. The Harvard authorities, however, were timorous, and although some of the leading thinkers of that sect in the United States, as, for example, Emerson and Channing, were graduates of the college, yet when the former addressed the divinity students in 1838, exception was taken to some of his remarks as being too liberal. Harvard's attitude toward the slave question was decidedly conservative. Charles Sumner and Wendell Phillips, leading advocates of the abolition movement, had, however, been educated at the college, and when the final call to arms was issued, its sons were among the first to respond. To the memory of those who fell in the Civil War, Memorial Hall, one of the finest buildings of the university, and erected by the alumni at a cost of over \$300,000, was fittingly dedicated in 1874. The administrations following President Quincy's resignation in 1845 were distinguished for their conservatism. The only notable additions to the university during that period were the Lawrence Scientific School and the Dental School. The struggle between the humanities and sciences, the rigid curriculum and the more liberal elective system, was about to come on in earnest, and Harvard's position in the educational world was largely decided when the great organizer and educational reformer Charles William Eliot was elected in 1869 as its president.

At the beginning of President Eliot's administration Harvard consisted of the college, wherein the courses were largely required, and a

number of semi-independent professional schools, having no entrance requirements or correlation of studies. The total attendance, which was largely from New England, was, in 1869-70, 1107, including 615 college students and 13 graduates. The resident faculty numbered 78, including Lowell, Holmes, Agassiz, and Gray. The elective question was as yet in a chrysalid state, and the few elective courses offered were still in ill repute and not considered as on a par with required work. The funds of the university aggregated \$2,257,989.80, and the income \$270,404.63. The total value of university property was estimated at about \$10,000,000. The library contained about 192,000 volumes. President Eliot reorganized and consolidated the several schools, and in 1903 Harvard University comprised eleven correlated departments as follows: (1) Harvard College, the Lawrence Scientific School, established in 1847, and which grew slowly until 1885, and the Graduate School, organized in 1872 for students pursuing original research. These have, since 1890, been under the immediate charge of the Faculty of Arts and Sciences, and include fourteen departments, offering elective courses in the sciences, mechanical and fine arts, and humanities, which lead to the degrees of B.A., B.S., M.A., M.S., Ph.D., and S.D. In 1902-03 the attendance in the college was 2109; in the Scientific School, 584; and in the Graduate School, 316. In addition to the regular courses offered by the faculty, persons holding the Ph.D. or S.D. degree are authorized to give courses either gratuitously or at a stipulated fee, in the same manner as the docents at the German universities. Evening readings, lectures, and concerts, including those of the Boston Symphony Orchestra, have become a permanent feature at the university. For graduates engaged in original research, 41 fellowships, yielding from \$300 to \$1000, are available. There are also 205 scholarships open to all students under this faculty, besides several special funds for the assistance of needy students. (2) The Law School, established in 1817, and reorganized in 1872 by Professor Langdell, who first introduced the inductive or case method, confers the LL.B. degree, and had, in 1903, an attendance of 640. (3) The Medical School, established in 1782, and the Dental School, founded in 1867, united since 1899 under the faculty of medicine, and located at Boston. They confer the M.D. and D.D.S. degrees, and had, in 1903, an attendance of 445 and 112, respectively. (4) The Divinity School, formally organized in 1819, is non-sectarian, and confers the degree of S.T.B. Under certain specific conditions, its students may also earn the M.A. and Ph.D. on recommendation of the faculty of arts and sciences. Its attendance is small. (5) The Bussey Institution, a scientific school of agriculture and horticulture, the only school to which there are no formal entrance requirements, was organized in 1871, and is situated at Jamaica Plain, about five miles from Boston. It confers the degree of Bachelor of Agricultural Science. (6) The Arnold Arboretum was founded in 1872 under the will of James Arnold, for scientific research in arboriculture, forestry, and dendrology, and has a museum for Massachusetts trees and shrubs. It occupies about 220 acres in West Roxbury. (7) The University Library, including the separate libraries of the several schools and

departments, aggregates 576,900 volumes and 250,000 pamphlets, the largest collection being at Gore Hall, which contains 387,100 volumes. (8) The University Museum, situated at a short distance from the main buildings, consists (a) of the Museum of Comparative Zoölogy, founded in 1859 by private subscription and by the State, and greatly enriched by the collections of Prof. Louis Agassiz and the gifts of his son; (b) the Peabody Museum of American Archaeology and Ethnology; (c) the Botanical Museum; and (d) the mineralogical and geological sections. The Semitic, the Fogg Art, and the Germanic Museums are each located in separate buildings. (9) The Botanic Garden, founded in 1807, occupies about seven acres, on which are cultivated about 5000 species for scientific purposes. (10) The Gray Herbarium includes the famous collection of Prof. Asa Gray, presented to the university in 1864. (11) The Astronomical Observatory, established in 1843, maintains a station near Arequipa, Peru, and a series of meteorological stations crossing the Andes at elevations varying from 100 to 19,200 feet.

In 1879 the solution of the question of higher education for women was partially begun by Harvard professors and instructors, with the organization of the Society for the Collegiate Instruction for Women. In 1894 the name of the society was changed by the General Court of Massachusetts to Radcliffe College (q.v.), and permission was given it to confer the ordinary collegiate degrees subject to the approval of a board of visitors, composed of the president and fellows of Harvard College, under whose direction and control Radcliffe was then placed. Its immediate government is in charge of a council and an academic board, of which bodies the president and dean of Harvard College are members. Instruction is given mainly by the faculty of Harvard College, and sixteen scholarships are available for worthy students. Its attendance is approximately 450. The government of Harvard University is vested in (1) a board of overseers, of which the president and treasurer are members ex-officio, and five of whom are elected annually for a term of six years; (2) the corporation, composed of the president, treasurer, and five fellows—a self-perpetuating body, having charge of the management of the material and educational interests of the university; (3) the university council, composed of the members of the several faculties, with jurisdiction on educational questions that concern more than one faculty; and (4) the faculties of the several schools.

Students under any of the faculties may register in any course in the university, a provision which tends to bind more closely the interests of the several schools. The entrance requirements were gradually raised, until 1890, when the limit was practically reached; and sciences and modern languages are now accepted at the college in lieu of one ancient language. These changes have had a very wholesome effect in forcing preparatory schools in turn to raise and broaden the standard of their courses of study. The professional schools, with the exception of the Dental School, now require matriculants to hold a collegiate degree. The question of shortening the college course has not been definitely settled. Industrious students may, however, so arrange their

work as to complete the college course in three years.

The university maintains a summer school under the faculties of arts and sciences, theology, and medicine, with courses designed mainly for teachers. In the summer of 1902, 945 students were enrolled. The schools issue a number of important publications, partly independent journals and partly stated reports in scientific periodicals. Important work is done by students in clubs connected with the various departments. Athletic sports are regulated by a committee representing the faculty, the graduates, and undergraduates. Physical training is provided by the Hemmenway Gymnasium, built in 1878, and by two athletic fields, containing twenty-four acres. The Harvard Union, an elaborate students' clubhouse, the gift of Henry Lee Higginson, was opened in 1901. In 1886 attendance at chapel was made voluntary, and, contrary to expectations, the religious side of the university has not suffered thereby. Five eminent preachers are annually appointed, without regard to sect, to conduct daily services at the chapel, and seats also are provided for students at the local churches at the expense of the university. Religious societies find ample accommodations for their meetings at the Phillips Brooks House. The grand total attendance of the university in 1903 was 5206, with a faculty numbering 534. The university property, in 1902, was estimated at \$20,914,541, and consisted of grounds and buildings valued at \$5,300,000, scientific apparatus, etc., valued at \$1,500,000, and productive funds of \$14,114,541. The income, exclusive of gifts and bequests to the amount of \$1,095,737, was \$1,436,292.

The publications of the university, issued officially or indirectly, are: *Harvard Oriental Series*; *Harvard Studies in Classical Philology*; *Studies and Notes in Philology and Literature*; *Harvard Historical Studies*; *Quarterly Journal of Economics*; *Harvard Law Review*; *Annals of the Observatory of Harvard College*; *Annals of Mathematics, New Series*; *Contributions from the Cryptogamic Laboratory*; *Publications of the Museum of Comparative Zoölogy*; *Contributions from the Zoölogical Laboratory*; *Publications of the Peabody Museum of Archaeology and Ethnology*; *The Harvard Graduates' Magazine*.

The presidents of Harvard since its inception have been: Henry Dunster, 1640-54; Charles Chauncy, 1654-72; Leonard Hoar, 1672-75; Urian Oakes, 1675-81; John Rogers, 1682-84; Increase Mather, 1685-1701; Samuel Willard, 1700-07; John Leverett, 1708-24; Benjamine Wadsworth, 1725-37; Edward Holyoke, 1737-69; Samuel Locke, 1770-73; Samuel Langdon, 1774-80; Joseph Willard, 1781-1804; Samuel Webber, 1806-10; John Thornton Kirkland, 1810-28; Josiah Quincy, 1829-45; Edward Everett, 1846-49; Jared Sparks, 1849-53; James Walker, 1853-60; Cornelius Conway Felton, 1860-62; Thomas Hill, 1862-68; Charles William Eliot, 1869—.

vard College; and *The Harvard University Catalogue*.

HARVEST AND HARVESTING (AS. *hærfest*, OHG. *herbist*, Ger. *Herbst*; probably connected with Lat. *carpere*, to pluck, Gk. *καρπός*, *karpos*, fruit). The season and the process of gathering ripened crops. Formerly the terms were applied to the time of reaping and garnering cereals, but with the growth and extension of other branches of agriculture, especially in the fruit industry in America, they are more loosely applied, as 'hay harvest,' 'cherry harvest,' 'potato harvest,' etc. As in other agricultural lines, the development of the methods of harvesting has been marked, and during no period so strikingly as during the last half of the nineteenth century. In former times the single-handed sickle and two-handed scythe, which appeared somewhat later, seem to have been the sole implements for cutting the stalks of grain. In using the sickle the operator would catch the severed stems with his free arm, and when he had obtained enough for a sheaf, would either stop to bind the bundle or would leave it to be tied by another; in using the scythe he would leave the stalks somewhat disarranged in a more or less uniform row for the sheaf-maker to work upon; in using the cradle—a much more recent invention, which consists of a scythe to the handle of which is fastened a set of three or more fingers of light but strong wood as long as the blade and parallel with it—the skillful operator would leave the stalks all parallel as they were caught by the cradle-fingers when the blade severed them. A feature of primitive methods of harvesting was the gleaner, who went over the field to pick up the heads of grain overlooked by the reapers. Methods of separating the grain from the straw and the chaff were not less crude than those of cutting. The sheaves were spread upon a floor, which was often the bare rock or even the earth, and animals yoked to heavy planks studded with flints or iron were driven across it until the separation of the grain from the stalk seemed complete. Then the straw was removed with crude forks, and the chaff blown away by the wind or by hand fans.

In contrast with this picture of primitive agriculture the present stands out boldly. The slow, laborious, uncleanly methods of the ancients have mostly disappeared among civilized peoples, but there are countries where the traveler may find them still in vogue, though perhaps somewhat modified. Even in sections of enlightened lands many of the modern implements and methods are unknown. Even within fifty miles of the city of New York there are farms upon which the grain is still reaped with the cradle. But such cases are exceptional. The cradle has given place to the mower, which was at first used only in cutting grass for hay, but which genius soon adapted to cut grain and lay it in piles of convenient size for binding into sheaves. The same inventive spirit produced the self-binder, a still more highly modified mower which not only does all the work of the reaper, but ties the sheaves with twine or wire. Yet more recently has appeared the heading-machine, which, drawn by a score or more of horses or propelled across the field, severs only the heads of the plants, and threshes and winnows the grain and places it in sacks ready for market. On many of the Western wheat farms, more especially of the arid

districts, this machine has supplanted not only the reaper, but the threshing-machine, since it performs the office of each. Yet the threshing-machine is still popular where grain must be allowed to stand in the shock to dry for a few days after cutting. This machine has long since replaced the flail and the fanning-mill, combining as it does the purpose of both. Formerly it was operated by horse-power, but is now generally driven by a portable engine which, in many instances, has also traction gearing, and takes the place of horses in drawing the machine from farm to farm. A revolution has also taken place in hay-making. Hand labor has been reduced to a minimum. The mower has supplanted the scythe in cutting; the hay-tedder, which tosses the grass as it lies in the field, has replaced the hay-fork in curing; the hay-loader, drawn behind the wagon to be loaded, has largely taken the place of loading by hand forks, and the horse-power hay-fork, which will dispose of a large load of hay in three or four forkfuls, has become a common implement on farms where stock-raising or dairying are leading features. In fact, throughout the whole domain of agriculture the methods of harvesting, so far as has been possible, have been improved to a remarkable extent. Corn, beets, beans, indeed, nearly every important crop has its special harvesting machinery. Cotton is the most notable exception; machines adapted to its method of ripening seem impossible.

No less remarkable have been the developments in methods of fruit-harvesting. It is highly probable that in all countries methods were at first crude and wasteful. In America, during the first half of the nineteenth century, apples rarely arrived in market except in bulk by the wagon-load, and peaches at first were treated no better. During the last half, reform has taken place; the former rarely arrive, except in local markets, in any other package than the barrel, and the latter, it is probable, never in bulk as formerly, but almost always in baskets. In olden times when there was little or no market for fruits, except in the towns and their immediate neighborhood, the tree-fruits were shaken or beaten to the ground, a method still popular with those apples the chief end of which is cider. But with the development of a fresh-fruit market, increased care was taken to avoid bruising. With increasing prosperity the demand for fine specimens increased, and the grower was compelled not only to produce a superior article, but he was forced to present it for sale in an attractive package. All details of modern fruit harvest depend upon the peculiar demands of the market, the distance the product must be shipped, the means of transportation, and the shipping qualities of the kind or the variety of fruit. These four factors determine the time of picking, which, with perishable fruits, especially when sent to distant markets, is several days before maturity, a stage learned only by experience with the individual kind or even variety. In general, for shipping to distant markets, strawberries are gathered when they have colored well; red raspberries when they become soft; peaches when an experienced picker detects, with the ball of his thumb, a very slight softness of the tissue; plums while still too green to be pleasantly edible; pears when, upon lifting the fruit, the twig and the stem separate without either one breaking; apples when they readily

part from the stem by a twist of the fruit. For local markets the fruit may be allowed to become riper. Again, these factors determine the style and size of the package and many other details which, since they properly belong to the sale of fruit rather than to harvesting, will be found discussed under the title **MARKETS AND MARKETING**. See also **HORTICULTURE**; **FRUITS, CULTIVATED**; and articles upon individual fruits.

HARVEST-FISH (so called from the time of its annual appearance). An edible fish of the rudder-fish family (Stromateidæ), also called 'butter-fish' or 'dollar-fish,' and 'lafayette.' The common Northern species (*Rhombus triacanthus*) is about seven inches in length; is related to and resembles in its compressed oval shape the pompano; and when first taken from the water displays brilliant shifting, iridescent colors. They are an excellent pan-fish, tasting like mackerel,

HARVEST-FISH, OR BUTTER-FISH
(*Rhombus paru*).

and are extensively caught off New Jersey and New England in midsummer (at harvest-time). A Southern species (*Rhombus alepidatus*) ranges from Chesapeake Bay to Brazil, and is a favorite in the Virginia coast markets under the name 'whiting.' See **BUTTER-FISH**; and Plate of **HARVEST-FISH, ETC.**

HARVEST-FLY. The popular name in the United States for several species of cicada, because they make their appearance in harvest. See **CICADA**.

HARVEST-MAN, **DADDY-LONG-LEGS**, or **GRANDFATHER GREYBEARD**. An arachnid of the order Phalangidæ. These creatures are of worldwide distribution, and are very common in most parts of the United States and in South America. One blind form inhabits Mammoth Cave, Kentucky. The majority of the family may be recognized by their short bodies and long, stilt-like legs, bowed or elevated in the middle, so that the body of the insect is almost on the ground. They have a very characteristic and disagreeable smell. The eyes are two in number, and the mandibles are pincer-like. There is only one pair of spiracles on the lower side of the body at the junction of the cephalothorax and abdomen. The crane-flies of the dipterous family Tipulidæ are called 'daddy-long-legs' in Europe, and should not be confused with these arachnida. The harvest-men are said to feed on small insects, especially aphids; but C. M. Weed states that they are much more apt to feed on insects found dead than to kill living ones. They are abundant in woods and fields from middle summer until late autumn, and are likely to collect in sheds, out-houses, barns, and even houses, or on bare rocks or tree-trunks. Very few species survive the

winter as adults. Most of them lay their eggs in the ground in the autumn.

(Urbana, 1884-88); Say, "Account of the Arachnides of the United States," in *Journal of the Philadelphia Academy of Natural Sciences*, vol. ii. (Philadelphia, 1821); Wood, "On the Phalangidæ of the United States," in *Essex Institute Bulletin*, vol. vi. (Salem, 1874); Wood, *Canadian Entomologist*, vol. xvi. (London, 1874).

HARVEST-MITE. See **MITE**.

HARVEST MOON. The moon does not rise at the same time every night, on account of her changing position in the sky caused by her orbital motion around the earth. Each night the rising is later; and the *retardation*, as it is called, averages about 50 minutes. In the latitude of New York the maximum retardation is 1 hour 17 minutes, and the minimum, 23 minutes. In higher latitudes the range of the retardation may be even greater, and the minimum retardation may descend to *nil*. When the retardation is a minimum at the time of full moon, farmers have the advantage of strong moonlight almost all night on several successive nights; for, the retardation being small, the moon rises at nearly the same time each night as she does on the night of full moon. As this state of affairs is very favorable to harvesting, this full moon is called the harvest moon. It is always the full moon occurring nearest the date of the autumnal equinox (q.v.), September 22d.

HARVEY. A city in Cook County, Ill., 20 miles south of the Chicago court-house, on the Illinois Central, the Cleveland, Cincinnati, Chicago and Saint Louis, and other railroads (Map: Illinois, D 1). It is a residential suburb of Chicago, and also an industrial centre with manufactures of mining and ditching machinery, gas stoves, automobiles, and railroad supplies. Harvey, founded in 1891, and incorporated the succeeding year, is governed by a mayor elected every two years, and a council. Population, in 1900, 5395.

HARVEY, GABRIEL (?-1545-1630). An English author. He was born at Saffron Walden, and educated at Cambridge, where he took his B.A. degree in 1570, and was elected fellow of Pembroke Hall a few months later, and master of Trinity Hall in 1585. He passed most of his life at the university. He was involved with Robert Greene and Thomas Nash in one of the most notorious personal controversies of the time, to which his own contributions are specimens of the most abusive style of Elizabethan prose. He is best known as the friend of Sidney and of Spenser, who has celebrated him under the name of Hobbinal in the *Shepherd's Calendar*, and as a leading member of the school which vigorously endeavored to enforce upon Englishmen the strict rules of classical metre and dramatic construction. He asserted that he was the first English poet to naturalize the dactylic hexameter, and he induced Spenser to abandon for a time the use of rhyme. Consult: his *Works*, ed. A. B. Grosart, privately printed in eight volumes (London, 1884-85), and *Letter Book*, ed. Scott (ib., 1884).

HARVEY, Sir GEORGE (1806-76). A Scottish historical and landscape painter. He was born at Saint Ninians, near Stirling, in February, 1806. Displaying a taste for drawing, he was at the age of eighteen placed in the school of the Trustees' Academy, Edinburgh, where he made rapid progress. In 1826, when the Royal Scottish Academy was instituted, he was elected an associate, and in 1829 an academician. He was a constant contributor to the Academy's exhibitions, and many of his works are well known through the medium of engravings. The principal of these are: "Covenanters Preaching," "Battle of Drumclog," "The First Reading of the Bible in Old Saint Paul's," "The Curlers," "Columbus Discovering America," and "Quitting the Manse." Harvey did not confine himself to historical art, some of his most successful works being representations of Scotch scenery. Among the finest of the landscapes are: "The Enterkin," "Ferragon," "Sheep-Shearing," "Glen Dhu Arran," and "Inverarnan, Loch Lomond." They are remarkable as representations of pastoral peace. Harvey was elected president of the Royal Scottish Academy in 1864, and knighted in 1867. He died in Edinburgh, January 22, 1876. Compare his *Notes on the Early History of the Scottish Academy* (London, 1873); his *Recollections* (London, 1888).

HARVEY, Sir JOHN. A Colonial Governor of Virginia. He first visited the province as one of the commissioners sent out by James I. in 1623 to get evidence which would justify him in suppressing the Virginia Company. Appointed Governor after Yeardley's death, he began his administration in 1629, and soon made himself thoroughly detested by the colonists, for he not only favored the interests of individuals, such as Lord Baltimore, at the expense of Virginia, but filled his own pockets by imposing unusual fines on the settlers, all fines being by royal warrant a perquisite of the Governor's. In 1635 an assembly was called to hear complaints against him, and on April 28th the council met and decreed "Sir John Harvey thrust out of his government, and Capt. John West acts as Governor till the King's pleasure known." Sir John went at once to England and appealed to Charles I., who reinstated him, and refused even to listen to the delegates who had been sent over to present the case of the colonists. Two years after his return to Virginia, however, the King relieved him and appointed a new Governor in his place.

HARVEY, Sir JOHN (1778-1852). A British soldier. He entered the army at a very early age, and saw service in many parts of the world. In 1812 he was appointed deputy adjutant-general of the army in Canada, and was received with great favor by Sir George Prevost, who asked his advice on the defense of the wide frontiers of Canada against the United States forces. He was present at the unsuccessful defense of Fort George (May 27, 1813), but escaped with General Vincent and most of the British troops. On June 6th he led an attack on General Dearborn's forces at Stony Creek, and later in the year was adjutant-general of the British army at the battle of Chrystler's Farm. Upon the close of the War of 1812 he returned to England, and at the battle of Waterloo was on the staff of the Duke of Wellington. In 1836 he was once more in America, this time as Governor of Prince Edward

Island. From 1837 to 1841 he was Lieutenant-Governor of New Brunswick, and in 1846 was appointed Governor and commander-in-chief of Newfoundland, but remained there only a short time before he was made Lieutenant-Governor of Nova Scotia, which office he held until his death.

HARVEY, MOSES (1820—). A Canadian author, born near Armagh, Ireland, and educated at Belfast College in arts and theology. In 1852 he left his charge in Maryport, Cumberland, England, and became pastor of the Free Presbyterian Church of Saint John, Newfoundland, from which he retired in 1878. Harvey made special studies of the geography and history of Newfoundland, contributed to the *Encyclopædia Britannica* (9th ed.) articles on "Seal Fisheries," "Newfoundland," and "Labrador," and published: *Poetry and Literature of the Bible* (1852); *Lectures, Literary and Biographical* (1864); *Comack's Journey Across Newfoundland* (1873); *Across Newfoundland with the Governor* (1879); *Newfoundland, the Oldest British Colony* (1883); *Text-Book of Newfoundland History* (2d ed. 1890); *Newfoundland as It Is* (1894); and *Newfoundland in the Jubilee Year* (1897).

HARVEY, WILLIAM (1578-1657). An English anatomist, celebrated as the discoverer of the circulation of the blood. He was born at Folkestone, in Kent, of a London family of great respectability. When he was fourteen years old he was sent to Caius College, Cambridge, where he was admitted as a pensioner in 1593. After five years' study at the university he traveled through France and Germany, and decided to study medicine at Padua. Here he came under the influence of some of the best teachers of the time, notably Fabricius (q.v.). From this master the young student learned of the existence of the valves in the veins. Having obtained his medical degree in 1602, he returned to England, and began to practice his profession in London. He was admitted a candidate of the London College in 1604, and was elected a fellow in 1607. Two years later he was appointed physician to Saint Bartholomew's Hospital, and in 1615 was made professor of anatomy and surgery. His discovery of the circulation of the blood he perfected in 1616. He was appointed physician extraordinary to James I. in 1618, and was physician to Charles I. from 1632 to 1646. He accompanied the King in the battle of Edgehill in 1642, and during this engagement the Prince and the Duke of York were intrusted to his care. In 1645 he was, by the royal mandate, elected warden of Merton College, succeeding Dr. Nathaniel Brent. During his residence at Oxford he made many experiments, and pursued researches connected with the subject of generation. In 1646, upon the surrender of Oxford to Parliament, he went to practice his profession in London. In 1651 the results of his investigations on the development of the chick, in which he was assisted by Rev. George Bathurst of Trinity College, were given to the world. In 1653 Harvey built a library and museum, which he presented to the members of the College of Physicians. He resigned his professorship of anatomy and surgery in 1653, at the age of seventy-five, and he died on June 3, 1657, of paralysis, which succeeded several years of suffering from gout.

Harvey's description of the course and circu-

lation of the blood met with great opposition, founded perhaps upon jealousy, and the ridicule and unwarranted attacks resulted in a great diminution of his practice. In time, however, he had the satisfaction of seeing his doctrine accepted entire; but the labor and devotion of twenty-five years were requisite for the attainment of the final result. Six diagrams giving views of the circulatory system of the human body, life-size, with which Harvey illustrated his lectures, are still preserved in the museum of the Royal College of Physicians. Previous to Harvey's time, it was believed that the blood was constantly in motion, but the arteries were believed to contain air only, because they were found to be empty after death. Others were close to the discovery of the course of the blood, but it was reserved for Harvey to comprehend and elucidate the whole matter. Although he communicated his discovery to his pupils as early as 1619, it was not till 1628 that his work *Exercitatio de motu Cordis et Sanguinis in Animalibus* was published at Frankfurt, as a small quarto of 72 pages, called by Haller *Opusculum aureum*. The best edition of it was published at Leyden (1739). Among other works are his *Exercitationes de Generatione Animalium, quibus accedunt quedam de Partu, de Membris ac Tumoribus Uteri, et de Conceptione* (cir. 1651; also Leyden, 1737); and *Exercitationes Duæ Anatomicæ de Circulatione Sanguinis* (Oxford [?] cir. 1645). A complete edition of Harvey's works in Latin was published in 1766 by the College of Physicians of London, including his *Treatise on the Circulation*, with the prefaces of the first edition of 1628; his *Exercitations* addressed to Riolan; his work on the *Generation of Animals*; the *Account of the Dissection of Thomas Parr*; and *Nine Epistles of Harvey* addressed to various persons; together with a copy of the diploma of doctor of medicine conferred upon Harvey by the University of Padua. Prefixed to this collection of his works is a *Life of Harvey*, by Lawrence. Consult Willis, *Life of Harvey* (London, 1881). See CIRCULATION; PHYSIOLOGY.

HARVEY, WILLIAM HENRY (1811-66). An Irish botanist, born at Summerville, near Limerick. He received the bent toward his specialty from the schoolmaster with whom he studied in Kildare. A field naturalist, he began his researches in his native land, but they extended to South Africa (1835-42), and for the last ten years of his life he was professor of botany in Dublin University. Travels in America, India, Australia, and the South Seas had augmented his botanical knowledge, and he was an authority especially in algae, though he disputed the Darwinian hypothesis. He published: a *Manual of British Algae* (1841); *Phycologia Britannica, a History of British Seaweeds* (1846-51); *Nereis Boreali-Americana* (1852-58); *Phycologia Australica* (1858-63); and other works.

HARVEYZED STEEL, HARVEY PROCESS. See ARMOR PLATE; IRON AND STEEL.

HARWICH, här'ij. An ancient seaport, market-town, and municipal borough in Essex, England, at the mouth of the Stour, on the North Sea, 70 miles northeast of London (Map: England, H 5). Its important industries are fisheries, ship-building, and cement and manure manufacturing. Its coasting and foreign trade with Germany, Denmark, and Holland is con-

siderable. It exports cement, fish, manure, ironware, machinery, leather, etc., and imports grain, silk, woolen and cotton goods, timber, and tobacco. The harbor is commodious, safe, and strongly fortified. An average of 3500 vessels enter and clear a gross tonnage of 1,800,000 annually. The total annual value of its imports and exports during the five years ending in 1900 was £22,000,000 (\$110,000,000). The town is pleasantly situated on an elevated promontory, and is a favorite sea-bathing resort. It has tramways, and is supplied with water, gas, and electric lighting. Harwich was a Roman station, and a great Danish military depot. In 885 it was the scene of a great naval conflict between the Danes and King Alfred's fleet, and in 1666 of another between the Dutch and English. It was made a Parliamentary and municipal borough by Edward II. in 1318. Population, in 1891, 8200; in 1901, 10,019.

HARWOOD, ANDREW ALLEN (1802-84). An American naval officer, born at Settle, Pa. He entered the United States Navy, and in 1828 was appointed to the receiving-ship *Philadelphia*. In 1835-37 he served in the Mediterranean Squadron, in 1848 was promoted to be commander, and in 1855 to be captain. In 1862 he was appointed chief of the Bureau of Ordnance and Hydrography, and in 1863 commandant of the Washington Navy Yard, with rank of commodore. In 1869 he was retired with rank of rear-admiral. He published *Law and Practice of United States Navy Courts-Martial* (1867), and edited *Summary Courts-Martial*.

HARZER, här'tsör, PAUL HERMANN (1857—). A German astronomer, born at Grossenhain (Saxony). After study in Leipzig, Berlin, and Rome, he was assistant at the Leipzig Observatory from 1878 to 1881; was appointed observer there in 1882, and in the same year became a lecturer in the university. From 1887 to 1897 he was director of the Archdual Observatory at Gotha, and in the latter year was appointed director of the Kiel Observatory. In theoretical astronomy he made numerous investigations of importance, results of which appeared at various times in scientific journals, particularly in the *Astronomische Nachrichten*, his contributions to which include: "Eine neue Methode die negativen und ungeraden Potenzen der Entfernungen der Himmelskörper zu entwickeln" (vol. cii., 1882) and "Untersuchung über die astronomische Strahlenbrechung auf Grund der Differentialgleichungen der elastischen Lichtbewegungen in der Atmosphäre" (vols. civ., cvii., 1882, 1883).

HARZ (härts) MOUNTAINS. An isolated mountain range in Northern Germany, extending between the rivers Saale and Leine, through Prussia, Brunswick, and Anhalt (Map: Germany, D 3). Its length from Mansfeld on the southeast to Seesen on the northwest is about 60 miles, and its total area about 900 square miles. The range, formed by a flatly arched uplift, rises sharply from the surrounding plain, and is dissected by numerous stream valleys. The Upper Harz, comprising the northwestern section, has an elevation of from 1000 to 3000 feet, and culminates in the Brocken, 3747 feet. In the southeastern or Lower Harz region, the elevations rarely exceed 1000 feet. The mountain slopes are heavily wooded with pine, oak, and

beech, but the summits, owing to the raw climate, support only a stunted growth of vegetation. The higher peaks are enveloped in fog during a large part of the year, and the rainfall is heavy. Geologically, the range consists of Devonian and Carboniferous strata, which have been broken through by eruptive granites, diabase, and porphyry. The mineral resources are of great importance, copper, silver, lead, and iron being produced at several localities. Mining was carried on as early as the twelfth century, but the deposits are still far from exhausted. Clausthal, in the Upper Harz, is the seat of a famous mining academy. The region is well patronized by tourists, as it is rich in historic and legendary interest, as well as in scenery. See BROCKEN.

HARZREISE, härts'ri-ze, DIE (Ger., journey through the Harz). A celebrated autobiographical narrative by Heinrich Heine (1824), based on an actual tour by the author, of which the work is a picturesque account.

HASAN, hä'san, AND **HOSEIN**, hô-sân'. Two grandchildren of Mohammed, sons of his youngest daughter, Fatima, and Ali. After the assassination of Ali (q.v.), his adherents at Cufa recognized his eldest son Hasan as caliph, while Moawiya asserted his claim to the entire Moslem Empire, and gathered a powerful army to invade Irak. Hasan, a man of little courage, with more taste for the harem than the camp, agreed to abdicate at the first taste of war, and retired to Medina (661). He was poisoned by one of his wives eight years later. On the death of Moawiya (680) the people of Cufa made overtures to Hosein, who was then at Mecca visiting him, to claim the caliphate in opposition to Yezid, Moawiya's son. With a small force he proceeded to Irak. Yezid, well informed of the movement, had made ample preparations to receive him, and he was slain at Kerbela on the 10th of Muharram, 681. The fate of the house of Ali made a deep impression on the Moslem world. The Shiites (see MOHAMMEDAN SECTS) still refuse to recognize the claims to the caliphate of any except Ali and his sons. They observe the 10th of Muharram as a day of mourning, and devote the nine preceding days of the month to the memory of the martyrs. The so-called 'miracle play,' a dramatic representation of the history of Hosein, is given, and the spectators become wrought up to the most extravagant expressions of sorrow, and the highest pitch of fanatical enthusiasm. In one of its forms the play lasts for the entire ten days, culminating on the last day in the representation of the death of Hosein. Consult: Muir, *Annals of the Early Caliphate* (London, 1883); Pelly, *The Miracle Play of Hasan and Hosein, Collected from Oral Tradition* (London, 1879).

HAS'CALL, MILO SMITH (1829—). An American soldier, born in Genesee County, N. Y. In 1846 he moved to Goshen, Ind., and two years later was appointed a cadet at the United States Military Academy. After two years' service in the Regular Army he resigned his commission, and went back to Goshen, where he became a lawyer and filled various political offices. At the outbreak of the Civil War he enlisted as a private, but was soon appointed aide-de-camp to General Morris, with the rank of captain, and assisted in organizing six volunteer regiments. On June

12, 1861, he was made colonel of the Seventeenth Indiana Volunteers, and took part in the successful West Virginia campaign. He was commissioned brigadier-general of volunteers on April 25, 1862. Having been transferred to the Army of the Cumberland, he was put in command of a brigade which fought through the Tennessee campaign (October, 1862, to March, 1863). At the battle of Murfreesboro (December 31, 1862-January 3, 1863) he had command of the Sixth Division under Major-General Crittenden. From June to August, 1863, he was in command of the District of Indiana, and afterwards commanded a division in the Army of the Ohio, which took part in the defense of Knoxville (November to December, 1863). The next year he commanded the Second Division of the Twenty-third Army Corps in the Army of the Ohio during the invasion of Georgia. He resigned on October 27, 1864, and returned to Goshen, where he engaged in banking, but later entered the real estate business in Chicago.

HASCHKA, häsh'kä, LORENZ LEOPOLD (1749-1827). An Austrian poet, born at Vienna. In 1798 he became professor of aesthetics in the Theresianum; he was custodian of the university library, and wrote many lyrics, of which the best-known is the Austrian national hymn, "Gott erhalte Franz den Kaiser," set to music by Haydn.

HASDEN, häs'dën, BOGDAN PETRICEICU (1838—). A Rumanian poet, historian, and philologist. He taught history in the gymnasium of Jassy, and in 1875 became professor of comparative philology and director of the national archives at Bucharest. His literary labors include dramas, satiric romances, and editorial work, especially on the *Revista Noua*. The most important of his philological works is *Etymologicum Magnum Romanicæ* (1886).

HAS'DRUBAL (Phœnician, whose help is Baal, Gk. Ἀσδρούβας, *Asdroubas*). A name of frequent occurrence in Carthaginian history. The more important characters who bore the name follow: (1) Son of Hanno, a general during the First Punic War, who took the field against Regulus in B.C. 256, and met with signal defeat. He was afterwards sent to Sicily with a large army and 140 elephants, but accomplished nothing during a two years' stay in the island, and was at length totally overthrown at Panormus (Palermo) by the Roman consul Metellus in B.C. 250, and on his return to Carthage was put to death for his lack of generalship. (2) Son-in-law of the great Hamilcar Barca (q.v.), an important statesman of the period between the First and Second Punic wars, and a constant ally of his father-in-law and the popular party in Carthage. After demonstrating his military ability in several minor campaigns, he was given the chief control in Spain, where he soon proved his still greater administrative and diplomatic power. He founded the city of Carthago Nova (Cartagena) as a port of communication with the mother city, and also as a convenient centre for the silver-mines which contributed immensely to the Carthaginian resources; and he was so successful in winning over or subduing the Spanish tribes that he brought almost the whole peninsula under his sway. He was assassinated by a revengeful slave in B.C. 221. (3) Son of Hamilcar Barca, and brother of the great Hannibal, who left him in command in Spain when he began his famous

march across the Alps to Italy (B.C. 218). For several years he carried on operations in Spain against the Roman forces under the two Scipios, but without decisive results, although supported by reinforcements under Himilco, Mago, and Hasdrubal, son of Gisco (see below). In 212, however, they gained a great victory over the Romans, in which Publius Scipio was slain; but the Romans regained the advantage in the following year by the capture of Carthago Nova, the enemy's base of supplies. Shortly after, Hasdrubal gathered a greater force with the intention of following Hannibal's example and invading Italy. He crossed the Alps in B.C. 207 and laid siege to Placentia (Piacenza)—a fatal step, as delay gave the Romans an opportunity to attack him before he could join with Hannibal. A bloody battle was fought on the banks of the Metaurus, and Hasdrubal fell in the thick of the fight. (4) Son of Gisco, mentioned above as one of the generals sent to Spain to assist Hasdrubal No. 3. Afterwards he took charge of the military operations in and around Carthage; and when Scipio came into Africa with a large army (B.C. 204), the diplomacy of Hasdrubal won over the assistance of Syphax, the Numidian King, which Scipio also had endeavored to gain. (See SOPHONISEA.) But the allied forces were mercilessly annihilated by Scipio, who hemmed them within their burning camp; but few, including the two generals, escaped. Hasdrubal met a violent death in Carthage for his ill success. (5) A general of the Third Punic War. For his ill success in war against the Numidian King Masinissa, he had been banished from Carthage, but was recalled to take the command in the last struggle against Rome (B.C. 149). His arbitrary and despotic command alienated many from him, and notwithstanding the heroism of the defenders, the persistence of the Roman attack led to the fall of Carthage (B.C. 146), when Hasdrubal fled to Scipio's camp, and was made prisoner. He was led in triumph at Rome, and allowed to pass his remaining days in obscurity in Italy.

HASE, hä'ze, KARL AUGUST VON (1800-90). An eminent theological writer of Germany. He was born at Steinbach, in Saxony, August 25, 1800, and studied theology at Leipzig and Erlangen. He became, in 1823, privat-docent at Tübingen, but was for political reasons, after a tedious trial, confined for ten months in the fortress of Hohenasperg, during which time he produced a theological novel, *Die Prosolyten* (1827), and a *Lehrbuch der evangelischen Dogmatik* (1826, 6th ed. 1870). Released in August, 1825, he went to Dresden and did literary work. In 1828 he became privat-docent at Leipzig and in 1830 professor of philosophy in Jena, where his lectures on dogmatics and the life of Christ proved especially attractive. His *Leben Jesu* (1829, 5th ed. 1865; trans. *The Life of Jesus*, 1881), which appeared six years before Strauss's, proposed as its aim to show "how Jesus of Nazareth, according to divine destination, by the free act of His own spirit, and by the opportunities of His time, became the Saviour of the world." He opposed modern supernaturalism in *Die Leipziger Disputation* (1827) and extreme rationalism in *Theologische Streitschriften* (1834-37) and *Die Tübinger Schule* (1855). His *Hutterus Redivivus* (1827, 10th ed. 1862) seeks to do justice to the old Lutheran dogmatics in contrast with modern

systems, by exhibiting its harmonious completeness. Besides his *Lehrbuch der Kirchengeschichte* (1834, 11th ed. 1886), which has been translated into English (*A History of the Christian Church*, from the 7th ed., New York, 1855), Hase treated special portions of Church history in *Die beiden Erzbischöfe* (1839); *Neue Propheten* (1851); *Franz von Assisi* (1856); *Das geistliche Schauspiel* (1858; trans., *Miracle Plays and Sacred Dramas*, 1880); *Handbuch der protestantischen Polemik gegen die römisch-katholische Kirche* (1862, 4th ed. 1886). He also published several works on ecclesiastical history; an edition of the *Libri Symbolici Ecclesie Evangelicæ* (1827); and *Ideale und Irrthümer* (1872).

HASE, hä'ze, KARL BENEDIKT (1780-1864). A German philologist, born at Sulza, near Weimar. He studied at Jena and Helmstedt, and in 1801 went to Paris, where he was put in charge of the manuscripts of the Imperial Library (1805), was appointed professor of Greek paleography and of modern Greek at the Ecole des Langues Orientales (1816), then professor of German at the Polytechnic Institute (1830), conservator of manuscripts in the library (1832), and, in 1852, professor of comparative grammar in the University of Paris. He was long an editor of the *Journal des Savants*; contributed to Dindorf's edition of Stephanus's *Lexicon* (1831-44); edited Leo Diaconus (1819); Valerius Maximus (1823); Suetonius (1828); and the fragment, *De Ostentis et Mensibus*, by Laurentius Lydus (1823); and by his wide knowledge of late Greek greatly facilitated the publication of *Recueil des historiens des croisades* (1875). Consult: Guigniaut, *Notice historique sur Hase* (Paris, 1867); and Haime, *Hases Briefe von der Wanderung und aus Paris* (Leipzig, 1894).

HASELRIG, hä'zel-rîg, **HESILRIGE**, or **HAZLERIGG**, SIR ARTHUR (?-1661). An English statesman, member of the Long Parliament, and one of the famous Five impeached by King Charles. He took an active part in the Civil War as commander of a regiment of horse called 'The Lobsters' by the Royalists, and was equally prominent in Cromwell's Parliament, but opposed to the protectorate. Ultimately he voted for the restoration of the Stuarts, though too late in so doing to save more than his life, for he died in the Tower.

HASELTINE, hä'zel-tîn, WILLIAM STANLEY (1835-). An American painter, born in Philadelphia. He studied under Weber in his native city, and at Düsseldorf, and was elected a National Academician in 1861. Much of his life was spent in Italy, and he rarely exhibited. Among his works are views of Nahant, Capri, and Amalfi.

HASENAUER, hä'ze-nou'ër, KARL, Baron von (1833-94). An Austrian architect, born in Vienna, where he studied at the academy under Van der Nüll and Siccardsburg, and obtained the first prize in 1854. After having traveled extensively in Germany, Italy, France, England, and Scotland, he entered upon an active career in Vienna, was again awarded the first prize for architecture at the art exhibition of 1864, became a member of the Academy of Fine Arts in 1866, and honorary member of the Institute of British Architects in 1868. Among a number of

private palaces built by him, the Palais Lützow is to be noticed as one of the finest houses in Vienna, but his most important work was the erection of the magnificent Imperial Museums of Art and Natural History (1872-91) in purest Renaissance style, after his own and Semper's designs. He also built the new Hofburg theatre (completed 1888), and designed the addition to the Imperial palace. He was architect for the buildings of the Vienna Exposition in 1873, and was raised to a baronetcy in the same year.

HASENCLEVER, hä'zen-klä'vēr, JOHANN PETER (1810-53). A German painter, born at Remscheid. He studied under Schadow, at the Düsseldorf Academy, and then spent some years in Munich and Italy. After 1842 he settled in Düsseldorf. His works are usually humorous genre subjects, such as "A Family Quarrel" (1837, New Pinakothek, Munich); "Tasting Wine," and "The Reading Room" (1843, both in National Gallery, Berlin); "Toppers in the Wine-cellar" (1847, Ravené Gallery, Berlin). He also executed a series of scenes from Kortum's *Job-siade*, including "The Examination" (1840, New Pinakothek, Munich); "The School" (1846, Ravené Gallery, Berlin); and "Jobs as Night Watchman" (1852, ib.). His "Gaming-Table" is his most important work of a serious nature. He was also successful in portraiture.

HASENCLEVER, WILHELM (1837-89). A German socialist agitator, born in Arnsberg, Westphalia. He received his education at the gymnasium of his native city, and then became a tanner. In 1862 he was chosen editor of the *Westfälische Volkszeitung*, in 1871 president of the Allgemeiner Deutscher Arbeiterverein, and in 1875 presiding officer of the newly organized Socialist-Labor Party of Germany. He was elected to the Reichstag several times, and controlled or edited various socialist newspapers.

HASENPFLUG, hä'zen-pflōgg, KARL (1802-58). A German architectural painter, born in Berlin, the son of a shoemaker. After a hard struggle in early life, he became the pupil of the decorative painter Karl Gropius, and a few years later was enabled by a royal stipend to study at the academy, but really owed his development mostly to his own efforts. Attracted by the mediæval architecture of Halberstadt, he made his home there in 1830, and, besides cathedrals, painted chiefly views of ruined castles and convents half buried in snow, which appealed to a large public by their great poetic charm. Especially noteworthy among his works are two views of Cologne Cathedral (1832-33); Erfurt Cathedral (1827); and three views of and in Halberstadt Cathedral (1828-36, the last four in National Gallery, Berlin); "Cloister in Winter" (1840, Kunsthalle, Hamburg); "Mediæval Castle Yard" (1842, Schwerin Gallery); and "Ruined Chapel" (Stettin Museum).

HÄSER, hä'zēr, HEINRICH (1811-85). A German medical author, born at Rome, the son of the musician, August Ferdinand Häser. He studied medicine at Jena; taught there from 1836 to 1849, then went to Greifswald, and in 1862 to Breslau. He edited: *Gruner, Scriptores de Sudore Anglico* (1847); a *Bibliotheca Epidemiographica* (2d ed. 1862); the *Repertorium für die gesamte Medizin* (1840-42); and the *Archiv für die gesamte Medizin* (1840-49); and wrote:

Historisch-pathologische Untersuchungen (1839-41); *Lehrbuch der Geschichte der Medizin und der Volkskrankheiten* (3d ed. 1875-82); *Geschichte der christlichen Krankenpflege und Pflegerschaften* (1857); *Die Vaccination und ihre Gegner* (1854); and *Grundriss der Geschichte der Medizin* (1884).

HASHISH, häsh'esh (Ar. *hashishat*, from Ar. *hashish*, herbage, hay, from *hashsha*, to cut grass). The Oriental name of the tops and tender parts of Indian hemp (*Cannabis Indica*). Various preparations of the plant are employed for the producing of a peculiar intoxication. A favorite mode of extracting its active principle is by boiling the tops and flowers with water, to which butter or oil has been added, evaporating and thus forming an oleaginous solution or fatty extract. This fatty extract is frequently mixed with other substances which are reputed to possess aphrodisiac properties, and is taken in the form of electuary confection, or pastil. The majoon used at Calcutta, the mapouchari employed at Cairo, and the dawames or dawamesk of the Arabs, are preparations of this kind. In India it is employed as a narcotic stimulant under the names hashish, churrus bhang, and gunjah. American hemp (*Cannabis Americana*) possesses a similar but weaker action. The effect of hashish depends largely upon the individual. Among the Orientals the dreams are often of an erotic character, but this is not so among the Western nations. One of the first appreciable effects of the drug is the gradual weakening of the power of controlling and directing of the thoughts. Then comes the stage already described; and accompanying, and in part following it, there are observed errors of sense, false convictions, and the predominance of one or more extravagant ideas. These ideas and convictions are generally not altogether of an imaginary character, but are suggested by external impressions which are erroneously interpreted by the perceptive faculties. A minute may seem a year, and an hour only an instant. Sounds may be greatly exaggerated. The sense of duration of time and extent of space and the appreciation of personality are lost; there is a sensation of weight in the extremities, and anæsthesia of the skin, which may become very complete. Finally, if the dose is sufficiently powerful, there is marked drowsiness and sleep. The drug is used as a sedative as a substitute for opium. For the relief of pain in neuralgia and migraine it has been successfully used.

HASIDÆ'ANS. A Jewish sect. See CHASIDIM.

HAS'KELL. A town and the county-seat of Haskell County, Tex., 16 miles north of Stamford, the nearest railroad station (Map: Texas, E 3). The leading industries are farming and stock-raising. Population, about 1000.

HASKINS, CHARLES HOMER (1870—). An American historical scholar, born at Meadville, Pa. He graduated at the Johns Hopkins University in 1887, where he remained as an instructor in history until 1890, when he took his Ph.D. degree, and accepted a position as instructor at the University of Wisconsin. In 1891 he became assistant professor of history, and in 1892 was elected professor of institutional history, which chair he retained until 1902. He spent the year 1896-97 in research work in Europe, devoting himself

especially to examination of the Vatican archives at Rome. In 1899-1900 he was a lecturer on history at Harvard University, and in 1902 was made professor of history in that institution.

HASLER, hās'lēr, or **HASSLER**, HANS LEO VON (1564-1612). A German composer, one of the founders of a national German music, born at Nuremberg. He studied with his father, Isaac Hasler, town musician, and in 1584 with G. Gabrieli at Venice. He was the first important German composer who studied in Italy, and his works, despite their originality, were influenced by the Italian style. From 1585 to 1601 he was organist to Count Octavianus Fugger at Augsburg; in the latter year he received the post of Court musician at Prague to Emperor Rudolph II. In 1608 he accepted an appointment at the Court of the Elector of Saxony. His compositions were of great value in the history of music, but are of little modern importance. Consult Eitner, *Chronologisches Verzeichniss* (Berlin, 1873-74) of Hasler's printed works.

HASLINGDEN, hāz'ling-den. A manufacturing and market town in Lancashire, England, four miles south-southeast of Accrington (Map: England, D 3). It has manufactures of cottons, silks, woollens, sizing of cotton warps, and iron-works. In the neighborhood are coal-mines and extensive stone-quarries. Situated in a hilly district near the Forest of Rossendale, it derives its name, signifying 'Hollow of the Hazels,' from the neighboring trees. Its church, restored in 1879, dates from the thirteenth century, and has handsome endowed schools attached. Population, in 1891, 18,200; in 1901, 18,500.

HAS'MONÆ'ANS. See MACCABEES.

HASNER, hāz'nēr, LEOPOLD, von Artha (1818-91). An Austrian statesman and jurist, born at Prague. He studied law at Prague; was appointed professor of the philosophy of law there (1849), and then of political economy (1851); and was elected to the Bohemian Diet and the Austrian House of Deputies in 1861. Two years afterwards he was made president of the latter body and head of the Council of Education. In 1865 he became professor of political economy in the University of Vienna, was called to the Austrian House of Peers in 1867, was appointed Minister of Public Instruction in 1868, and was for a short time president of the Ministry in 1870. He resigned in that year, and was active as a leader of the Liberal Centrist Party in the Upper House. The Austrian public-school system in its present form is a product of his labors. He wrote: *Philosofie des Rechts und seiner Geschichte in Grundlinien* (1851), and an unfinished *System der politischen Oekonomie* (1861). Consult his posthumously published *Denkwürdigkeiten. Autobiographisches und Aphorismen* (Stuttgart, 1892).

HASPINGER, hās'ping-ēr, JOACHIM (1776-1858). A Tyrolese patriot, born at Sankt Martin im Gsiess. He studied at Bozen and Innsbruck, fought against the French in 1796, 1797, and 1799-1801, and became a Capuchin priest in 1805. He was an ardent patriot, and took a leading part in the rising of the Tyrolese against Bavaria, to which power Napoleon had given their country. In 1809 he distinguished himself by his bravery in a number of encounters with the French, and in 1810 he was second only to

Hofer and Speckbacher as a leader in the renewed revolt of that year. In 1810 he was exiled by the Bavarians and went to Vienna, whence he was sent on a secret mission two years afterwards to arouse the people of Upper Italy to revolt. He was pastor of a church near Vienna, at Hietzing, from 1814 to 1848; then went into Italy as chaplain to a company of Tyrolese volunteers; lived at Döbling until 1854, and then at Salzburg. He was buried beside Andreas Hofer at Innsbruck. As a member of the Capuchin Order he had unusually great influence with the people, who called him 'Pater Jochem' and 'Rotbart.' Consult Schallhammer, *Biographie des Tiroler Heldenpriesters Joachim Haspinger* (Salzburg, 1856).

HAS'SALL, ARTHUR (1853—). An English historian, born at Bebbington, in Cheshire. He studied at Trinity College, Oxford, where he was history exhibitioner in 1876, and the next year won a first-class honor in the School of Modern History, Oxford. From 1880 to 1883 he was a lecturer and tutor at Keble College, and from 1890 to 1892, and again in 1901, examiner in the Honor School of Modern History. He was elected a member of the Hebdomadal Council from 1892 to 1896; was senior proctor in 1893-94; Censor of Christ Church, 1894-95; and was reelected member of the Hebdomadal Council in 1897. His publications include: *Louis XIV. and the Zenith of the French Monarchy* (1895, in the "Heroes of the Nations" Series); *The Balance of Power, 1715-89* (1896, in the series "Periods of European History," of which he was made general editor); *History of France* (1901); and *The French People* (1901).

HAS'SAM, CHILDE (1859—). An American painter, born in Boston. He studied in Paris under Bou langer and Lefebvre, and has won many medals and prizes. He was elected president of the New York Water-Color Club, and was made one of the Ten American Artists, and a member of the Société Nationale des Beaux-Arts in Paris. His street scenes are notable for atmospheric effect, and his landscapes, in the impressionistic French style, are brilliant in color and broadly painted. His "Plaza Centrale, Havana," won the Webb prize in 1895. He received a third-class medal at the Paris Exposition of 1889.

HASSAN BEN SABBAH, hās'sān ben sāj'bā. The founder of the sect of the Assassins (q.v.).

HAS'SAR. Any of several of the dorads or mailed catfish of the Orinoco River and its tributaries, which have some extraordinary habits. They make nocturnal journeys in the dry season, from a diminishing pond to another one, or from river to river, overland, often in companies, and to such distances that several nights are consumed in travel. They also construct nests of leaves at the margin of ponds and streams at the beginning of the rainy season, where the eggs are deposited and guarded till they hatch. Most of them belong to the genus *Doras*.

HAS'SARD, JOHN ROSE GREENE (1836-88). An American journalist. He was born in New York City, and graduated at Saint John's College, Fordham, in 1855. He was one of the editors of the *New American Cyclopadia*, in 1865

edited the *Catholic World*, and in 1866 joined the editorial staff of the *New York Tribune*. He became widely known as a graphic correspondent, and also as a musical critic of rare capacity and judgment. After the death of George Ripley (1880), he was also literary editor of the *Tribune*. In 1878, with Grosvenor, also of the *Tribune*, he deciphered the telegrams which were thought to prove corruption on the part of the Democratic National Committee, or of Tilden's friends, in the disputed election of 1876. Among his publications are: a *Life of Archbishop Hughes* (1866); *The Ring of the Nibelung* (1877); *Life of Pius IX.* (1878); and *A Pickwickian Pilgrimage* (1881).

HASSE, häs'se, FRIEDRICH RUDOLF (1808-62). A German Protestant Church historian. He was born in Dresden, June 29, 1808, educated at Leipzig and Berlin, and at the latter university first took up the study of Anselm of Canterbury. In 1834 he began to lecture in Berlin on Church history, and went to Greifswald as extraordinary professor of Church history in 1836; thence in 1841 in the same capacity to Bonn, where he became full professor (1849). He made his reputation by his masterly work on Anselm—vol. i., *Life* (1843); vol. ii., *Theology* (1852). He died at Bonn, October 14, 1862. After his death his lecture outlines upon the *Geschichte des alten Bundes* (1863), and *Kirchengeschichte* (1864; ed. by W. Engelmann, 1872), appeared. For his life, consult Krafft (Bonn, 1865).

HASSE, JOHANN ADOLPH (1699-1783). A German dramatic composer, born at Bergedorf, near Hamburg. In 1718 he became a tenor at the Hamburg Opera, and in 1722 became connected with the Brunswick Theatre, where the next year his first opera, *Antigonus*, was produced. In 1724 he went to Italy, studying with Porpora and A. Searlatti. In 1731 Augustus the Strong appointed him kapellmeister and director of the opera at Dresden, and his wife, the celebrated singer, Faustina Bordini, was engaged as prima donna. While in that city he was involved in a bitter rivalry with Porpora and Mingotti, and it was not until after their departure that Hasse became supreme. At the siege of Dresden, in 1760, he suffered great losses, many of his manuscripts being destroyed. His operas, some of the best of which were composed during his stay in Italy, were extremely popular, among the best of them being: *Il Sesostrate* (1726); *Attalo, re di Bitinia* (1728); and *Dalisa* (1730). In his seventy-fifth year he produced at Milan his last opera, *Ruggiero*, in celebration of the marriage of the Archduke Ferdinand. His music was marked by great naturalness of expression and charming melody. In addition to over a hundred operas, he wrote ten oratorios, five Te Deums, and numerous instrumental pieces and sacred compositions.

HASSELQUIST, häs'sel-kwist, FREDRIK (1722-52). A Swedish naturalist, born at Törnevalla, East Gothland, and educated at Upsala. In 1749 he undertook a journey to Palestine. He spent the winter in Smyrna, and the next year in Cairo, where he studied the ebb and flow of the Nile, and later proceeded to the Holy Land. He died near Smyrna, on his return. Linnæus published his *Her Palæstinum* (1757; translated into English, 1766).

HASSELT, häs'selt. The capital of the Belgian Province of Limburg, situated on the left bank of the Demer, 49½ miles by rail from Antwerp, and 19 miles from the Netherlands frontier (Map: Belgium, D 4). It has manufactures of tobacco, laces, linen, and chicory. The town possesses a theological and a teachers' seminary and an industrial school. Population, in 1890, 13,250; in 1900, 15,249. Here the Dutch gained a victory over the Belgians on August 6, 1831.

HASSELT, a'säl', ANDRÉ HENRI CONSTANT VAN (1806-74). A Belgian historian and poet, born at Maestricht, and educated at Liège and Ghent. He was employed in the Royal Library at Brussels; was appointed inspector of primary education (1843) and of normal schools (1850); and edited the old French *Romans de Cléomadès* (1865). He compiled: *Het gouden Boekskén* (1845); *Cours de littérature française* (1861); and *Leçons choisies de littérature française* (1865). His prose works include: *Histoire de Rubens* (1840); *Les Belges aux Croisades* (1846); and *Histoire des Belges* (1848); and among his poems mention should be made of: *Poésies* (1852-57); *Primevères* (1854); *Poèmes, paraboles, odes et études rythmiques* (1862); *Les quatre incarnations du Christ* (2d ed. 1872); and *Le livre des ballades* (1872). He also wrote juveniles under the pseudonym 'Alfred d'Aveline' or 'Charles André,' and some Flemish poetry under the name 'Jan van Limburg.'

HASSENFRATZ, a'sän'fräts', JEAN HENRI (1755-1827). A French scientist, born in Paris. He studied under Monge, became a geographical engineer (1780), and after three years' study of mining, entered Lavoisier's laboratory. He was an ardent Jacobin, a member of the Assembly which decided the fate of the Girondists, and was instrumental in postponing the decree against them. Throughout the Revolution he was active in providing military material, in reorganizing military schools, and in founding the Ecole Centrale de Travaux Publics, in which he was professor of mineralogy and physical geography, and which later became the Polytechnic School. In 1795 he led the bands of the Faubourg Saint-Marceau in their attack on the Convention, and had to leave Paris until the general amnesty of that year. In 1797 he became professor of physics at the School of Mines, and taught until 1814, when he retired. Besides contributions to the *Annales de Chimie* and the *Journal des Mines*, he wrote: *Manuel militaire* (1790); *Géographie élémentaire* (5th ed. 1809); *Cours révolutionnaire d'administration militaire* (1794); *Tableau de minéralogie* (1796); *Cours de physique céleste* (1803); *Sidérotechnie* (1804).

HASSENPFUG, häs'en-pfügg, HANS DANIEL LUDWIG FRIEDRICH (1794-1862). A Hessian Minister, born at Hanau, and educated at Göttingen. He was made Minister of Justice and of the Interior (1832), and was an energetic administrator, but a bitter enemy of the Hessian Constitutional Party in the Diet, and of a free press. For five years his absolutist policy was successful, but in 1837 he found himself losing favor at Court, and left the country. In 1841 he went to Berlin, where he was a member of the judiciary until 1850, when he returned to Cassel as Prime Minister, and again fought and finally lost the battle with the Diet. In 1855 Hassen-

pfug retired to Marburg, where he died seven years afterwards.

HASSENSTEIN, häs'en-stin, BRUNO (1839—). A German cartographer, born at Ruhla. His work includes revisions of Fay's *Great Outline of Geography* (1869), and Spruner's *Hand-atlas* (1871-79); a new atlas of Japan (1885); and in *Petermanns Mitteilungen*, maps of most of the important exploring expeditions since 1878, especially of the country covered by Junker, Emin Pasha, Hans Meyer, and Sven Hedin.

HASSLER, häs'lër, FERDINAND RUDOLPH (1770-1843). A Swiss-American engineer; born in Aarau, Switzerland. He was employed for a time on the trigonometrical survey of Switzerland, subsequently emigrated to the United States, and was acting professor of mathematics at West Point from 1807 to 1810, and at Union College in 1810-11. He was the first superintendent of the United States Coast Survey, and for many years was chief director of that important work. He was afterwards at the head of the Bureau of Weights and Measures in the Treasury Department. His publications include a *System of the Universe*, and valuable reports to Congress on weights and measures, besides several textbooks of science.

HASSLER EXPEDITION. The name given to the United States Coast Survey expedition of 1871, in the steamer *Hassler* (see **HASSLER**, F. R.), which was the first important scientific expedition sent by the Government for marine exploration. The expedition included Prof. Louis Agassiz and Mrs. Agassiz; Dr. F. Steindacher, ichthyologist; Dr. Thomas Hill, botanist; and Count L. F. de Pourtales, Mr. J. A. Allen, and others. The steamer left Boston December 4, 1871, and reached San Francisco in August, 1872. On the way to Saint Thomas surface observations were made. Deep-sea dredging was done at Barbadoes and along the Brazilian coast. At the Straits of Magellan frequent stops were made, and at particularly interesting places several days were spent, and inland excursions were made, especially to examine glaciers. Throughout the route collections were made, and much of this material was deposited in the Museum of Comparative Zoölogy at Cambridge, Mass. Some of the zoölogical results of the expedition have been published by Agassiz, Lyman, and Pourtales.

HASSUNITES, häs'sun-its. A name given to the followers of Anton Hassun (1809-84), an Armenian patriarch. Hassun desired to acknowledge the supremacy of the Pope and attended the Vatican Council of 1870. A considerable number of the Armenians were opposed to Hassun, and chose the Bishop Kupelian in his place. After much strife Hassun was banished by the Sultan. Kupelian acknowledged the Pope in 1879, and Hassun, who had been allowed to return to Constantinople, was acknowledged by the Government as head of the Armenian Catholics in Turkey. The anti-Hassunites also submitted to the Pope. In 1880 Hassun resigned, went to Rome, and was made a cardinal.

HASTINAPURA, häs'ti-nä'poo-rä (Skt., Elephant City). An ancient city of India, on the bank of the Ganges, some fifty miles northeast of the present city of Delhi, and probably one of the earliest Aryan settlements out-

side of the Punjab. Its importance lies in the fact that it forms a central point of the principal scenes of the *Mahābhārata*. It was the residence and capital of the Kuru family; whereas their rival and noble cousins, the Pandus, built their royal city at Indraprastha, or Indrapat, nearly on the site of the modern Delhi. There are but few traces of the ancient city Hastinapura remaining, though tradition points to a group of shapeless mounds as being the residence of the princes of the House of Bharata whose deeds are commemorated in the great national epic.

HASTINGS, häst'ingz. A Parliamentary and county borough in Sussex, England, on the English Channel, 62 miles southeast of London (Map: England, G 6). It was the premier Cinque Port, but lost its importance after being burned by the French in 1377. It is now the largest fishing-station on the south coast, and a celebrated watering-place, largely frequented for its historical interest, picturesque situation, fine sandy beaches, and its healthful, bracing climate. It lies in a valley, surrounded by hills. Saint-Leonard's-on-Sea, a western suburban town, has been absorbed and joined to the borough. Hastings has two fine piers, large tepid swimming-baths, numerous hotels, good schools, and interesting remains of an ancient Norman castle. The marine parade, three miles in length, is one of the finest sea walks and drives in the kingdom. The town owns spacious open grounds on the East and West hills, a beautiful park, three public gardens, the Brassey Institute, with public library, museum, and art schools presented by Lord Brassey, a fish market, cemetery, an excellent well-water supply, and electric-lighting supply, and maintains bath-houses and hospitals. The streets are sprinkled with sea-water, which is also supplied to private houses for bath purposes through mains. In 924 Athelstan established a mint at Hastings, then an important place, and there William the Conqueror landed and encamped prior to his famous victory over Harold at Senlac Hill (now Battle Hill), which secured to him the conquest of England, on October 14, 1066. On the spot where Harold fell William founded Battle Abbey. (See **BATTLE MONUMENT**.) William I. by charter made Hastings one of the Cinque Ports. Hastings had early municipal privileges, and received its charter of incorporation from Elizabeth. Population, in 1891, 63,000; in 1901, 65,000. Consult: Cooper, *Notices of Hastings* (1862); Burrows, *Cinque Ports* (London, 1888).

HASTINGS. A city and the county-seat of Barry County, Mich., 32 miles southeast of Grand Rapids; on the Thornapple River, and on the Michigan Central and the Chicago, Kalamazoo and Saginaw railroads (Map: Michigan, H 6). It has a public-school library, and a fine city hall, court-house, and jail. The city is of importance as a manufacturing centre, its products comprising flour, furniture, felt boots, cigars, hose-reels, pumps, car-seats, carriages and wagons, etc. The water-works are owned by the municipality. Population, in 1890, 2972; in 1900, 3172.

HASTINGS. A city and the county-seat of Dakota County, Minn., 20 miles southeast of Saint Paul, at the junction of the Vermillion River with the Mississippi, and on the Chicago,

Milwaukee and Saint Paul Railroad (Map: Minnesota, F 6). It is of considerable importance as a distributing centre, and exports grain, flour, and lumber; its industries include several grain-elevators, a malt-house and breweries, saw, planing, and flour mills, sash, door, blind, wagon, and furniture factories, etc. Population, in 1890, 3705; in 1900, 3811.

HASTINGS. A city and the county-seat of Adams County, Neb., 96 miles west of Lincoln, on the Chicago, Burlington and Quincy, the Missouri Pacific, and other railroads (Map: Nebraska, F 3). It is the seat of Hastings College (Presbyterian), opened in 1882, and of the State Asylum for the Chronic Insane, and has a fine city hall, and City, Prospect, and Heartwell parks. The city is surrounded by an agricultural and stock-raising section, has an important trade in grain, and manufactures flour, wagons, etc. Hastings, incorporated in 1874, is now governed under a charter of 1901, which provides for a mayor, elected biennially, and a city council, the members of which are elected one-half by wards and one-half at large. The water-works and electric-light plant are owned and operated by the municipality. Population, in 1890, 13,584; in 1900, 7188.

HASTINGS. A Danish viking, or sea rover, of the ninth century, to whom legend ascribes most of the deeds performed by the Danish pirates of that time. The facts known concerning him are as follows: From 859 to 863 he was engaged in plundering the Spanish and Italian coasts, and in the latter country captured Luna by stratagem. In 866, Robert, Count of Paris, fell in battle fighting against Hastings, who was then in the Loire Valley. He left this portion of France in 872, and in 889 appeared in the valley of the Somme. In 893 he was defeated by Alfred the Great with whom he made peace. At that time the two sons of Hastings were baptized. Of his later history nothing is known.

HASTINGS, BATTLE OF. The name usually given to the great struggle which took place at Senlac, near Hastings, on October 14, 1066, between the Normans, under William, Duke of Normandy, and the English, under King Harold. Duke William claimed that Harold had agreed to support his claim to the English crown on the death of Edward the Confessor (q.v.), and when this was not done William began preparations to wrest the crown from Harold by force. Harold had just conquered his brother and rival, Tostig, at Stamford Bridge (September 25, 1066), when he heard that the Normans were ravaging the south, and he immediately hastened in that direction. He reached the hill of Senlac on October 13th, and proceeded to fortify his position with a palisade and a ditch. The Norman army was divided into three parts, of which the left wing consisted of Bretons, Poitevins, etc, the right wing of mercenary troops, and the centre of Norman knights and archers led by Duke William in person, and grouped around the banner which the Pope had given. On the English side the best troops were the Hus-carls or bodyguard of Harold. At nine in the morning the battle began with a shower of arrows from the Norman archers, but no impression was made on the English ranks. The Bretons fled and a part of the English, contrary to Harold's orders, broke ranks and pursued. William noticed that they became disordered thereby, and he ordered a large part

of his army to feign a retreat. The English fell into the trap, broke their ranks and began to pursue. The Norman centre thereupon was able to storm the summit of the hill, and though the English still fought bravely, Harold's eye was pierced by an arrow, and the battle was lost. William met little vigorous opposition henceforth in his conquest of England. Consult: Freeman, *Norman Conquest*, vol. iii. (2d ed., London, 1876); Green, *The Conquest of England*, vol. ii. (London, 1899). On the spot where Harold stood William erected Battle Abbey. See BATTLE MONUMENT.

HASTINGS, FRANCIS RAWDON-HASTINGS, first Marquis of (1754-1826). An English soldier and statesman, Governor-General of India. He was educated at Harrow, and matriculated at Oxford, but entered the army at the age of nineteen, and was sent to America, where he distinguished himself in the Revolutionary War till 1781, rising to be adjutant-general (1778), and afterwards brigadier. He was rewarded with a title, Baron Rawdon, and in ten years had inherited another title from his father, the Earl of Moira. His campaigning in Holland (1794-95) was followed by a term of home service, as master-general of ordnance, and he also was most active in the politics of the time. He was Governor-General of India from 1813 to the beginning of 1823. There he showed his mettle in the transformation of the warlike Gurkhas from foes into friends, and he was accused even of exceeding his instructions in the subjugation of native races, to whom, however, he played the amiable despot, encouraging education and civil reform. In recognition of his services in the establishment of British power in India, he was made Marquis of Hastings (1816), and he was commander-in-chief at Malta for the last two years of his life.

HASTINGS, FRANK ABNEY (1794-1828). An English naval commander. He was the son of Lieut.-Gen. Sir Charles Hastings, and was forced to leave the British Navy for insubordination. He joined the Greek Navy in the struggle against the Turks, fought at Nauplia (1822), and served in Crete as commander of artillery. He bought and equipped a vessel in 1824, with which he did great damage to the Turkish fleet, distinguishing himself especially in the bay of Salona in 1827. In December of the same year Hastings captured Vasiladi. He died of a wound received at Anatonikon in 1828.

HASTINGS, HENRY, Earl of Huntingdon. See HUNTINGDON.

HASTINGS, SELINA SHIRLEY. See HUNTINGDON, SELINA HASTINGS.

HASTINGS, THOMAS (1787-1872). An American musician. He was born at Washington, Conn., but at an early age removed to Clinton, N. Y. He became interested in sacred music, and made its study and improvement the chief business of his life. From 1823 to 1832 he edited a religious paper, the *Recorder*, in Utica; then went to New York City as musical instructor and composer, and there published, among other works: *Mother's Hymn Book* (1849); *History of Forty Choirs* (1854); and *Dissertation on Musical Taste* (2d ed. 1853).

HASTINGS, WARREN (1732-1818). An English statesman, Governor-General of India. De-

descended from an ancient family long settled at Daylesford, in Worcestershire, he was born at Churchill, in Oxfordshire, on December 6, 1732. He was early left an orphan; but when only seven years old he resolved to recover the estate which had passed out of the possession of his family. Entering Westminster School, he became an excellent scholar, when, at seventeen, he was sent to India as a service writer in the East India Company's service. Having realized but a moderate fortune, notwithstanding the great temptation to enrich himself by means of his position, he returned in 1764 to England. In 1769 he again went to India, on his appointment as member of the Council at Madras, and in 1772 he became president of the Supreme Council of Bengal. When a little later Parliament created a Governor-Generalship of India, it bestowed that office upon Hastings, who entered upon his duties at the beginning of 1774. The finances of his Government were in a disordered state, and the incessant demands of the East India Company for money led to some unscrupulous expedients for raising funds. For instance, Siraj-ud-Daula, Nawab of Oudh, having a claim upon the rich provinces of Katakhr, occupied by the Rohillas, asked of Hastings military aid in subduing these people. Hastings granted the request, as in fact a treaty with the Nawab required, and received for the service a large sum of money, which he used to supply a deficit in the Bengal treasury. The Nawab treated the conquered with great severity in spite of the intercession of Hastings. The condemnation and execution of the ambitious, intriguing Brahman, Nanda Kumar, is perhaps unjustly laid at his door. But to raise more money Hastings deposed Chait Singh, Rajah of Benares, for disloyalty and insurrection, and confiscated his possessions. He made an agreement also with Asaph-ud-Daula, son of Siraj-ud-Daula, under which he deprived the mother and grandmother of the Nawab of extensive domains which had fallen irregularly into their hands. The administration of Warren Hastings, although he was constantly trammelled by orders from home, and frequently borne down by an able and factious majority in his own council, was vigorous and successful, and his conduct of military affairs was no less efficient. He broke the power of Hyder Ali, Rajah of Mysore; he organized a system by which justice was dispensed, the revenue collected, and peace maintained. It is greatly to his credit, too, that he encouraged Asiatic learning. When he left India in the spring of 1785 that great empire was tranquil. A treaty had been concluded with Tipu Sahib, son and successor of Hyder; and the Carnatic had been evacuated by the armies of Mysore. On his arrival in England he was received with distinction by George III. and the Court. The directors acknowledged his services by a unanimous vote of thanks. The Whig opposition was, however, loud and vehement against him, and succeeded in carrying in the Lower House a motion for his impeachment at the bar of the House of Lords. The trial began in Westminster Hall, February 12, 1788, the managers of the impeachment being Burke, Fox, Sheridan, Windham, and Charles (afterwards Earl) Grey. Burke opened the proceedings in a speech which extended over four sittings; Fox and Grey urged the charge respecting Chait Singh; and Sheridan was intrusted with the conduct of the article relating to the begums or

princesses of Oudh. The interest taken by the public in the impeachment began to decline after these great displays of rhetoric. The trial, notwithstanding, lasted for upward of seven years. On April 23, 1795, it terminated in the acquittal of Hastings. Of 400 peers only 29 voted.

Hastings passed the last twenty-four years of his life at Daylesford in the pursuits of literature and in the occupations of a country gentleman. He died on August 22, 1818, in his eighty-sixth year, and was buried behind the chancel of the parish church of Daylesford. A man of great industry, with an extraordinary capacity for administrative details, he undoubtedly labored for the good of India, often, however, by questionable methods. To him the English Government is largely indebted for its political and judicial organization of India, and for its method of Indian administration. Consult: Gleig, *Memoirs of the Life of Warren Hastings* (3 vols., London, 1841), containing original documents; Trotter, *Warren Hastings* (London, 1878); Bond, *Speeches of the Managers and Counsel* (London, 1859-61); Mill, *History of British India* (London, 1848); *The Minutes of Evidence* (London, 1786); *History of the Trial* (London, 1796); *Debates of the House of Lords* (London, 1797); Forrest, *Administration of Warren Hastings, 1772-1785* (Calcutta, 1892); Lawson, *Private Life of Warren Hastings* (London, 1895); Logan, *Review of the Principal Charges Against Warren Hastings* (London, 1878); Lyall, *Warren Hastings* (London, 1889); Macaulay, *Essay on Warren Hastings* (biased); Malleson, *Life of Warren Hastings* (London, 1894); Strachey, *Hastings and the Rohilla War* (Oxford, 1892); Busted, *Echoes from Old Calcutta* (2d ed., Calcutta, 1888); Beveridge, *Trial of Nandu Kumar* (Calcutta, 1886); Stephen, *Dictionary of National Biography*, xxv. (brief but excellent biography by Keene).

HASTINGS, LORD WILLIAM (c.1430-83). An English soldier in the service of King Edward IV. He was the son of Sir Leopold Hastings, and upon his father's death succeeded to landed estates in Warwickshire and Leicestershire. Upon the accession of Edward IV. to the throne in 1461, he rewarded Hastings, who, during the civil war, had been a faithful friend and retainer of his father, the Duke of York, with lucrative offices and grants of land. He was an energetic soldier in all the King's wars, besides being an ambassador and negotiator for him on various occasions. He fought in Edward's Scottish campaigns, and upon Warwick's invasion, aided the King in escaping, raised forces in his behalf, and, after his return, commanded part of the army at the battle of Barnet. Having invaded France in 1475, he obtained a treaty of peace and an annuity from the French King. After the death of Edward IV. he was accused of treason by the Duke of Gloucester, and beheaded.

HASTINGS SAND. See WEALDEN SERIES.

HASTY PUDDING. A humorous poem by Joel Barlow (1793). It was written in Savoy, and published in 1796 at New Haven with a dedication to Martha Washington.

HASWELL, CHARLES HAYNES (1809-). An American civil, marine, and mechanical engineer, born in New York City. He learned his profession in a steam-engine factory, and in 1836 was appointed chief engineer in the United States

Navy. During his service, which lasted until 1850, he was a member of the boards which designed the *Missouri*, the *Mississippi*, and six other steam frigates. He built the first practicable steam launch (1837), and was the first to use zinc to protect the hulls of iron vessels and marine steam boilers from the galvanic action of salt water and copper. He superintended the construction of the crib bulkhead at Hart's Island, and after 1898 was the consulting engineer of the board of public improvements in New York City. His publications include: *The Mechanic's and Engineer's Pocket Book* (1844; 66th ed. 1901); *Mechanic's Tables* (1854); *Mensuration and Practical Geometry* (1856); and *Reminiscences of an Octogenarian* (1895).

HAT (AS. *hæt*, Icel. *hattr*; connected ultimately with Skt. *chad*, to cover), and HAT MANUFACTURE. The hat is a head-covering, distinguished from the cap and bonnet by having a brim around it. Hats were first manufactured in England about 1510, and superseded caps, or soft headgear, in the reign of Queen Elizabeth. The felting of caps is, however, said to have been known long before this period; and there is a tradition that a knowledge of felted caps or hats had been introduced by the Crusaders. At any rate such an industry flourished in Germany and France in the fourteenth and fifteenth centuries. As the process of felting is ascribed by tradition to Saint Clement, he was early assumed as the patron saint of the craft, and the annual festival of the trade was appointed for the 23d of November. Wool was the material first employed in forming felt hats; but in time, as European trade with America developed, the fur of the beaver, being finer and softer, came into use; hence the term beaver was long synonymous with hat. For about three centuries, fine beaver hats dyed black, and prepared with much skill, formed the head-covering of the higher classes in Great Britain, and distinguished them from the middle and humbler classes, which continued for a length of time to wear the less expensive caps and bonnets.

The growing scarcity of beaver-fur led to attempts to substitute a cloth formed of silk plush, drawn over a pasteboard frame, about 1810. These were not very successful; and hats of wool or beaver-felt were common until about 1840. The high cost of beaver at length brought out the improvement of silk hats to such an extent that the beaver was entirely superseded, and the fabrication of silk hats brought to great perfection.

With the course of fashion hats have undergone a great variety of changes of shape. The raising of the top part and the widening or diminishing of the brims have constituted the chief differences. Sometimes the top has been high and narrow, sometimes high and widened; and as regards the brim it has sometimes been so broad as to loop up. Political and religious differences have been marked by the form of hats. The Puritan of the reign of Charles I. adopted the steeple hat, high and narrow, with a broad brim, and devoid of ornament. The Cavalier, during the same era, wore a lower and broader crown, with a feather stuck on one side. The Quaker hat, low in the crown, with a broad brim, and plain, dates from the origin of the sect at the middle of the seventeenth century. A growing extravagance in breadth of brim led to

the device of looping up the back and sides, and thus led to the cocked hat which was worn by gentlemen throughout the eighteenth century. Some men of fashion, however, by way of singularity, wore low-crowned hats with brims, from which was evolved the round hat, which finally superseded every variety of cocked hat at the beginning of the nineteenth century.

The Hungarian patriot Kossuth introduced into the United States the soft felt hat, which has since been an especial favorite in the South and West. Straw hats began to be worn in America about 1800, the first importations being of the palm-leaf variety. With the increased taste for traveling, and for bicycling, golf, and other cut-of-door sports, a great demand has arisen from adults of both sexes and from children for light, soft, undressed hats, not easily damaged by rain or rough treatment. Such hats are usually of cloth, and come in great variety of shapes and colors.

HAT-MAKING IN THE UNITED STATES. The history of hat manufacture in this country dates back to very early colonial days. In 1662 the Assembly of Virginia enacted a law offering ten pounds of tobacco for every good wool or fur hat made in the Colony. In 1675 laws were passed prohibiting the exportation of raccoon furs from the provinces. By 1731 the industry had become of so much importance as to interfere most seriously with the trade of the English manufacturers, who in that year petitioned Parliament to forbid the importation of hats from the American colonies. A special committee to which the petition was referred reported that in New York and New England 10,000 beaver hats were manufactured annually, and that there were ten hatters in the single city of Boston, one of whom made forty hats a week. In accordance with the spirit of this petition, laws were passed forbidding the exportation of American hats to other English colonies, forbidding the manufacture of hats by any person who had not served an apprenticeship of seven years at the business, and forbidding negroes from working at the business. But in spite of these hampering restrictions, the industry continued to thrive and to be encouraged by the various colonial governments. Delaware, in 1753, offered a prize of forty shillings for the neatest and best hat manufactured in the lower counties. Carolina, by 1767, had developed a flourishing hat industry, with a large export trade to the Spanish islands. Soon after the close of the Revolution the manufacture of hats had become of great importance in Pennsylvania, and from that time the industry has continued to flourish. Statistics, showing the growth of this industry in the United States, are given at the close of this article.

MANUFACTURE. Felt hats are made in a wide range of qualities. The finer and more expensive qualities are formed entirely of fur; the commoner qualities use a mixture of fur and Saxony wool; and for the lowest kinds wool alone is employed. The processes and apparatus necessary for making hats of fur differ also from those required in the case of woolen bodies; and in large manufactories, especially in America, machinery is generally employed for operations which formerly were entirely manual. Hatter's fur consists principally of the hair of rabbits (technically called coney) and hares, with some proportion of nutria, musquash, and beaver's

hair, though the latter material has been for many years extremely scarce, and generally any parings or cuttings from furriers are also used. Furs intended for felting are deprived of their long, coarse hairs, after which they are treated with a solution of nitrate of mercury, an operation called carroting or secretage, whereby the felting properties of the fur are greatly increased. The fur is then cut from the skin. Perhaps the modern method of making a felt hat may be best understood by describing the method of the ancient hatter and then the various modifications in this process which have been effected by machinery. Fifty years ago the hatter beat his fur with a bow into a triangular piece of felt which, when laid together by two straight edges, assumed the shape of a cone. (See FELT.) The felt was next shrunk between cloths which were kept hot and wet by frequent dipping in a kettle of boiling size, care being taken to preserve the triangular shape of the felt. Having been shrunk to about one-third its original size, or to proper dimensions for a hat, the conical bag was drawn over a block and tied tightly at the point where the crown spreads out into a brim. The brim portion was next pulled and stretched into shape with a special instrument. While still on the block, the hat was dyed, and again washed, stiffened, and dried. If a long nap was desired, the surface of the felt was carded; while to obtain a smooth finish it was rubbed with pumice-stone. It was then ready to be 'trimmed,' that is, to have the band, binding, lining, and sweat-band put on. Beginning with the cutting of the fur, these processes are now performed by automatic machinery. The description of the general method employed is condensed from that furnished by the Twelfth United States Census (section on wool manufactures), that being the most recent information available. The separation of the fur from the skin is effected by cutting the skin into shreds by means of rapidly revolving shear-blades, fixed just below a table, but so adjusted that, as the skin passes under a roller or guide fixed above the shear-blade, it drops beneath the machine, while the fur, without the apparent displacement of a fibre, passes on the other side of the roller, whence it is removed and packed away until required. Different kinds or qualities of fur are next mixed to produce the quality of hat desired—an operation which is accomplished by means of a machine called a 'devil,' in which the fibres are pulled apart and thoroughly mingled. The fur is next taken to a blowing-machine, where it is kept constantly agitated in a light current of air. The matted pieces, and those to which skin adheres, together with the hair and dirt thrown out from the fine fur, drop through a set of sieves which separate the valuable pieces of fur for further treatment. The blowing process continues until the fur is perfectly free from extraneous matter, when it leaves the machine in a lap, fine and soft, but so light and filmy that it hardly bears the touch. As the fur comes from the blower, it is weighed out into boxes, each of which contains fur enough for one hat. Each box of fur is now passed on to a 'former,' a machine which consists of a revolving cone made of brass or copper, of suitable size for the hat-body. The cone is pierced with innumerable small holes, through which a current of air is drawn by means of an exhaust fan. There is

also an arrangement by which minute jets of hot water are thrown upon the newly formed hat-body to give it sufficient consistency to permit its removal from the cone. The fur is fed through a tube to a revolving cylinder, which thoroughly opens and distributes the fur into the machine and spreads it evenly over the surface of the cone, which during this operation is inclosed in a tight box. When the fur is properly distributed the box is opened, and the jets of water are thrown upon the fur, and the embryo hat, over which a cloth is spread for its protection, is removed by hand. The whole operation takes but two or three minutes. The fur is then rolled and pressed, first by hand and then by machinery, to felt it and reduce it to its proper proportions. In the meantime it is sized to add to its strength and durability. An application of shellac dissolved in alcohol is used, a much stronger solution being required for a 'derby' than for a soft hat. Thus far the hat has retained its conical form, but the next step is to give it the hat shape. It is placed upon a mold, consisting of a block and a matrix, which shapes both the crown and brim. The next step is dyeing, after which the hair receives further shaping upon another block. This final block is adjustable, so that all the dimensions of a hat—size of band, height and diameter of crown, and width of brim—are accurately gauged by levers, so that of a given shape, every size can be made on the same block. Pouncing, which is a process of sandpapering to remove inequalities, follows, and is accomplished by placing the hat on a rapidly revolving block, and rubbing the surface with fine emery paper. The trimmings—that is, the sweat-band, the lining, and the ribbon binding—are now attached, and the hat given another shaping upon the block.

Wool hats are made by a different initial process. The wool, as it comes from the card in a continuous lap, is wound upon a machine consisting of two cones placed base to base and revolving upon an axis placed parallel to the end of the card. The double cone is so rotated that the continuous lap of wool is wound in a zigzag manner, crossing and recrossing from end to end. When a sufficient quantity of wool has been received, the machine is stopped, the double cone of wool is divided in the centre, the two resulting hat-bodies removed for felting, and the process repeated. The processes of felting, dyeing, stiffening, blocking, finishing, and trimming follow.

The silk hat, now universally known as an article of dress, is of comparatively modern use. It was known in Florence over a century ago; but its manufacture was not introduced into France till about 1825, and its development has taken place entirely since that time. A silk hat consists of a light stiff body, covered with silk plush of a brilliant glossy texture, the manufacture of which is the most important element in the industry. Originally the bodies were made of felt and various other materials, but now calico, muslin, or other cotton material is almost exclusively used. The muslin is first stiffened with a varnish of shellac, and then cut into pieces sufficient for crown, side, and brim. The side-piece is wound round a wooden hat-block, and its edges are joined by hot ironing, and the crown-piece is put on and similarly attached to the side. The brim, consisting of three thicknesses of muslin cemented together, is now

slipped over and brought to its position, and then a second side-piece and another crown are cemented on. The whole of the body, thus prepared, now receives a coat of size; subsequently it is varnished, and it is ready for the operation of covering. In covering this body, the under brim, generally of merino, is first attached, then the upper brim, and lastly the crown and side sewed together are drawn over. All these by hot ironing and stretching are drawn smooth and tight, and as the varnish of the body softens with the heat, body and cover adhere to each other at all points without wrinkle or pucker. Dressing and polishing, by means of damping, brushing, and ironing, come next, after which the hat is velured in a revolving machine by the application of haircloth and velvet velures, which cleans the nap and gives a smooth and glossy surface. The brim has then only to be bound, the linings inserted, and the brim finally curled, when the hat is ready for use. The plush used for silk hats is made almost wholly in France. For many years in all kinds of hat-making the French excelled, and in such centres as Anduze, Lyons, and Paris the trade is very extensive and important. In Great Britain the felt hat trade is principally centred at Denton and other localities in the neighborhood of Manchester, and in America the States of Connecticut, New York, and New Jersey enjoy the greater part of the industry.

The manufacture of straw hats has grown to be a large industry in the United States within recent years, and large quantities are annually exported. The straw braid, like all hat materials, is chiefly imported, coming from Italy, China, and Japan. The straw braid is sewed by machinery and shaped by means of a block, the pressing being done, frequently, with hydraulic machines. A sizing of glue is used to stiffen the hat before it is pressed. See STRAW MANUFACTURES.

Statistics.—In 1810 the number of fur hats reported as made in the country in one year was 457,666, of which 45,369 were made in Pennsylvania. According to the census of 1840, the value of the hats and caps of all kinds made annually in the United States was \$8,704,342. At the census of 1850, 1048 establishments, with a capital of \$4,427,798, were engaged in the manufacture of hats and caps. Half a century later 171 establishments were engaged in the manufacture of fur hats, and 24 of wool hats. The fur-hat industry engaged a capital of \$16,701,308, and there was produced an annual output valued at \$27,811,187. The wool-hat industry involved a capital of \$2,050,802, and produced goods valued at \$3,591,940.

HATASU, hä'tä-sōō, or **HATSHEPSET**, hä-chép'sét (HATSHEPSU). An Egyptian queen of the Eighteenth Dynasty, also called Ramaka (or Ma-ka-ra) and Chnemt Amum. The daughter of Thotmes I., she was associated with him in the last years of his reign; became the concubine of his son Thotmes II., who succeeded his father; and, as guardian of his son, later Thotmes III., to whom she married her daughter, exercised a great influence over his brilliant reign, and was for some time practically sovereign, as is typified by her appearance on the monuments in male garb. The mutilation of her name in inscriptions points to a falling out between her and the young King, and probably to his complete assumption of power. From South-

ern Arabia an expedition sent out by Hatasu brought back rich treasure. The temple near Thebes, called Der el-Bahri, which is approached by a lane of sphinxes and is surrounded by obelisks, contains many of the records of her reign and an especially vivid representation of the expedition to Punt.

HATCH, EDWARD (1832-90). An American soldier in the Civil War, born in Bangor, Maine. He began his military career at Washington in 1861, but went West the same year, and rose rapidly from captain to be lieutenant-colonel of the Second Iowa Cavalry. By 1862 he was colonel of the same. He served under General Grant in the South, and after commanding the entire cavalry division in the Army of the Tennessee he was made brigadier-general (1864). His gallantry in the field caused his further promotion to the rank of major-general, and his transference from the volunteer to the regular army corps as colonel of the Ninth United States Cavalry. In this capacity he was engaged in military service in the far West after the war was over.

HATCH, EDWIN (1835-89). An English theologian, born at Derby. He was educated at Pembroke College, Oxford; was ordained deacon in 1858, and priest in 1859; from 1859 to 1862 was professor of classics in Trinity College, Toronto, Can., from 1862 to 1867 rector of the Quebec High School; and from 1867 to 1885 was vice-principal of Saint Mary Hall, Oxford. In 1883 he became rector of Purleigh, Essex, in 1884 university reader in ecclesiastical history and secretary to the boards of faculties. He was Bampton lecturer in 1880, Grinfield lecturer on the Septuagint from 1882 to 1884, and Hibbert lecturer in 1888. The degree of D.D. was conferred upon him by the University of Edinburgh in 1883. He was a founder (1870) and the first editor of the *Official Gazette*. In theology he was an independent thinker, who sought to effect at Oxford a scientific basis for that study. He published *The Student's Handbook to the University and Colleges of Oxford in 1873* (7th ed. 1883), but *The Organization of the Early Christian Churches* (Bampton Lectures, 1881) was his first important volume. This was rendered into German, by the eminent Dr. Harnack, as *Die Gesellschaftsverfassung der christlichen Kirchen in Alterthum* (Giessen, 1883). Other works by him were: *The Growth of Church Institutions* (1887), and *Greek Influence on Christianity* (the "Hibbert Lectures," edited by Dr. Fairbairn, 1890). His writings were read and discussed with interest in Scotland, Germany, and the United States, as well as in England. Consult an article by Harnack in the *Theologische Litteratur Zeitung* (1890).

HATCH, JOHN PORTER (1822-1901). An American soldier, born in Oswego, N. Y. He graduated at West Point in 1845, and went in 1846 to the war in Mexico as a lieutenant of infantry, but exchanged the following year for the mounted rifles, and was promoted for gallantry in the field during the Civil War, which he had entered as brigadier-general of volunteers. He joined the Regular Army in 1866, and rose to be colonel of the Second Cavalry Regiment, 1881, but retired in five years.

HATCH, RUFUS (1832-93). An American banker, born in Wells, York County, Maine. Removing to Illinois, he was first a clerk in a

grocery store at Rockford, after which he joined a surveying party on one of the earliest railroads in Wisconsin, and finally, in 1854, entered the grain commission business in Chicago, where he rapidly accumulated a fortune. In 1862 he removed to New York City, where he established a stock-brokerage business, and became well known as a dealer in and promoter of railway stocks. He managed the famous Chicago and Northwestern 'deal' in 1868, secured control of the Pacific Mail Steamship Company, and finally, after varying fortunes, failed in the Northern Pacific collapse in 1883.

HATCH, WILLIAM HENRY (1833-96). An American lawyer, born at Georgetown, Ky. He was admitted to the bar in 1854; served in the Confederate Army during the Civil War, and rose to the rank of lieutenant-colonel; was member from Missouri in the United States House of Representatives from 1879 to 1895, and during this time took a leading part in securing legislation for the benefit of the agricultural interests. He was largely responsible for the passage of the act, commonly known as the Hatch Act, granting Federal aid to agricultural experiment stations in all the States and Territories.

HATCHEL. See HACKLE.

HATCHIE. A tributary of the Mississippi River. See BIG HATCHIE.

HATCHMENT, or ACHIEVEMENT (formerly *atchment, achement, atcheament*, an abbreviation of *achievement*, Fr. *achèvement*, from *achever*, OF. *achever, achievever*, to achieve, from *venir a chief*, Fr. *venir à chef*, to come to the head, or end). In heraldry, an escutcheon or armorial bearing; specifically, the armorial bearing placed on the residence of a person lately deceased. The funeral hatchment is in the form of a lozenge, upon which the shield is placed. The crest and other accessories are given, but in place of the motto a text or other religious legend is used. For a bachelor, the whole of the lozenge background is black. In the hatchment of an unmarried lady, the legend is omitted and a knot of ribbon takes the place of the crest. The hatchment of a husband whose wife survives impales his arms with his wife's in a shield with the external ornaments to which he is entitled, the ground of the hatchment being, under his side of the shield, black, and under his wife's, white. If the wife be an heiress, her arms are not impaled, but carried in an escutcheon (q.v.) of pretense. The arms of a wife whose husband survives are impaled with her husband's arms in a shield, or, in the case of an heiress, borne on an escutcheon of pretense. There is no helmet, crest, or mantling, but a peeress is entitled to her robe of estate. The ground under the dexter side of the shield is white, and under the sinister, black. The hatchment of a widower differs from that of a husband, in the ground being entirely black. The hatchment of a widow differs from that of a wife, both in having the ground entirely black, and in the form of the escutcheon, which (except in the case of an escutcheon of pretense) is lozenge-shaped. The arms are encircled by a silver cordon or cordelière, the symbol of widowhood. On the decease of the last of a family, a death's head surmounts the shield in place of a crest.

The achievement of a reigning king or queen,

whether married or not, represents the royal arms complete on a ground entirely black. That of an archbishop or bishop has the insignia of his see impaled with his paternal arms, the whole surmounted by a mitre, and the ground is per pale argent and sable. The dean of a cathedral or collegiate church and a king-at-arms also impale the arms of office with their family arms. In the achievement of the wife of a prelate, there are two shields—the first containing the impaled arms of the see and the bishop, surmounted by a mitre; and the second, the family arms of the bishop with those of his wife. The ground is all white, except that part which is under the arms of the wife.

Funeral escutcheons in Scotland, France, and Germany differ considerably from those in use in England, in that they indicate not merely the right of the deceased to a coat of arms, but his gentility of descent. The hatchment is much larger, sometimes consisting of a lozenge above six feet square, and the arms of the deceased, which occupy the centre, are surrounded by those of the eight or sixteen families from whom he derived his descent, the paternal quarterings on the right side, and the maternal on the left. The deceased is not entitled to a hatchment unless all these families had a right to bear arms. On the four corners are death's heads and the initials and titles of the deceased; the black interstices are powdered with tears. See HERALDRY.

HATCHWAY, JACK. A retired naval officer in Smollett's *Peregrine Pickle*. He is the boon companion of Commodore Truncheon.

HATFIELD. A market-town in Hertfordshire, England, on the Lea, 7 miles southwest of Hertford (Map: England, F 5). Population of parish, in 1891, 6963; in 1901, 7551. It is noted for the vicinity of Hatfield House, the seat of the Marquis of Salisbury, built on the site, and containing remains, of the famous Ely Episcopal Palace, erected in the twelfth century. It was acquired by Henry VIII. Edward VI. and Queen Elizabeth were both called to the throne while residents of the palace; James I. also resided here, and it was one of the prisons of Charles I. The present stately Elizabethan mansion, built 1608-11, and situated in extensive and beautiful grounds, contains valuable portraits and historical manuscripts. Consult Brewer, *English Studies*, edited by Wace (London, 1881).

HATFIELD, EDWIN FRANCIS (1807-83). An American Presbyterian clergyman, born in what is now Summit, N. J. He graduated at Middlebury College in 1829, studied theology at Andover, and was ordained in New York in 1832. He then became rector successively of the Second Presbyterian Church in Saint Louis and of the Seventh and North Presbyterian churches in New York. Ill health obliged him to give up preaching in 1863. He was for a time agent for the Union Theological Seminary, for which he raised a large sum of money, and for many years clerk of the Presbyterian General Assembly. He was the author of: *Universalism as It Is* (1841); *Saint Helena and the Cape of Good Hope* (1852); *The History of Elizabeth, N. J.*; *The Church Hymn-Book, with Tunes* (1872); and *The Poets of the Church* (1884). He left his library of 6000 volumes to Union Theological Seminary.

HATH'AWAY, ANNE, or AGNES. The maiden name of Shakespeare's wife. See SHAKESPEARE.

HATH'ERLY, Sir WILLIAM PAGE WOOD, Baron (1801-81). An English jurist, born in London, and educated at Winchester and Cambridge. He was called to the bar in 1827, and was Queen's Counsel eighteen years later. He entered Parliament for Oxford in 1847, and became a power in Church matters, and, though not a polished speaker, was highly respected for his knowledge and conscientiousness. From being a judge and a baronet he rose to be a peer of the realm and Lord Chancellor of Great Britain (1868), but retired in 1872. His personal benevolence influenced his Parliamentary career, and his piety is apparent in his published works, such as *Truth and Its Counterfeits* (1857), and *The Continuity of Scripture* (1867).

HATHOR, hä'thōr. An Egyptian goddess. See ATHOR.

HATIFI, hä'té-fé, ABDALLAH (c.1460-1521). A Persian epic poet, nephew of Jami (q.v.), born at Khardird, in Herat. The last of the important epic poets, he wrote in rhymed couplets five poems: *Laila wa Majnūn*, a story of unhappy love (edited by Jones, 1788; and in lithograph, Lucknow, 1862); *Haft Manzar*, an imitation of Nizami's *Haft Paikar*; *Shirīm wa Khusru*, a tale of the love of a Hindu prince for a rajah's daughter, and remarkable as being based on contemporary fact, and not on conventional legend; *Timur Nāmah*, or *Zafarnāmah*, celebrating the deeds of Timur or Tamerlane, the most important historical epic after the *Sāhnāmah*, of which a part was published by Jones (1788; lithographed at Lucknow, 1869); and an uncompleted story of the glories of Shah Ismail. This pentad is one of the many imitations of Nizami's *Khamsah*. Hatifi is also the name of an earlier Persian poet, who wrote *Gui u Chaugān*, a poem on the relation of man to God under the figure of the ball and the racket—though afflicted and beaten, he must turn again to him who smote; and again of a Turkish poet of Amasia in Asia Minor, who wrote in the sixteenth century.

HATTALA, hä'tä-lä, MARTIN (1821—). A Czech philologist, born in the County of Arva, Hungary. He studied at Pressburg and Vienna; became a priest in 1848, but soon devoted himself to linguistics; was teacher in the Pressburg Gymnasium (1850-54), instructor (1854), and later professor of Slavic philology in the University of Prague. His writings comprise studies in Czech and Slovak phonetics and syntax. Especially to be noted is his defense of the authenticity of the manuscripts of Kvalove-Dvor and Grünberg, containing old epics and lyrics in Bohemian; also, *De Continuarum Consonantium in Linguis Slavicis Mutatione* (1867); attacks on Schleicher and others; and, with A. Patera, *Reliquiæ Metricarum Alexandreidon Palæobohemicarum* (1881). He also wrote on the phonetics of Bohemian and Slovak (1854); a comparative grammar of Bohemian and Slovak (1857); a Slovak grammar (1864); and *Brus jazýka českého*, a work on style and diction (1877).

HATTERAICK, hä'tēr-āk, DIRK. A smuggler in Scott's *Guy Manuering*.

HATTERAS, CAPE. See CAPE HATTERAS.

HATTE'RIA, or SPHENODON. A genus of New Zealand 'lizards,' described in more detail under TUATARA (q.v.), which is the sole remaining representative of the group Prosauria, and is therefore of great interest as illustrating in its structure a "primitive, almost ideally generalized type of reptiles."

HATTI SHERIF, hä'té shā-rēf', or **HATTI HUMAYUN**, hōō'mā-yōōn' (Turk., excellent writing, from Ar. *khaff*, script, line, from *khaffa*, to trace, and *šarif*, sublime, from *šarafa*, to surpass). The name given by the Turks to important rescripts of the Sultan. The hattı sherifs are composed in the Turkish language, and written in the Arabian court-hand Divani. Above the text, as a token of the authenticity of the rescript, stands the intricate flourish or mark of the Sultan, usually in black, but sometimes in red or gold. This flourish is called *tugra*, or rishani sherif. The hattı sherif is irrevocable, while the written decrees of the Sultan relative to matters not so important, called *Irads*, are arbitrary decisions or opinions of the ruler liable to be amended, and, in many instances, entirely abrogated.

HATTO, hä'tō. The name of two archbishops of Mainz. **HATTO I.** (c.850-913) became Abbot of Reichenau in 888, and Archbishop of Mainz three years later. He possessed great influence at the Court of the Emperor Arnulf, and after the death of the latter in 899 became the guardian of his infant son, Louis the Child. In the struggle between the German kings and the anarchic feudal nobility, Hatto was a zealous partisan of the monarchy, and brought to its aid a bold spirit, a crafty mind, and a conscience which balked neither at treachery nor murder. His haughty bearing and magnificent mode of life still further incensed the nobles, who hated him as the instrument of the royal power. The feeling with which he was regarded by the people as a whole is attested by the widespread legend that his body, after death, was carried off by the devil and flung into the crater of Mount Etna. Of greater authenticity is the story related of his perfidious conduct toward Count Adalbert of Babenberg, a noble of Thuringia, who had been at enmity with the Emperor, and who was induced by Hatto to seek the King's presence for the purpose of effecting a reconciliation, the Archbishop promising under oath to restore him unharmed to his castle. After the two had started on their journey from Adalbert's home, Hatto found some pretext for returning with his unsuspecting companion to the castle, thus fulfilling the letter of his vow. Setting out once more, they arrived at the royal camp, where Adalbert was put to death. Hatto is also the hero of the well-known legend connected with the Mouse Tower, situated on an island in the Rhine, near Bingen. During a famine, as the story goes, the Archbishop caused a number of poor people to be burned in a barn, comparing their cries of agony to the squealing of mice. He was thenceforward pursued by a plague of these animals, to escape which he built the tower on a rock in the Rhine. He could not, however, evade his persecutors, and was finally devoured by them. This story, however, is told with slight variations of several historic characters, and is quite as frequently associated with his namesake, **HATTO II.**, who was Archbishop of Mainz from 968 to 970. Consult:

Heidemann, *Hatto I., Erzbischof von Mainz* (Berlin, 1865); Baring-Gould, *Curious Myths of the Middle Ages* (London, 1866-67).

HATTON, Sir CHRISTOPHER (1540-91). An English statesman and jurist, born at Holdenby. He became a member of the Inner Temple (1559), sat in the Parliaments of 1571, 1572, 1584, and 1586, and showed himself a bitter enemy of the Jesuits. Parry, who defended them in Commons, Hatton accused, and finally had him condemned to death. He was a commissioner at the trial of Babington, of the conspirators against Elizabeth, and of Mary Stuart, and in general showed himself a clever courtier of the Queen. In 1587 she made him Lord Chancellor—the 'dancing Chancellor,' as he was called, in allusion to the story that the Queen first looked on him with favor when she saw him dancing. In literary history Hatton is best known as the patron of Spenser, who dedicated to him *The Faerie Queen*. Consult Nicolas, *Memoirs of the Life and Times of Sir Christopher Hatton* (London, 1847).

HATTON, FRANK (1846-94). An American journalist, born in Cambridge, Ohio. He learned the newspaper business in the office of his father, who edited the *Cadiz (Ohio) Republican*. He served through the Civil War, attaining the rank of first lieutenant, and then became a journalist in Iowa, finally becoming editor-in-chief of the *Burlington Hawkeye*. In 1881 he was appointed Assistant Postmaster-General, and three years later succeeded Walter Q. Gresham as Postmaster-General, thereby becoming the youngest Cabinet officer since Alexander Hamilton. He was for some time editor-in-chief of the *Mail* in Chicago, and in 1888 returned to Washington, where he edited the *Post*.

HATTON, JOSEPH (1841—). An English journalist, novelist, and playwright, born at Andover. He was educated at home and in Chesterfield, and began his literary career by writing for the *Derbyshire Times*, a paper his father had founded. In 1868 he went to London to edit and transform the *Gentleman's Magazine*, and was soon correspondent for German, Australian, and American papers, while he made frequent visits to the United States in the interests of English journals. His popular *Cigarette Papers* appeared first in the *People*, of which he became editor in 1900. His Eastern travels bore fruit in *The New Ceylon* (1881), and he brought out *Henry Irving's Impressions of America* (1884); but he is best known as the author of such novels as: *Under the Great Seal* (1893); *The Banishment of Jessop Blythe* (1895); *The Dagger and the Cross* (1897); *When Rogues Fall Out* (1899); and *In Male Attire* (1900). His romance, *John Needham's Double*, was dramatized for E. S. Willard, and Richard Mansfield produced his version of *The Scarlet Letter*. Hatton also arranged *The Prince and Pauper* for his daughter Bessie, and *Jack Sheppard* for Weedon Grossmith. One of his novels, *By Order of the Czar*, had the distinction of being condemned by the Russian censor.

HATTON, JOSEPH LIPTRÖT (1809-86). An English musical composer, born in Liverpool. With much natural ability, inherited from father and grandfather, both violinists, he was never thoroughly educated, and but one of his songs, "To Anthea," ranks as a classic. He wrote about three hundred in all, and many of them

were as popular as the composer himself. A versatile genius with a sense of humor, he filled many rôles—organist at sixteen years of age; actor with Macready in *Othello* (1832); conductor of chorus in English opera (1842-43); composer of pianoforte pieces and an operetta, *Queen of the Thames*; interpreter of Bach's fugues without the notes; and vocalist at the Hereford Musical Festival (1846). He went on concert tours with Vieuxtemps, Sims Reeves, and other artists, and upon one of his American visits stayed for two years. From 1853 to 1859 he was musical director at the Princess's Theatre under Charles Kean, and when the Ballad Concerts were started at Saint James's Hall, London, in 1866, Hatton was the accompanist and conductor till 1875. He edited song albums for Boosey & Co., attempted oratorio as well as opera, and his part songs are still sung. He died at Margate, and was buried in Kensal Green.

HÄTZER, hêts'ör, LUDWIG (c.1500-29). A prominent Swiss Anabaptist. He was born at Bischofszell, near Saint Gall, Switzerland; studied at Freiburg im Breisgau, and attained high rank as a scholar, particularly in Latin, Greek, and Hebrew. He was intimate with Zwingli, but being a radical he desired to move faster than Zwingli thought prudent. In the fall of 1524 he returned to Zurich and openly allied himself with the Anabaptist party. He published a German translation of Ecolampadius's book upon the sacraments; but his continued rejection of infant baptism alienated Zwingli from him, and in March, 1526, he was banished. He went to Basel, where he translated Malachi, with Ecolampadius's commentary (1526), and finally to Strassburg, where he finished, with Johann Denk, a translation of the Prophets (1527), which he published at Worms. He returned to Augsburg, only to be banished again (spring, 1528). He wandered to Constance, and on the trumped-up charge of having seduced the servant of his wife, he was beheaded after three months' imprisonment, February 4, 1529. So bitter is still the feeling against the Anabaptists that even to-day he is represented as having been immoral and justly condemned. His very name has been spelled in an opprobrious manner, Hetzer, meaning irritator.

HATZFELD, häts'fêlt, or (Hungarian) **ZSOMBOLYA**, zhôm'bó-lyô. A small town, in the County of Torontál, Hungary, 152 miles southeast of Budapest, in a very fertile district (Map: Hungary, G 4). Wheat, corn, and rape are raised, and horses are exported. Hatzfeld is the principal settlement of the Swabians of Southern Hungary, who recaptured the town from the Turks in 1718, and redeemed the district from swamps. Population, in 1890, 9600; in 1900, 10,152; mostly Catholic Germans.

HAUBERK, ha'bêrk (from OF. *hauberc*, *hul-berc*, Fr. *haubert*, from MHG., OHG. *halsberc*, *halsberge*, AS. *halsbeor*, *hauberik*, from OHG., MHG., Goth. *hals*, Ger. *Hals*, AS. *heals*, neck; ultimately connected with Lat. *collum*, neck + OHG. *bergan*, MHG., Ger. *bergen*, Goth. *hairgan*, AS. *beorgan*, to protect). In mediæval armor, a defense for the body consisting of a shirt made of steel. Originally the hauberk was only a protection for the neck, and was made of thick leather. Later it was made of chain mail, and at the end of the eleventh century was joined to

the mail shirt or byrnie (q.v.), the name being applied to the whole garment. In the twelfth century the sleeves of the hauberk sometimes terminated at the elbow, but in the thirteenth and fourteenth centuries these came down to the wrist, and very generally descended over the hand in the form of a glove or mitten. In the fourteenth century the hauberk was sometimes worn under plate armor. See ARMOR.

HAUBOLD, hou'bólt, CHRISTIAN GOTTLIEB (1766-1824). A German jurist of the historical school, born at Dresden and educated at Leipzig, where he became professor in 1789. He wrote: *Institutiones Juris Romani Litterariæ* (1809); *Institutionum Juris Romani Privati Lineamenta* (last ed., by Otto, 1826); *Manuale Basilicorum* (1819); *Doctrinæ Pandectarum Lineamenta* (1820); and the excellent *Lehrbuch des sächsischen Privatrechts* (3d ed., by Hänsel, 1847-48).

HAUCH, houk, JOHANNES CARSTEN (1790-1872). A prolific Danish poet and dramatist. Born at Frederikshald, in Norway, of Danish parents, he came to Denmark (1803) when his mother died, and fought against the English in 1807. He entered the university at Copenhagen in 1808, and was made a doctor in 1821. Through association with Oehlenschläger, he became an apostle of literary reform. He wrote many dramas of little importance. Then in 1834 he turned to prose fiction, in which field he wrote: *Vilhelm Zabern* (1834), the most admired; *Guldmagere* (1836); *En polsk Familie* (1839); and *Slottet ved Rhinen* (1845). In 1842 he published a collection of poems. In 1846 he was made professor of Scandinavian languages at Kiel, but returned to Copenhagen in 1848, and now wrote many good tragedies, such as: *Söstrene paa Kinnekullen* (1849); *Marsk Stig* (1850), the best; *Tycho Brahe's Ungdom* (1852); and *Julian den Frafaldne* (1868). He wrote also an historic epic, *Valdemar Atterdag* (1862), and a second collection of poems (1861). He succeeded Oehlenschläger as professor of aesthetics at Copenhagen in 1851. Of strong imagination and with a bent for the mystic and supernatural, his work at its best is admirable, but its average is not high. Hauch's *Dramatic Works* appeared in three volumes (Copenhagen, 1852-59); his romances in seven (ib., 1873); and his poems have also been collected (ib., 1890 et seq.). Consult Brandès, *Danske Digtere* (Copenhagen, 1877).

HAUCK, houk, ALBERT (1845-). A German Lutheran theologian, born at Wassertrüdingen, in Middle Franconia. He studied at the universities of Erlangen and Berlin, and in 1882 became a professor at Erlangen, where he remained until 1889, when he went to the University of Leipzig. In 1891 he was elected a member of the Royal Academy of Sciences. His writings include: *Tertullians Leben und Schriften* (1877); *Die Bischofswahlen unter den Merowingern* (1883); *Kirchengeschichte Deutschlands*, in six parts (parts 1-3, 1887-96; parts 1-4, 2d ed. 1898-1902). As a reward for these labors he was given the great Verdun prize by the Prussian Academy of Sciences (1899). In 1881 he became an editor of the revised edition of the *Realencyklopädie für protestantische Theologie und Kirche* (3d ed. 1896), and after Herzog's death in 1882, the sole editor.

HAUENSCHILD, hou'en-shilt, RICHARD GEORG SPILLER VON (1825-55). A German poet

and novelist, born in Breslau, better known under his pseudonym, 'Max Waldau.' He began the study of law in the university of his native city, but soon forsook it for modern languages, history, and philosophy. He was one of the most gifted German poets of the first half of the nineteenth century. His poems include: *Blätter im Winde* (1848); the epics *Cordula*, *Graubündner Sage* (2d ed. 1855) and *Rahab* (1855); and the elegy, *O diese Zeit! Kanzenen* (1850). Of his novels, the humorous romances, *Nach der Natur* (2d ed. 1851), and *Aus der Junkerwelt* (1850), are most noteworthy.

HAUER, hou'ër, FRANZ VON (1822-99). An Austrian geologist, born at Vienna, and educated there and at Schemnitz. In 1846 he became an assistant of Haidinger, and from 1849 to 1867, as a member of the Imperial Geological Institute, and later as its director, took part in many geological surveys. In 1885 he was appointed superintendent of the Vienna Museum of Natural History, and edited its *Annalen* (1886-96), and for the last seven years of his life was a member of the Austrian House of Lords. His published works include: *Geologische Uebersicht der Bergbaue der österreichischen Monarchie* (1855), with Poetterle; *Die Geologie und ihre Anwendung auf die Kenntniss der Bodenbeschaffenheit der österreichisch-ungarischen Monarchie* (2d ed. 1878); and a *Geologische Karte von Oesterreich-Ungarn* (5th ed. 1896). Consult Böhmersheim, *Zur Erinnerung an Franz von Hauer* (Vienna, 1899).

HAUFF, houf, WILHELM (1802-27). A German novelist, born at Stuttgart. His education was desultory, and revealed no precocity; his effective training came from his mother and sisters, and tended to cultivate the imagination rather than the intellect. He studied theology at Tübingen (1820-24), and in 1826 published his first volume, *Märchenalmanach*, followed by two sequels of like title, all marked by a singularly dramatic humor. Equally successful were the *Mitteilungen aus den Memoiren des Satans* (1826), and *Der Mann im Monde* (1826), the last under the name of H. Clauren, a lesser novelist, whose sentimentality it was intended to parody. This it did so successfully as to deceive Clauren's most enthusiastic admirers. His best romance is his *Lichtenstein* (1826). It is a vivid series of historical pictures of men and manners, and has held its popularity for three generations. Hauff traveled in Germany, France, and Belgium, became editor of the Stuttgart *Morgenblatt*, and married. The summer of 1827 he passed in the Tyrol, still at work; but in September his health began to fail, and in October he died. To 1827 belong the *Phantasien im Bremer Katskeller*; *Das Bild des Kaisers*; and *Die Bettlerin vom Pont des Arts*. Among the other collected *Tales*, the best are: *Das Wirtshaus im Spessart*; *Othello*; *Jud Süß*; and *Die Sängerin*. Hauff's Works are still often reprinted, and enjoy undiminished popularity. In his early death Germany lost a writer of unusual ability and rich promise.

HAUG, (JOHANN CHRISTOPH) FRIEDRICH (1761-1829). A German poet, known also by his pen-name 'Hophthalmos,' born at Niederstotzingen (Württemberg). He studied in Stuttgart at the Karlschule, or military institute of Duke Karl Eugen, where he was one of the Schil-

ler group; in 1783 was appointed a secretary to the Ducal Board of Privy Councilors, in 1794 private secretary, and in 1816 librarian of the Royal Public Library at Stuttgart, with the title of Aulic Councilor. Ready in improvisation, he wrote quantities of neat but rather commonplace verse for literary almanacs, anthologies, and journals, and for Cotta's *Morgenblatt*, of which he was an editor from 1807 to 1817. As an epigrammatist, however, he was perhaps second only to Logau (q.v.). The most representative exercise of his wit is to be found in his *Zweihundert Hyperbeln auf Herrn Wahls ungeheure Nase* (1804, 3d ed. 1850), a *tema con variazioni*, which certainly to unprejudiced minds attests his mobility and resourcefulness. A selection from his *Gedichte* appeared at Stuttgart in 1840; another forms No. 1136 of Reclam's *Universalsbibliothek*. Consult Fischer, *Beiträge zur Literaturgeschichte Schwabens* (Tübingen, 1901).

HAUG, HOU, MARTIN (1827-76). A German Orientalist, born at Ostdorf, in Württemberg. Overcoming every obstacle to his early education, he became a school-teacher, first at Ostdorf and later at Unternsingen. Here he was forced to continue his classical and Hebrew studies in secret; but he persevered, and developed a taste in linguistics and Sanskrit. Haug entered the gymnasium at Stuttgart in 1848, and in 1852 received the degree of doctor of philosophy at Tübingen. Until 1859 his work was mainly at Bonn and Heidelberg, but in that year he was appointed superintendent of Sanskrit studies at the Government College at Poona, India. Leaving Europe with his bride, he went to India, where he worked unceasingly in Sanskrit, Avestan, and Pahlavi, in addition to the task of reforming the system of native education. In 1866 Haug returned to Germany, and two years later was appointed to the newly created chair of Sanskrit and comparative linguistics at Munich, which he held until his death. Haug's work was of signal importance for Indo-Iranian studies in the Orient. He was the first to recognize the importance of the traditional interpretation of the texts as contrasted with the linguistic or comparative school; and his books, though comparatively few in number, are still, for the most part, of value. His chief contributions were: *Die fünf Gāthās* (2 vols., 1858-60); *The Aitareya Brahmana of the Rigveda* (2 vols., 1863); *An Old Zend-Pahlavi and Pahlavi-Pazand Glossary*, in collaboration with Hoshengji Jamsppji (2 vols., 1867-70); *The Book of Arda Viraf*, in collaboration with E. W. West (2 vols., 1872-74); and *Essays on the Parsis* (3d ed. 1884). Consult Evans, in West's edition of the essays.

HAUG, ROBERT (1857-). A German artist, born in Stuttgart. His studies were begun at the Art School of Stuttgart, and continued at Munich in the academy, the Old and New Pinakothek, and the Schack Gallery. At the Munich International Exposition of 1888 he attracted very favorable notice by his two works, "The Prussians Near Mückern" (in the Stuttgart Gallery) and "Volunteer Riflemen of 1813" (in the National Gallery, Berlin), the latter of which also obtained the gold medal at the Berlin Art Exposition in 1891. He became an instructor in the Stuttgart Art School in 1894. His further works, for the most part scenes from the War of

Liberation, characterized particularly by fine atmospheric effects, include "At Dawn" (1891; Dresden Gallery); "The Approach of Blücher's Army to the Rhine" (1893), "Fight in the Streets of Leipzig, October, 1813" (1895; Leipzig Museum); "The Castle Guard," and "Battle in a Cornfield" (National Gallery, Berlin).

HAUGIANS, hou'gi-anz. A religious body in Norway, the followers of Hans Nielsen Hauge (1771-1824). He was an ignorant peasant, but became an enthusiastic revival preacher early in the nineteenth century, and so annoying to the regular clergy that they procured his punishment by fine and imprisonment. He held that the ministry is a common duty, and that ordination for the service is not necessary; that Church creeds and confessions are of small account, but faith and works are everything; and he laid much stress upon strict discipline. He gained many followers, particularly from the lower classes, and his work was continued after his death. For the life of Hauge, consult Bang (Christiania, 1875). His name is commemorated in Hauge's Synod, one of the independent Lutheran bodies of the United States. The synod was organized in 1846-50 by immigrants from Norway. Its main strength is in the States of Minnesota, South Dakota, and Wisconsin.

HAUGWITZ, hou'vits, CHRISTIAN HEINRICH KARL, Count (1752-1831). A Prussian statesman, born near Oels, in Silesia, and educated at Halle and Göttingen. His mystical philosophy won him the favor of Frederick William II., who sent him to Vienna as Ambassador, and in 1792 appointed him Minister of Foreign Affairs. During his administration the second partition of Poland took place (1793), and the humiliating Peace of Basel was signed (1795). When the French occupied Hanover in 1803, Haugwitz resigned; but two years later, when the French troops had entered Ansbach, he was sent to treat with Napoleon, and after Austerlitz signed the treaty ceding Ansbach, Cleves, and Neuchâtel to the French, and giving Hanover to Prussia. Soon after he replaced Hardenberg as Prime Minister, but was unable to better the relations with France, and after Jena retired to his estates in Silesia and Poland. Consult Minutoli, *Der Graf von Haugwitz und Job von Witzleben* (Berlin, 1844).

HAUK, MINNIE (1852-). An American dramatic soprano. She was born in New York, of German parentage, and studied both at home and in Europe. Her first appearance was on the concert platform in New Orleans (1865), and three years later she made her operatic debut in New York City. The same year she appeared in Italian opera in London with great success. The following year she was engaged as the prima donna of the Vienna Court Opera, and from 1873 to 1875 was employed in a like capacity at Berlin. She also sang with marked success in every capital of the civilized world.

HAUKSBEE, haks'bē, FRANCIS, the elder (?-c.1712). An English physicist, admitted to the Royal Society of London in 1705, and who made a number of brilliant discoveries. Little is known of his life save through his scientific papers which were published in the *Philosophical Transactions*, and a volume on *Physico-Medical Experiments on Various Subjects, Containing an*

Account of Several Surprising Phenomena Touching Light and Electricity Producing on the Attraction of Bodies. He discovered that light could be produced by mercury shaken in a glass tube, and that this effect was increased when the action took place in a vacuum. Hauksbee devised one of the first electrical machines, and also made improvements in the air-pump. He is supposed to have died in 1712, his last papers in the *Philosophical Transactions* appearing posthumously in 1713. He is mentioned by Newton in certain letters.

HAUKSBEE, FRANCIS, the younger (1687-1763). An English optician, possibly a son of the foregoing. He was for forty years previous to his death clerk and housekeeper of the Royal Society, London. He was somewhat of a scientist, being an instrument-maker and optician, and is said to have been the first to deliver scientific lectures with experiments in London. "A Course of Mechanical, Optical, and Pneumatical Experiments" was given by Hauksbee, who performed the experiments while the explanatory lecture was delivered by William Whiston, M.A. The syllabus of this course of lectures, as well as those on astronomy and chemistry, is interesting as showing the state of experimental science at that time.

HAULIK DE VÁRALJA, hou'lik dá v'ä'röl-yö, GEORG (1787-1869). A cardinal and archbishop of Agram, born at Tyrnau in Hungary. He was a very aggressive and determined adversary of Kossuth, who in 1849 proscribed him as a traitor. His *Selections Encyclicæ Literæ et Dictiones Sacræ* (1850-53), a collection of pastoral letters, is of value to historical study.

HAULLEVILLE, ôl'vêl', PROSPER CHARLES ALEXANDRE, Baron de (1830-). A Belgian publicist, born in Luxemburg, of a French immigrant family from Lorraine. He studied law at Liège, Brussels, and Bonn, and then entered Belgian politics as a member of the Constitutional-Catholic Party. He was editor at various times of *L'Universel*, the *Revue Générale*, and the *Journal de Bruxelles*. His books include: *Histoire des communes lombardes depuis leur origine jusqu'à la fin du XIIIème siècle* (1858); *La définition du droit* (1875); and *De l'avenir des peuples catholiques* (1876), the last of which was translated into nine languages, and procured him the position of Papal chamberlain.

HAUNTED MAN, THE. A Christmas story by Charles Dickens (1847).

HAUPT, haupt, ERICH (1841-). A German Protestant theologian, born at Stralsund, and educated at Berlin. He was professor of New Testament exegesis, successively at Kiel (1878), Greifswald (1883), and Halle (1888). He wrote: *Der erste Brief des Johannes* (1869); *Die alttestamentlichen Citate in den vier Evangelien* (1871); *Die Kirche und die theologische Lehrfreiheit* (1881); *Plus ultra, zur Universitätsfrage* (2d ed. 1890); *Die Bedeutung der heiligen Schrift für den evangelischen Christen* (1891); *Zum Verständnis des Apostolats im Neuen Testament* (1896), etc.

HAUPT, HERMAN (1817-). An American engineer, born in Philadelphia, Pa. He graduated at West Point in 1855, but resigned a commission in the Second Infantry to become an assistant engineer on the public works of

Pennsylvania. In 1844 he became professor of civil engineering and mathematics in Pennsylvania College, but three years later he resumed the practice of his profession, as principal consulting engineer of the Philadelphia Railroad, of which he became, successively, the general superintendent and chief engineer. He was chief engineer of the Hoosac Tunnel from 1856 to 1861. In the Civil War he was chief of the United States Bureau of Military Railroads, and served on the staff of General McDowell with the rank of colonel. From 1872 to 1876 he was general manager of the Piedmont Air-line Railroad, from 1876 to 1878 was chief engineer of the Pennsylvania Transportation Company and Seaboard Pipe-line, from 1881 to 1885 was general manager, and 1885 to 1886 was general superintendent of the Northern Pacific Railroad. He invented a drilling machine that won the highest prize of the Royal Polytechnic Society of Great Britain, and was the first to prove the practicability of transporting oil in pipes. He wrote: *Hints on Bridge Building* (1840); *General Theory of Bridge Construction* (1852); *A Consideration of the Plans Proposed for the Improvement of the Ohio River* (1855); *Military Bridges* (1864).

HAUPT, LEWIS MÜHLENBERG (1841-). An American civil engineer, born in Gettysburg, Pa. He was educated at Harvard and at West Point, became lieutenant of lake surveyors by 1868, and in the following year was attached to a military district in Texas. From 1872 to 1892 he was professor of civil engineering in the University of Pennsylvania, and in 1885-86 was editor of the *Engineering Register*. In 1886 he invented a method for marking channels. He was a member of the Nicaraguan and the Isthmian Canal Commissions (1897-99), was president of the Colombia-Canea Arbitration (1897), and was chief engineer of the survey for ship canals across New Jersey, and was consulting engineer on the construction of the Ohio-Lake Erie ship canal. In addition to his numerous contributions to engineering journals, his publications include: *Working Drawings and How to Make and Use Them* (1881); *The Topographer—His Methods and Instruments* (1884); *Physical Phenomena of Harbor Entrances* (1887); *Canals and Their Economic Relation to Transportation* (1890); and *A Move for Better Roads* (1891).

HAUPT, haupt, MORITZ (1808-74). A well-known German philologist. He was born at Zittau, and studied from 1826 to 1830 at Leipzig, where in 1841 he was appointed professor of the German language and literature. For having participated in the agitation of 1848-49, he was deprived of his professorship. In 1853, however, he was called to Berlin to succeed Lachmann as professor of classical literature. In 1861 he became perpetual secretary of the Academy of Sciences. By his painstaking and scholarly critical work he rendered distinguished service to both classical and German philology, chiefly as an editor of texts. In the former field he published: *Quæstiones Catullianæ* (1857); *Observationes Criticæ* (1841); editions of Horace (4th ed. 1881), Catullus, Tibullus, Propertius (5th ed. 1885), Vergil (2d ed. 1873), and other classical writers. His chief contributions to German philology were editions of Hartmann von Aue's *Erec* (1839), *Lieder und Büchlein*, and *Der arme Hein-*

rich (1842); Rudolf von Em's *Der gute Gerhard* (1840); the poems of Gottfried von Neifen (1851); and the *Moritz von Craon* (1858), and *Von dem übeln Weibe* (1871) of Neidhard von Reuenthal, and, above all, Konrad von Würzburg's *Engelhard* (1844, new ed. 1890). He also edited Æschylus from the papers of Hermann (2d ed. 1858), and completed Lachmann's edition of the Mediæval German lyrics of the Minnesingers (*Des Minnesangs Frühling*, 4th ed. 1888). In 1836, with Hoffman von Fallersleben, he founded the *Altdeutsche Blätter*, succeeded in 1841 by the *Zeitschrift für deutsches Altertum*, which he edited until his death. His numerous briefer contributions are collected in his *Opuscula* (3 vols., 1875-76); and his *Französische Volkslieder* appeared posthumously in 1877. Consult: Belger, *Haupt als akademischer Lehrer* (Berlin, 1879); and Nettleship's lecture (Oxford, 1879).

HAUPT, PAUL (1858—). A Semitic scholar, one of the pioneers of Assyriology in America. He was born at Görlitz, Germany, November 25, 1858. He studied at the universities of Berlin and Leipzig. In 1880 he became privat-docent in the University of Göttingen, and from 1883 to 1889 was assistant professor of Assyriology. In 1883 he became professor of Semitic languages at Johns Hopkins University, but until 1889 continued to lecture in the summer at Göttingen. Besides numerous smaller articles, he projected and edits the *Polychrome Bible*, a critical edition of the Hebrew text of the Old Testament, and a new English translation with notes. A unique feature of this edition is the use of different colors to distinguish the various sources and component parts in the Old Testament books—each one of which is intrusted to a specialist in biblical studies. Among his Assyriological publications may be mentioned his edition of the *Nimrodepos* (the Gilgamesh epic, 1884-91); *Akkadische und sumerische Keilschrifttexte* (1881-82); *Die akkadische Sprache* (1882); and *Sumerische Familiengesetze* (1883). He is also co-editor with Friedrich Delitzsch of the *Beiträge zur Assyriologie und semitischen Sprachwissenschaft*, published in Leipzig.

HAUPTMANN, haupt'män, GERHART (1862—). One of the greatest of modern German dramatists. He was born in Salzbrenn, son of a hotel-keeper, and grandson of a weaver. His first work, *Promethidenlos* (1885), was an epic. His dramas, *Vor Sonnenaufgang* (1889), *Das Friedensfest* (1890), *Einsame Menschen* (1891), and *Die Weber* (1892), show the influence of Zola, Ibsen, and Tolstoy, a spirit of revolt against the social conditions and the artistic ideals of a military and capitalistic State. Thus the young Hauptmann, with the young Sudermann, was for a time leader of a second Young German movement, and the production of *Vor Sonnenaufgang* at the Free Theatre of Berlin was the signal for a contest, recalling in a way that over the *Cid* or *Hernani*. The quiet and retiring poet became at once a notoriety. These dramas were aggressively democratic, social, realistic. His actors are no longer persons or characters, they are described as 'people in action,' who walk, talk, and act as in every-day life, or at least seem to do so, by an art that hides art. And it is every-day life of which they speak, the sordid social struggles of to-day in which they are engaged, the vulgar

views that hold them in a gloomy, brutal grasp. This naturalism is as pessimistic as that of Zola. *Die Weber* constantly suggests *Germinal*, but the poet and the artist in Hauptmann here rises above the theorist and the philosopher. The idealist is not defeated, but is learning to lift ugliness itself to the realm of art.

Up to 1892 Hauptmann might have seemed morbidly ethical in tragedy. He was now to show himself in *Kollege Crampton* (1892) and *Der Biberpelz* (1893) capable of painting delightful pastels of humorous character, though it is here with a professional thief and there with a drunkard that we have to do. And presently in *Hannele* (1893) he was to reveal himself in still another character as an extreme idealist, dealing no longer with vice, hunger, and mental decay, but with dreams, fantasies, and faith. *Hannele* is a mystic poem. So is *Florian Geyer* (1895), and *Die versunkene Glocke* (1897, translated by Meltzer, 1900) calls itself 'a fairy drama.' Then may be noted in *Fuhrmann Henschel* (1898) a turn from mysticism to an idealized realism in a situation suggesting that of Balzac's *La rabouilleuse*, though its fundamental naturalism is tempered by a spiritual restraint that comes from a great poet's moral intuition. Here Hauptmann has touched earth again as the poet of social altruism, giving to the German working class an artistic expression of their own weakness, and of the selfish strength of others. He is here the poet of the poor, the downtrodden, the lonely, the helpless, the perplexed, even the vicious. He recognizes the individualism produced by the material struggle for existence and wealth, but he would convert it to new ends by the inspiration of a Christian socialism. *Schluck und Jan* (1900), a farce, is a romantic adaptation of an Arabian tale, and Hauptmann's next drama, *Michael Kramer* (1900), while abounding in lines of sententious eloquence, is sordid in subject, and proved on the stage a melancholy failure. Hauptmann wrote also two novelistic studies, *Der Apostel* and *Bahnwärter Thiel* (1892).

HAUPTMANN, haupt'män, MORITZ (1792-1868). A German composer and eminent writer on the theory of music, born at Leipzig. He was educated as a musician, and studied the violin under Spohr. His opera, *Mathilde* (1826), was very successful, but it was not until 1842, when he became cantor and musical director at the Thomasschule in Leipzig, that his genius as a teacher was universally acknowledged. His pupils, among whom were F. David, Kiel, Joachim, Sullivan, Von Bülow, and Cowen, cherished an enthusiastic admiration for him, and at his death Leipzig was in mourning. Of his compositions, all of which are marked by purity and beauty of style, the best are his violin pieces. He embodied the result of many years' labors in his *Die Natur der Harmonik und Metrik* (1853, 2d ed. 1873; Eng. trans. 1888), which was a work of paramount importance and the foundation of modern musical theory.

HAURAKI (hou-rä'két) **GULF**. An inlet on the east coast of North Island, New Zealand, 70 miles long and 40 miles broad. The Great Barrier Island forms a natural breakwater at its entrance, and it contains numerous picturesque islands and good harbors. Auckland and Thames are the chief towns on its shores.

HAURAN (Arabic *el-Hauran*, Gk. *Ἀβάρῆς*, *Auranitis*). A district of Syria, east of the Jordan (Map: Turkey in Asia, C 2). In a wider sense the name is used to designate the Turkish province including Hauran proper, Jedur, Jaulan, and part of the hill-country south of the Yarmuk. Whether the Hauran mentioned by Assurbanipal (b.c. 668-626), on the Rassam cylinder (vii. 111), was intended as a designation of this larger territory cannot be determined. But in Ezek. xlvii. 16-18, Jaulan is clearly included in the description. In a narrower sense Hauran extends east of Jaulan to the desert and from the district of Damascus to the Yarmuk. This tract of land includes: (1) en-Nukra, 'the cavity'; (2) el-Leja, 'the refuge'; and (3) el-Jebel, 'the mountains.' En-Nukra is a hollow east of Jaulan, south of el-Leja, and west of Jebel ed-Druze, 1500 to 2000 feet above sea-level, with an exceedingly rich soil, formed by decomposed volcanic matter. El-Leja is composed entirely of lava found in great masses and in fantastic shapes, with little vegetation. El-Jebel is the high mountain region, with the lofty peaks of el-Kuleib and the fortress of Salkhad. The oldest monument is probably the so-called Job-stone at Sheikh Saad, which is now known to have been erected by Rameses II. (about b.c. 1300). The underground dwellings are no doubt much older. None of the cities of which ruins now exist can be regarded as older than the Græco-Roman period; but there may have been older cities on the same sites. Great houses, built entirely of basalt, have been perfectly preserved, and arouse the amazement of travelers. Numerous Greek inscriptions have been found, both Christian and pagan. A railroad extends from Damascus to Mzerib. Consult: Wetzstein, *Reisebericht über Hauran und die Trachonen* (Berlin, 1860); Schumacher, *Across the Jordan* (London, 1883); Merrill, *East of the Jordan* (New York, 1883); G. A. Smith, *Historical Geography of the Holy Land* (London, 1895).

HAURÉAU, *ô'râ'ô'*, JEAN BARTHÉLÉMY (1812-96). A French historian and politician, born in Paris. He was educated in the colleges of Louis le Grand and Bourbon, and became a revolutionary writer on the staff of several metropolitan newspapers before he went to edit the *Courier de la Sarthe* (1838-45) in Le Mans, where he also became city librarian. Thence he returned to the *National* in Paris, and after the Revolution of 1848 he was made keeper of the manuscripts in the National Library, retaining the position until the coup d'état of December 2, 1852. He was sent by the Department of Sarthe to the Constituent Assembly, after the dissolution of which he abandoned politics. He was made librarian of the *Ordre des Avocats* in 1861, and director of the National Printing Office in 1870, but retired in 1882. He was commander of the Legion of Honor from 1878. He wrote *François I. et sa cour* (1853); *Charlemagne et sa cour* (1854); *Gallia Christiana* (1856-65); and *Histoire de la philosophie scholastique* (1872-80), his best-known work.

HAURIENT (from Lat. *hauriens*, pres. part. of *haurire*, to draw water). A term in heraldry (q.v.), applied to a fish placed upright per pale.

HAUSA (*hou'sá*) **STATES**, or **HAUSA LAND**. A term of ethnographical rather than geographical significance. It now designates that part of Nigeria (q.v.) which lies north of the Benue

and Niger rivers. It embraces the kingdoms of Sokoto (q.v.) and Nupe. The former includes the sub-sultanate of Gando, and the Kalam, Muri, Bautehi, and Jauri territories, and the Adamawa Empire. Bornu borders on the east, and the Niger from Lokodja to Birni borders on the west. The total area is estimated at 150,000 square miles, with about 4,000,000 inhabitants. The Hausa people are negroes with much admixture of other races—Tuareg, Berber, Fulah, etc. Their cranial index, or ratio of head-width to head-length, is 77.3. They are said to be intelligent, industrious, and hospitable, and are one of the most civilized races of Central Africa. They engage in agriculture, cattle-raising, and commerce, and make good artisans. They form a large part of the military forces of Great Britain in Nigeria, and also of the Congo Free State. For the most part they have adopted Mohammedanism from their conquerors, the Fulahs. The Hausa language has become that of trade over a large region to the westward and northward to the Barbary States. It represents an isolated branch of the Hamitic family of languages. An association for its study was formed in London in 1892, and a professorship has been established at Cambridge. Another race found in the region is the Tukulör. The Hausa Empire is supposed to have been very powerful about the middle of the fifteenth century. It gradually became divided up into States, some of which represented the highest civilization of the Sudan. The Fulahs entered the country gradually, and in the early part of the nineteenth century made themselves masters of the whole region. Consult: Robinson, *Hausaland* (London, 1896); *Hausa Literature* (Cambridge, 1896); *Hausa Grammar* (London, 1897); Robinson and Brooks, *Hausa Dictionary* (Cambridge, 1899-1900). There are also grammars by Schoen (London, 1862) and Marre (Vienna, 1901).

HAUSEGGER, *hou'zëg-ër*, FRIEDRICH VON (1837-). An Austrian writer on musical theory, born at Vienna. He studied music with Salzmänn and Otto Dessoff, and, after practicing law for some time at Gratz, became in 1872 a teacher of music at the university there. His most important book is *Musik als Ausdruck* (1885), and *Richard Wagner und Schopenhauer* (1892) and *Vom Jenseits des Künstlers* (1893) are also valuable.

HAUSER, *houz'ër*, FRANZ (1794-1870). A Bohemian opera singer, born at Prague. He was a pupil of Tomaschek, and had a remarkable barytone voice. From 1817 to 1837 he sang with great success in Prague, Dresden, Vienna, London, Berlin, etc., and from 1846 to 1864 was director and singing teacher at the Munich Conservatory. He had a splendid collection of Bach's works, and his correspondence with Hauptmann and Mendelssohn is interesting. He died at Freiburg, Baden.

HAUSER, Miska (1822-87). An Hungarian violinist, born at Pressburg. He was a pupil of Kreutzer and Joseph Matalay, and of the Vienna Conservatory. He made successful concert tours of Europe, America, Australia, and India, and composed a good deal of violin music. He published *Aus dem Wanderbuch eines österreichischen Virtuosen* (1858-59), which was an account of his American trip. He died at Vienna.

HAUSRATH, hous'rät, ADOLF (1837—). A German Protestant theologian, born at Karlsruhe. He was educated at Jena, Göttingen, Berlin, and Heidelberg, and was appointed professor of ecclesiastical history at Heidelberg in 1867. His publications include: *Der Apostel Paulus* (2d ed. 1872); *Neutestamentliche Zeitgeschichte* (3d ed. 1875-79); *D. F. Strauss und die Theologie seiner Zeit* (1876-78); *Arnold von Brescia* (1891); *Peter Abälard* (1893); *Martin Luthers Romfahrt* (1894); *Die Arnoldisten* (1895); *Karl Holsten* (1897); *Aleander und Luther auf dem Reichstage zu Worms* (1897); *Alte Bekannte* (1899-1901); and, under the name George Taylor, the historical novels *Antinous* (1880); *Klytia* (1883); *Jetta* (1884); *Elfriede* (1885); and *Peter Maternus* (1898); and the stories *Unter dem Katalpenbaum* (1899) and *Potamiäna* (1901).

HAUSSA STATES. See HAUSA STATES.

HÄUSSER, hois'ër, LUDWIG (1818-67). A German historian and politician, born at Kleeburg in Lower Alsace. He entered the University of Heidelberg as a student of philology, but under Schlosser's influence soon devoted himself to history, the study of which he continued at the University of Jena. After his graduation he taught for a number of years, spent some time in Paris, and in 1845 was appointed professor of history at Heidelberg. Soon afterwards he became interested in the political movements of the day and wrote a pamphlet on *Schleswig-Holstein, Deutschland und Dänemark* (1846). At the beginning of 1847 he was chosen an editor of the *Deutsche Zeitung*, and in November of the same year was elected to the Second Chamber of the Baden Legislature, where he supported the Federal Constitution. He took no part in the May Revolution of 1849, and the next year again became a member of the Legislature, but resigned in October, and devoted himself to his historical studies. His opposition in 1858 to the reaction in the Protestant Church was as successful as the polemic into which he entered in 1859 against the concordat with the Papacy. From 1860 to 1865 he was again a member of the Second Chamber, and supported the Liberal Ministry. He was one of the founders of the *Süddeutsche Zeitung*, and in December, 1863, took part in the assembly of representatives of the German States at Frankfort. Though Häusser was conspicuous in politics, his fame rests chiefly upon his historical works. He was a brilliant and inspiring lecturer. His chief work, *Deutsche Geschichte vom Tode Friedrichs des Grossen bis zur Gründung des Deutschen Bundes* (4 vols., 1854-57; 4th ed. 1869), is one of the most striking achievements of modern German historical research. Among his numerous other publications are *Geschichte des Zeitalters der Reformation* (1868; 2d ed. 1879) and *Geschichte der Französischen Revolution* (1867; 3d ed. 1891), which were issued after his death. Many of his lectures, edited from stenographic reports, have also been published.

HAUSSEZ, ô'sâ', CHARLES LEMERCIER DE LONGPRÉ, Baron d' (1778-1859). A French politician, born at Neufchâtel, of an aristocratic family. At sixteen he began to take a part in conspiracies against the Directory and the Consulate, and was an enthusiastic supporter of the

Empire, but joined the Royalist Party on the return of the Bourbons. In 1829 he became Naval and Colonial Minister, and in the following year was forced to flee to England because of his loyalty to Charles X. He was condemned to perpetual imprisonment; but in 1839, after extensive travels in Italy, Switzerland, and Germany, benefited by the amnesty to return to France. Among Haussez's works the following may be mentioned: *Réflexions d'un ami du roi* (1816); *La Grande Bretagne en 1833* (1833); *Voyage d'un exilé* (1835); *Alpes c' Danube* (1837); and *Etudes morales et politiques* (1844 and 1851). From his political memoirs excerpts were published in the *Revue de Paris* (1894).

HAUSSMANN, ôs'män', GEORGES EUGÈNE, Baron (1809-91). A French official under the Second Empire. He was born in Paris, and was educated at the Conservatory of Music, but became an advocate. After the Revolution of 1830 he was sous-préfet successively of Nérac, Saint-Girons, and Blaye, and under the Presidency of Louis Napoleon was prefect of Var, the Yonne, and Gironde. He was appointed Prefect of the Seine in 1853. While holding this office, Haussmann expended some \$500,000,000 in rebuilding and beautifying Paris. Parks were planted on the sites of hovels; splendid boulevards were run through the city; squares were laid out; statues, bridges, and magnificent public buildings sprang up with almost miraculous rapidity. In carrying on his work Haussmann let no considerations of private rights or financial expediency stand in the way. His enemies accused him of systematic speculation, and declared that his broad boulevards were intended for the rapid mustering of troops and cannon in case of any uprising against the Empire. A stinging pamphlet by Jules Ferry, and the enmity of Ollivier, who became Minister in 1870, brought about Haussmann's downfall. His work, however, had done much to make the Second Empire popular. In 1857 he was made a Senator, and elected a member of the Academy of Fine Arts. He was likewise a member of the Imperial Council of Public Instruction. After the fall of the Empire he quitted France for a time. On his return he was appointed director of the Crédit Mobilier, and did much to improve the condition of that financial institution. In 1877 he was returned to the Chamber of Deputies by the Arrondissement of Ajaccio, in Corsica.

HAUSSONVILLE, ô'sôn'vêl', GABRIEL PAUL OTHENIN DE CLÉRON, Count d' (1843—). A French author and politician, born at Gury-le-Châtel. Elected a Deputy in 1871, he voted with the Right Centre. He failed of reelection in 1876, because of his lack of loyalty to the Republic, and in 1877 retired to private life and literary labors. He was elected to the French Academy in 1888, and in 1891 became the spokesman of the Orleanist dynasty. Haussonville's more important works are: *Les établissements pénitentiaires en France et aux colonies* (1875); *Sainte-Beuve* (1875); *L'enfance à Paris* (1879); *Le salon de Mme. Necker* (1882); *Etudes biographiques et littéraires* (1879-81); *Mme. de La Fayette* (1891); *Socialisme et charité* (1895); *Lacordaire* (1896); and *La duchesse de Bourgogne et l'alliance savoyarde* (1898-1901).

HAUSSONVILLE, JOSEPH OTHENIN BERNARD DE CLÉRON, Count d' (1809-84). A French

statesman and author, born in Paris. He was secretary to the Embassy at Brussels, then at Turin, then at Naples, and from 1842 to 1848 represented Provins in the Chamber of Deputies. He was not a great speaker, but was an active member of the Conservative Party until the Revolution of 1848, when he retired and devoted himself to literature. His most important works are: *Histoire de la politique extérieure du gouvernement français de 1830 à 1848* (1850); *Histoire de la réunion de la Lorraine à la France* (1854-59); and *L'Eglise romaine et le premier Empire* (1864-69), the work which gained him admission to the Academy in 1869. During the Franco-German War he wrote political letters valuable for their opportuneness more than for their literary style, notably, *La France et la Prusse devant l'Europe*. After the peace he became the protector of exiles from Alsace and Lorraine who wished to continue under French rule. His wife, Louise de Broglie, was also a writer, and the Count supported her brother, the Duke, in politics, against M. Thiers. He became Senator for life in 1878.

HAUSTORIA (Neo-Lat. nom. pl., from *haustor*, drawer, from *haurire*, to draw). A term applied to special structures which are found in a variety of plants, and whose function is that of attachment and suction. Some of the best illustrations of such outgrowths are found among parasitic fungi, in which the filaments have the general habit of putting forth processes that penetrate the cells of their hosts. In the interior of the host cell the haustorium usually enlarges, and through the greatly increased surface it is able rapidly to absorb nourishment for the fungus. Such haustoria generally cause the death of the host cells. Haustoria of a far more complicated structure are found in higher plants, as the dodder (*Cuscuta*), and such parasites as the beech-drop and broom-rape (*Orobanchaceæ*), which live on the roots of certain trees. In these groups the haustoria are probably really ad-

site actually taps the sources of food-supply, water, and organized food material, and draws off what it needs.

HAUTBOIS, hō'boi. See OBOE.

HAUTEFEUILLE, ôt'fē'y', PAUL GABRIEL (1836—). A French mineralogist and chemist, born at Etampes, and educated at the Ecole Centrale, in which he taught metallurgy, and was director of the chemical laboratory until 1885. In that year he became professor of mineralogy in the University of Paris. His written work appeared mostly in technical journals, especially in the *Comptes Rendus* of the French Academy of Sciences, and he also published: *Recherches sur l'ozone* (1884), as well as a biographical memoir, *Henri Sainte Claire Deville* (1885, with Chappuis).

HAUTE-GARONNE, ôt'gá'rún'. A department in the south of France, bounded on the south by the Pyrénées, and on the west by the departments of Hautes-Pyrénées and Gers (Map: France, H 8). Area, 2219 square miles; population, in 1896, 459,377; in 1901, 448,481. It is watered by the Garonne, from which it derives its name, and within the basin of which it wholly lies. The soil in the valleys is very productive, and yields heavy crops of grain, maize, beans, etc. Orchard-fruits, with melons and tobacco, are produced in abundance, and the annual yield of wine is large. Rick salt is produced, and fine marble is obtained at Saint Beat. The chief manufactures are woolen and cotton fabrics and hardware. The Department of Haute-Garonne was formerly divided between the provinces of Languedoc and Gascony. It is divided into the four arrondissements of Toulouse, Muret, Saint Gaudens, and Villefranche. Capital, Toulouse.

HAUTE-LOIRE, ôt'lwär'. A southeast department of France, formed mainly from portions of Auvergne and Languedoc (Map: France, K 6). Area, 1916 square miles. The surface is mountainous, covered by the Cévennes, the Cantal Mountains, and the Margeride chain, with wooded slopes. The chief rivers are the Loire and the Allier. The soil of the plains is fertile, and the agricultural produce, consisting of the usual crops, with fruits, is abundant. Iron, coal, copper, lead, and other minerals are found, and there are important manufactures of silk and lace. Capital, Le Puy. Population, in 1896, 316,699; in 1901, 314,580.

HAUTE-MARNE, ôt'märn'. A department in the northeast of France, southeast of the Department of Marne (Map: France, M 3). Area, 1402 square miles. The surface is generally hilly and mountainous in the south and east; about one-fourth is in forest. The principal rivers are the Marne, with its tributaries, and the Meuse. Oats and wheat are largely cultivated, and wines are produced in several parts—Aubigny, Montsaugéon, etc. The department is rich in iron ore, and there are numerous furnaces, the production of iron being the principal branch of industry. Capital, Chaumont. Population, in 1890, 232,057; in 1901, 226,545.

HAUTERIVE, ôt'rèv', ALEXANDRE MAURICE BLANC DE LANAUTE, Count d' (1754-1830). A French diplomat and politician, born at Aspres, and educated at Grenoble and Tours. In 1792 he was made consul at New York. A false accusation lost him this post, and he was forced to

HAUSTORIA OF DODDER

1. Haustorium enlarged. 2. Dodder-vine, showing positions of haustoria.

ventitious roots, but the structure becomes greatly modified. They penetrate the tissue of the host and establish a direct connection with the conducting vascular bundles, so that the para-

live as a farmer in America until 1798, when he was recalled and appointed chief of the first division of political correspondence in the Ministry of Foreign Affairs. His brochure, *De l'état de la France à la fin de l'an VII.*, undertaken at the order of Bonaparte, won him a high place under the Consulate and Empire, and he frequently served as Minister of Foreign Affairs in the absence of Talleyrand. But his policy of an Austrian alliance clashed with his chief's demand for a Prussian alliance, and he was transferred to the post of director of archives. In his later years he interested himself in archaeology, wrote on Egyptian antiquities, and was elected to the Society of Inscriptions (1820).

HAUTES-ALPES, ô'tzálp'. A southeastern department of France, adjoining the Italian frontier, formerly part of the ancient Province of Dauphiné (Map: France, N 7). Area, 2158 square miles; population, in 1896, 113,229; in 1901, 109,510. It is traversed by the Cottian Alps, which reach their maximum altitude in the department in Les Ecrins, 13,460 feet in elevation. The chief river is the Durance, noted for the picturesque scenery along its course. Marble is quarried and anthracite coal and argentiferous lead are mined. Mountain pasturage for sheep is its chief agricultural branch. Capital, Gap.

HAUTE-SAÔNE, ô't'sôn'. A northeastern department of France, bounded on the north by the Department of Vosges, and on the east by Belfort. Area, 2062 square miles. It is traversed from north to south by the Saône River, from which it derives its name. About one-half of the entire area is cultivable land; more than a fourth, comprising the north and northeast districts, is covered with forest-clad mountains. In the south and southwest are fertile plains, bounded by hills, covered with vines or timber. Fruits and tobacco are largely cultivated. Sheep, including some flocks of the merino breed, and cattle are raised in large numbers. Coal, copper, manganese, and iron are found. Capital, Vesoul. Population, in 1896, 272,891; in 1901, 266,605.

HAUTE-SAVOIE, ô't'sá'vwí'. An eastern department of France, bordering on Switzerland and Italy, formerly part of Savoy. Area, 1667 square miles. The summit of Mont Blanc is situated in this department; about one-fourth of the surface is forested. The Rhône is the principal river. In the north, south, and west, wheat, oats, and fruit are cultivated, but the chief agricultural industry is pastoral. Capital, Annecy. Population, in 1896, 262,142; in 1901, 263,803.

HAUTES-PYRÉNÉES, ô't'pé'ráná'. A southern department of France, part of the old Province of Gascony lying east of the Basses-Pyrénées. Area, 1749 square miles. As its name implies, it contains some of the loftiest summits of the Pyrenean chain. The aspect of the scenery is varied, mountains and precipitous rocks in the south, an agreeable diversification of hill and dale in the centre, with fertile plains in the north. The principal rivers, none of which, however, are navigable in the department, are the Adour and the Gave de Pau. The well-cultivated and artificially watered lowlands yield good crops of cereals, leguminous plants, flax, and fruit of every kind, including the grape,

from which excellent wine and brandy are made. Horses, mules, cattle, sheep, swine, and poultry are raised. This department—which is the richest part of the Pyrénées in mineral products, especially marble, copper, iron, zinc, lead, antimony, slate, and granite—contains also the celebrated sulphur springs of Saint-Sauveur, and the hot baths of Bagneres, Barèges, and Cauterets. Capital, Tarbes. Population, in 1893, 218,973; in 1901, 215,546.

HAUTE-VIENNE, ô't'vyën'. A west central department of France, formed mainly from portions of the old Limousin and Marche. Area, 2130 square miles. It is traversed by the Monts du Limousin, ranges of low hills, well wooded, and intersected by fertile valleys. The Vienne River crosses the department from east to west. Rye, wheat, and other cereals are cultivated in the valleys; cattle are raised on the extensive meadow lands, and chestnuts are grown for local consumption and export; the soil generally, however, is stony, and agriculture is in a backward condition. Mines of iron, lead, copper, and antimony are worked; granite and building-stone are quarried, and in the south, near Saint-Yrieix, there are valuable deposits of kaolin, from which the porcelain factories of Sèvres and Limoges draw in part their supplies. Capital, Limoges. Population, in 1896, 375,724; in 1901, 381,753.

HAUTLEIN, ô'tlân', MARQUIS DE. The courtly French nobleman at whose castle Sir Walter Scott professes to have gathered the materials for his novel *Quentin Durward*.

HAUT-RHIN, ô'trân'. A former department of France. See BELFORT, TERRITORY OF.

HAÛY, á'wé', RENÉ JUST (1743-1822). A French mineralogist, born in Saint-Just, France. He was educated for the Church, and took priest's orders. While engaged in teaching in Paris, he acquired a fondness for botany, but, subsequently, hearing Daubenton lecture on mineralogy, he developed an interest in that science. The accidental dropping of a crystal of calcite revealed to him the geometric law of crystallization, on which subject he published more than a hundred papers. During the Revolution he was thrown into prison, but was released through the influence of Geoffroy Saint-Hilaire. In 1793 he was appointed on the Commission of Weights and Measures, and in 1794 became keeper of the Cabinet of Mines. Subsequently, in 1802, he became professor of mineralogy in the Museum of Natural History in Paris, where his magnificent collection of crystals is still preserved. Besides being an honorary canon of Notre Dame, he was a member of the French Academy, and of other scientific societies. Abbé Haüy's principal works are: *Traité de minéralogie* (1801), in which he contended that the crystalline form should be the principal element in the determination of a mineral; *Traité élémentaire de physique* (1803); *Traité des caractères physiques des pierres précieuses* (1817); *Traité de crystallographie* (1882).

HAÛY, VALENTIN (1745-1822). A French abbé, brother of the preceding, who invented methods for teaching the blind. He was born in Saint-Just, and it is said that his interest in a pianiste stricken with blindness first stimulated his search for a means to alleviate the

affliction. This means he first discovered in the printing of raised maps and letters. He started schools for the purpose of giving manual, mathematical, and musical training to the blind, but his zeal outran his discretion, and others excelled him in the carrying out of his ideas. During the ascendancy of Napoleon, he lived in Saint Petersburg for more than ten years, working there for the blind. He was twice married, though a priest. His publications include *L'éducation des aveugles* (1786), and *Mémoire historique sur les télégraphes* (1810). Consult: Strebitzky, *Valentin Haüy à Saint Pétersbourg* (Paris, 1884).

HAÛYNITE, ä'wê-nit, or **HAÛYNE**, ä'wên. A sodium, calcium, aluminum silicate and sulphite that crystallizes in the isometric system, has a vitreous lustre, and is blue, green, red, and yellow in color. It is found chiefly in igneous rocks, usually in association with nephelite and lucite, occurring especially in volcanic regions, such as in the lavas of Vesuvius, on Mount Somma, and elsewhere in Italy; also in the Azores, Canary, and Cape Verde Islands, and in the United States it is found in Montana. The mineral is named after the famous French mineralogist Haüy.

HAVANA, hä-vä'nä or hä-vän'ä (Sp. *La Habana*). The capital of Cuba and the largest city in the West Indies, situated on the northern coast of the island, in latitude 23° 8' N., and longitude 82° 22' W. (Map: Cuba, C 3). It lies on a peninsula bounded by the Gulf of Mexico and the Bay of Havana. The latter is regarded as one of the safest harbors of the world, while its depth is sufficient for vessels of the greatest draught; its narrow entrance is protected by the Punta Castle on the west and Morro Castle and La Cabaña on the east. Havana comprises an area of about nine square miles, and is surrounded by a sea wall on the west. The older portion of the city, which was formerly surrounded by a wall begun in 1633 and demolished in 1863-80, has all the shortcomings of the old colonial town. Its streets are narrow and crooked, and up to the time of the American occupation were in a state of the utmost neglect. Beyond the limits of the old city, however, Havana is essentially modern. The well laid out and broad streets, the abundance of promenades, and picturesque plazas would do credit to any city on the Continent. The houses are generally low and built in the Spanish style, which, however, is relieved by the bright coloring of the walls and roofs. The atmosphere, also, is generally bright and clear, as there are very few days wholly clouded, the rain generally falling in the afternoon. The climate, though tropical, is tempered by alternating land and sea breezes. The mean temperature is 78° for the warmest, and 70° for the coolest month, the extremes being 50° and 90°. The humidity, however, is above 80 per cent. at all seasons.

In the old city, and near the inner entrance to the harbor, is the Plaza de Armas, fronting which on the west stands the former Governor's palace, while the next block behind is occupied by the university. To the north of this plaza is La Fuerza, the oldest structure in the city, built as a defense in 1538 by Hernando de Soto. Beginning at the Castillo de la Punta at the outer harbor entrance, and running outside the old

city wall, is the Prado, a wide and beautiful boulevard with a double row of shade-trees along the middle. It terminates in the Colón Park, or Campo Marte, the largest in the city, planted with trees and palms, and having a fountain in the centre. Running west from Colón Park is the Calle de La Reina, which is continued as the Paseo de Tacón, a splendid drive passing the Botanical Gardens and terminating at the citadel of El Príncipe outside of the city. At the eastern entrance stands a fine statue by Canova of Charles III., and from its western end a road leads to the Colón Cemetery with a magnificent entrance of three granite arches, and containing numerous fine monuments, among which the firemen's monument, made entirely of marble, and erected to the memory of thirty firemen who perished in the performance of their duty, is a magnificent piece of monumental sculpture. Other notable promenades are the Alameda de Paula and the Calzada de La Infanta, a fine boulevard skirting the city on the west.

The public buildings of the capital are not far behind its natural embellishments; the Governor's palace and the cathedral dating from 1724, which contained, until 1898, the remains of Columbus, are among the most prominent. The educational institutions include the University of Havana with five faculties, founded by the Dominicans in 1670; the Jesuit College de Belén, a museum and library, and a number of minor schools. The theatres are numerous, and one of them, the Teatro Tacón, is one of the largest playhouses in the world. There are numerous hotels and clubs in the city; and the newspapers and periodicals number over a hundred, the leading ones being: *La Lucha*, *El Diario*, *La Discusión*, and *El Nuevo País*. Barring the water-supply, which is excellent, the public works of Havana are utterly inadequate. At the end of the Spanish-American War the American authorities found the city in a woefully unsanitary condition. The streets were unswept, garbage was piled in heaps, and the pavements were in a miserable condition, especially in the old city. The sewerage system was hardly more than a name. The existing sewers were in some places completely clogged, and all of them leaked, contaminating the surrounding soil. In 1902, however, the city was handed over to the new Republic in a wonderfully improved condition. A well-regulated system of street-cleaning and garbage collection had been put in operation. Many of the streets had been repaved and various kinds of experimental pavements were laid. Contracts had been let for a new sewer system, and a complete survey of the city, with a view to adopting a system of street grades, had been made. Streets, hospitals, and other buildings had been so thoroughly disinfected that yellow fever, which during the recent war carried off many thousands of people, has now been almost, if not wholly, eradicated.

The chief industrial establishments of Havana are its cigar and tobacco factories, which are the largest in the world. The exports consist chiefly of cigars, tobacco, and sugar, which mostly find their way to the United States. Havana is the chief outlet for the products of the island. It is connected by steamers with the United States, France, England, and Spain, and by rail with every important centre on the island. The imports consist chiefly of foodstuffs and cotton.

Since the evacuation of the island by Spain, the commerce of Havana has shown a considerable increase. The total value of the foreign commerce for 1900 was about \$75,000,000, of which about \$50,000,000 represented imports. The total commerce with the United States in the same year amounted to about \$32,000,000. During the same year 3276 vessels, with a total tonnage of 2,078,126, entered the port, and 3226, with a tonnage of 2,079,802, cleared. The extensive commerce of Havana is greatly facilitated by the numerous financial institutions situated in the city. The population of Havana, including its suburbs, was 242,055 in 1899, against 200,448 in 1887. The foreign born at the last census numbered 52,900, or about 22.5 per cent. of the total population.

The Bay of Havana was discovered in 1508 by Sebastian de Ocampo. The city itself was originally founded in 1515 on the south coast, by Diego de Velasquez, but in 1519 it was transferred to its present site. It was sacked and burned by pirates in 1528; was plundered by another band in 1555, having by that time become Spain's chief naval station in the New World; and was again despoiled in 1563. It was unsuccessfully attacked by Drake in 1585, after which the forts Morro and de la Punta were built. During the seventeenth century it was several times attacked and blockaded by Dutch fleets, while pirates were continually hovering around, on the watch for unprotected galleons. During the eighteenth century the city was several times threatened by the English, who took Morro Castle by assault in 1762 and captured the city, remaining in control for a year. The United States battle-ship *Maine* was blown up in the harbor on February 15, 1898. In that year the city and harbor were blockaded by the American fleet during the war with Spain. For a good description of Havana, see Norton, *Complete Handbook of Havana and Cuba* (Chicago, 1900).

HAVANA. A province of Cuba. See LA HABANA.

HAVANA. A city and the county-seat of Mason County, Ill., 40 miles southwest of Peoria, on the Illinois River, and on the Illinois Central and the Chicago, Peoria and Saint Louis railroads (Map: Illinois, B 3). It has manufactures of drills, gasoline engines, farm implements, flour, etc., and a considerable trade in fish, agricultural produce, grain, and fruit. The city owns its water-works. Population, in 1890, 2525; in 1900, 3268.

HAVARD, á'vär', HENRY (1838—). A French art critic, born at Charolles. He left France because of his part in the Commune, but returned after the amnesty. His stay in Italy, Belgium, and Holland during his exile did much to influence his choice of art criticism as a vocation. In 1887 he was appointed inspector-general of fine arts. Among his more important works, after the early critiques in the *Siècle*, are: *Les merveilles de l'art hollandais* (1873); *Objets d'art et de curiosité tirés des grands collections hollandaises* (1873); *Les quatre derniers siècles* (1874); *La Hollande pittoresque* (1874-78); *Amsterdam et Venise* (1876); *L'art et les artistes hollandaise* (1879-81); *Histoire de la peinture hollandaise* (1881); *La Hollande à vol d'oiseau* (1880); *La Flandre à vol d'oiseau*

(1882); *L'art dans la maison* (1884); the valuable *Dictionnaire de l'ameublement et de la décoration* (1887-90); with Vachon, *Les manufactures nationales* (1888); *Van der Meer de Delft* (1889) *Les Bouille* (1893); *L'orfèverie* (1896); *Les arts de l'ameublement* (1897); and *Histoire et philosophie des styles* (1899-1900).

HAVAS (á'vá') AGENCY. An organization in Paris, founded by a rich merchant, Charles Havas, in the reign of Louis Philippe, for the purpose of gathering telegraphic news and supplying it to newspapers. It was in 1879 converted into a company.

HAVASUPI, há'vá-sú'pé. A small but interesting tribe of Yuman linguistic stock in the Coconino Cañon, northwestern Arizona. Although numbering only 250, their isolation has enabled them to preserve their primitive characteristics to a remarkable degree. Living as they do in the bottom of a cañon, isolated from the outside world by great perpendicular barriers of rock, the Havasupi Indians are perhaps nearer to the original estate than any other tribe in the Southwest. They are agriculturists and entirely self-supporting, having always possessed three years' provisions stored away in stone-built granaries in the clefts of the mountain walls. The women are expert basket-makers. To the Spaniards they were known as Cojonino.

HAVEL, há'vel. A river of Northern Germany, and a considerable tributary of the Elbe. It has its origin in a small lake a mile west of the town of Neustrelitz, in Mecklenburg (Map: Germany, E 2). It flows southward from its source to Potsdam, and thence west and northwest to its junction with the Elbe, opposite the town of Werben. Its entire length is 220 miles, and it is navigable to Fürstenberg, a town within 30 miles of its source. The Havel, forming for a considerable part of its course the connecting link to a long chain of lakes, is of great importance to the internal trade of Prussia, and serves as a feeder to numerous canals. Of its affluents, the Spree, which is longer than the Havel, is the only one worthy of mention.

HAVELOCK, háv'è-lök, Sir HENRY (1795-1857). An English soldier. He was born April 5, 1795, at Bishop-Wearmouth, Durham, where his father was a merchant and a ship-builder. He was educated at the Charterhouse and studied law at the Middle Temple, but abandoned the profession. He entered the army soon after the battle of Waterloo, went to India in 1823, and distinguished himself in the Afghan and Sikh wars. In 1856 he commanded a division of the army that invaded Persia. News arriving of the Indian Mutiny, in 1857, he hastened to Calcutta. He was directed to organize a small movable column at Allahabad, and to push on to the relief of Cawnpore and Lucknow. By forced marches and three sanguinary victories he reached Cawnpore, and found the mutilated bodies of the English women and children who had been massacred upon his approach. An avenging column quitted Cawnpore to advance upon Lucknow. After eight victorious battles with the rebels, Havelock's little army, thinned by fatigue and sickness, was obliged to retire upon Cawnpore. Early in September, 1857, General Outram arrived with reinforcements; Havelock again advanced to the relief of Lucknow, Outram chivalrously refusing to take the com-

mand out of his hands. After desperate fighting at Mungulwar, at the Alam Bagh, and through the streets of Lucknow, they gained the Residency, to the joy of the beleaguered garrison, but were in turn besieged. They held their own until Sir Colin Campbell (later Lord Clyde) forced his way to their rescue on November 19th. Havelock, unfortunately attacked by dysentery, died five days after the relief, on November 24, 1857. His services had won him the distinction of K. C. B., and other honors, including a baronetcy, were conferred upon him before the news of his death reached England. The rank and the pension were given to his widow. For his biography, consult: Brock (London, 1858); Marshman (London, 1860); Forbes (London, 1890).

HAVELOCK-AL/LAN, SIR HENRY MARSHMAN (1830-97). An English soldier, the son of Sir Henry Havelock, the reliever of Lucknow. He was born at Chinsurah, India, and was educated at a private school in London. In 1846 he was commissioned an ensign in the Thirty-ninth Foot. He was a lieutenant in 1848 and an adjutant in 1852. In 1857 he saw active service in Sir James Outram's Persian campaign. After the outbreak of the Indian Mutiny he accompanied his father to Calcutta, and served on his staff in his victorious march to the relief of Cawnpore and Lucknow. At Cawnpore, on July 16, 1857, his gallantry and daring in leading a charge for the capture of a gun won for him the Victoria Cross. In the advance from Cawnpore to Lucknow he was severely wounded. In January, 1858, the baronetcy and pension which it had been proposed to bestow upon his father was conferred upon him. He served until the suppression of the mutiny, received brevets of major and lieutenant-colonel, and commanded Hodson's Horse in Lord Clyde's last campaign. He served in New Zealand under Sir Duncan Campbell in the Maori War of 1863-64, and as assistant quartermaster-general in Canada in 1867-69. On leave of absence, and as a newspaper correspondent, he saw the Franco-German War of 1870-71, and the Russo-Turkish War of 1877-78. He was a member of Parliament as a Liberal, and later as a Liberal-Unionist, 1874-81, 1885-92, and from 1895 until his death. He took an active part in the debates, and held the position of chairman of the Naval and Military Service Committee. In the latter capacity he visited India to study the needs of the Indian Army in the Parliamentary recess of 1897, and visited the Afghan frontier, where a campaign against the hill tribes was in progress. Here, on December 30, 1897, while accompanying the troops near Ali Masjid, an unmanageable horse carried him beyond the lines, and he was fired upon and killed by some Khairis who were harassing the British flank. He took the additional surname of Allan in 1880, and retired from the active list of the Army in 1881 with the rank of lieutenant-general. He wrote *Three Main Military Questions of the Day* (1867). Consult: Kaye, *History of the Sepoy War* (London, 1864-75); Malleon, *History of the Indian Mutiny* (ib., 1878-80); Marshman, *Life of Sir Henry Havelock* (ib., 1870).

HAVELOCK THE DANE, THE LAY OF. An Anglo-Danish legend of early England. Gaimar, an Anglo-Norman chronicler of the twelfth cen-

tury, speaks of it as an ancient story. The earliest form is a French version, *Le Lai de Aveloc*, abridged by Gaimar. The old French and an English version of the later thirteenth century were published by Sir F. Madden for the Roxburgh Club (1828), and *The Lay of Havelock the Dane* was edited by W. W. Skeat in the Early English Text Series (1868). The Danish prince, Havelock, was rescued by Grim, a fisherman, who became his foster-father. When Havelock gained the English crown, he rewarded Grim, who built the town of Grimsby.

HAVEMANN, HÄ'VE-MÄN, WILHELM (1800-69). A German historian, born in Lüneburg, Hanover. He studied law in the universities of Göttingen and Erlangen. In 1825 he was arrested for his alleged revolutionary activity, and was sentenced to five years' imprisonment. After his release he taught in various schools until 1838, when he became a professor in the University of Göttingen, where he was admitted to the *Gesellschaft der Wissenschaften* (1850). His most important work is the *Geschichte der Lande Braunschweig und Lüneburg* (rev. ed. 1853-57).

HAVEMEYER, HÄ'VE-MI'ER, WILLIAM FREDERICK (1804-74). An American politician. He was born in New York City, of German parentage, was educated at Columbia, and went into business with his father. In 1842 he retired from business with a good fortune, and devoted himself to politics. He was an enthusiastic Democrat, and was elected Mayor of New York in 1845 and in 1848 by large majorities, and for a third time in 1872, but by a narrow margin. His first two terms were marked by the thorough care he bestowed on even the smallest details of his office and the honesty and economy he exacted. His third administration was less felicitous than the others in his appointments, and contentions with the aldermen monopolized the greater part of his time. An appeal was made to the Governor for his removal, but was not acted upon. He was president of the Bank of North America from 1851 to 1861, and brought it successfully through the crisis of 1857. His fearlessness and political experience were of the greatest value in the overthrow of the Tweed 'ring.'

HAVEN, ALICE BRADLEY (1828-63). An American author. Her maiden name was Emily Bradley, and she was born at Hudson, N. Y. Her first writing appeared in the Philadelphia *Saturday Gazette*, to whose editor, Joseph C. Neal, she was married in 1846. She continued her writing under the name of 'Cousin Alice,' and although after her husband's death in 1847 she took editorial charge of the paper, she still found time to contribute many poems and short stories to other periodicals. In 1853 she married Samuel L. Haven. Her works include: *The Gossips of Rivertown* (1850); *Contentment Better than Wealth*; *All's Not Gold that Glitters*; and *Out of Debt, Out of Danger*.

HAVEN, ERASTUS OTIS (1820-81). An American educator and Methodist Episcopal bishop. He was born in Boston, graduated at Wesleyan University in 1842, and after a short period of teaching in preparatory schools entered the Methodist ministry. In 1853 he was chosen professor of Latin in Michigan University, and three years later became editor of *Zion's Herald*, in Boston. He was twice elected to the Massachusetts Senate, where he distinguished him-

self by his intense interest in educational matters. In 1863 he accepted the presidency of Michigan University, and six years later became president of Northwestern University. He later held the position of corresponding secretary of the Methodist Episcopal Board of Education, but resigned in 1874 to become chancellor of Syracuse University. In May, 1880, he was ordained a bishop. Among his works are: *The Young Men Advised* (1855); *Pillars of Truth* (1866); and a treatise on *Rhetoric*.

HAVEN, GILBERT (1821-80). An American clergyman, bishop of the Methodist Episcopal Church. He was born at Malden, Mass.; graduated at Wesleyan University in 1846, taught for several years, and in 1851 joined the New England Conference. He was for a short time chaplain of a Massachusetts regiment in the Civil War. In 1862 he traveled in Europe for his health, and on his return was two years a preacher in Boston. In 1867 he became editor of *Zion's Herald*, holding the place until elected bishop in 1872. For some years he had manifested great interest in the welfare of negroes, especially in the Southern States, and had supervision of relief for destitute freedmen in Mississippi. As bishop he was stationed at Atlanta, Ga., with special charge of the interests of his Church in the South. He was an earnest advocate of Protestant missions in Mexico, and described his missionary journey to that country in *Our Next-Door Neighbor* (1875). Among his other writings were: *The Pilgrim's Wallet* (1865); *Life of Father Taylor, the Sailor Preacher* (1871); and *Christus Consolator* (1893), edited by his son.

HAVEN, JOSEPH (1816-74). An American Congregational clergyman. He was born in Dennis, Mass.; graduated at Amherst in 1835, and studied theology at the Union Theological Seminary and at Andover. He held pastorates at Ashland and Brookline, Mass., from 1846 to 1850, and also edited the *Congregationalist*. He was professor of mental and moral philosophy at Amherst (1850-53), and from 1858 until 1870 was professor of systematic theology at the Chicago Theological Seminary. Besides text-books on mental and moral philosophy, he published: *Studies in Philosophy and Theology* (1869), and *Systematic Divinity* (1875).

HAVERCAMP, hāv'ēr-kämp, SIEGEBERT (1684-1742). A Dutch numismatist and scholar, born and educated at Utrecht. He was long a preacher and an instructor in Greek at Leyden, and was appointed professor of Greek and later of history in the same university. He edited Josephus (1726), Lucretius (1725), and other works; wrote on the history of Holland (1739), and a universal history to the time of Charlemagne (1736-39); but is best known for his numismatical writings, *De Numismate Alexandri Magni* (1722); *Thesaurus Morellianus* (1734); and *Nummophylasium Reginae Christianæ* (1742).

HAVERFORD COLLEGE. An educational institution situated at Haverford, Pa. It was opened in 1833 as a school designed to afford literary instruction and religious training to the children of Friends, under whose control the present college continues. Systematic physical training and athletic sports were made prominent in the original plan, and are still insisted upon. The school was temporarily suspended in 1845,

in order to give opportunity for collecting an endowment, and was reorganized as a college in 1856. In 1902 the faculty numbered 20 and the student body 125. At the same time the library contained 40,000 volumes. The college grounds, occupying 225 acres, are valued at \$400,000, the buildings are valued at \$300,000, while the endowments represent \$1,000,000. The degrees of B.A., B.S., M.A., and M.S. are conferred.

HAVERFORDWEST, hāv'ēr-förd-wëst' or här'förd- (Welsh *Hwlffordd*). A seaport, market-town, and municipal county, the capital of Pembrokeshire, Wales, on Saint George's Channel, 8 miles northeast of Milford (Map: England, A 5). It has coal-mines and a paper-mill. A thriving trade exists, exporting coal, cattle, and agricultural produce, and importing timber, spirits, tea, etc. Its port admits vessels of 100 tons. It has an interesting old church, the remains of a castle built about 1140, and of a twelfth-century priory endowed by Robert de Hwlffordd. The town was colonized with Flemings by Henry I. in 1107, and has a long roll of charters embodying peculiar privileges. It owns its gas and water-works, markets, and slaughter-houses. Population, in 1901, 6000.

HAVERGAL, FRANCES RIDLEY (1836-79). An English religious writer. She was born at Astley, England, where her father, William Henry Havergal (q.v.), was rector. She was educated partly at home and partly at Düsseldorf, Germany. She early developed considerable musical talent, and wrote hymns for which she furnished the harmonies. These gradually found their way into print; their popularity induced editors of religious magazines to seek her out, and she became known almost against her will. Her devotional works, in both verse and prose, include: *The Ministry of Song* (1870); *Kept for the Master's Use* (1879); *Loyal Responses* (1878); *Coming to the King* (1886); and *Red-Letter Days* (1879). She is best known as author of the hymn "Take My Life and Let It Be." Her *Poetical Works* (2 vols., 1884), containing her hymns, her best work, were collected by her sister, who also published *Memorials of Frances Ridley Havergal* (London and New York, 2d ed. 1880).

HAVERGAL, WILLIAM HENRY (1793-1870). An English composer, born at Chipping Wycombe, Buckinghamshire, and educated at Oxford. He took orders; was curate under Biddulph at Saint James, Bristol, and Creech Heathfield (1816-20); and later curate at Coaley (1820-22), and at Astley (1822-26). In 1829 he received severe injuries in a carriage accident, and after that time did little preaching, but devoted himself more and more to music. He edited Ravenscroft's *The Whole Booke of Psalms* (1844), and published a collection of his own compositions, *A Hundred Psalm and Hymn Tunes* (1859). Of his separate works the best known are the "Worcester Chant," the song "Summer Tide is Coming," and the psalm tune "Evan." Consult the biography by his daughter, Mrs. Crane (London, 1882).

HAVERHILL. A city in Essex County, Mass., 33 miles north of Boston, at the head of navigation on the Merrimac River, and on the Boston and Maine Railroad (Map: Massachusetts, E 2). The city, which includes several villages, is handsomely built on hills sloping

to the river, and is connected by iron bridges with the towns of Groveland and West Newbury. Haverhill is noted as an industrial centre, particularly for the manufacture of boots and shoes. Other manufactures are slippers, woolen hats, paper, boot and shoe machinery and supplies, woollens, leather, boxes, and bricks. Among the principal buildings are the city hall, public library, Masonic Temple and other society halls, old ladies' home, children's home, Hale Hospital, city hospital, city almshouse, and Bradford Academy. There are also a marble soldiers' monument, and one to Hannah Dustan. Under the original city charter of 1870, the government is administered by a mayor, elected annually, and a bicameral council, which confirms the executive's appointments of police, fire, and health boards, and park, water, and license commissioners, and elects all other municipal officials, excepting the school board, which is chosen by the people. The annual income and expenditures of the city amount to about \$1,170,000 and \$1,145,000 respectively, the principal items of expense being \$33,000 for the police department (including amounts for police courts, jails, etc.), \$50,000 for the fire department, and \$139,000 for schools. The city owns and operates its water-works. Population, in 1890, 27,412; in 1900, 37,175.

In 1640 a company from Ipswich and Newbury settled on the site of the old Indian town Pentucket, and in the following year adopted the name Haverhill (from Haverhill, England, the birthplace of their minister, John Ward). Being a frontier town, Haverhill was continually harassed by the Indians. In the attack of 1697 Mrs. Dustan was captured. (See DUSTAN, HANNAH.) In 1708 the French and Indians entered the town and killed 16 and captured 35 of the inhabitants. In 1645 a town charter was secured, and in 1870 Haverhill was incorporated as a city. The town of Bradford was annexed in 1897. In 1882 there was a disastrous fire. Lake Kenozia, one mile northeast, is famous as the birthplace of Whittier. Consult: Chase, *The History of Haverhill* (Haverhill, 1861); Frankle (editor), *The Story of a New England Town* (Boston, 1891).

HAVERHILL. A town, including several villages, and a county-seat of Grafton County, N. H., 85 miles north by west of Concord; on the Connecticut River, and on the Boston and Maine Railroad (Map: New Hampshire, F 5). It has extensive granite-quarrying and dairying interests, and manufactures lumber, farm wagons, house-finishings, stanchions, whetstones, etc. Population, in 1890, 2545; in 1900, 3414.

HÄVERS, CLOPTON (c.1650-1702). An English anatomist and physician. He studied at Cambridge and Utrecht, and from the latter college obtained the degree of M.D. in 1685. Hävers began his medical practice in London, and gave special attention to the subject of anatomy, embodying his ideas in the *Osteologia Nova* (1691). This work was the first exhaustive treatise on the structure of the bone, and served to perpetuate the author's name by the term 'Haversian canals.' His other publications are a *Survey of the Microcosme* (1695), and a *Discourse of the Concoction of the Food* (1699).

HAVERSACK (Fr. *havresac*, from Ger. *Habersack*, *Hafersack*, *haversack*, sack for oats, from *Hafer*, *Hafer*, oats + *Sack*, sack). A can-

vas or strong duck cloth bag, carried by soldiers on the march. It is a part of the man's equipment, and on service contains the rations for immediate consumption. It is worn on the left side, secured by a strap passing over the right shoulder.

HAVERSCHMIDT, hä'vêr-skmit, FRANÇOIS (1835-94). A Dutch poet, born at Leeuwarden. He studied for the Church at Leyden, and undertook two small charges in 1859. Three years afterwards he went to Nieuwediep, and in 1864 to Schiedam. There he published some prose essays, *Familie en Kennissen* (1876); but he is better known as 'Piet Paaltjens,' under which name he published all the poems written after his early youth—*Snikken en Grimlachjes* (1867), of which six editions were called for in two years.

HAVERSIAN CANALS. See BONE.

HAVERSTRAW. A village in Rockland County, N. Y., 32 miles north of New York City. It is picturesquely situated on the west shore of the Hudson River, which here expands into Haverstraw Bay, and on the New Jersey and New York and the West Shore railroads (Map: New York, F 4). It is principally engaged in brickmaking, and has a public library. The village is governed under a general State act, the administration being vested in a president and a council chosen at the annual charter election. Population, in 1890, 5070; in 1900, 5935. Haverstraw was settled by the Dutch, became a precinct in 1719, and was incorporated as a town in 1854. At the house of Thomas H. Smith, since called the 'Old Treason House,' Arnold met André in September, 1780, to arrange for the surrender of West Point. In 1825 the 'Haverstraw Community' was organized here, but broke up in a few years. Consult an article, "Smith House at Haverstraw," in *Magazine of American History*, vol. v.

HAVET, a'vâ', ERNEST (1831-89). A French philosopher, born in Paris. After some educational appointments of minor importance, he was on the staff of the Normal School (1836), and became also professor of French literature at the Collège de France (1855-85), and member of the Academy of Moral and Political Sciences. His best works are an edition of Pascal's *Pensées*, with commentary (1881), and *Le christianisme et ses origines* (4 vols., 1871-84).

HAVILAH. A country in Arabia. It is mentioned in Gen. ii. 11-12 as surrounded by the river Pishon and containing gold, bdellium, and *shoham* stone; in Gen. x. 29 (I. Chron. i. 23), as one of the districts of Joktan; in Gen. x. 7 (I. Chron. i. 9), as one of the tribes of Cush; in Gen. xxv. 18, as bordering on the territory of the Ishmaelites; and in I. Sam. xv. 7, where, however, the name should probably be emended into Telam. Niebuhr found a district called Huwaila between the seats of the Beni Khalid and Oman on the Persian Gulf. In South Arabian inscriptions a Khaulan is mentioned. The products of this country referred to in Gen. ii. 11, gold, the gum of the *bedolach* tree, and the *shoham* stone, which is the Assyrian *samtu*, or malachite, seem to point to Jemama and Northeast Arabia extending to the Persian Gulf (Glaser). As the priestly additions to the law (see HEXATEUCH) connect the South Arabian tribes with Africa, Gen. x. 7 may be explained without the theory of an Arabian Cush. Consult: Glaser, *Skizze der Ge-*

schichte und Geographie Arabiens (Berlin, 1890); Meyer, *Geschichte des Alterthums*, vol. i. (Stuttgart, 1889); and the commentaries on Genesis by Dillmann (Leipzig, 1892) and Gunkel (Göttingen, 1901).

HAVILAND, WILLIAM (1718-84). An English soldier in the French and Indian War in America. He was born in Ireland, and in 1739 was appointed ensign in an infantry regiment, with which he is believed to have served at Porto Bello and Cartagena. During part of the rebellion of 1745 he was aide-de-camp to Colonel (afterwards Lord) Blakeney, and subsequently returned to Ireland, where he remained until 1752, when he was appointed a lieutenant-colonel. In 1757 he went to America with a regiment, was in command at Fort Edward during the winter of 1757-58, served under Abercromby at Ticonderoga, and later under Amherst. In 1760 he was put at the head of a mixed force of colonists and Indians, 3400 strong, and ordered to force a way by Lake Champlain, defended by a French post at Isle aux Noix, and to join the armies of General Murray and Lord Amherst, which were converging on Montreal. He was entirely successful. After the capitulation of Montreal he served in the West Indies, and was present at the conquest of Havana in 1762. An energetic and resourceful officer, he was advanced in rank until he was made general in 1783.

HAVILDAR' (Hind. *havāldār*, from Hind., Pers. *havālah*, Ar. *havālat*, charge, custody + Pers. *dār*, possessing). The highest non-commissioned rank in the native army of British India.

HAVIN, á'vān', LÉONOR JOSEPH (1799-1868). A French politician, born in Paris. He studied law, became justice of the peace at Saint-Lô (1830), and for the following seventeen years was Deputy from the Department of La Manche. He was a prime mover in the agitation which led to the February Revolution, but allied himself with the Moderates in the National Assembly of 1848-49. He continued to take a prominent part in the Republican Government up to 1851, but after the coup d'état he lost his position in the State Council, and his influence was henceforth exerted through his journal, *Le Siècle*, which became noted for good judgment and loyalty to liberal principles.

HAVLÍČEK, háv-lě'chěk, KAREL (1821-56). A Bohemian journalist, critic, and poet, born at Borová, whence his pseudonym, 'Havel Borovský.' He studied at Prague, taught at Moscow, and after his return to Bohemia wrote for the *Národní Noviny* at Prague, and at Kuttenberg for the *Slovan*. For his liberal articles in these journals he was imprisoned at Brixen in the Tyrol, where he wrote the sarcastic *Tiroler Elegien*. He returned to Bohemia in 1855, and died at Prague in the following year. He wrote many clever epigrams, which have not all been published; the satiric poem, *Křest sv. Vladimira* (1877); and translations from Gogol, Voltaire, and others. His collected works, *Sebrané Spisy*, contain a part of his epigrams. His biography, by Tuma, was published at Prague (1883).

HAVRE, á'vr', LE. The second seaport of France, and the capital of an arrondissement of the Department of Seine-Inférieure, on the estuary of the Seine, 108 miles northwest of Paris (Map: France, F 2). It is a well-built and

regularly laid out city, with a number of fine boulevards and squares, as the Boulevard François I., Strasbourg, and the Course de la République, the chief boulevards occupying the site of the ancient ramparts. The most prominent public buildings are the city hall, built in Renaissance style; the Church of Notre Dame, dating from the sixteenth century; the exchange, the Palais de Justice, arsenal, and custom-house. The museum has fine statues of Bernardin de Saint-Pierre and Casimir Delavigne (both natives of Havre), and contains collections of paintings and sculptures and a library of about 50,000 volumes. The harbor, formed in part by an immense dam, is regarded as one of the best in France, and has a capacity of about 500 vessels. Its entrance, defended by two forts and a number of batteries, is barely 300 feet in width. The harbor is divided into nine separate basins, and has over eight miles of quays.

The situation of Havre at the mouth of the Seine gives it great advantage in regard to the internal trade of the country, while its position on the English Channel makes it one of the chief centres of the foreign trade. The annual imports and exports exceed 2,000,000 tons, valued at nearly 2,000,000,000 francs. The chief articles of import are coffee, cotton and cotton goods, grain, hides and skins, silk, etc. The exports are mainly silk and cotton goods, coffee, clothing, metal articles, and artificial flowers. Havre has a number of large industrial establishments, including sugar refineries, chemical and glass works, breweries, ship-building yards (for battleships as well as merchant vessels), electrical works, and works for the manufacture of guns and heavy ordnance. Population, in 1896, 119,470; in 1901, 130,196.

Havre, originally named Ville Française, or Francoiseville, and afterwards Havre de Grâce, was founded in 1517 by Francis I., from whom it received numerous privileges. It was surrendered to the English by the Huguenots in 1562, but was retaken by the French soon afterwards. It was bombarded by the English in 1694, 1759, 1794, and 1795. Havre owes its harbor improvements to Richelieu, Louis XIV. (who employed Vauban), Louis XVI., and Napoleon.

HAVRE DE GRACE, häv'er de gräs. A city in Harford County, Md., 36 miles northeast of Baltimore; on the Susquehanna River, near its mouth, in Chesapeake Bay, and on the Baltimore and Ohio and the Philadelphia, Wilmington and Baltimore railroads (Map: Maryland, N 2). It makes large shipments of coal and lumber, and has shad and herring fisheries, flour, cotton, saw, and planing mills, and can and shoe factories, and carries on fruit-canning. On Battery Island is a Government fish hatchery. Population, in 1890, 3244; in 1900, 3423.

HAWAIIAN (hä-wi'an) ISLANDS, or HAWAII, hä-wi'ä (formerly SANDWICH ISLANDS; politically, the TERRITORY OF HAWAII). A chain of islands in the Pacific Ocean, belonging to the United States, and forming geographically and ethnologically the extreme northeastern group of Polynesia. They are situated between latitudes 18° 54' and 22° 15' N., and between longitudes 154° 50' and 160° 30' W., about 2200 miles southwest of San Francisco, and 4893 miles from Hong Kong. The chain consists of eight inhabited and several small uninhabited islands, ar-

ranged nearly all in single file extending for about 400 miles from southeast to northwest. The inhabited islands with their areas are, beginning at the southeast: Hawaii, 4210 square miles; Maui, 760; Kahulaui, 63; Molokai, 270; Lanai, 150; Oahu, 600; Kauai, 590; and Niihau, 97. Total area, 6740 square miles. Small as the land area is, it is about half that of all the other Polynesian Islands. Oahu is as large as the Society group; Maui corresponds in size with the Marquesas group; and the island of Hawaii is nearly as large as all the other Polynesian groups.

TOPOGRAPHY AND GEOLOGY. The islands are purely of volcanic origin, being really the summits of enormous volcanic cones raised by eruptions from the bottom of the ocean, which falls rapidly to a depth of 18,000 feet not far from the shores. The islands are all mountainous, but only one, Hawaii, is actively volcanic, having two of the largest craters in the world, Mauna Loa and Kilauea (q.v.). Hawaii is the most recent in order of formation; it is much less eroded than the others, and though it contains the highest peak of the group—Mauna Kea, 13,805 feet—its elevations are all rounded and easily ascended. The other islands, especially Kauai, which is considered the oldest, are deeply eroded into picturesque crags and deep ravines and gorges. The coasts are to a large extent steep and rocky, consisting in some places of precipices 100 to 500 feet high and extending for several miles. There are some sandy beaches, however, and in many places the coasts are lined with coral reefs; between the mountains and the coasts extend fertile plains and valleys, which are the scene of agricultural activity.

CLIMATE AND HYDROGRAPHY. The climate is in general characterized by a remarkable equability of temperature; it is never too warm and never cold, except on the mountain summits, and even within the narrow limits there are no sudden changes. This is due to the fact that there are neither large ice-fields nor hot continental deserts within thousands of miles, and the winds which reach the islands have to pass over a broad expanse of water of a uniform and moderately warm temperature. The average temperatures of the lowlands of Hawaii are 70° for January and 78° for July, and the extreme maximum and minimum temperatures recorded are, respectively, 89° and 54°. On the mountain peaks, of course, frosts occur, and snow sometimes remains throughout the year. The mean temperature is about 10° cooler than in any other land in the same latitude. The winds show the same equability; the prevailing winds for ten months in the year are the northeast trades. Alternate diurnal land and sea breezes occur, especially on the southwest coasts and around Hilo Bay on the northeast coast of Hawaii; warm southwest gales are also common in winter. Storms are rare, and hurricanes unknown. With respect to humidity and rainfall, however, the climate is extremely varied, each narrow locality having its own peculiar climate, depending on its position with regard to the winds and mountains. Most of the rain is brought by the northeast trade winds, and, owing to the great elevation of the islands, it is almost all precipitated on the northeastern sides, which have accordingly the most varied vegetation, while the leeward or southwestern sides are much

drier and, especially in Hawaii Island, almost arid. Just above Hilo Bay, where the cold winds from the mountains meet the warm and moist trade winds, there is an annual rainfall of 100 to 200, and even 250, inches, one of the heaviest in the world; but at Honolulu the rainfall is only about 32 inches a year. Though the sky is as a rule clear and sunny when it is not actually raining, the humidity is considerable, turning to almost oppressive sultriness during the winter southwest winds. In general, the climate is very healthful and agreeable to Europeans, but it is not an ideal one for cases of pulmonary tuberculosis.

The rivers of Hawaii are nearly all small mountain torrents, and, as might be foreseen from the foregoing, they are largely confined to the north and east sides of the island.

FLORA AND FAUNA. The indigenous flora and fauna of Hawaii are interesting, as they partake of the characters both of the Asiatic and Australian, as well as of the American flora. There are about 130 species of ferns and 900 species of flowering plants, of which 600 are peculiar to the islands. Some of the characteristic plants are a peculiar Pandanus or screw-pine, several tree-ferns, and among the forest trees the Koa (*Acacia Koa*). Forests still cover large areas of the uplands, but have greatly decreased. Where vegetation is found it generally grows luxuriantly, but large areas, especially in Hawaii, are covered with naked lava fields.

There are very few indigenous mammals in Hawaii, and no reptiles, except a single species of lizard. The birds are interesting, including many peculiar and highly specialized species, notably in the family Drepanididae, which differ characteristically from those of the rest of Polynesia. The land mollusks have also reached a remarkable development, almost every valley having its own peculiar species, some of which are allied to those of Mexico and California.

AGRICULTURE. Hawaii is of industrial interest almost wholly by virtue of its agricultural development. The physical and climatic conditions make possible the successful cultivation of a very large variety of industrial plants, including those of both the temperate and tropical zones. The area of possible cultivation is greatly limited, however, by the decidedly mountainous character of the islands and the area covered with lava. Less than half the total area, or about 2,000,000 acres, is adaptable to grazing, and 294,000 acres are improved. The soils, wholly derived from basaltic lavas, are formed either by decomposition (the dark and light red and yellow soils) or by sedimentation, the decomposed rocks being removed by rainfall to lower altitudes. The highland soils are thin and poor, having been depleted of many soluble elements that nourish plants; the upland soils (dark red), just above the sedimentary flats and lowlands, and the lowland soils are very deep and remarkably productive. In a general way the variety of crops depends upon the elevation. Sugar-growing is largely confined to the low plains and hill-sides, followed on the higher levels in turn by coffee, fruits and vegetables, and pasture lands, but these zones are not clearly defined. In the census year 1900 there were only 86,854 acres in crops. Prominent among the factors which have prevented a fuller development have been the absence of a local market and the great scarcity

of labor. At an earlier date the unsettled political conditions and the uncertainty of the continued favor of the United States discouraged the investment of capital. Thus far, sugar-cane is the only plant extensively raised. The sugar industry dominates the entire industrial life of the islands. Over half the population is engaged in the industry in some capacity. Any cause that lowers the price of sugar injuriously affects the general prosperity. Sugar-cane has long been grown on the islands of Hawaii, Maui, Kauai, and Oahu, and has recently been introduced on Molokai and Lanai. There are over 60 great plantations now in operation. The acreage in sugar in 1900 was over 65,000 acres, and the annual production, about 225,000 tons, varies considerably from year to year.

The sugar industry involves large outlays of capital, and is, therefore, not suited to a system of small proprietorship. On the contrary, the system of cultivation resembles in some ways the old plantation system of the South with its gangs of laborers and overseers. The scarcity of labor led to its importation under contract, especially from Japan and China, and the greater part of the labor force has been thus secured. To those under contract, labor is compulsory and enforced through the courts, violence being forbidden. On the west side of the islands irrigation is required, but under irrigation the cane grows more quickly and yields more abundantly than on the east side. Water is conducted from the mountain streams through flumes, which also often serve for the conveyance of cane to the mills. Rice occupies as yet the second place in area of production, and in the value of the product. The lowest flats close to the sea are used for rice. The home consumption is so large that only a few million pounds are left for export. It is cultivated almost wholly by the Chinese. Coffee is a young industry, and though it is cultivated on the four larger islands, it is not yet important. The prospects of the coffee industry are regarded as most favorable, as the coffee-berry is a natural product of the islands, where it grows wild. Little progress has been made in the raising of most fruits, vegetables, and cereals; but bananas and pineapples are raised in export quantities. The finest pineapple is a small native variety. The bananas are known for their good quality. Recent experiments show that American maize grows and matures perfectly. The natives raise very few vegetables for the market, only taro and a few Irish potatoes coming from the country districts. Honolulu is supplied with vegetables almost wholly by the Chinese, who occupy suitable lands around the city.

Owing to the uncertainty of rainfall in the pasture area, and to the horn-fly nuisance, the stock-raising industry is but little developed. Almost every native possesses from one to three horses. According to an arrangement made in 1848, the greater portion of the land was divided between the King, the chiefs, and the Government. The portion received by the chiefs has passed almost wholly into the hands of foreigners. The crownlands and the Government lands, amounting to about 1,750,000 acres, were assumed by the United States. In 1895 a land act, passed to regulate the disposal of this land, was carefully drawn with a view to preventing its monopolization by

speculators, and to securing its division into homesteads for actual settlers. It may be acquired by individuals for 'homestead lease,' lease with right of purchase, cash freehold, etc., the amount that can be acquired generally being limited in a manner that prevents capitalists from acquiring permanent control of the land.

MANUFACTURES. The lack of fuel and of metals will permanently limit the scope of Hawaii's manufactures. Sugar manufacture is the only branch of this industry which is at present important. No molasses is made, nor is the sugar refined within the Territory. In 1900 there were 44 sugar-making establishments, with 2369 hands employed, \$7,991,000 capital invested, and an annual product estimated at \$19,254,000. The combined product of the three fertilizer establishments and that of the four foundry and machine-shops each exceeded \$1,100,000. The capital invested in the islands came almost wholly from the United States.

TRANSPORTATION. The islands are favorably situated for purposes of communication with the rest of the world, inasmuch as they are on the line of traffic between the United States and the Southern Asiatic countries and Australia. They are a convenient midway station, and many vessels renew their supply of coal at the islands. The port of Honolulu is one of the best in the Pacific. It is protected by a coral reef, through which a channel 30 feet deep has been cut to admit large vessels. The harbor facilities have not increased as rapidly as has the commerce, and the limitations are such that recourse may ultimately have to be taken to Pearl Harbor, five miles to the north, which offers unlimited facilities, and requires only the cutting of a channel through the reef for a passageway. In 1900 the tonnage of merchant vessels entering Hawaiian ports was 786,800, of which 363,160 was American. Regular steamboat communication is maintained between the larger islands of the group. The principal railroad extends along the coast of Oahu from Honolulu northward and east to Kahuku. Other short lines have been constructed, chiefly on the sugar plantations.

COMMERCE. The limited home market for the principal product of the islands and the lack of home manufactures give rise to a very large export and import trade. The following figures show the development of the merchandise trade with the United States:

Imports from Hawaii to the United States, 1880, \$4,606,000; 1890, \$12,313,000; 1900, \$20,707,000.

Exports from the United States to Hawaii, 1880, \$2,086,000; 1890, \$4,711,000; 1900, \$13,500,000.

Uncorrected estimates for 1901 place the exports and imports respectively at \$28,000,000 and \$20,000,000. The exports are almost exclusively sugar, and the imports principally machinery used in the sugar industry and other manufactured products. The trade of the United States with these islands is more than four times that of the United States with the Philippine Islands. Our large trade with Hawaii has developed almost wholly since 1876, the year of the reciprocity treaty, which made possible the growth of the sugar industry. Practically all

of the exports of the islands come to the United States, while the imports from foreign countries—of which coal is the most important item—are less than a third of the amount received from the United States.

FINANCE. The total cash receipts for 1901 amounted to \$2,140,000, of which \$1,230,000 were collected by taxation. The total expenditures were \$2,925,000, the largest items being 'public works,' 'health,' and 'public instruction.' The assessed value of property increased almost fourfold from 1892 to 1901.

POPULATION. The population of Hawaii is exceedingly heterogeneous, and the question of population is one of the most vital and difficult with which the present and future welfare of the islands is concerned. The earliest estimate of the native population, that of Captain Cook in 1778, placed the number at 400,000, which is generally considered as being about a fourth too large. At any rate, the native population soon after this date began rapidly to diminish. The decline is shown by the following figures: in 1823, 142,000 (missionaries' estimate); in 1872, 49,044; in 1890, 31,019; and in 1900, 29,834. The cause of this decline is not fully understood, but prominent among the reasons assigned is the introduction of foreign diseases, which have proved peculiarly fatal to the natives, and the small birth-rate, which is the result in part, at least, of a maternal aversion to domestic responsibilities. In Honolulu the death-rate per thousand in 1900 for Hawaiians was 42.81, which is abnormally large. These tendencies therefore indicate the ultimate extinction of the race. Notwithstanding the disposition shown by the Hawaiians freely to intermingle with other races, there is a remarkably small number of 'part Hawaiians,' as will be seen in the table below. Marriages between natives and Chinese are common, but the Japanese have shown an aversion to mixed marriages. The decrease in the native population and their disinclination to work made necessary the importation of labor. Among those first imported were the Portuguese from the Azores, but these were not inclined to reëngage as plantation laborers at the expiration of their three-year contract, and subsequent importations have been almost wholly of the lower class of Chinese and Japanese. An attempt to introduce Polynesians did not result satisfactorily. Immediately after the establishment of the Republic, the Japanese came in large numbers, but a treaty with Japan in 1899 gave the United States the right to regulate immigration, and in the year ending in June, 1901, there were only 391 immigrants from that country. The United States law restricting Chinese immigration applies to the islands, and this source of labor is now closed. Prior to the annexation to the United States the Government encouraged and aided immigration, though endeavoring at the same time to check the inflow of Chinese. Under the United States control Government aid ceased, and Chinese laborers are not allowed to enter. The last labor experiment was the importation of Porto Ricans, but they did not prove very satisfactory. The Chinese are the most desirable unskilled labor that can be obtained, and the planters are loud in their demands for the per-

mission of the United States to admit them. The population for 1890 and 1900 was as follows:

	1890	1900
Hawaiians.....	34,436	29,834
Part Hawaiians.....	6,186	7,835
Caucasians.....	21,300	28,533
Chinese.....	15,300	25,742
Japanese.....	12,360	61,122
South-Sea Islanders.....	409	407
Negroes.....	254
Total.....	89,991	153,727

Of the Caucasians in 1900, 12,061 were Hawaiian born, 4068 were born in the United States, and 12,357 were foreign born. More than two-thirds of the total population are males. The inhabitants by islands were as follows: Hawaii, 46,843; Oahu, 54,504; Maui, 25,416; Kauai and Niihau, 20,734; Molokai and Lanai, 2504. Honolulu, on the island of Oahu, is the principal city; population, in 1900, 39,306.

ETHNOLOGY. The original inhabitants of the Hawaiian Islands are, in physique, good representatives of the Polynesian race, rather tall, and often quite good-looking. In head-form they have a tendency toward brachycephaly. In language the Hawaiians are most nearly related to the Samoans and Tahitians, but their speech has some phonetic and grammatical peculiarities of its own. In mental ability and artistic genius the Hawaiians rank high among their kindred, as their advanced governmental institutions, their assimilation of foreign culture, their industrial and artistic manufactures (kapa-printing, straw-plaiting, feather-weaving, etc.), and their development of a literature amply demonstrate. The love of Hawaiians (and other Polynesians) for games and sports proves them not incapable of action requiring both mental and physical exertion. It was upon one of the peculiarities of the Hawaiian family system, the *punulua*, a sort of incipient polyandry, that Morgan (1871-77) based his second stage in his scale of evolution of the family, the '*punuluan* family.' From the older culture the *Kahuna* beliefs, the *hula-hula* dance, etc., have survived. The advent in 1900 of Papa Ita, the Tahitian 'fire-walker,' proved how much of the ancient Hawaiian religion was still alive beneath the cover of Christianity.

RELIGION. With a population representing so many races, there is naturally a variety of religions. The great activity of the early missionaries succeeded in bringing the native population within the fold of the Christian Church. However, the Christian faith is oftentimes lightly held, and their old-time pagan practices are sometimes secretly indulged in. The native Protestant following is nearly twice that of the Catholic, the Mormons among them numbering about 4000. The Portuguese are mainly Catholic; but most of the other European and American elements represented are Protestants. The Chinese and Japanese hold generally to their Oriental faith.

EDUCATION. One of the earliest results of missionary effort in Hawaii was the establishment of schools. The first Constitution (1840) provided for a school in districts wherever fifteen or more children suitable to attend school lived close together. At present the school attendance is compulsory for the entire school year for children between the ages of six and fifteen,

and tuition is free. Ninety-six per cent. of all children of the above age attend school; 83 per cent. of all those of Hawaiian blood above six years old can both read and write. In all schools the English language is the basis of instruction. The supervision of the schools is in the hands of a Minister of Public Instruction and six commissioners. No person in holy orders nor any minister of the gospel is eligible as commissioner. The salaries of teachers are high compared with those received by teachers in the States. There were 559 teachers in 1900, of whom 299 were American. The climatic conditions do not necessitate heavy investments in school buildings, and the tuition constitutes about 73 per cent. of the total cost. The per capita expenditure is about \$2.17, which amounts to \$23.36 per capita for those who attend school. There are a normal training school, high school, and an endowed college at Honolulu. There are six private boarding schools for Hawaiian girls. See EDUCATION, COLONIAL.

CHARITABLE INSTITUTIONS. The principal public charitable enterprise is the maintenance of the leper settlement on the island of Molokai. The settlement is located on a peninsula which is shut off from the mainland by mountains. The number of lepers is decreasing, there being at present in the settlement about 900, nearly all of whom are natives. Some of their own property in the settlement and are self-supporting, but the Government makes every effort properly to care for them, and the annual expense is heavy. A certain amount of local self-government is allowed in the settlement.

GOVERNMENT. By an act of Congress in 1900, Hawaii was organized with a Territorial form of government, similar to that of the other organized Territories of the United States. It has a Territorial representative in Congress. The capital is Honolulu. See TERRITORIES OF THE UNITED STATES.

HISTORY. Peopled probably from the Polynesian Islands, the Hawaiian Islands when first known to white men had passed through the first stages of savagery, and were progressing toward civilization. The particular stage which it had reached was that of feudalism. Instead of a heterogeneous collection of tribes, there were in the eighteenth century as many kings as there were inhabited islands in the group, and in the island of Hawaii there were at least two kings. The people held the land which they tilled in tenancy to a class of middlemen, or gentry, who served subordinate chiefs, who were themselves under the control of the dukes or high lords, who owed allegiance to the King. The land was held in military tenure. Society was highly organized into orders, religious and social, with a system of checks, by means of laws and ceremonies. The whole tendency of political movement was toward centralization.

The first white men in Hawaii were the survivors of the crews of two Spanish vessels which were wrecked on the islands as early, possibly, as 1527. They intermarried with the natives, and their descendants, recognized by their Caucasian characteristics in complexion and features, are known to this day at Kekea. Gactano, in 1542, made a landfall here, and in 1567 Mendana located scientifically the position of Kauai, as has been shown by Spanish scholars; but it was reserved for Capt. James Cook (q.v.), while on his third

voyage in the Pacific, to find this group in 1778. After returning from Bering Strait, to pass the winter in Hawaii, he abused the hospitality of the natives, and in a squabble lost his life. His estimate of the population at 400,000, though an undoubted exaggeration, shows that the group was densely inhabited. Cook named the group Sandwich Islands, after John Montague, the fourth Earl of Sandwich (1718-92). In 1790 Kamehameha, one of the kings of the main island, defeated Keoua, a rival in another portion of the same island, and thus paved the way for the establishment of a single dynasty. Kamehameha's ambition was to bring the whole group of islands under his sway, but with ordinary weapons it is uncertain whether he could have succeeded. In the nick of time, American whalers and fur traders brought the King firearms, which gave him a tremendous advantage over his opponents, who were still living as in the Stone Age. In 1792 the British navigator George Vancouver brought over cattle, and taught the inhabitants ship-building. At the beginning of the nineteenth century the fur trade on the Pacific coast received a tremendous impulse as a result of the epoch-making expedition of Lewis and Clark. American vessels, reaching the northwest coast in the spring, traded up and down it with the Indians for peltries. Spending the winter in the Sandwich Islands, the American shipmen dressed their furs, refitted, laid in fresh provisions, and bought the sandalwood then so abundant in the islands, besides sharks' fins and tortoise-shells, for the China trade. To this day in China the name for Hawaii is 'Sandalwood Islands.' In the second spring season they went north on the American coast for furs, stopping again at Hawaii, and then sailing to China and exchanging their cargo of furs and sandalwood for tea, silk, porcelain, matting, ginger, and firecrackers, they sailed homeward with a favorable monsoon. Native Hawaiians served on these ships, and thus became known in the United States, stimulating missionary interest.

This trade in sandalwood enriched the chiefs and kings, but especially Kamehameha, who thus secured the sinews of war by sending his people all over the island to cut and transport the fragrant wood, which he traded for vessels, arms, ammunition, and military stores. Master of a navy and an army, he was able, after several campaigns, to conquer the whole of the Hawaiian archipelago. He made the once feudalized islands a central monarchy, and established the royal succession in his own line. He died May 8, 1819, and his oldest son, Liholiho, succeeded him, under the title of Kamehameha II., though the real power behind the throne was an 'empress dowager,' the widow of Kamehameha I. Under the old religious system of taboo (q.v.), which represented conservatism, a class of men corresponding to the 'literati' of other lands existed who were more or less hostile to change, and especially to centralization. So, exactly as in the case of China, when feudalism was overthrown by She-Hwang-Ti, the new King, advised by his Premier, the widow of Kamehameha I., abolished by decree the hoary system of taboo. This bold reform met with organized resistance, and in the appeal to arms a bloody battle was fought. The conservatives were overthrown and the iconoclasts went through the islands smashing and burning the idols, or tossing them into the

sea. Thus the Hawaiians were a people without a religion. At this juncture of affairs Christian missionaries from the United States arrived. More than ten years before, native Hawaiians, serving as sailors on American ships, had stirred the generous impulses of New England, and one of the first missionary companies sent out by the American Board of Commissioners of Foreign Missions, seven married men with their wives, reached Honolulu April 4, 1820. The King and his Queen made a voyage to England in 1823, and died there in 1824. This event put fresh power into the hands of the widow of Kamehameha I., who governed the kingdom for nine years, until the younger brother of the deceased King reached his majority and reigned as Kamehameha III. Under the training of the American missionaries, all the people were in a few years taught to read and write. The Ten Commandments were adopted as a basis of laws in 1825, and other criminal laws were enacted in 1827 and 1829. In 1840 the King and his nobles promulgated a constitution granting civil rights to the people. In 1846 he abolished the last relics of feudalism by approving the Land Act, which yielded up the Crown lands and provided for the people becoming owners of the soil. In 1852 the Constitution was revised by the King, and the Legislature and free suffrage were established. Dying on December 15, 1854, Kamehameha III. was succeeded by Alexander Liholiho, son of Kinau, the daughter of the founder of the dynasty. This prince assumed the title of Kamehameha IV. After reigning nine years, honored because of his perseverance in the principles of civilization, he died November 30, 1863, and was succeeded by his brother Lot, as Kamehameha V. During his reign Honolulu became a beautiful modern city, and business and commerce prospered greatly. Nevertheless the new ruler was a reactionary. He forcibly abrogated the national Constitution, and issued another, in which the right of suffrage was limited by a property qualification. When he died, December 11, 1872, without issue, the direct line of Kamehameha became extinct. After four weeks' government by the Cabinet, the Legislature elected the nominee of the people, Lunalilo, as King. He attempted in vain to restore the old Constitution. His short and troubled reign of one year ended February 3, 1874.

Lunalilo died childless, and the Legislature again proceeded to elect a king, and on February 12, 1874, chose David Kalakaua, though their action was violently opposed by Emma, the Queen Dowager. In the riot which broke out between her partisans and the legislators, several persons were injured. The war-ships in the harbor under the British and American flags landed marines and sailors, order was restored, and the King began his reign. Kalakaua visited the United States in 1874, and in 1875 a reciprocity treaty was arranged between that country and Hawaii. This was renewed in 1887. The King made a tour of the world in 1881. Nevertheless he showed a tendency in the latter part of his reign to relapse into the ancient savagery of his people. The patience of the better elements of society being exhausted, the party of progress at a mass meeting held June 30, 1887, demanded from the King a new constitution and better government, with a Cabinet under the control of the

Legislature. Although Kalakaua agreed to the demand and signed a new constitution, which was ratified by the vote of the people, he lost no opportunity to regain his power. In this course he was encouraged by his sister, the Princess Liliuokalani. On the King's attempting in 1889 to overthrow the new Government, the progressive party reorganized, and a skirmish occurred in which the royal partisans were defeated. On January 20, 1891, Kalakaua died in San Francisco. His sister, Liliuokalani, became Queen. Her reign was marked by continual evasions and nullification of the Constitution. The men of the progressive party, consisting chiefly of Americans and the better elements among the foreigners and natives, were fully acquainted with her determination to promulgate a new political instrument which would enhance the royal power; but just when she was about to bring her plans to consummation they dethroned the Queen and organized a provisional government. The Committee of Thirteen, January 15, 1893, passed a resolution "that it is the sense of this committee that, in view of the present unsatisfactory state of affairs, the proper course to pursue is to abolish the monarchy, and apply for annexation to the United States." The Queen's ministers appealed for help to the foreign legations, while the leading citizens of the town were openly and publicly preparing to abolish the Queen's government by force of arms. The United States legation was in close touch with the best element both of the Americans and of the native Hawaiians. Realizing the great significance of the Revolution and the importance of the interests of his country that were involved, the United States Minister, John L. Stevens (q.v.), had a force of 140 sailors and marines landed from the U.S.S. *Boston*, for the protection of American interests, and at once recognized the provisional government on behalf of his own. Commissioners were sent to the United States to negotiate a treaty of annexation, while Minister Stevens, believing that this small State was not safe from aggression, on his own responsibility declared Hawaii under the protection of the United States, February 16, 1893. President Harrison submitted to Congress a treaty of annexation, but upon the accession of President Cleveland the treaty was withdrawn, the Minister's action disavowed, and a special commissioner, Mr. Blount, was sent to the islands to report upon the situation. The commissioner's report represented that the action of Mr. Stevens had been unwarranted, and that it was the landing of the United States seamen that made the success of the Revolution possible. The disposition of the United States Government appearing to be favorable to the deposed Queen, negotiations were entered upon for her restoration; but her refusal to grant a general amnesty made it impossible to support her pretensions. Thrown upon its own resources, Hawaii was proclaimed a republic July 4, 1894, and duly organized, with Sanford B. Dole as President, and a Legislature of two chambers. The political excitement that had made the annexation question a disturbing one in the United States having subsided, and the Republican Party being again in power, the Government of Hawaii, then firmly established, renewed negotiations for annexation in 1898.

In accordance with a resolution of Congress, passed July 7, 1898, the Hawaiian Islands were formally annexed August 12, 1898. By the act

of Congress of April 30, 1900, all persons who, on August 12, 1898, were citizens of the Republic of Hawaii, were declared to be citizens of the United States and of the Territory of Hawaii. On June 14, 1900, Hawaii was organized as a Territory, with ex-President Dole as the Territorial Governor. The political problem of Hawaiian administration lies in the number of races, that which is strongest in wealth and intelligence being smallest in numbers.

During the monarchy, which lasted about a century, the foreign relations of Hawaii were influenced chiefly by naval officers, who often acted with a high hand. The first commercial agency of the United States was established in 1820, and in 1823 Capt. Ap Catsby Jones, U. S. N., negotiated a treaty of commerce and navigation, the first ever made by Hawaii with a foreign power, which was not, however, ratified by Congress. In 1839 Commander La Place of the French frigate *Artémise*, under threat of war, demanded privileges for Roman Catholic converts of the French missionaries, who had been on the islands since 1827. In 1842 the independence of the kingdom was recognized by the United States. In 1843 a British officer, Lord Paulet, made demands which resulted in a provisional cession of the islands to Great Britain; but his action was promptly overruled by his superiors at home, and the same year Admiral Thomas restored the islands and the Hawaiian flags. In 1862 the English Reformed Catholic missionaries began their work. In 1843 the United States commercial agent was made a commissioner, in 1863 Minister Resident, in 1898 Minister Plenipotentiary.

HAWARDEN, här'den. A market-town in Flintshire, Wales, eight miles southeast of Ches-

ter (Map: Wales, D 3). Population of parish, in 1891, 13,610; in 1901, 15,817. Near by stands Hawarden Castle, long the residence of William E. Gladstone. The castle, built in 1752, stands near the ruins of an older one granted by William the Conqueror to his nephew, Hugh of Avranches, called by the Welsh the Wolf. After many vicissitudes it became the property of Cromwell's Lord Chief Justice, Sergeant Glyne, from whom it descended to Mrs. Gladstone. Consult Morley and Friederichs, "In William Gladstone's Village," in *Strand Magazine*, vol. xvi. (London, 1898).

HAWEIS, hüz, HUGH REGINALD (1838-1901). An English clergyman and author. He was born at Egham, Surrey; graduated at Trinity College, Cambridge, in 1859; served under Garibaldi at the siege of Capua; and in 1860 became curate of Saint James's Church, Marylebone, London. Indefatigable in his efforts to educate the masses, he strongly advocated the opening of libraries, galleries, and museums on Sundays. He often lectured at the Royal Institution, and was the Lowell Institute lecturer in Boston in 1885. He was the Anglican delegate to the Chicago Parliament of Religions in 1893, and for the next two years continued a successful lecture and preaching tour around the world. His numerous published works include: *Music and Morals* (1871); *American Humorists* (1883); *Christ and Christianity* (5 vols., 1886-87); *The Broad Church* (1891); *Travel and Talk* (2 vols., 1897); and *Old Violins* (1898).

HAWEIS, MARY ELIZA (JOY) (?-1898). An English author, artist, and philanthropist, daughter of the genre painter T. M. Joy, born in London. She married the Rev. H. R. Haweis, was a member of the Society of Authors and of the Society of Woman Journalists, vice-president of the Maternity Society and of the Central National Society for Women's Suffrage, and superintendent of the Mercy Branch of the British Woman's Christian Temperance Union. She exhibited at the Royal Academy, at the Dudley Gallery, and the British Institution, and was a successful illustrator. She wrote *Chaucer for Children*, *Chaucer for Schools*, and *Tales from Chaucer*; conducted a course in Chaucer in the National Home Reading Union; wrote on art, decoration, gardening, and the like; and published a novel, *A Flame of Fire* (1897).

HAWES, haz, STEPHEN (?-1521). An English poet. He was born probably in Suffolk, and was educated at Oxford. He traveled on the Continent, and became a groom in the household of Henry VII. His rare minor poems are of interest chiefly to bibliophiles. But his *Passetyme of Pleasure, or the Historie of Grande Amoure and la Bel Pucel* (printed by Wynkyn de Worde in 1509) occupies an important place in the history of English poetry. It is a long allegorical poem written in seven-line stanzas, divided into forty-six chapters. It describes the education and career of a perfect knight. Standing midway between Chaucer and Spenser, Hawes is the connecting link between them. Reprints of sixteenth-century editions have been made by Southey in *English Poets* (London, 1831), and by Wright (Percy Society, ib., 1845).

HAWESVILLE, haz'vil. A city and the county-seat of Hancock County, Ky., 85 miles west by south of Louisville; on the Ohio River,

and on the Louisville, Henderson and Saint Louis Railroad (Map: Kentucky, E 3). It is in a coal-mining district, and manufactures flour, hubs, shingles, etc. Population, in 1890, 1013; in 1900, 1041.

HAWFINCH (from *haw*, hedge + *finch*). A large European finch or grosbeak (*Coccothraustes vulgaris*), considerably larger than the chaffinch. The adult male has the crown and back chestnut brown, the neck and rump gray, the wings partly black, the larger wing-coverts white. The hawfinch exists numerously over the whole Palearctic Province, and is only partly migratory, but is a very shy bird, avoiding man, and not much is known of its habits. It frequents orchards and hedgerows, seeking for berries and fruit, and gets its name from its supposed partiality for hawthorn-berries. It nests in such places and in forest trees.

HAWICK, ha'ik. A manufacturing town and ancient burgh or barony in Roxburghshire, Scotland, at the junction of the Teviot and Slitrig, 50 miles southeast of Edinburgh (Map: Scotland, F 4). It has important hosiery and tweed mills, dye-works, and tanneries. Its antiquities have almost disappeared; the most important is the Moathill, an earthen work 30 feet high and 312 in circumference. Its oldest church, dating from 1214, was rebuilt in 1763. It has fine modern residences, a handsome town hall, a splendid water-supply, and a complete system of drainage. Its municipal charter was granted in 1537. Population, in 1891, 19,200; in 1901, 17,303.

HAWK (AS. *heafoc*, *hafuc*, Icel. *hawk*, OHG. *habuh*, *habih*, Ger. *Habicht*, hawk, from AS. *hebban*, Goth. *hafjan*, OHG. *heffan*, Ger. *heben*, Eng. *heave*; connected with Lat. *capere*, to seize, Alb. *kap*, I seize). A term popularly meaning any bird of prey not an owl nor vulture. In a more restricted sense the word designates a section of the family, the Accipitrinae, reckoned by falconers among the ignoble birds of prey. They have wings so short as not to extend to the extremity of the tail, and the bill short and curving from the base. In many of their characters and habits, however, they make a very near approach to the true falcons. In this sense the term would exclude eagles, buzzards, harriers, kites, and the like. In fact, however, the scientific use is hardly more exact than the popular, and descriptions of the various birds so called will be found under FALCON, and under the names of groups or species, as BUZZARD; HEN-HAWK; MARSH-HAWK; PIGEON-HAWK; and so on. (See also Plate of EAGLES AND HAWKS.) It should also be noted, however, that in some instances the name is entirely misapplied, ornithologically speaking, to birds whose shape or actions suggest those of a falcon. Examples of this are 'man-of-war hawk' (the frigate-bird) and 'nighthawk' (q.v.), or 'mosquito-hawk' (a nightjar).

HAWK-BILLED PARROT. A large and remarkable parrot (*Derotypus accipitrinus*) of the Amazon and Orinoco valleys, related to the Amazon group (Chrysotis), and especially characterized by an erectile collar or ruff around the back of the neck. This ruff, the breast, and abdomen are dark red, each feather with a blue edge; the head is brown; the shoulder and inside of both wings and tail are black, while the

plumage of the back wings and tail above are green. It frequents palm-trees, utters a cry of piercing shrillness, and erects its ruff when angry or excited with a most threatening effect. It is said to become an admirable pet, as it is easily tamed, is very hardy, agile, and graceful in its movements, and is nearly as good a talker as the gray parrot. Consult Greene, *Parrots in Captivity* (London, 1884).

HAWKE, EDWARD, Baron HAWKE (1705-81). An English admiral. He was born in London. He entered the navy in 1720, and served on the North American and West Indian stations until 1725, when he returned to England and passed his examinations. After serving several years on various foreign stations, he came into prominence in the naval engagement at Toulon in 1744, when he broke from the line of battle in order to engage the Spanish ship *Poder*, and succeeded in compelling her to strike her colors. In 1747 he was promoted rear-admiral of the white. In October of the same year he captured six out of a squadron of nine French men-of-war conveying a fleet of merchant vessels bound for the West Indies, and was created a Knight Companion of the Bath. In December of the same year he was chosen member of Parliament for Bristol. In May, 1748, he became vice-admiral of the blue, and in January, 1755, admiral of the white. In 1756 he succeeded Admiral Byng as commander of the fleet in the Mediterranean. In 1759 he took charge of a squadron sent to cruise off Brest, and to intercept a French fleet preparing for an invasion of England. On the morning of November 20th he sighted the French fleet under Admiral Conflans, off Belle-Isle, and notwithstanding that the French, trusting to their knowledge of the rocks and shallows, retired toward the shore, he engaged them with such impetuosity that more than half of their vessels were either disabled, captured, or driven on shore. For this victory, gained with the loss of only two vessels, Hawke received the thanks of the House of Commons and a pension of £2000 per annum. In 1765 he was appointed Vice-Admiral of Great Britain and First Lord of the Admiralty. In 1776 he was raised to the peerage, by the title of Baron Hawke of Towton. He died at Sunbury, October 17, 1781. Consult Burrows, *Life of Edward Lord Hawke* (London, 1883).

HAWK-EAGLE. A convenient term for a group of large birds of prey of the Old World, which combine characteristics of both eagles and hawks, and in most cases are crested. The best known of these is Bonelli's hawk-eagle (*Nisaetus fasciatus*), which ranges from Spain (where it is a common resident on the rock of Gibraltar) to the Far East, where it is one of the largest and most prominent birds of prey. In India it is numerous and conspicuous, both in the high mountains and in the lowland jungles, and is one of the large hawks called 'peacock-killers.' The booted eagle (*Nisaetus pennatus*) of the Mediterranean region, noted for its shrill scream, and the beautiful great crested eagle of Africa (*Spizaetus bellicosus*), are other representatives of the group, in which some authors include the crested 'eagle-hawks' of tropical America.

HAWKE BAY. An inlet on the east coast of North Island, New Zealand, which gives its name to a provincial district, and a county be-

tween Auckland and Wellington (Map: New Zealand, F 3). The bay was named after Sir Edward Hawke, First Lord of the British Admiralty, when Captain Cook on October 8, 1769, entered it for the first time. Napier, the chief city and port of the district, is on the bay. European settlement dates from 1848.

HAWKER. See PEDDLER.

HAWKER, ROBERT STEPHEN (1803-75). A Cornish poet and antiquary, born at Stoke Damerel, Devonshire. He was educated at Pembroke College, Oxford (where he won the Newdigate prize in 1827 by a poem on Pompeii), was ordained in 1831, and went as vicar to Morwenstow, Cornwall, in 1834. Afterwards the neighboring parish of Wellecombe was added to the living. Hawker did much for the people in his poor parish during his forty years as priest among them, especially for the sea-faring men. Toward the end of his life he became a Roman Catholic, and in his last hours was received into that Church. His works include: *Records of the Western Shore* (1832; second series, 1836); *Ecclesia* (1840-41); *Reeds Shaken by the Wind* (1843); *Second Cluster* (1844); *Echoes from Old Cornwall* (1846-47); *The Quest of the Sangraal* (1864); *Cornish Ballads and Other Poems* (1869 and 1884). His collected poetical works appeared in 1879, with a notice by J. G. Godwin. He also wrote *Footprints of Former Men in Far Cornwall* (1870). His most celebrated poem, *Trelawny*, first published anonymously, was believed, even by such men as Scott and Dickens, to be an old ballad. Consult: Lee, *Memorials of the Late Rev. R. S. Hawker* (London, 1876); and Gould, *The Vicar of Morwenstow* (London, 1876). Mortimer Collins pictures Hawker as Canon Tremaine in his novel *Sweet and Twenty*.

HAWKESBURY. A river of New South Wales, Australia. It rises in the Blue Mountains, and flows northeast parallel with the coast until it passes Windsor, where it turns to the southeast and enters the Pacific at Broken Bay, 20 miles north of Sydney (Map: New South Wales, F 3). Its length is about 330 miles, and it is navigable for ships of 100 tons to Windsor, about 50 miles from its mouth. It is crossed by a steel railway bridge, 2900 feet long. The Hawkesbury is remarkable for its inundations, and in 1844 the waters rose 20 feet in a few hours.

HAWKESBURY. A lumber town and terminus of a branch line of the Canada Atlantic Railway, in Prescott County, Ontario, Canada (Map: Ontario, J 2). It is on the river Ottawa, 55 miles northwest of Montreal, and has ferry communication with Grenville on the opposite bank. Population, in 1891, 2042; in 1901, 4150.

HAWKES'WORTH, JOHN (c.1715-73). An English writer. Apprenticed to an attorney, his first steps in literature were in the footprints of Samuel Johnson, compiling Parliamentary debates for the *Gentleman's Magazine* (1744), in which some of his poems were afterwards published. Most of his essays appeared in the *Adventurer*, successor of the *Rambler*, which was very popular during the two years of its existence (1752-54), and of which Hawkesworth was editor and joint founder. Besides adapting old and writing such new plays as *Edgar and Emmeline* (1761), he wrote the words for an oratorio,

Zimri (1760); an Oriental tale, *Almorán and Homét* (2 vols., 1762); translated Fénelon's *Télémaque* (1768); prepared an edition of the *Works of Jonathan Swift* (6 vols., 1755), and an unsatisfactory account for the Government of the voyages of Captain Cook and others in the southern seas. He was for some time intimate with Dr. Johnson, whose style he could imitate to perfection; and his portrait was painted four times by Sir Joshua Reynolds.

HAWKEYE. One of the names by which Natty Bumppo is called in Cooper's Leatherstocking novels.

HAWKEYE STATE. Iowa. See STATES, POPULAR NAMES OF.

HAWKING. See under FALCONRY.

HAWKINS, ANTHONY HOPE (1863-). An English novelist, born in London. He was educated at Marlborough and at Oxford, where he took honors in classics. He studied law and was admitted to the bar in 1887, but gave up practice in 1894. In 1897 he visited the United States. His first book was *A Man of Mark* (1890), followed in quick succession by *Father Stafford* (1891); *Mr. Witt's Widow* (1892); *Sport Royal*, a collection of short stories (1893); and *The Prisoner of Zenda* (1894). This last book, the scene of which is laid in an imaginary principality of South Germany, is a happy combination of romanticism and modernity. To the same year belong the delightful *Dolly Dialogues*. Among the successful novels are *The Chronicles of Count Antonio* (1895); *Comedies of Courtship*, and *The Heart of Princess Osra* (both 1896); *Phroso* (1897); *Simon Dale and Rupert of Hentzau* (both 1898); *The King's Mirror* (1899); *Quisante* (1900); and *The Intrusions of Peggy* (1902). Mr. Hawkins writes with an animation and precision of touch that are admirable, and he is also notable for a keen if superficial psychology. The *Dolly Dialogues* (reprint with four additional dialogues, 1902) contain a shower of neat epigrams and extremely clever repartees.

HAWKINS, BENJAMIN WATERHOUSE (1807-89). An English artist and author, born in London. He lived at Knowsley, the seat of the Earl of Derby, for five years, where he studied animal painting. He was assistant superintendent of the International Exhibition of 1851, and in 1852 the Crystal Palace Company employed him to make restorations of extinct animals, in which he was an expert. In 1868 he lectured in New York City and other cities of the United States, and afterwards lived in this country. He was employed by the Central Park commissioners of New York City in restoring the forms of extinct creatures, but later administrations rejected his work, much of which was destroyed. He wrote: *Elements of Form* (1842); *Comparative View of the Human and Animal Frame* (1860); *Atlas of Comparative Osteology* (with Huxley, 1865); *Artistic Anatomy of Cattle and Sheep* (1867); and *Artistic Anatomy of the Dog and Deer* (1876).

HAWKINS, DEXTER ARNOLD (1825-86). An American lawyer, born in Camden, Maine. He graduated at Bowdoin College in 1848, after which he divided his time between teaching, traveling, and studying law until 1854, when he began to practice in New York City. He lectured

and wrote on various subjects, but especially on education, which engaged his chief interest. He was largely instrumental in securing the establishment of the National Bureau of Education, and his pamphlets did much to open the eyes of the people to abuses practiced under the educational laws of New York. His publications include: *Report on Compulsory Education* (1874); *The Duty of the State to Protect the Free Common Schools by Organic Law* (1871); and *The Roman Catholic Church in New York City, and the Public Land and Public Money* (1880).

HAWKINS, HAMILTON SMITH (1834—). An American soldier, born in South Carolina. He graduated at the United States Military Academy in 1855, and in 1861 entered the army. In 1883 he attained the rank of major, and in 1889 was promoted to be lieutenant-colonel. In 1888 he became commandant at the United States Military Academy, in 1894 colonel, and in the same year commandant of the Fort Leavenworth school. During the Spanish-American War he commanded the division which took San Juan Hill in the second day's battle at Santiago. In 1898 he was promoted to be brigadier-general, and retired.

HAWKINS, or HAWKYNS, Sir JOHN (1532-95). An English naval commander, the son of William Hawkins, a merchant and sea-captain of Plymouth, who had made several voyages to America. He was born at Plymouth. He followed the sea from an early age, and by 1561 had made several voyages as far as the Canaries. In 1562, with influential backing, he sailed from England with three ships, secured a cargo of 300 negroes on the coast of Sierra Leone, and then crossed the Atlantic to the West Indies, where he forced the Spaniards to take slaves in exchange for hides, spices, sugar, and ginger. He himself returned to England, but sent two shiploads of merchandise to Spain, where they were seized and the cargoes confiscated. This loss did not deter him from fitting out another expedition on a larger scale in 1564, in which the Earl of Pembroke and Robert Dudley, later Earl of Leicester, were among his partners, and in which Queen Elizabeth herself was interested to the extent of lending him her ship *Jesus*. With four vessels he sailed to the African coast, where his cargoes of negroes were obtained only after hard fighting. After a show of arms at Burburata, Venezuela, and at Rio de la Hacha, a 'satisfactory trade was opened,' and his negroes at length disposed of. Sailing northward, Hawkins relieved the French colony of Laudonnière, on Saint John's River, Florida, leaving them provisions and a small ship, and thence sailed homeward. The voyage was exceedingly profitable for all the partners, and Hawkins was granted a coat of arms for his skill. The protests of the Spanish were so great at this threat to their trade monopoly that it was not until 1567 that the Queen would consent to let Hawkins undertake another voyage. Then, indeed, she showed her favor so far as again to lend him the *Jesus*, quite likely becoming thereby a partner in the enterprise. On October 2d the little fleet of six ships, one of which, the *Judith*, was commanded by Francis Drake (q.v.), a kinsman of Hawkins, set sail from Plymouth. Following the course of his previous voyages, Hawkins sailed first to Sierra Leone, where about 500 negroes were obtained,

and where some Portuguese merchantmen were plundered and more than 70,000 pieces of gold secured from them. Again force had to be used before the Spanish in the West Indies would trade with them. A large part of his cargo was disposed of at Rio de la Hacha, Carthagena, and other ports, and they had turned their prows toward home, when, according to Hawkins's account, a storm drove them into the harbor of San Juan de Lua (Vera Cruz) on the coast of Mexico. There, on September 17th, a day after they had entered the port, they were beset by a Spanish fleet of thirteen ships. After three days' negotiation a peaceful agreement was arrived at, and the Spanish fleet entered the harbor. The truce was short-lived, however, and on the 24th a conflict was precipitated. Hawkins defended his ships stubbornly, but the odds against him were overwhelming. The *Jesus* was disabled, and Hawkins transferred himself to the *Mission*, one of his smaller ships, in which he finally escaped to sea. The *Judith*, with Drake in command, was the only other English ship that got away from the harbor. After this disastrous voyage, Hawkins remained in England for some years, was elected to Parliament in 1572, and was made Treasurer and Comptroller of the Royal Navy, both of which offices he held for life. His practical experience as a navigator enabled him to bring about a number of important improvements in the rigging and construction of the ships of the navy; and in spite of charges of dishonesty in contract work, the navy was made more efficient than it had ever been before. In 1588 he took part as a rear-admiral in the defeat of the Spanish Armada, personally commanding the *Victory*, and winning knighthood for his bravery in action. In 1595 he accompanied Sir Francis Drake in his successful expedition to the West Indies, but died at sea off Porto Rico. He was one of the founders, with Drake, of the fund for disabled seamen known as 'the chest at Chatham,' and in 1592 built the Sir John Hawkyn's Hospital at Chatham. Consult: Campbell, *Lives of the Admirals* (London, 1812-17); Southey, *Lives of the British Admirals* (London, 1833-40); *The Hawkins's Voyages*, Hakluyt Society Publications (London, 1877); and Winsor, *Narrative and Critical History of America*, vol. iii. (Boston, 1884).

HAWKINS, Sir JOHN (1719-89). An English writer on music. He was born in London; became a lawyer, and devoted his leisure to his favorite study of music. His marriage to a wealthy woman in 1753 enabled him to indulge his passion for acquiring rare works of music, and he bought the collection formed by Dr. Pepusch, which he subsequently presented (1779) to the British Museum. On such materials he founded his celebrated work on the *General History of the Science and Practice of Music* (1776; republished 1853 and 1875), which, although badly written, contains much of historical value. Hawkins was a member of two of the small clubs which Dr. Johnson founded, though he was pronounced by the lexicographer a 'most unelutable man.' He drew Johnson's will for him and became one of his executors. Hawkins afterwards wrote a life of Johnson, which appeared with an eleven-volume edition of his works (1787-89), but was soon superseded by Boswell's biography.

HAWKINS, or **HAWKYN**S, Sir RICHARD (c.1562-1622). An English naval hero, only son of the more famous Sir John Hawkins (q.v.). He went to the West Indies for the first time in 1582 with an expedition commanded by his uncle, William Hawkins. In the fight against the Invincible Armada (1588) he commanded the Queen's ship *Swallow*; and in 1593 he started on a voyage around the world, which was to eclipse the achievements of all previous circum-navigators, as he meditated making a thorough investigation of the lands at which he might touch; their geography, their cities and peoples, and the prevailing conditions of trade. An account of the early part of this voyage was written by himself many years afterwards, and is therefore not to be too greatly relied upon. He touched at various places on the east coast of South America, passed through the Straits of Magellan, and then sailed northward to Valparaiso, which he captured and plundered; but on June 18, 1594, almost exactly a year after he had left England, he was attacked in the Bay of San Mateo by two Spanish ships under the command of Don Beltran de Castro, a brother-in-law of the Viceroy. The English numbered only about 75 men at this time, while the Spaniards are said to have been at least ten times as numerous. After three days of fighting, Hawkins surrendered on condition that the prisoners' lives should be spared, and that they should be sent back to England as soon as possible. In spite of this he was kept in Lima until 1597, and then sent to Spain, where he was imprisoned for a number of years. When at last released he returned to England, where he was knighted, elected a member of Parliament, and made Vice-Admiral of Devon. In 1620-21 he was vice-admiral under Sir Robert Mansell of the unsuccessful expedition against the pirates of Algiers. Consult Markham, *The Hawkins's Voyages* (London, 1878).

HAWKINSVILLE, hă'kinz-vil. A town and the county-seat of Pulaski County, Ga., 40 miles south of Macon; on the Oemulgee River, at the head of navigation, and on the Southern and other railroads (Map: Georgia, C 3). It is the centre of a region which ships agricultural produce, melons, lumber, naval stores, and cotton, and has a cotton-mill, cotton gins and compresses, cottonseed-oil mills, carriage and wagon shops, barrel factories, etc. Population, in 1890, 1755; in 1900, 2103.

HAWK-MOTH. A moth of the family Sphingidæ. These moths have very stout bodies and long, narrow wings. The sucking-tube is usually very long, and when not in use is coiled spirally under the head. Most of the hawk-moths are large, strong on the wing, and fly at dusk. The larger species are not infrequently called 'humming-bird moths,' because while sipping nectar they have the same poised attitude of the body as the humming-birds, maintained by a rapid wing movement. They are all beautiful moths, but in quiet hues—olive, gray, or brown being the prevailing colors, with a bit of yellow or pink in some species. The larvæ have given the name Sphinx to the type genus of the family, because of the stiff, erect poise assumed by them when disturbed. Near the posterior end of the body a dorsal horn, tubercle, or knob is usually present. About 100 North American species

have been described. The most common species are the tomato-worm, and the tobacco or 'horn' worm (qq.v.). Consult Beutenmüller, "Descriptive Catalogue of the Sphingidæ Found Within Fifty Miles of New York City," in *Bulletin of the American Museum of Natural History*, vol. vii. (New York, 1898).

HAWK-OWL. (1) A large and remarkable owl (*Surnia ulula*) of the subarctic region of both continents, occasionally seen in Central Europe and the Northern United States in mid-winter. It is about 16 inches long, and mottled brown in color, the American specimens being darker as a rule than those of the Old World. There are no ear-tufts, the top of the head seems flat, and the face very hawk-like; it is also hawk-like in its manner of flight, and is often seen abroad in full daylight. It feeds upon birds and small mammals, and always appears in large numbers when the lemmings become plentiful and take to migrating. It usually nests in the hollow of a broken tree-top, and defends its five to eight white eggs or young with great courage. In Alaska it is not uncommon, and destroys many ptarmigan. See Plate of OWLS.

(2) Any of the owls of the genus *Ninox* inhabiting Southeastern Asia and Australia, and also Madagascar, often distinguished as 'Oriental hawk-owls.' Their small heads, long tails, and hard plumage give them a very falconine appearance, and the Australian species (*Ninox strenua*) reaches a length of 24 inches.

HAWKS, FRANCIS LISTER (1798-1866). An American clergyman, born at New Berne, N. C. He graduated at the University of North Carolina (Chapel Hill) in 1815; studied law under Judge William Gaston of New Berne; was admitted to the bar; and was elected from New Berne to the State Legislature. He studied theology under the direction of the Rev. W. M. Green (later Bishop of Mississippi); was ordained to the diaconate in 1827; in 1830 was elected professor of divinity in Washington College (now Trinity, Hartford, Conn.); and in 1831 was instituted rector of Saint Stephen's Church, New York City; later in 1831 he was elected to the rectorship of Saint Thomas's parish, New York City, in which office he continued until 1843. He was appointed professor of ecclesiastical history in the General Theological Seminary in 1833; in 1835 and in 1836 visited England for the purpose of making copies of documents pertaining to the early history of the Protestant Episcopal Church in America. From the eighteen large folio volumes of manuscripts he prepared two works—on Virginia (1836) and Maryland (1839) respectively. Because of criticism of these, he then withdrew from the undertaking. A school, Saint Thomas Hall, established by him at Flushing, L. I., in 1839, became involved in financial embarrassments, and failed in 1843. Upon the establishment of the University of Louisiana, he was elected its first president. In 1849 he returned to New York City as rector of the Church of the Mediator, later merged with Calvary Parish, the rectorship of which he assumed. In 1862, owing to difference of opinion between his parishioners and himself regarding the Civil War, he resigned, and until 1865 he was rector of Christ Church, Baltimore, Md. He became rector of the newly organized parish of the Holy Saviour in New York City, in 1865. He was a scholar

of high attainment, particularly in ecclesiastical history, and an eloquent preacher. The long list of works written or edited by him further includes: *Commentary on the Constitution and Canons of the Protestant Episcopal Church in the United States* (1841); *Egypt and Its Monuments* (1849); *A History of North Carolina* (1857); *Narrative of Commodore Perry's Expedition, Compiled from Perry's Original Notes and Journal* (1856); and (with W. S. Perry) *Documentary History of the Protestant Episcopal Church in the United States of America* (vols. i. and ii., 1863-64). Consult the sketch by Richardson (reprinted from the *American Quarterly Church Review* for April, 1867) in a memorial volume (New York, 1867); also the commemorative discourse by Morgan (New York, 1867).

HAWKS/BEE, FRANCIS. The name of two English physicists. See HAWKS/BEE.

HAWKSBILL TURTLE, or CARET. A large carnivorous sea-turtle (*Eretmochelys imbricata*), so named on account of the shape of its bill, which is a formidable weapon. Its flesh is not good food, but its eggs are sweet. The species is valuable for the plates of its shell, which overlap each other, and furnish the 'tortoise-shell' of commerce. This turtle is common in tropical seas, especially the West Indies, the South Sea Islands, and in the Indian Ocean.

HAWKSHAW, hək'shə, Sir JOHN (1811-91). An English civil engineer, born in Yorkshire, England. After a common-school education in Leeds, he turned to the practical study of engineering, went to Ireland in 1831 to serve under Alexander Nimmo, and in 1832 engaged in mining engineering in Venezuela. He returned in 1834, was connected with various English and German railroads, and settled in London in 1850 as a consulting engineer. His subsequent professional work was concerned with many branches of engineering, in all of which he displayed intimate knowledge and sound judgment; and he was consulted regarding almost all the great engineering projects of his time in Europe. He constructed the Charing Cross, East London, and Cannon Street railroads; a tunnel under the Severn River; the Clifton suspension bridge, the Londonderry bridge in Ireland, and the Nerbudda bridge in India; and the Amsterdam Ship Canal. He was often the Government commissioner in investigating sanitary and military matters, and was the engineer summoned to report finally upon the plans and site for the Suez Canal. In 1873 he was knighted. He became a member of the Royal Society in 1855, was president of the Institution of Civil Engineers from 1862 to 1864, was made president of the British Association in 1875, and was an honorary member of the American Society of Civil Engineers. His published works include: *Reminiscences of South America* (1838), and a large number of reports dealing with his varied professional labors.

HAWKSLEY, THOMAS (1807-93). An English civil engineer, born at Arnold, near Nottingham. He was educated at the Nottingham grammar school, and in 1822 began an apprenticeship to an architect and surveyor named Stavely, by whom he was finally admitted to partnership. His first important engineering work was the development of an increased water-supply for Not-

tingham in 1830. In 1847, with Lord Armstrong, he invented the well-known self-acting valve designed to close a pipe automatically when the velocity of the water reaches a certain limit. In 1852 he removed to London, where his fame and reputation grew rapidly, until he was recognized as the greatest authority on water-works engineering in England, and one of the foremost engineers in that branch in the nineteenth century. At one time or another he was engaged in some capacity, either as a consulting or constructing engineer, by almost every large city in the United Kingdom. His greatest achievements were in connection with the Sheffield water-works, the construction of the Thorntown Park and Bradgate reservoirs at Leicester, the planning and construction of the Vyrnwy Valley dam and lake, for supplying water to the city of Liverpool—one of the most remarkable and important pieces of water-works engineering ever attempted. He was president of the Institute of Civil Engineers in 1872-73, president of the Institution of Mechanical Engineers in 1876-77, and was elected a fellow of the Royal Society in 1878.

HAWKS/MOOR, NICHOLAS (1661-1736). An English architect. He was born in Nottinghamshire, and at eighteen years of age began his professional studies under Sir Christopher Wren. Unusual aptitude in his profession procured him steady employment from the outset of his career, and under Wren's supervision he built several important structures. He became deputy surveyor at Chelsea Hospital (1682-90); clerk of the works of Greenwich Hospital in 1698, and deputy surveyor in 1705. Although at first working under the superintendence of Wren, he afterwards was associated on more equal terms with his former master and with Sir John Vanbrugh and Inigo Jones. He assisted Wren in building Saint Paul's Cathedral from 1675 to 1710, was associated with Sir John Vanbrugh at Castle Howard, Yorkshire, and also at Blenheim Palace, Oxfordshire. At Oxford he designed the library and the south quadrangle of Queen's College and also the north quadrangle (with the exception of the library) of All Souls' College. A scheme of building fifty new London churches at the close of Queen Anne's reign engaged a large share of Hawksmoor's attention. He was appointed one of the surveyors for that purpose, and designed six of the new churches, the best being that of Saint Mary Woolnoth, with a very fine interior, and Saint George's, Bloomsbury, noted for its portico. After the death of Wren in 1723, Hawksmoor was appointed surveyor-general of Westminster Abbey, and continued the works of the two western towers after his former master's designs. He also drew designs for monuments and bridges. He was not remarkable for creative genius, his chief excellence being a mastery of details and construction; but on the other hand, some of the buildings attributed to his more eminent associates, notably Sir John Vanbrugh, are believed to have been designed by him.

HAWKWEED (*Hieracium*). A genus of plants of the natural order Compositæ. The species are annual or perennial, with leafless scapes or leafy stems, one-flowered, or many-flowered; the leaves, stems, and involucre in many species are hairy. The hawkweeds are very numerous, natives of the temperate and colder

regions of the Northern Hemisphere, particularly abundant in Europe. The flowers are generally yellow. The orange hawkweed (*Hieracium aurant-*

ORANGE HAWKWEED.

ticum), a perennial, two feet high, is a native of the south of Europe, often cultivated in gardens for its rich orange flowers. It has been introduced into Canada and the New England States, where it has become one of the most troublesome weeds in grass-lands. Experiments conducted at the Vermont Experiment Station showed that it could be eradicated by salt sown at the rate of 300 pounds per acre. Every plant was killed, and the grass, a species of *Festuca*, was improved by the treatment. Plowing under and devoting the land to hoed crops will destroy it. There are about a dozen species, native or introduced, in the Eastern United States.

HAWKWOOD, SIR JOHN DE (?-1394). An English soldier of fortune, born at Hedingham Sibil, Essex. He is reported to have fought with the Black Prince at Crécy and Poitiers, and to have been knighted by Edward III.; but by 1359 he was at the head of a body of freebooters, plundering Gascony and the northern parts of Italy. His thousand lancers, each with knight and page, came to be known as the 'White Company,' and, joined to double their number of foot soldiers, armed with stout bows of yew, they spread terror throughout Southern Europe, devastating villages, holding great noblemen for ransom, and exacting heavy toll from the clergy. After serving under the Marquis of Montferrat, the White Company went into the pay of the Pisan Republic, which was then engaged in a Florentine war. From that time onward, Hawkwood took a prominent part in the strife between the different Italian republics, fighting generally upon the side of Florence, by whom he was paid a pension. He fought both for and against Pope Gregory XI. He was endowed with an equal talent for strategy and for organization. He spent the last years of his life among the Florentines, who buried him with great pomp.

HAWLEY, CHARLES B. (1858—). An American musician, born in Brookfield, Mass. He studied composition under Dudley Buck, Joseph Mosenthal, and C. B. Rutember, and voice culture with G. J. Webb, P. A. Rivarde, and Gustav Federlein. He became bass soloist in the Calvary Episcopal Church, New York; assistant organist of Saint Thomas's; and in 1883 director of the choir at the Broadway Tabernacle. His compositions include many excellent and popular songs, and considerable church music.

HAWLEY, GIDEON (1727-1807). An American missionary among the Indians. He was born in Stratford, Conn., graduated at Yale in 1749; and under the supervision of Jonathan Edwards began missionary work among the Indians at Stockbridge in 1752. Two years later he undertook a mission to the Iroquois on the Susquehanna River, but he was driven out in 1756 by the French and Indian War. The latter part of his life was passed in missionary duties among the Indian tribes at Marshpee, Mass.

HAWLEY, JOSEPH (1723-88). An American statesman of the Revolutionary era. He was born in Northampton, Mass., was educated at Yale, and prepared himself to be a clergyman, but turned lawyer instead. He was a delegate to the Massachusetts Congress (1774-75), and a special pleader for popular rights.

HAWLEY, JOSEPH ROSWELL (1826—). An American politician and legislator, born in Stewartsville, N. C. His father, a Connecticut Baptist clergyman, returned to his native State in 1837, and there the son was brought up, and imbued with anti-slavery ideas. He was educated at Hamilton College (N. Y.), where he graduated in 1847, afterwards studying law, and beginning practice at Hartford, Conn., in 1850. He immediately entered politics as a Free-Soil Democrat, became chairman of the party's State Committee, and in 1852 editor of its principal State organ, the *Charter Oak*. The movement which resulted in the founding of the Republican Party received his support, and the first meeting for its organization in Connecticut was held in his office. In the next year he abandoned the law, and became editor of the *Hartford Evening Press*, the newly established Republican paper. Twenty-four hours after President Lincoln's first call for troops, Hawley recruited the first company of volunteers raised in the State, which became Company A of the First Connecticut Regiment, with Hawley as captain. He participated in the first battle of Bull Run, after which he became lieutenant-colonel of the Seventh Connecticut Volunteers, and with it took part in the Port Royal expedition. In January, 1863, as colonel, he took his regiment to Florida, and was present at the siege of Charleston and capture of Fort Wagner. In February, 1864, he commanded a brigade in the battle of Olustee, Florida, and later in the same year saw active campaigning in Virginia, being present at the siege of Petersburg. In September, 1864, he was promoted brigadier-general of volunteers. In 1865 he served as General Terry's chief of staff, was with Sherman in the Carolina campaign, and was mustered out of service in January, 1866, with the brevet rank of major-general. In April following he was elected Governor of Connecticut. In 1867 he was defeated for reelection, and turned his attention to journalism, purchasing

the *Hartford Courant*, and uniting it with the *Press*. He became prominent as a Republican campaign speaker, was chairman of the Republican National Convention in 1868, and chairman of the Committee on Resolutions at the Convention of 1876. In November, 1872, he was elected to fill a vacancy in Congress, and was reelected for a full term to the Forty-third Congress, serving from 1873 to 1875. He was defeated in 1874 and 1876, but was again elected in 1878, serving from 1879 to 1881, and at the end of the term was elected to the United States Senate. He was president of the United States Centennial Committee from its organization in March, 1873, to the completion of the work of the Centennial Exposition. In 1884 he was a candidate for the Presidential nomination before the Republican National Convention. He was reelected to the Senate in 1887, 1893, and 1899, and continued to take a prominent part in legislation, and served as chairman of the Senate Committee on the Civil Service.

HAWORTH, hā'wōrth, ADRIAN HARDY (1767-1833). An English entomologist and botanist, born at Hull. He studied law, but never practiced it. His place of abode was alternately Cottingham and Little Chelsea, and he was founder-in-chief of the Entomological Society of London, afterwards a section of the Linnaean Society, of which he was also a member. The Botanical Garden at Hull was begun under his direction, and he made collections of specimens, and wrote works upon botany and entomology, including: *Observations on the Genus Mesembryanthemum* (1794); *Prodromus Lepidopterorum Britannicorum* (1802), enumerating 793 species; the sixth volume of the *Botanist's Repository* (1803); and *Synopsis Plantarum Succulentarum* (1812), which is planned on the Linnaean system, and gives in Latin the description, habitat, date of introduction, and month of flowering of each species. A supplement to this work was issued in 1819.

HAWORTH, JOSEPH (1855—). An American actor, born at Providence, R. I. At the age of eighteen he became a member of a stock company in Cleveland, Ohio, where he was brought up, having already once appeared upon the stage there a year or two before with Charlotte Crampton in *Richard III*. During the season of 1882-83 he toured with John McCullough. Afterwards, for several years, he himself traveled as a star in *The Bells*, *The Leavenworth Case*, *Hamlet*, and other Shakespearean plays. In 1896-98 he supported Madame Modjeska, playing an exceedingly effective Macbeth to her Lady Macbeth. His subsequent rôles included those of John Storm in *The Christian*, Rafael in *The Ghetto*, Vinicius in Stanislaus Stange's version of *Quo Vadis*, and Cassius in Mr. Richard Mansfield's production of *Julius Cæsar*. Consult: *Strang, Famous Actors of the Day in America* (Boston, 1900); Clapp and Edgett, *Players of the Present* (New York, 1899).

HAW RIVER. A name sometimes applied to the upper course of Cape Fear River (q.v.) in North Carolina, above its confluence with Deep River, the two being regarded as the headstreams of the Cape Fear.

HAWSE (older form *halse*, from Icel. *hāls*, neck, fore part of a ship, AS. *heals*, Goth., OHG. *hals*, Ger. *Hals*, neck; ultimately connected with

Lat. *collum*, neck). (1) The part of a ship in which the *hawse-pipes*, or heavy castings forming the lining for the *hawse-hole* through which the anchor cable passes, are placed. (2) The direction of the cable by which the ship is riding. (3) The cables of a ship when moored. A vessel is *athwart the hawse* of another when she or her chain is ahead of the latter and across her stem or chain, or nearly so. When a ship is moored she is said to have a clear hawse when the chains lead from the hawse-pipes to the anchors without touching each other. The hawse is *open* when the chains lead away from the bows to their respective anchors and the ship rides to both of them. If a ship lying in this position swings through 180° she will have a *cross* in her hawse, the chain leading from its pipe across the stem to the anchor which is on the other side; another swing of 180° in the same direction gives an *elbow* in the hawse; the next, a *round-turn*; the next, a *round turn and an elbow*; the next, *two round turns*, etc. A ship is said to have a *foul hawse* if her hawse is neither *open* nor *clear*. When the chains are in this condition the *hawse* must be cleared by unwrapping them. To effect this a chain pendant, called the *clear hawse pendant*, is led out of one of the hawse-pipes and by means of a large hook on the end firmly secured to one of the chains, usually the lee one (i.e. the one which is hanging slack—not the one by which the ship rides). The clear hawse pendant being made fast inside the ship, the lee chain is unshackled, and by means of a *dip-rope* the end is *dipped* underneath the other and unwound from it. It is then brought into the ship and shackled to its other part again. This seems a very simple operation, but, owing to the great weight of the chain cables of large ships, and to the fact that much of the work must be done in a boat, perhaps in quite rough water, it is a very laborious and troublesome one. To avoid the necessity of it, heavy swivels, called *mooring swivels*, are frequently used. This device has two shackles attached to the lower part and two to the upper. The chains are unshackled and the inner ends attached to the upper shackles of the swivel and the other ends to its lower shackles. The ship thus moored is free to swing without fouling her chains so long as the swivel is kept in order so that it will revolve with the ship. See MOOR; MOORING-SWIVEL.

THE HAWSE-BUCKLER is an iron plate, hinged to the upper edge of the hawse-pipe on the outside of the ship, and designed to close the hawse-pipe against the admission of water when at sea. THE HAWSE-HOLE is the hole in sides of the ship through which the cable passes.

THE HAWSE-PIPE. A heavy casting which forms a lining for the hawse-holes and prevents the cables from tearing the plating of the bow.

HAWSER (older forms *halser*, *haulser*, *halsier*, OF. *haulserce*, from *haulser*, *hausser*, Fr. *hausser*, It. *alzare*, to raise, from Lat. *altus*, high). A rope of manila fibre four inches or more in circumference, or a wire rope exceeding three inches in circumference. It was formerly the custom to call heavy ropes hawsers only when they were *hawser-laid*; that is, when they consisted of three *plain-laid*, three-stranded ropes laid up left-handed. Large plain-laid ropes were called tow-lines. Present practice is, however, less precise, all large ropes being commonly re-

ferred to as hawsers; and rope which was formerly called hawser-laid is now called *cabie-laid*.

HAWTHORN (from AS. *hægþorn*, Ger. *Hagedorn*, from AS. *haga*, Eng. *haw*, hedge + *þorn*, Eng. *thorn*), *Cratægus oxyacantha*. A shrub or small tree, native of Europe, Siberia, and Northern Africa, which reaches a height of 25 feet. It has roundish obovate three to five lobed deciduous leaves, and corymbs generally of white, rose-colored, or sometimes deep crimson flowers, succeeded by a small red fruit (*haw*) with yellow pulp, which, since they remain on the tree after the leaves have fallen, afford winter food to birds. Of the many varieties of hawthorn, the Glastonbury thorn—so named because supposed to have originated at Glastonbury Abbey—is remarkable for its early flowering, which in England often takes place in the middle of the winter. The common kind blossoms in May or June. The winter flowers are, however, not generally followed by fruit, and a second flowering often takes place in

HAWTHORN.

the same year. The common hawthorn is often popularly called 'may,' from the season of its flowering in England. It is also called 'whitethorn,' to distinguish it from the sloe or blackthorn. It is also sometimes employed as a stock on which to graft apples and other pome fruit. The wood is very hard, close-grained, and takes a fine polish, but is apt to warp. A fermented liquor, which is very intoxicating, is made from the fruit in many parts of France. The hawthorn is particularly valuable as a hedge-plant, for which purpose it is widely used in Great Britain, in consequence of its strong and plentiful spines, quick growth while young, its long life, and its ready adaptation to a variety of soils and especially to trimming. For this purpose it is propagated by seed. See CRATÆGUS; HEDGE.

HAWTHORNDEN. See ROSLIN.

HAWTHORNE, JULIAN (1846—). An American novelist, born in Boston, son of Nathaniel Hawthorne. He entered Harvard in 1863, but did not graduate. He studied civil engineering in America and Germany, was engineer in the New York City Dock Department under General McClellan

(1870-72), spent ten years abroad, and on his return edited his father's unfinished *Dr. Grimshawe's Secret* (1883). While in Europe he wrote the novels, *Bressant* (1873); *Idolatry* (1874); *Garth* (1877); *Archibald Malmaison* (1879); *Sebastian Strome* (1880). Of many novels written after his return to America, perhaps the most noteworthy are: *Noble Blood* (1884); *John Parmlce's Curse* (1886); *The Professor's Sister* (1888); *A Fool of Nature* (1896); and *One of Those Coincidences and Other Stories* (1899). He also wrote: *Saxon Studies* (1876); *Nathaniel Hawthorne and His Wife* (1885); *Confessions and Criticisms* (1886); *American Literature* (1891); journalistic articles on the famine of 1897 in India, and on the Cuban War; and a *History of the United States* (1899).

HAWTHORNE, NATHANIEL (1804-64). An American romancer. He was born at Salem, Mass., July 4, 1804. He was of English descent, and his family had spelled their name 'Hathorne,' to which Nathaniel added the 'w.' His ancestor, William Hawthorne, had accompanied Winthrop in the *Arbella* in 1630. He settled first in Dorchester, and moved thence to Salem (1636), where he received a large grant of land. He seems to have been a man of strong and energetic will, and a Puritan of the grimmest type. John, his son, was like him in abilities and disposition, took an active part in the persecution of witches at Salem, and was a magistrate as well as a soldier. Two of the Hawthornes were privateersmen during the Revolution. The novelist's father, Nathaniel Hawthorne (1776-1808), was also a sailor and sea captain, and married Elizabeth Clark Manning, of Salem, whose ancestors had emigrated to America about 1680. They had three children, of whom Nathaniel was the second. Upon her husband's death, the mother took her children to her father's house, but of Nathaniel's boyhood we only know that he was fond of long solitary walks, and showed an hereditary longing for the sea. When he was fourteen his mother went to live with his uncle, Richard Manning, at Raymond, Cumberland Co., Maine. Nathaniel still cared more for nature than for study, hunted and roamed the woods, and jotted in his note-book impressions that show how close was his sympathy with nature, and how minute his observation. After a year here, he returned to Salem to prepare for college. He entered Bowdoin College in 1821, where he found two fellow-students who were destined to exercise much influence on his future, the poet Longfellow, and the future President, Franklin Pierce. His scholarship was good, especially in the classics. Upon his graduation (1825), he returned to Salem. Here he led a somewhat secluded life, and still indulged in long walks and in literary studies, in which he is said, at times, to have become so absorbed that food would be left for him before his locked door. He wrote much, but destroyed almost as much, for he could not satisfy his taste. *Fanshawe*, the first work of fiction that he committed to the press, was issued anonymously in 1828. His name was first attached to four "Tales," in the *Token* (1831), a holiday annual under the direction of S. G. Goodrich. They were favorably received, but hardly justly appreciated. Goodrich persuaded Hawthorne to do some hack work for an *American Magazine of Useful and Entertain-*

ing Knowledge, on which he worked also as editor (1836), at a salary of \$500. For the same publisher he compiled a *Universal History*, by which he earned little. Meantime his genius had been discovered by the London *Athenæum*, which reprinted three of his most characteristic pieces, and with this encouragement Goodrich brought out in 1837 the first collection of *Twice-Told Tales*. These were generously reviewed by Longfellow, who praised the author's genius and the beauty of his style; but they were received by the public with languid appreciation.

The slight returns from literature prompted Hawthorne to accept from the Collector of the Port of Boston, George Bancroft, the historian, a post as weigher in the custom-house there, and in this office he measured coal, salt, and the like, at a salary of \$1200. Salem was strongly Federalist in politics, and Hawthorne, an hereditary Democrat, owed this position less to his own abilities than to partisan policy. He performed his irksome work for two years (1839-41), but was dismissed on the advent of the Whigs to power. With a mind somewhat widened by this experience, he returned to Salem and to literature, and wrote a series of sketches of New England history for children, which he published as *Grandfather's Chair* (1841). In April of that year he was drawn to Brook Farm (q.v.). He invested \$1000 in the enterprise, his savings from the custom-house, and charmed his associates by his modest manliness; but, like the Miles Coverdale of his *Blithedale Romance*, a hardly disguised picture of this experiment, he was rather a looker-on than a participant. The genius of Brook Farm was discipline through society. Hawthorne's taste was for solitude, and after a year's patient experiment he left it, married Miss Peabody, of Salem, and made a home for himself at Concord, in the house that he has made memorable by his *Mosses from an Old Manse*. Here he wrote a second part of *Grandfather's Chair* (1842), and in 1842 published a second collection of *Twice-Told Tales*. In that year he also edited the *African Journal* of his old classmate at Bowdoin, Horatio Bridge, and in the next year published two volumes of *Mosses from an Old Manse*, the fruit of his scholarly leisure. Many of these sketches, however, had first appeared in the *Democratic Review*, from whose irregular payments he derived most of his income, till it failed, much in his debt (1845). These stories include such masterpieces in miniature as: *The Celestial Railroad*; *The Procession of Life*; *Roger Malvin's Burial*; *Rappaccini's Daughter*; *The Birthmark*; *Young Goodman Brown*; *The Artist of the Beautiful*, which, with some of the *Twice-Told Tales*, notably the four *Legends of the Province House*, first represent his mature genius. But they did not afford him a living, and after four years at Concord he returned to the civil service, and accepted from the new Democratic Administration the post of surveyor of the custom-house at Salem. There his powers ripened for three years, and reached their fullest expression in *The Scarlet Letter* (1850), the first draught of which he wrote before leaving his post. He has told the story of this period in the introduction to the novel with an irony not a little resented by his fellow-citizens, to whom, indeed, he felt he owed no debt, having been, he said, "deliberately lied down" by them till he was at last removed from office.

The Scarlet Letter, as written at Salem, seemed to him so sombre that he submitted to his friend and publisher, James T. Fields, in Boston, a proposal to print with it some sketches in lighter vein, that may now be read in *The Snow Image* (1852), but Fields was so deeply impressed by the work that he persuaded Hawthorne to revise and extend it, though he was skeptical enough to have the type distributed without stereotyping. The first edition of five thousand copies was sold in two weeks. The book was immediately reset, at once reprinted in England, and on both sides of the Atlantic was received with the greatest enthusiasm. It was Hawthorne's first sustained effort, and his greatest. From this time till his death he devoted himself to writing, and found a ready market for his work. He moved in the summer of 1850 to Lenox, Mass., still eagerly seeking seclusion, save for the genial companionship of Herman Melville, who lived at Pittsfield. Here he wrote *The House of the Seven Gables* (1851), a story of subtle power. The same year brought forth the juvenile *Wonder Book*. In 1851 he left Lenox for West Newton, where he wrote *The Blithedale Romance* (1852), *The Snow Image*, and other *Twice-Told Tales* (1852); and in the spring of the next year went back to his old favorite Concord, where, with Alcott for his next-door neighbor, he wrote, by one of literature's ironies, a campaign *Life of Franklin Pierce* (1852), and also *Tanglewood Tales* (1853). He had declared that he would take no office in case of Pierce's election, but his friends made him think better of it, and he accepted from his old college mate the consulate at Liverpool.

The next seven years Hawthorne spent in Europe—five at the consulate, with little journeys to the English lakes and Scotland, two in France and Italy. A record of the English years remains in *English Note-Books* and *Our Old Home*. That of the Continent may be found in *French and Italian Note-Books*. The monumental work of this period is *The Marble Faun* (1860), published also in England under the title *Transformation*, a romance long popular, but which scarcely holds its own with the critics. When he returned to America on the eve of the Civil War, he found himself somewhat remote, both by nature and by political sympathy, from the intense passions of the period. He was, as he had ever been in public affairs, rather a looker-on than an actor. Very characteristic of his attitude is a little paper, "Chiefly About War Matters," printed in the *Atlantic Monthly* (1862), with some editorial excision and foot-notes, which, though ascribed to the editor, are Hawthorne's own. Characteristic, too, of his aloofness from the passion of the time was his dedication to the then unpopular President Pierce of *Our Old Home*. This book indeed well expressed the feeling of New England for the Old. That the English did not like the book rather enhanced the interest in it in America. This was Hawthorne's last book. *The Doliver Romance*, begun in the *Atlantic Monthly*, was incomplete at his death, as was *Dr. Grimshawe's Secret*, first printed in 1882. *Septimius Felton* also was rescued from loose sheets and printed, not as he would have had it, in 1871. These, and even more inchoate fragments, add nothing to his fame or achievements. He did little after the spring of 1864. His health failed rapidly, and he received a shock, from which he never recovered, by the sudden death of his

friend and publisher, Ticknor, during a visit that they made together to Philadelphia. He had a premonition that his own death would be on a like journey, and so it befell. He went in May, with his friend Pierce, to the White Mountains; on the 18th they came to Plymouth, and there in his sleep Hawthorne died. He was buried in Sleepy Hollow Cemetery, Concord, on the 24th, where his body now lies, close to those of his friends Emerson and Thoreau.

Hawthorne's bearing and features were as noteworthy as his personality. His face had a romantic beauty, symmetrical, full and strong in feature, with a massive brow, and an expression that veiled power behind a poetic refinement. In manner he was shy but always self-possessed, quiet in conversation, and often silent in company. To the end, as in boyhood, he did not shun solitude, living much within himself and seeming to find no better company. The style was like the man, exquisite in its purity of diction, finely poetic, delicate, gentle; yet it had a manly gravity, that bore witness to the inherited Puritan conscience. These qualities, subtly and strangely blended, give to his style a unique literary quality, and make him one of the greatest masters of English prose, in spite of the fact that when read continuously his elaborateness is sometimes found to cloy. Turning from the man to his work, one finds the dominant note, alike of the short tales and of the novels, well described by Henry James as a "feeling for the latent romance of New England." He found the shadow and the mystery in the Puritan conscience with its oppressing sense of responsibility and ingrained sin. It is the hidden passion, the secret impulse, the double life, the weird and supernatural imaginations, religion grown fierce in the struggle and isolation of early New England, out of which his poet's fancy loved to create symbolic impersonations. In the early tales, and to the last, he preferred to explore the dark corners of the human heart rather than to describe the expression which they found in social relations. Something of this tendency could be detected in *Fanshawe*, but its quaintness is in the tales of old Massachusetts, *Goodman Brown*, the *Legends of the Province House*, or in the more whimsically humorous *Village Uncle*, and *A Rill from the Town Pump*. When he went abroad for his scenes, he carried New England with him. *Rappaccini's Daughter* has in it as little of the atmosphere of Italy during the Renaissance as *Roger Malvin's Burial*; and when we turn to the novels it is still the romance of the Puritan conscience in its self-tormenting of which we read first, and supremely in *The Scarlet Letter*, with its climax of penance and demoniac triumph at Dimmesdale's shame. And that study of sin festering in darkness, shunning the antidote, and seeking vainly the anodyne, has its counterpart there in Hester Prynne, who finds in sin itself the power of a higher spiritual life; while her child is a joyous and perennially fascinating mystery. *The House of the Seven Gables* is no less characteristic, though the noonday light is here softened to a mystic glow, and we breathe a ghostly atmosphere of vicarious sorrow and atonement. *The Blithedale Romance*, too, could have been dreamed only in New England, and of *The Marble Faun*, one must say with Henry James, that Hawthorne "took with him to Italy more of the old Puritan

conscience than he left behind." One feels it in Donatello, and it is in every fibre of Hilda's being. Here, as always, moral guilt, and its effect upon the individual alone with himself, is the theme on which the reader's thought is concentrated with vague yet persistent shadowings of the supernatural and weirdly fascinating revelations of the depths of human souls, around which the Italian scene throws the glamour of antiquity. Hawthorne has caught the genius of the place, the sense and the spirit of the landscape. And as we find New England in this story of Italy, so we find it in the point of view of the *Note-Books*. While he was at home he sought relief from the present in the past; when he was abroad, he viewed the new scene from the standpoint of the old, always remote from the present, and looking at English, French, and Italian society with the same detachment and aloofness that marked his attitude toward American politics and the socialistic aspirations of the Transcendentalists. He was less a moralist than a dilettante in morals, without dogmatism, without insistence, "outside of everything, an alien everywhere, an æsthetic solitary" (Henry James).

BIBLIOGRAPHY. There are *Lives* of Hawthorne by his son Julian, *Nathaniel Hawthorne and His Wife* (Boston, 1885); by Henry James, in the English Men of Letters series (London, 1880); by M. D. Conway in the Great Writers series (ib., 1890); and by Woodberry, in the American Men of Letters series (Boston, 1902). There is also an excellent *Study of Hawthorne*, by George Parsons Lathrop, his son-in-law (Boston, 1876), and editor of his *Works*, with a *Memoir* (12 vols., Boston, 1883). Interesting, too, is the *Memories of Hawthorne* (Boston, 1897), by Rose Hawthorne Lathrop. There is an analytical index to the *Works*, by Evangeline M. O'Connor (Boston, 1882).

HAW'TREY, CHARLES HENRY (1858—). An English actor-manager and playwright, born at Eton, and educated there and at Oxford. At the age of twenty-three he made his theatrical debut. His plays include *The Private Secretary*, *Jane*, and *Mr. Martin*, the first of which was originally produced in Cambridge in 1883, and was an adaptation from Von Moser's *Der Bibliothekar*. It proved a tremendous success, and was performed 844 consecutive times. In 1884 a compromise was arranged by which William Gillette's adaptation of the same play could be produced in America. Several years ago Hawtrey got control of the Comedy and Avenue theatres in London. During the season of 1901-02 he brought his company to New York with *A Message from Mars*, which had already run for 500 performances in London.

HAXO, ak'só'. FRANÇOIS NICOLAS BENOÎT, Baron (1774-1838). A French general of engineers, born in Lorraine. He fought in the armies of the Republic, first in Germany and afterwards under the First Consul in Italy. His ability was recognized by Napoleon, who sent him to Turkey in 1807 to fortify Constantinople for the Sultan. At the end of the year he returned to Italy, and in 1808 was sent to Spain, where he took an active part in the capture of Saragossa. In 1811, as commander of engineers in the Army of Germany, he inspected the fortresses held by the French in Prussia and Poland. Many of them he strengthened, particularly those at Modlin and Danzig; and in the latter he in-

roduced casement batteries of his invention, which were later adopted for the fortresses of France. During the retreat from Moscow he received from Napoleon the brevet rank of general of division, and in June, 1813, he was made commander-in-chief of the engineers of the Imperial Guard. After the Peace of 1814 the Bourbons gave him employment, but on Napoleon's return from Elba he joined the Emperor and fought under him during the Hundred Days. Nevertheless, upon Napoleon's final overthrow, the Bourbons again received him into their service and made him inspector-general of fortifications. In the discharge of this office he worked so strenuously to modernize the fortresses of France that General Rogniat said of him: "Peace was for him more laborious than war." He proposed the method of fortifying Paris which, with some modifications, was finally adopted, and in 1832, he conducted the celebrated siege of Antwerp. He left a number of writings on military engineering and analogous subjects.

HAY (AS. *hig*, Goth. *hawi*, OHG. *hewi*, *howwi*, Ger. *Heu*; probably connected with AS. *hācan*, OHG. *houwan*, Ger. *hauen*, Eng. *hew*). A term applied to a considerable number of cured crops used for feeding farm animals. The most important hays are made from the various grasses (timothy, meadow fescue, meadow foxtail, brome grasses, etc.), legumes (clover, alfalfa, etc.), and cereal grains (rye, oats, and barley). The different crops should be cut for hay before they have fully ripened seed, as, generally speaking, the nutritive value increases up to this time and decreases afterwards. (See GRASSES.) While most crops will not cure unless they are cut and treated in the usual way, some grasses, for instance Buffalo grass, dry in their natural habitat without appreciable loss of nutritive material, and constitute fairly good natural hay. If the

cut crop to the sun and air. The processes of hay-making vary with the crop and climatic conditions. The varying nature of the crops converted into hay, the dampness or dryness of the soil, the amount of moisture in the atmosphere, and the duration and intensity of the sunlight are all factors which influence the problem. At the present time hay-making is quite generally carried on by the aid of machinery. (See REAPERS, REAPING; IMPLEMENTS, AGRICULTURAL.) Generally speaking, hay is cured in the United States by spreading on the ground. In some parts of Northern Europe, in the Mackenzie River region of Canada, and elsewhere, where the rainfall is very abundant, hay is cured on racks. During the curing process the green crops lose water, which is, perhaps, the most marked change. However, there are other changes, which are due to the action of ferments. These modify more or less the composition of the hay and aid in developing the peculiar aroma. It has been found that grass which is merely dried does not have exactly the same composition as a similar sample which has been cured as hay. Fermentation, which begins in the field, often continues after the hay is stored. As in many other chemical changes, fermentation is accompanied by the liberation of heat, and in the case of hay the temperature may rise sufficiently to cause ignition. Many fires have been caused by the spontaneous combustion of hay owing to this cause. Though frequently a single grass or other crop is planted for hay, meadows often have a number of crops growing together as grasses and clovers, and these yield what is termed mixed hay. The hay from salt marshes consists of such plants as black grass (*Juncus gerardi*), fox-grass (*Spartina patera*), branch grass (*Distichlis spicata*), flat sage (*Spartina stricta maritima*), etc. The average composition of a number of sorts of hay follows:

AVERAGE PERCENTAGE COMPOSITION OF A NUMBER OF SORTS OF HAY FROM GRASSES, LEGUMES, AND CEREAL GRAINS

KIND OF HAY	Water	Protein	Fat	Nitrogen-free extract	Crude fibre	Ash
GRASSES

cereal grains are allowed thoroughly to ripen before cutting, and the grain separated, the material is called straw, and is not as valuable for feeding as hay. Hay is cured by exposing the

Hay contains more nutritive material in proportion to its bulk than the green crops from which it is made. In other words, it has been concentrated by the evaporation of a large

amount of the water originally present. It contains fairly large amounts of carbohydrates, both nitrogen-free extract and crude fibre, and a considerable amount of protein. The latter constituent is especially abundant in hay from leguminous crops. The different sorts of hay are very important feeding stuffs for all classes of farm animals. They are valuable not only for the nutrients they contain, but because, like all coarse fodders, they furnish the needed bulk in the ration. In early times animals were wintered on hay alone, but experience has shown that although farm animals may be maintained without other feeding stuffs, if it is desired to produce gains in weight or abundant yield of milk, hay must be supplemented by grain or other concentrated feed.

Rowen, that is, hay made from second-growth grasses or aftermath, is especially rich in nutrients; but it is made at a time of the year when the ground is often damp, the days shorter, and the sun's heat less strong than earlier in the season. This renders the curing of rowen somewhat difficult, and the product is usually of less value for some purposes than first-crop hay. When cured under favorable conditions, aftermath hay is an excellent article for winter feeding. In Switzerland and other parts of Europe it is customary to cut the soft grasses which are often grown a number of times during the season. The resulting hay is fine, and is said to be especially relished by stock. New-made hay is laxative, and should not be fed to work-horses or to driving horses. Generally speaking, new-crop hay cannot be successfully fed until the sweating process in the mow is completed and the hay has cooled. The average coefficients of digestibility of a number of sorts of hay follow:

increases the palatability of the feed, though it probably does not increase its digestibility. Cooked clover hay is often given to poultry with advantage. In general it does not pay to steam or cook hay for stock.

'Hay tea,' properly made, has been successfully used for rearing calves in place of milk. The tea should be supplemented by ground flaxseed and middlings cooked in it, or some other suitable material.

Hay is commonly stored under cover or in stacks in the open field. It is now generally baled for shipping, in which form it is conveniently handled and stored.

HAY, FRANCIS (?-1631). A Scottish nobleman, ninth Earl of Errol, identified with attempts to reestablish the Roman Catholic religion in his native country. He became a convert to that religion, and after succeeding to the earldom in 1585 he joined Huntly in the attempt to induce Philip II. of Spain, after the defeat of the Armada, in 1588, to fit out another expedition for the conquest of England. On discovery of his treachery, he was summoned before the Council to answer the charge of attempting to subvert the Protestant religion, and upon refusing to appear he was denounced as a rebel. The Earl's career from 1589 to 1617 was little more than a series of attempts to carry out his main design, during which he engaged in conspiracies, fomented rebellions, was tried, imprisoned, and afterwards released. The Scottish King, James (afterwards James I. of England), was unwilling to exercise extreme severity upon Errol, though he knew of his guilt, and warned him of the futility of his attempts. After an abortive rebellion, in which the Earl and Huntly were the leaders, the former was sent to prison in

Hay is fed 'long,' i.e. whole, or 'chopped,' i.e. more or less finely cut. Where a large number of animals are fed, chopping has some advantages. If a little water is added to the chopped hay it lays the dust. Meal may be added to the moistened chopped hay. Such a ration is especially recommended for hard-worked horses which are in the stable only at night. If animals have abundant time for chewing and digesting, chopping is not very desirable. Growing pigs and breeding swine are often benefited by a reasonable allowance of steamed or boiled and chopped alfalfa or clover hay. The boiling or steaming

Edinburgh Castle for an alleged share in Bothwell's attempt to capture Falkland Palace while the King was occupying it. In 1592 he was again denounced as a rebel for alleged complicity in Spanish intrigues, but was finally ordered to choose between exile and accepting the Protestant religion. Having failed to make a choice he was declared a traitor. The Earl and Huntly rebelled in 1594, and defeated a force sent against them by the King. Soon afterwards they fled the country, but returned in 1596, and the following year Errol, having complied with the King's conditions by abjuring his religion and subscribing

to the Confession of Faith, was restored to his rights and possessions. The genuineness of his profession was, however, doubted by the Scotch Kirk, and after various unsuccessful attempts to satisfy themselves on that point, Errol was imprisoned in Dumbarton Castle, but was finally released in 1617.

HAY, GEORGE (1729-1811). A Scotch Catholic bishop and polemical writer, born in Edinburgh, where he was educated and became a surgeon's apprentice. In 1778, after the death of Bishop Grant, he became Vicar Apostolic of the Lowlands. A year later his chapel-houses were mobbed and burned and his library ruined by fanatics, who were roused by the fear that Government purposed more lenient treatment of the Catholics. Hay was influential in the reestablishment of the Scots College at Rome, and in building a Catholic seminary at Aquhorthies (1799). His most important work was *The Scripture Doctrine of Miracles* (1775). A complete edition of his works was published in five volumes at Edinburgh.

HAY, JAMES, Earl of Carlisle (c.1575-1636). An English diplomat and favorite of James I. He was born at Pitscorthy, Fifeshire, and educated in France. James knighted him, took him to England, gave him a rich wife, Honora, heiress of Sir Edward Denny, and repeatedly paid off the debts which Hay, who was an easy-going spendthrift, was always making. In 1619, soon after his creation as Viscount Doncaster, he was sent on a mission to Bohemia, where James's son-in-law, Frederick of the Palatinate, was for a short time King. A little later we find him in France (1621-22), exerting himself unsuccessfully in an effort to make peace between Louis XIII. and the Huguenots. He was made Earl of Carlisle in 1622, and was sent back to Paris two years later to arrange a marriage between Charles and Henrietta Maria, and advised the King against promising Richelieu that there should, in event of the marriage, be any abatement of laws against Catholics. Carlisle seems to have distrusted the French alliance now as strongly as he had before desired it; and he retired from politics when it became apparent that the Court policy was for peace with France. The title of Carlisle became extinct on the death of his son James (1660). See HAY, LUCY.

HAY, JOHN (1838—). An American statesman, author, and journalist. He was born in Salem, Ind., of Scotch ancestry, October 8, 1838; graduated at Brown University in 1858; and then studied law at Springfield, Ill., where he became acquainted with Abraham Lincoln, then the acknowledged leader of his profession and of the Republican Party in the State. He was taken into the latter's law office, and in 1861 was admitted to practice in the Supreme Court of Illinois. He accompanied President-elect Lincoln on his memorable journey to Washington, and served as his assistant private secretary until his (Lincoln's) death, with the exception of a brief interval, during which he served as adjutant and aide-de-camp to the President, and of a few months, when he served in the army under Generals Hunter and Gillmore. In the latter capacity he rose to the rank of major, and was subsequently brevetted lieutenant-colonel and colonel. After Mr. Lincoln's death, he went to Paris as secretary of legation, which position he held for three

years; he then served for more than a year as secretary of legation and chargé d'affaires at Vienna, and after a short interval went in the same capacity to Madrid, where he remained for another year. From 1870 to 1875 he was an editorial writer on the *New York Tribune*, and for a short time acted as editor-in-chief of that journal. In the meantime he had married the daughter of Amasa Stone, of Cleveland, Ohio. From 1879 to 1881 he served under President Hayes as First Assistant Secretary of State. He then was again engaged in literary pursuits until March 19, 1897, when he was appointed by President McKinley Ambassador to Great Britain, to succeed Thomas F. Bayard. His service in this capacity was marked by thoroughness, skill, and tactfulness. His public addresses were models of their kind and examples of diplomatic propriety. With excellent social gifts, he made a favorable impression on English society, and did much to promote friendliness between the two nations. On September 20, 1898, he was appointed Secretary of State, to succeed William R. Day, who had just resigned. His conduct of the foreign affairs of the nation was, from the first, characterized by unusual vigor, tact, and sagacious foresight. Perhaps his greatest diplomatic achievement was the maintenance of the 'open-door' policy in China, and the consequent postponement of the threatened dismemberment of that nation. Not content with verbal assurances from the European nations, Secretary Hay demanded and secured written guarantees that the 'open door' should be maintained in China. During the British war in South Africa he used his good offices to secure the neutrality of the Continental European powers. Other notable diplomatic achievements of Secretary Hay were the settlement of the Samoan dispute, as a result of which the United States secured Tutuila, with an excellent harbor in the Pacific; the settlement of the dispute with Great Britain over the Alaska boundary, temporarily by the conclusion of a *modus vivendi* in 1898, and by treaty in 1903; the negotiation of reciprocity treaties with Argentina, France, Germany, Cuba, and the British West Indies; the negotiation of a treaty with Great Britain relative to the construction of an interoceanic canal (see HAY-PAUNCEFOTE TREATY); the negotiation of new treaties with Spain; and the negotiation of a treaty with Denmark for the cession of the Danish West India Islands.

Colonel Hay won literary distinction by *Pike County Ballads* (1871) and *Castilian Days* (1891). With John G. Nicolay he wrote an authoritative life of Lincoln, entitled *Abraham Lincoln: A History* (10 vols., 1890). A once popular anonymous novel, *The Bread-Winners* (1883), is generally attributed to him, but thus far without sufficient evidence.

HAY, JOHN, Marquis of Tweeddale. See TWEEDDALE, JOHN HAY, Marquis of.

HAY, LUCY, Countess of Carlisle (1599-1660). An English political intriguer, daughter of Henry Percy, Earl of Northumberland. At the age of eighteen, much against the will of her imprisoned father, she married James Hay (q.v.). Cartwright, Herrick, Carew, and Suckling sang of her beauty and wit. She soon gained a high place in the favor of the Queen, and did much for Strafford with her influence. When Strafford was dead she became the spy and servant of the

Parliamentary Party, which she warned of the plan to arrest the five members. In both civil wars she was intimate with the aristocratic Presbyterian Party, and intrigued in behalf of Holland. In 1649 she was arrested, imprisoned, and threatened with the rack, and was held in confinement until 1652. She died suddenly in 1660, a few months after she had renewed her intrigues. Three portraits of her by Vandyck are engraved in Lodge's *Portraits*.

HAY ASTHMA. See HAY FEVER.

HAY-BOTE, or **HEDGE-BOTE** (from *hay*, AS. *hege*, *haga*, OHG. *hag*, Ger. *Hag*, Eng. *hawe*, hedge + ME. *bote*, AS. *bōt*, Goth. *bōta*, OHG. *buoza*, Ger. *Busse*, Eng. *boot*, advantage, recompense). A common-law right of a tenant for life or years to cut timber for the repair of hedges and fences. It belongs to the class of rights known as estovers. See ESTOVER.

HAYDEN, FERDINAND VANDEVEER (1829-87). An American geologist, born in Westfield, Mass. Graduating from Oberlin College in 1850, he studied medicine at Albany, N. Y., and in 1853 commenced the series of scientific explorations which have made his name famous, by an examination of the remains of extinct animals found in the Bad Lands of Dakota. The next three years were passed in a similar exploration of the Upper Missouri, resulting in the discovery of an important collection of fossils, which was afterwards divided between the academies of science of Saint Louis and Philadelphia. Being appointed geologist of a Government expedition to the Northwest, he acted in this capacity until the outbreak of the Civil War, when he entered the Union Army as a surgeon. He rose to be chief medical officer of the Army of the Shenandoah. In 1865, and until 1872, he was professor of geology and mineralogy in the University of Pennsylvania, vacating this post on account of his duties in connection with the United States Geological Survey of the Territories, which had been placed in his charge in 1867. He made important contributions to the geological, geographical, and botanical knowledge of the Western States, mostly included in the reports of the surveys issued by the Government. He was a member of many scientific societies in both America and Europe.

HAYDN, hī'd'n, JOHANN MICHAEL (1737-1809). An Austrian musician, brother of Josef Haydn, born at Rohrau. From 1745 to 1755 he was a chorister at Saint Stephen's, Vienna, and, after studying the violin and organ, assistant organist there. In 1757 he was kapellmeister at Grosswardein, in 1762 concert-meister to Archbishop Sigismund at Salzburg, and in 1777 organist of the cathedral and of Saint Peter's Church in that city. In 1800 his property was destroyed by the French occupation of Salzburg, but his brother and friends and the Empress Marie Therese came to his assistance, and he was enabled to open a school of composition. This enterprise was very successful, among its pupils being Weber and Reicha. His best works were his oratorios, masses, cantatas, and anthems, which his brother held in the highest estimation. He published little, but his compositions embrace almost every department of music, including operas, symphonies, songs, quintets, marches, serenades, etc. He died at Salzburg.

HAYDN, JOSEF (1732-1809). A famous Austrian composer. He was born at Rohrau, Lower Austria, March 31, 1732. His father was a traveling wheelwright, with a natural love of music. The sweetness of the boy's voice and his correct ear for pitch were noted early. His cousin, Matthias Frankh, a schoolmaster and choir-master in Hainburg, took the lad, whom the father had destined for the Church, to his home for musical instruction. Though treated at times with much harshness, he undoubtedly was started on his career by Frankh.

From his eighth to his eighteenth year Haydn was a pupil in the choir school of Saint Stephens, Vienna, Kapellmeister Reuter having heard him sing in Hainburg. Though wretchedly poor and often without sufficient food, he studied diligently, and at thirteen composed a mass. When his voice broke, Reuter made his boyish prank in cutting off a fellow-pupil's queue the occasion for his dismissal. A former chorister whom he chanced to meet took him in and a kind-hearted tradesman, named Buchholz, loaned him 150 florins. Haydn not only repaid the loan, but years afterwards remembered Buchholz's granddaughter in his will. Gratitude, tolerance, and the never-failing good humor which is reflected in his music, and which even a wretched marriage could not mar, mingled in his nature.

Through Metastasio, the Italian poet and librettist, Haydn secured pupils, himself taking lessons in composition from Porpora, for which he paid by menial duties. In 1758 his circumstances changed for the better. Through Baron Fürnberg, for whom he had composed his first quartet, and Countess Thun, he was appointed musical director to Count Franz Morzin, for whose orchestra he wrote his first symphony. It was during this incumbency that he married the eldest daughter of a Viennese wigmaker, named Keller. He had loved the younger daughter, but she entered a convent, and urged by her father he married her sister instead. His wife was utterly unsympathetic and unworthy of him. She tore up his manuscripts for curl-papers and pie-forms, squandered his earnings for finery, and even selected a house to live in in anticipation of her widowhood. By an irony of fate Haydn survived her and went to live in this very house.

In 1760 he became kapellmeister to Prince Paul Anton Esterházy, and retained this position under his original patron's successors till near the time of his death. Prince Nikolaus played upon the barytone (a stringed instrument superseded by the 'cello), and for this instrument alone Haydn wrote nearly two hundred pieces. For operatic performances in the princely household he composed more than a dozen operas, and for concerts numerous symphonies, quartets, and sonatas. In 1772, at the summer seat, Esterházy, he brought out the "Abschieds" (Farewell) symphony, under circumstances which are variously described. Most probably, however, the Prince had denied the orchestra leave of absence to visit their families, and they had decided to leave his service. Toward the close of the symphony one player after another extinguished his candle and left. Finally only the violin leader remained. Having played the last phrase, he too blew out his candle and departed. The music and the action of the players moved the Prince so deeply that he granted their request.

Haydn and Mozart became acquainted in 1781, and from then until Mozart's death a close and generous friendship existed between them. Beethoven (q.v.) was a pupil of Haydn's for about a year, but, despite the fact that the latter praised some of his compositions, he soon grew dissatisfied with his teacher. Haydn's fame, however, steadily increased, and when, in December, 1791, he arrived in London under engagement to Salomon, the violinist, he was the musical lion of the season, as he was also on his second visit, in 1794. His *Salomon* symphonies were composed for his London concerts. The famous Austrian national anthem he composed in 1797, and in 1798 produced his oratorio *The Creation*, following it with *The Seasons* in 1801. His last years were ailing, and his undermined constitution could not stand the shock of the bombardment of his beloved Vienna by the French in May, 1809. After the third shot he fell into convulsions, and on May 31st he died.

Haydn was honored even during his lifetime by a monument erected near his birthplace by Count Harrach, in whose service his mother had been. He attended the unveiling on his return from his first London season. His musical output was enormous. It included over a hundred symphonies and nearly a hundred quartets. His chief service to music is that he expanded the sonata form of Philip Emanuel Bach, using it in the quartet and orchestra as well as on the piano, and thus in chamber music and in symphony was the precursor of Mozart and Beethoven. His *Seven Words on the Cross*, composed as an instrumental passion for the Cadiz Cathedral, is frequently given at church on Good Friday in his brother's (Michael Haydn's) arrangement as an oratorio.

HAYDON, BENJAMIN ROBERT (1786-1846). An English historical painter. He was born at Plymouth, January 26, 1786, the son of a printer and publisher. He was educated at Plymouth, where the headmaster encouraged his sketching, and at Plympton. As an apprentice to his father he worked three years, and during this time was attacked by a malady that caused a dimness of vision, which in after life prevented his executing small pictures. In 1804 he went to London and spent two years studying, drawing from the cast by himself, attending the academy schools and the lectures on anatomy by Charles Ball. He was one of the first of the English artists to appreciate the Elgin Marbles, and it was largely through his influence that they were acquired by the nation. From his studies of them he received inspiration for the painting "Dentatus" (1809), which brought him a premium of 100 guineas at the Academy Exhibition. Although his name was proposed for election as a member of the Academy, it was not accepted, owing probably to his action in withdrawing a picture, "Romeo and Juliet," because it was not given the place of honor which it deserved. His quarrel with the Academy was further aggravated by other slights, and by letters written by him-

self for publication, which alienated many of his powerful friends. In 1821 he married Mary Hymans, a beautiful widow, who did much to lighten his disappointments in life.

His life was a heroic struggle against adverse circumstances, partially the fault of others, but also as a result of his unscrupulousness in money matters, vanity, and egotism. His *Journal*, consisting of twenty-six manuscript volumes, contains a vivid record of this struggle. He painted only very large historical canvases, which involved him in debt, and he was several times an inmate of the debtors' prison. During his second confinement he painted the "Mock Election," which George IV. purchased for 500 guineas.

Although his ability was not recognized by the Academy, he numbered among his admirers such men as Keats and Wordsworth, both of whom wrote sonnets to him, Sir Walter Scott, Charles Lamb, Southey, Hazlitt, and Mrs. Siddons. They especially appreciated his ambitious plans for the promotion of English art, which he inculcated in his letters, pamphlets, books, and lectures. Among his published works the best-known is his *Lectures on Design* (London, 1844-46), delivered at the Mechanics' Institute at London, and often repeated, not only in the principal cities of England, but at the University of Oxford. As a teacher he was equally successful, numbering among his pupils Sir Charles Eastlake, Charles and Thomas Landseer, William Harvey, George Lance, and William Berwick. But although his ideas on schools of design and the decoration of the Houses of Parliament were adopted, he was neglected when it came to carrying them out. He struggled through life, mostly in great poverty, and finally, overcome by the mental strain consequent on the failure of the exhibition of his last two pictures, he committed suicide in the Thames, June 22, 1846.

Haydon's drawing shows great knowledge of anatomy, although it is often defective in proportions; his color, at times rich, is not always harmonious; his conceptions are always vigorous. The works which attracted most attention during his lifetime were: "Joseph and Mary Resting on the Road to Egypt" (1806); "Dentatus" (1809); "Romeo and Juliet" (1809); "Judgment of Solomon" (1814); "Christ's Entry into Jerusalem" (1820), now in Philadelphia; "Lazarus" (1822), now in the National Gallery; "Christ Blessing Little Children;" the "Anti-Slavery Society at Freemasons' Hall" (1840), now in the National Portrait Gallery. Among his other works are "Venus and Anchises," "Alexander and Bucephalus," "Napoleon," the "Reform Banquet," "Cassandra," "Xenophon," "Eucles" (National Gallery), "The Mock Election," "Maid of Saragossa," the "Banishment of Aristides," "Nero Playing the Lyre During the Burning of Rome." His smaller works are unimportant.

Consult: Haydon's *Correspondence and Table Talk*, edited by his son, Frederick Wordsworth Haydon (London, 1876); Tom Taylor, *Life of Haydon* (London, 1883); Redgrave, *A Century of Painters of the English School* (London, 1866).

HAYDUCKS, hî'dyks. See **HATDUCKS**.

HAYEL, hä-yêl', or **HAIL**, hä-êl'. Capital of the Sultanate of Shomer, situated in the northern part of Arabia, about 250 miles northeast of Medina (Map: Asia, D 6). It is a walled town, and a place of considerable trade. Population, 25,000.

HAYEM, á'yän', GEORGES (1841—). A French physician, born in Paris. He was educated at the University of Paris, where he afterwards became a professor in the faculty of medicine. He was made a physician of the Saint Antoine Hospital, and in 1886 was elected a member of the Academy of Medicine. From 1873 to 1893 he edited the *Revue des sciences médicales en France et à l'étranger*. His works include: *Des hémorragies intra-rachidiennes* (1872); *Du sang et de ses altérations anatomiques* (1889); and *Leçons de thérapeutique* (1887-93).

HAYES, hāz, AUGUSTUS ALLEN (1806-82). An American chemist, born at Windsor, Vt. He graduated at the Norwich Military Academy in 1823 and began the study of chemistry under Professor Dana at Dartmouth. Here he distinguished himself by his researches on the proximate constituents of American medicinal plants, and by his discovery of the organic alkaloid sanguinaria, a compound remarkable for the brilliant colors of its salts. He was for a time assistant professor of chemistry in the New Hampshire Medical College, and while there in 1827 investigated the compounds of chromium, and his paper on this subject was highly praised by Berzelius, the eminent Swedish chemist. He carried out several other interesting researches in organic chemistry, as well as on many questions in engineering. He was a contributor to the *Proceedings of the American Academy* and of the Boston Society of Natural History, the *American Journal of Science* and the *Annual of Scientific Discovery*. In 1837 his investigations into the generation of steam and the economy of fuel led to the construction of improved furnaces and boilers.

HAYES, ISAAC ISRAEL (1832-81). An American Arctic explorer, born in Chester County, Pa. He went with Captain Kane as surgeon on the second Grinnell expedition in search of Sir John Franklin (1853-55), and upon his return was fired with a desire to verify his conviction of the existence of an open polar sea. Through the influence of several scientific societies he succeeded in obtaining financial support, and set out from Boston in 1860, with two astronomers and but twelve other persons, on board the *United States*. The first winter he spent near Littleton Island, latitude 78° 18' N., but the following spring, if his observations were correct, he reached latitude 81° 35' N., longitude 70° 30' W., farther north than any of his predecessors in this quarter of the Arctic regions had been. The result of his explorations was to confirm him in the opinion that an open route to the pole was practicable for steamships in summer from Cape Frazer. He made a voyage to Greenland in 1869, published *An Arctic Boat Journey* (1860); *The Open Polar Sea* (1867); *Cast Away in the Cold* (1868); and *The Land of Desolation* (1872), and was honored by medals from the geological societies of Paris and London.

HAYES, RUTHERFORD BIRCHARD (1822-93). The nineteenth President of the United States. He was born in Delaware, Ohio, October 4, 1822. His paternal and maternal ancestry, it is claimed, can be traced back, each to a Scottish chieftain of noble blood, and he was a descendant in the sixth generation of George Hayes, who left Scotland in 1680 and settled at Windsor, Conn. His grandfather, Rutherford Hayes, born

in New Haven, Conn., in 1756, settled in Brattleboro, Vt. Here the father of the President, also named Rutherford, was born. His parents emigrated to Ohio shortly before his birth. When the boy was sixteen years old he was sent to Kenyon College, where he graduated at the head of his class in 1842. He studied law for two years in the office of Thomas Sparrow, of Columbus, and subsequently spent two years (1843-45) in the Harvard Law School. In 1845 he was admitted to the bar at Marietta, Ohio, and soon afterwards entered into practice at Fremont, the residence of his uncle Sardis Birchard, then a wealthy banker. In 1849 he removed to Cincinnati, where he soon gained a remunerative practice, and became prominent in his profession. In 1852 he married Miss Lucy W. Webb, daughter of Dr. James Webb, of Chillicothe, Ohio. In 1856 he was nominated as a candidate for judge of the Court of Common Pleas, but refused to accept the nomination, although later he served as City Solicitor. In 1861, when the Civil War broke out, he enlisted for the whole war, and on June 7th was commissioned as major of the Twenty-third Ohio, of which W. S. Rosecrans was colonel. To the regiment was assigned the duty, at Clarksburg, W. Va., of protecting the Baltimore and Ohio Railroad, and of defending the border from raids; and Major Hayes took a prominent part in various expeditions necessary for the defense of the position. He served for a time as judge-advocate of the Department of Ohio, and in August, 1862, he was promoted to the colonelcy of the Seventy-ninth Ohio, but he preferred to remain, with the rank of lieutenant-colonel, with the Twenty-third, which had been incorporated with Burnside's command in the Army of the Potomac. At South Mountain (q.v.) the Twenty-third, led by Hayes, was hotly engaged, more than a hundred of Hayes's men falling dead or wounded, and he himself being slightly wounded. There was a pause for reënforcements, when a dangerous flank movement of the enemy was discovered, and Hayes was again seen at the head of the regiment. He was finally carried, fainting with loss of blood, from the field. Upon his recovery he was promoted to the rank of brigadier-general, and placed in command of the Kanawha division, of which his old regiment formed a part. He remained at Kanawha Falls until March 15, 1863, when the division was ordered to Charleston, W. Va. After this he led in several important expeditions, notably in that which he himself organized to dispute the retreat of Morgan (q.v.) and his band after their raid through Ohio. By a quick movement he cut off Morgan's retreat and forced him to surrender. In the famous raid upon the Virginia and Tennessee Railroad, in May, 1864, he led the principal assault upon the enemy's fortifications with admirable boldness and success. He took an honorable part in the attack on Lynchburg, June 18th, covering the retreat of the Union forces under dangerous conditions with perfect success. In the campaign of the Shenandoah, under Sheridan (q.v.), his services were conspicuous and valiant. In the battle of Winchester especially he displayed great coolness and courage in the most trying circumstances. For his gallant services Hayes was brevetted major-general.

He was a Republican from the formation of the party, and had taken an active part in the

political campaign of 1860. His achievements in the war made his name popular in Ohio, and when the Republicans of the Second District felt the need of a strong candidate for Congress, he consented to accept the nomination, with the understanding that he would not take the seat unless the war should meantime be ended. When after the close of the war, he entered Congress, he at once attracted attention by his ability. He was reelected in 1866, but had only served through his first term when the Republicans of Ohio, in 1867, nominated him as their candidate for Governor, under the conviction that he was the only man whom they could hope to elect. He was chosen by a majority of 3000, and reelected in 1869 by a majority of 7518. He was elected for the third time in 1875, and while occupying the place was nominated by the Republican Party as its candidate for President of the United States, William A. Wheeler being nominated for Vice-President. The nominees of the Democratic Party were Samuel J. Tilden and Thomas A. Hendricks. The contest was severe and close, and disputes arose as to the electoral votes of several States. After a period of great tension all the contested cases were decided in favor of Hayes by the Electoral Commission (q.v.), and having a majority of one electoral vote (185 to 184), he was duly inaugurated on March 4, 1877. Aside from violent partisan disputes upon the questions adjudicated by the Electoral Commission, his administration was admitted by men of all parties to have been pure and honorable. An effort was made to reduce the evil of using appointments to office as rewards for partisan services, but this policy did not meet with hearty support. The President also failed to maintain close harmony with the party leaders in his attitude toward the 'reconstructed' States, from which he aimed to withdraw the Federal troops, even against the vigorous demands of the radicals for a continuation of the military supervision. He was generally recognized as a pacificator at a time when conciliation was essential to peace. Upon all political questions save those above referred to he was in full harmony with the Republican Party, and by his courageous and unflinching exercise of the veto power prevented the adoption of measures calculated to injure the credit of the country and hinder a return to specie payments. He also, by the interposition of the same power, prevented the repeal of the laws enacted by Congress, under the express authority of the Constitution, to guard the purity of national elections. After his retirement from public office President Hayes devoted himself as a private citizen to the support of philanthropy and education. As a member of the Peabody Education Board for the promotion of education in the South, as the first president of the States Board for the instruction of freedmen, and as president of the National Prison Association, he set an example of assiduity in attendance at the meetings of the boards and of patient and far-sighted counsel on the questions brought before him. He died January 17, 1893. Consult: Wilson (editor), *The Presidents of the United States* (New York, 1894); and a campaign biography by Howard, *Life, Public Services, and Select Speeches of Rutherford B. Hayes* (Cincinnati, 1876). For an account of the administration of Hayes, see the article UNITED STATES.

HAYESINE (named in honor of the American chemist A. A. Hayes). A hydrous calcium borate found in Peru and elsewhere in South America. It is a source of boric acid and borax (q.v.). Hayesine is now generally believed to be ulexite (q.v.).

HAYEZ, FÁTS, FRANCESCO (1791-1882). An Italian genre and historical painter, born in Venice. He studied under Maggiotto at the Venice Academy, and afterwards at the Academy of Milan and under Palagi in Rome. In 1820 he was appointed professor at the Milan Academy, and became head of the romantic movement in Italian art. He is a noted and vigorous colorist. Among his works are frescoes in the Vatican and the Venice Academy, and the following pictures: "The Two Foscari" (Vienna Museum); "Thirst of the Crusaders," "The Farewells of Pietro Rossi and His Family" (1820); "The Flight of Bianca Capello" (1854, National Gallery, Berlin); "The Battle of Magenta," and a portrait of Cavour.

HAY FEVER, HAY ASTHMA, HAY COLD, ROSE COLD, or AUTUMNAL CATARRH. A nervous affection which recurs annually at about the same time every year and lasts several weeks, characterized by a profuse flow of secretion from the nose, as well as of tears from the eyes, with frequent sneezing, general malaise, irritability, insomnia, increased perspiration, and in many cases asthma. The eyes flinch in bright light, headache occurs daily, appetite is lessened, and occasionally there is fever. In some patients the attack appears in June and lasts about a fortnight. This is termed *rose cold*. Many suffer first in July, during haying; but probably the greater number begin to suffer early in August, and are relieved only on the approach of frost in October. The cause appears to be threefold: (1) A central nervous disease, with the lesion probably in the floor of the fourth ventricle in the brain, as in spasmodic asthma. (2) Intra-nasal deformity, as a deviating septum, or distorted and chafing turbinates. (3) A special pollen, some plants affecting some and failing to excite others; while during the whole year fine dust causes in these patients sneezing, coryza, and slight rhinitis, lasting an hour or so. Removal to the seashore or a sea voyage benefits a few patients; while a sojourn in the mountains at an altitude of 1000 feet or more benefits a greater number. Of the mountains in the eastern part of the United States the White Mountains have the greatest reputation with regard to the effect of their atmosphere upon hay-fever patients. On returning home before frost, however, the affection recurs. It is said that most hay-fever patients are people of considerable intellectual development; certainly all are neurotics. Arsenic, iodides, bromides, and acetanilid benefit some. Nasal sprays and internal administration of extract of suprarenal gland (adrenalin) are serviceable in many cases, relieving the nasal stenosis. In England and on the Continent the disease appears to be of milder type, and to run a course of only a month. A Hay Fever Association, composed of sufferers from the disease, exists in the United States, which meets every year to compare results from new remedies.

HAYGOOD, ATTICUS GREENE (1839-96). An American clergyman of the Methodist Episcopal Church (South), born in Watkinsville, Ga. He graduated at Emory College, Georgia, in 1858,

and soon afterwards entered the ministry. When General Sherman evacuated Atlanta, he was one of the ministers sent there to gather together the scattered Methodists and rebuild the churches. Between 1870 and 1875 he edited the Sunday-school publications of the Southern branch of the Church. He was president of Emory College from 1876 to 1894, and during a part of that time was editor of the *Wesleyan Christian Advocate*. Large sums of money were placed in his hands to promote various institutions, and in 1883 he was elected general agent of the Slater fund of \$1,000,000 for the education of Southern negroes. He declined an election as bishop of the Methodist Episcopal Church (South) in 1872, but accepted another election in 1890. His published works include: *Our Children*; *Jacknife and Brambles* (1893); and *The Monk and the Prince* (1895).

HAYLEY, WILLIAM (1745-1820). An English poet, born at Chichester. He was educated at Eton and Trinity College, Cambridge. After some ill success as a playwright, he began the production of poetical epistles to his friends, one on *Painting to Romney* (c.1777), for example, and one on *History* (1780) to Gibbon. In *English Bards and Scotch Reviewers*, Byron impales Hayley as the author of the eminently successful poems, *The Triumphs of Temper* (1781) and *The Triumphs of Music* (1804). His prose *Life of Milton* (1794) was a more creditable performance, and through the writing of it he became an intimate friend of Cowper, for whom he was influential in obtaining a pension. Blake's illustrations enhance the value of his *Ballads Founded on Anecdotes of Animals* (1805), and on the whole Hayley was more noted as the friend of great men than for being one himself. Therefore, his *Memoirs*, published in 1823, after his death, are his most interesting contribution to English literature.

HAYM, HİM, RUDOLF (1821-1901). A German writer on philosophy and literary history, born at Grünberg, in Silesia. He studied at the universities of Halle and Berlin, and was a delegate to the National Assembly at Frankfort (1848-49). He wrote a number of biographies, among them: *W. von Humboldt* (1856); *Hegel und seine Zeit* (1857); *Arthur Schopenhauer* (1864); *Herder, nach seinem Leben und seinen Werken* (1877-85); and *Das Leben Max Dünklers* (1890). He also published *Erinnerungen aus meinem Leben* (1901), and edited *Briefe von W. von Humboldt an G. H. L. Nicolovius* (1894). Consult *Philosophische Abhandlungen dem Andenken Rudolf Hayms gewidmet von Freunden und Schülern* (1902).

HAYMARKET, THE. A former market for hay and straw in London, founded in the first half of the seventeenth century, and discontinued in 1830. On the square of the same name, occupying the site of the market, stand the Haymarket and Her Majesty's theatres. Addison wrote *The Campaign* while living there.

HAYMARKET SQUARE RIOT, THE. An occurrence at Chicago, May 4, 1886, in a square in Randolph Street, where an anarchist meeting was in progress. The attempt to disperse the gathering resulted in the killing of seven policemen and the wounding of twenty-seven others, by a bomb, thrown by an unidentified member of the mob, supposed to have been one Schnaubelt. The

actual bomb-thrower was never caught, but August Spies, Adolph Fischer, George Engel, and Albert Parsons were hanged as accomplices on November 11, 1887; Samuel Fielden and Michael Schwab were sentenced to imprisonment for life, and Oscar Neebe for fifteen years; and Louis Ling escaped the gallows only by committing suicide in prison.

HAYMARKET THEATRE. One of the most famous playhouses in London. It was originally built in 1720 by John Potter, on the site of the King's Head Tavern, in the Haymarket, and leased to a French company, whence the appellation, 'the New French Theatre,' by which it was for some time known. Fielding produced his burlesque *Tom Thumb the Great* there in 1730, and in 1734 became manager. Ten years later Charles Machlin assumed its management, and was followed in 1747 by Samuel Foote. In 1776, however, Colman the elder purchased it, and it was managed by him until 1794. In 1820, under Harris's management, the theatre was abandoned and a new one was built near by, which was opened on July 4, 1821, with *The Rivals*. In 1860 it was again removed, its present site being the south end of the Haymarket, opposite Charles Street.

HAYMERLE, Hİ'mër-le, HEINRICH KARL, Baron (1828-81). An Austrian statesman, born and educated at Vienna. He took part in the students' rising in the Revolution of 1848, and narrowly escaped execution. He served in the diplomatic corps at Athens, Dresden, and Frankfort; became Ambassador to Copenhagen in 1864; took part in negotiating the Treaty of Prague (1866); and from Berlin went to Constantinople (1868) and to Athens (1869), thence to The Hague (1872), and in 1877 to the Italian Court. In the following year he took part in the Berlin Congress, and in 1879 succeeded Andrassy as Minister of Foreign Affairs. In this post, which he held till his death, he was especially active in effecting friendly relations with Italy and cementing the alliance with Germany. Consult Arneth, *Heinrich Freiherr von Haymerle* (2d ed., Berlin, 1882).

HAYNAU, Hİ'nou, JULIUS JAKOB, Baron (1786-1853). An Austrian general. He was the natural son of the Elector William I. of Hesse, and was born at Cassel, October 14, 1786. He entered the Austrian service in 1801, and was gradually advanced in rank, becoming colonel in 1830, major-general in 1835, and field-marshal lieutenant in 1844. During the Italian campaigns of 1848-49 he evinced great military talents, but acquired also an unenviable reputation for cruelty, especially in the repression of the insurrection at Brescia, March 31 and April 1, 1849. Haynau was engaged in the siege of Venice, when he was summoned to Hungary to command the Imperial forces in that country. He stormed Raab on June 28th, and on August 9th gained a decisive victory over the Hungarians near Temesvár. After the surrender of the Hungarian main army at Világos, he executed a number of the leading Hungarian generals. In 1850, however, after being loaded with honors, he was dismissed from public service for the intractability of his disposition. In the same year he made a tour of Europe, but so general was the hatred his acts had inspired that he was several times in great danger from mobs, and while in

London was assaulted and beaten by the infuriated draymen of Barclay's brewery. For this insult the British Government declined giving any satisfaction. In Belgium and France he was also received by the populace with strong dislike, but by the vigilance of the authorities was preserved from actual harm. He died at Vienna, March 14, 1853. Consult Schönhal's, *Biographie des Feldzeugmeisters Julius Freiherrn von Haynau* (3d ed., Vienna, 1875), which seeks to vindicate him from charges of cruelty.

HAYNE, PAUL HAMILTON (1831-86). An American poet, born in Charleston, S. C. After the death of his parents he was reared by his uncle, Robert Y. Hayne (q.v.). He studied law after having been educated at South Carolina College, but did little practicing, because he was under no financial necessities, and because his bent was literary. When in his early twenties he edited *Russell's Magazine*, and was connected, as editor or contributor, with other Charleston and Southern publications, notably as contributor to the *Southern Literary Messenger*. He was a prominent member of the small literary coterie of which William Gilmore Simms and Henry Timrod (q.v.), were conspicuous ornaments. In 1855 a volume of his poems appeared; another followed in 1857, and a third in 1859. During the Civil War he saw active service and suffered greatly financially, among other losses being that of his library, which was burned. From 1865 to his death, he resided at a small cottage home near Augusta, Ga., which he called Cope Hill. His health was not good, but he maintained his spirits under his various misfortunes, and won a genuine though limited reputation as a poet, in both the North and his native section. His memory is still cherished warmly in Augusta and the surrounding region. His later publications include: *Legends and Lyrics* (1872); *The Mountain of the Lovers* (1873); and his complete *Poetical Works* (1882). He also edited, with a memoir (1873), the poems of his friend, Henry Timrod, and of Dr. F. O. Ticknor (1879), and wrote memoirs of R. Y. Hayne and H. S. Legaré (1878). Hayne's poetry is the work of a genuine artist, whose qualities, however, are not salient enough to attract greatly the general reader. Although he produced many good poems, in which much of the languorous sweetness of the South may be discovered, it was not his fortune to compose, like his friend Timrod, three or four lyrics of great power and popular appeal. Nevertheless he is one of the most important of Southern writers, and deserves more attention at the hands of historians of American literature than he has hitherto received.—His son, **WILLIAM H. HAYNE** (1856—), born in Charleston, inherited some of his father's poetical ability. His publications include *Sylvan Lyrics* (1893), and many occasional verses in the magazines.

HAYNE, ROBERT YOUNG (1791-1839). An American political leader, prominent as an exponent of the States' Rights view of the Federal Constitution. He was born in Saint Paul's Parish, Colleton District, S. C., on November 10, 1791; was educated in a private school at Charleston; studied law in the offices of Langdon Cheves (q.v.); was admitted to the bar at Charleston in November, 1812, and attained immediate prominence in his profession. During

part of the War of 1812 he acted as a captain in the Third South Carolina Regiment. From 1814 to 1818 he was a Democratic-Republican member of the State Legislature, serving as Speaker of the House in the latter year; and from 1818 to 1822 was Attorney-General of the State. In 1823 he was elected as a States' Rights Democrat to the United States Senate, in which body he quickly became conspicuous as a pronounced strict-constructionist and an advocate of free trade and of 'States' Rights.' He vigorously opposed the tariffs of 1824 and 1828, denounced the anti-slavery programme of the Panama Congress, and in various debates upheld the view that slavery was purely a domestic institution, and as such should be wholly exempt from Federal legislation or interference. He is best known, however, for his great debate with Daniel Webster in January, 1830, arising out of the so-called 'Foote's Resolution,' but covering the important question of the relation of the States to the Federal Government. Hayne began the debate on January 19th, and Webster answered on the following day, while Hayne again spoke on the 21st, 25th, and 27th, and Webster on the 26th and 27th. In these speeches, besides attacking New England, and especially Massachusetts, for the part taken by that section in the War of 1812, he brilliantly upheld the theory that the Federal Government was in reality a compact between the various States, as such; that the Federal Government itself was a party with each of the individual States to the compact thus formed, and that any State, when convinced that that compact had been broken, could for its own protection nullify or arrest the enforcement within her borders of any law deemed to be in violation of the Constitution. He naturally supported South Carolina in her controversy with the Federal Government over the tariff measures of May, 1828, and July, 1832; was a member of the Nullification Convention which assembled at Charleston on November 19, 1832; and as chairman of the 'Committee of Twenty-one,' reported the famous Ordinance of Nullification, which was passed by the Convention on November 24th. Soon afterwards he resigned from the Senate, partly, no doubt, in order that Calhoun might take his seat in that body; and in December he was elected Governor of the State and commander-in-chief of the State forces. On the 13th he delivered his inaugural address, pledging himself to maintain at all hazards the principle of nullification, and on the 20th issued a ringing counter-proclamation to the famous proclamation issued by President Jackson on the 10th. During the whole crisis he administered the executive office with marked ability, and though firmly convinced of the correctness of the position taken by his State, he used his influence on several occasions to restrain the nullificationists from acts of violence. His term as Governor ended in December, 1834. He was Mayor (intendant) of Charleston in 1835-37, and president of the Louisville, Cincinnati and Charleston Railroad from 1836 until his death. He died at Asheville, N. C., September 24, 1839. Consult: Paul H. Hayne, *Lives of Robert Y. Hayne and Hugh Swinton Legaré* (Charleston, 1878); McDuffie, *Eulogy upon the Life and Character of the Late Robert Y. Hayne* (Charleston, 1840); and Lindsay Swift (editor), *The Great Debate Between Robert Y. Hayne, of South Carolina, and*

Daniel Webster, of Massachusetts (Boston, 1898), in the "Riverside Literature Series."

HAYNES, HENRY WILLIAMSON (1831—). An American archaeologist, born in Bangor, Maine, son of Nathaniel Haynes, editor of the *Eastern Republican*. He graduated at Harvard, studied law, and practiced for a few years. Then he was appointed professor of Latin, and later of Greek, in the University of Vermont, a chair from which he resigned in 1873, to make archaeological researches in Europe and in Egypt. His memoirs on the Paleolithic Age in Egypt (1878) won him a medal and a diploma from the Anthropological Congress of that year in Paris, and afterwards were published in the papers of the American Academy of Arts and Sciences. Haynes was long a fellow of the American Association for the Advancement of Science, and recording secretary of the Massachusetts Historical Society.

HAYNES, JOHN (?-1654). An English Colonial Governor in New England. He was born in Essex, but emigrated to Massachusetts with other Puritans in 1633, and the following year tried to found a colony on the Connecticut River. He tried again (1636), after he had been for two years the third Governor of Massachusetts Bay, and he ultimately succeeded, becoming the first Governor of Connecticut and one of the five framers of that Colony's Constitution. That the colonists approved his rule is evident from his reelection as often as the law allowed. In Bancroft's *History of the United States*, vol. i., he is described as being "of a very large estate and large affections; of a heavenly mind and a spotless life; of rare sagacity and accurate but unassuming judgment; by nature tolerant, ever a friend of freedom."

HAY-PAUNCEFOTE TREATY. The name applied to the convention negotiated in 1901 by John Hay on the part of the United States, and Lord Pauncefote on the part of Great Britain, which abrogated the Clayton-Bulwer Treaty (q.v.), and declared the policy which would control the United States in the construction and maintenance of an Isthmian canal between the Atlantic and Pacific Oceans. The statement in President McKinley's annual message to Congress in 1898, that the construction of the canal had become a national necessity, led to diplomatic correspondence that resulted finally in the opening of negotiations, with the end in view of so modifying the Clayton-Bulwer Treaty that, without affecting the general policy of neutrality enunciated therein, the United States would be enabled to proceed with the canal's construction. The treaty then negotiated, and transmitted to the United States Senate by President McKinley on February 5, 1900, provided: (1) For the construction of the canal by or under the auspices of the United States Government; (2) for its neutralization on the same basis as the Suez Canal; and (3) for an invitation to other powers to join in guaranteeing such neutrality. The convention was finally ratified by the Senate on December 20, 1900; but with three amendments, the first of which provided that the restrictions contained in the second article, based on the Suez convention, should not apply to such measures as the United States might find it necessary to take for their own defense and the maintenance of public order; the second explicitly stated that the Clay-

ton-Bulwer Treaty was thereby suspended; and the third struck out the provision in regard to the guarantee to be asked of other non-constructing powers. In its amended shape Great Britain refused to ratify the convention, and it expired by limitation on March 5, 1901. Negotiations for a new treaty were immediately started, however, by Secretary of State Hay and Lord Pauncefote; the new convention was signed by them on November 18, 1901, transmitted to the Senate by President Roosevelt on December 5th following, and ratified by that body, with but slight opposition, eleven days later. The principal differences between the first and final treaties were three in number: (1) No guarantees of the canal's neutrality were to be asked either of Great Britain or any other power; (2) the Clayton-Bulwer Treaty was specifically abrogated, although the general principle of neutrality contained therein was retained; (3) certain undefined rights of control were to be allowed to the United States in time of war, the exact nature and extent of which was not specified, but there was no requirement that the canal should be kept open and free in time of war as in time of peace, nor was there a prohibition of the erection of fortifications commanding the canal or its adjacent waters.

HAY RIVER. A river of Athabasca, Can., which rises in the Rocky Mountains, and flows northeast, emptying into the Great Slave Lake (Map: Northwest Territories, F 3). Its length is 350 miles, of which 140 are navigable. The two Alexandra Falls, averaging 900 feet wide and about 250 feet high, occur in its course.

HAYS. A city and the county-seat of Ellis County, Kan., 289 miles west of Kansas City, on Big Creek, and on the Union Pacific Railroad. It has grain-elevators, flour-mills, machine-shops, etc., and a trade in flour, grain, and live stock. Hays is the seat of the western branch of the State Normal School and of an agricultural experiment station, comprising some 2000 acres, of the State Agricultural College. Population, in 1890, 1242; in 1900, 1136.

HAYS, ISAAC (1796-1879). An American physician, born in Philadelphia. He graduated at the University of Pennsylvania in 1816, studied medicine there for four years, and subsequently devoted himself largely to editorial work on medical journals. He was sole editor from 1827 to 1869 of the *American Journal of the Medical Sciences*; and was the founder of the *Medical News* in 1843, and of the *Monthly Abstract of Medical Science* in 1874; was president of the Academy of Natural Sciences in Philadelphia from 1865 to 1869; and was an active member of the Philosophical Society. He was also one of the founders of the Franklin Institute, was its secretary for several years, and at the time of his death was its oldest member. He was one of the oldest members, and for a time an officer of the College of Physicians of Philadelphia; also one of the founders of the American Medical Association, and author of its code of ethics, which has been adopted by all the medical societies in the country. He edited several important works on medicine.

HAYS, WILLIAM JACOB (1830-75). An American animal painter, born in New York. In order to paint animals, he visited the upper waters of the Missouri and Nova Scotia. Some of his pictures are: "The Herd in the Moor" (a herd of

buffaloes); "The Prairie-Dog Village;" "A Bison Bull at Bay;" "Prairie on Fire;" and "Herd of Caribou in Nova Scotia." Although Hays was not a colorist, his work is fresh and spirited.

HAYTER, Sir GEORGE (1792-1871). An English historical and portrait painter, born in London. He was the pupil of his father, Charles Hayter, a miniature painter, and of the Royal Academy. Afterwards he traveled much abroad. On his return he became painter to Queen Victoria. A number of his works are official pictures painted in this capacity; they include "The Coronation of Queen Victoria." His work, executed in detail, is mannered and spiritless.

HAYTER, HARRISON (1825—). An English civil engineer. He was born at Falmouth, and was educated at King's College. His first appointment was upon the construction staff of the Great Northern Railway. Among the other works with which he became associated are the Severn Tunnel, the Charing Cross and Cannon Street bridges in London, and one in India nearly a mile long; he built harbors and railways in England, and upon the Continent. His principal achievements were the canal at Amsterdam, the docks at Holyhead, and those at Buenos Ayres.

HAYTI, há'ti. See HAITI.

HAYWARD. The county-seat of Sawyer County, Wis., 58 miles southwest of Ashland; on the Namakagon River, and on the Chicago, Saint Paul, Minneapolis and Omaha Railroad (Map: Wisconsin, B 2). It has a public library and a United States Government Indian School. Lumbering is the most important industry. Population (town), in 1900, 2720.

HAYWARD (AS. *hæigweard*, from *haga*, OHG. *hag*, Ger. *Hag*, Eng. *hau*, hedge + *weard*, OHG. *wart*, Ger. *Wart*, guard). The name originally given in England to one who kept the common herd of cattle of a town, or of a manor, when the copyhold or other tenants had the right of sending cattle to graze. In the New England villages, particularly of Massachusetts, the name hayward was given to the keeper of the pound for strayed horses and cattle. The word is not now in general use in the United States.

HAYWARD, ABRAHAM (1801-84). An English essayist, born at Wilton, near Salisbury. He received his education at home with a tutor, and afterwards in the fine library of the solicitor to whom he was articled. While a student at the Inner Temple, London, he attracted attention as the joint editor of a law magazine, and also as a debater in the same club with J. S. Mill, whom he wrote against in later years. As a result of two German sojourns, Hayward made an acceptable translation of Goethe's *Faust* (1833), of which a second and enlarged edition was published the following year, and was thus introduced into the society of such men of letters as Lockhart, Macaulay, and Sydney Smith. He wrote a book upon *The Art of Dining* (1852), besides numerous treatises upon legal subjects, a travel sketch, critical essays on the authorship of the *Letters of Junius*, on the Crimean campaign, and other topics of his time. He left the Tory Party for the Whigs in 1846, but not receiving from them the preferment he considered his due, he took revenge upon his enemies with tongue and pen. However, he had many warm friends, and was a noted club man, whist-player,

and contributor of biographical and political essays to the leading reviews.

HAYWARD, Sir JOHN (c.1564-1627). An English historian. He was born and educated at or near Felixstowe, Suffolk, and graduated at Cambridge. His earliest production, *The First Part of the Life and Raigne of Henrie the III., Extending to the End of the First Yeare of his Raigne* (1599), placed him in the bad graces of Queen Elizabeth, who was easily persuaded that he was painting a moral for herself in his account of Richard II.'s downfall, and therefore had the historian imprisoned. Having learned policy, Hayward kept the favor of James I., dedicated books to him and his son, defended the divine right of kings, and advocated the union of England and Scotland. Among his works are: *An Answer to the First Part of a Certain Conference Concerning Succession* (1603); *The Lives of the Three Normans, Kings of England* (1613); *The Sanctuarie of a Troubled Soule* (1616); *David's Teares* (1622-23); *Christ's Prayer Upon the Crosse for His Enemies* (1623); *Of Supremacie in Affaires of Religion* (1624-25); and *The Life and Raigne of King Edward the Sixth* (1630), published after the author's death.

HAYWOOD, ELIZA (c.1693-1756). An English novelist and dramatist, born probably in London. Her maiden name was Fowler. She married when she was young, was deserted by her husband, and about 1715 appeared in Dublin and London as an actress. Steele's *Sappho*, in the *Tatler* of April 23, 1709, is usually identified with her, but wrongly it would seem from the dates. She rewrote *The Fair Captive* (1721); composed a comedy, *A Wife to Lett* (1723), in which she acted, and a tragedy, *Frederick, Duke of Brunswick Lunenburgh* (1729); and collaborated with Hatchett in *Opera of Operas* (1733). But she is best known for her novels, which brought upon her an attack by Pope in the *Dunciad* (book ii., 157 sqq.). Mrs. Haywood and Curll replied with a *Female Dunciad*. A collected edition of her novels, not including the famous *Memoirs of a Certain Island* (1725) and *The Secret History of the Present Intrigues of the Court of Caramania* (1727), appeared in 1724.

HAY-WORM. A lepidopterous larva (*Asopia costalis*), peculiar to North America, which has the strange habit of feeding normally upon dried hay, especially clover hay, but also upon timothy and alfalfa. In large numbers it attacks the hay, both in the mow and in the stack, cutting the leaves up into chaffy pieces and webbing them together with silken threads. The hay looks moldy, is infested with excremental pellets, and is distasteful to cattle. The larva is dirty white in color, and grows to a length of about three-fourths of an inch. The adult moth is lilac brown or purple, with two bands of a lighter shade on each fore wing. Old mows should be thoroughly cleaned out before putting new hay in a barn, and infested stacks should be burned.

HAY'YUG, JUDAH BEN DAVID (c.950-c.1000). A Jewish grammarian. He was born at Fez, near the middle of the tenth century, went to Cordova, and became a pupil of the grammarian Menahem ben Saruk. His theory that all Hebrew stems contain three letters was an important contribution at the time to Hebrew philology and lexicography. He died in the be-

gining of the eleventh century. His two important grammatical works are: *The Book of Verbs with Weak Letters*, and *The Book of Verbs Containing Doubled Letters*, which are intended to illustrate his theory. In addition, he prepared a monograph on *Punctuation*, setting forth the features of the Hebrew vowel system. Of a fourth grammatical work only fragments have been found. Consult Jastrow's edition of Hayyug's treatises on *Weak and Geminative Verbs in Hebrew* (Leyden, 1897).

HAZARAS, há-zá'ráz. A semi-independent and partially nomadic people, of Mongolian ancestry, in the region between Herat and Kabul, Afghanistan, into which country they are said to have come, in the fourteenth century, in the wake of the great Mongolian movement of Genghis Khan. They profess Islam, the Hazaras proper to the east being Shiites, the western Hazaras, or Aimak (i.e. 'horde'), as they are sometimes called, Sunnites. Their language has been not a little influenced by Persian.

HAZARD (OF. *hazard*, *hasard*, Fr. *hasard*, from Sp. *azar*, unlucky throw of dice, misfortune, ace of dice, from Ar. *al*, the + *zár*, from Pers. *zár*, die). A game of dice, formerly very popular in England, where it is played both for amusement and for purposes of gambling. In the latter respect, however, a frequent player, by his knowledge of the peculiarities of the game, has the beginner at a considerable disadvantage. The game is played with two dice. The 'main,' which is called by the 'caster,' may be either 5, 6, 7, 8, or 9. Should he (the caster) throw the number called—or, supposing 6 or 8 is the main, he throws 12—he is said to 'nick,' and thus defeats his opponent, who is styled the 'setter.' The caster loses when, for instance, he throws 2, 3, or 12, when 7 is the main; but should he throw any other numbers (for example, when 7 is the main, and he throws 4, 5, 6, 8, 9, or 10) he has a 'chance,' which permits him to continue throwing until either the 'main' or the 'chance' is thrown. The game is decided in favor of the 'caster' if the 'chance' is thrown first; and in favor of the 'setter' should the 'main' be the first thrown.

HAZARD, CAROLINE (1856—). An American educator, born at Peacedale, R. I. She was educated privately in the United States and abroad, contributed reviews, essays, and verse to magazines, published several volumes, and in 1899 was elected president of Wellesley College (Wellesley, Mass.). Her works include *Narragansett Ballads* (1894), and *The Narragansett Friends' Meeting* (1899).

HAZARD, á'zár', DÉsirÉ. A nom-de-plume of Octave Feuillet (q.v.).

HAZARD, EBENEZER (1744-1817). An American author, born in Philadelphia, and educated at Princeton. He went into the publishing business in New York in 1770, but left it five years later for a Government position, and from 1782 to 1789 was Postmaster-General. In 1791 he was once more in business—this time in Philadelphia, where he helped to establish the North American Insurance Company. Besides giving literary assistance in the compilation of two histories and a biblical translation, he published *Historical Collections* (2 vols., 1792-94), and a book about the Indians, in whose spiritual welfare Mr. Hazard took much interest. But his

most valuable literary remains are the letters in the possession of the Massachusetts Historical Society.

HAZARD, ROWLAND GIBSON (1801-88). An American manufacturer and author. He accumulated a fortune in the woolen business at Peacedale, R. I., and was for three terms a member of the State Legislature. Among his writings are: *Essays on Language: Its Connection with the Constitution and Prospects of Man* (1836); on *The Resources of the United States* (1864); and two letters addressed to John Stuart Mill, on *Causation and Freedom in Willing* (1869). His granddaughter, Caroline Hazard, has edited a collected edition of his works in four volumes.

HAZE. Any comparatively slight obscuration of distinct vision due to the opacity of any medium, such as the atmosphere, through which the object is seen. The thickest haze in the atmosphere obscures the light of the sun to such an extent that his disk is but just distinguishable from the surrounding background; any greater obscuration than this is usually spoken of as cloud. This hazy effect may be produced in several ways: (1) When the air is filled with small masses of very different densities, such as rising currents of hot air and descending currents of cold air over a heated soil. In this case the beam of light is by refraction broken up and diffused so that a hazy effect, or even complete opacity, may be produced, as in a mixture of air-bubbles and water. Such a mixture is also partly opaque to sound. The haze thus produced is ordinarily spoken of as *heat-haze*. (2) The ordinary hazy effect in the atmosphere produced by the presence of foreign particles, either solid or liquid. Minute particles of ice or water form an *aqueous haze*; all other material is included under the term *dust-haze*. The dust is raised from the ground by strong wind, by currents of hot air, and especially by volcanic eruptions; particles of salt left by the evaporation of salty water also produce dust-haze. The most delicate dust-haze is produced by myriads of shells and fragments of shells of diatoms and other microscopic forms of life living in fresh-water ponds and in marshes that are dried up at certain seasons of the year. The principal source of this dust is the interior of North Africa, whence it is carried outward in all directions, but especially westward and southward by dry Harmattan winds. A red dust-haze of a much coarser grade is carried by southerly winds from Northern Africa over into Europe, and in rare cases, as in March, 1901, this is carried to Northern Germany and England. Over India a cloud of yellowish dust-haze rises day by day higher and higher during the dry season, attaining a general level of from 2000 to 4000 feet, above which the air is comparatively clear. Dust-clouds of less extent are formed over the loess formations of China and North America. The great clouds of smoke from prairie and forest fires, as they subside, leave a hazy atmosphere due to the presence of fine particles of carbon, and it appears likely that each of these gathers to itself a special atmosphere of aqueous vapor, just as spongy platinum absorbs hydrogen. This haze occurs during Indian summer in America, and is known as the Moor-Rauch in Europe.

The finest dust-haze ordinarily produces a whitish or grayish tint in the sky; coarser particles produce buff and reddish tints. When the dust particles are exceedingly small and of regular

size, as when they are composed of a few molecules of water, so that their diameters are comparable with some wave-length of light, they produce the phenomena of selective reflection and refraction, giving to the sky its ordinary blue tint and forming glories of colored rings around the sun and moon. When they are a little larger they show the colors of thin plates, and when larger still they may by diffraction give rise to small glories and larger halos. The vapor-dust from the eruption of Krakatoa in 1883 spread over the north temperate zone, producing for a year or two magnificent sunset and sunrise tints and the Bishop's Ring, so called after its first observer, Sereno, Bishop of Honolulu. The eruption of Skaptar Jökul in 1783 furnished a similar cloud of aqueous haze and red sunsets to the greater part of Europe and North America; and the same phenomenon, although on a somewhat more restricted scale, followed the eruptions of Pelée on Martinique, and the Soufrière, on Saint Vincent, in 1902. The colors due to aqueous haze have been most thoroughly investigated by Prof. Carl Barus (see his "Colors of Cloudy Condensation," *United States Weather Bulletin* No. 12). The haze produced by volcanic eruption is described most fully in the *Report of the Krakatoa Commission* (London, 1887).

HAZEBROUCK, äz'bröök'. The capital of an arrondissement in the Department of Nord, France, on the Bourre, 37 miles southeast of Calais by rail (Map: France, J 1). It has canal communication with the Lys, and is an important railway junction of lines to Calais, Lille, Ypres, Dunkirk, and Arras. It is a well-built town, with several fine buildings, including a sixteenth-century Augustinian convent, various sections of which are used for a hospital, a linen market, college lecture-rooms, and a tobacco warehouse; the Church of Saint Eloi, dating from 1493 is noted for its openwork spire, 260 feet high. There are several educational institutions and a public library. Linen, leather, beer, salt, soap, oil, and lime are manufactured, and an active agricultural trade is carried on. It is one of the most typical of Franco-Flemish towns, where the Flemish language still lingers. Its Flemish name, signifying 'the marsh of the hares,' is derived from the marshland on which the town is built. Population, in 1901, 13,261.

HAZELNUT, FILBERT, or COBNUT (AS. *hæsel*, Icel. *hasl*, OHG. *hasala*, Ger. *Hasel*, hazel; connected with Lat. *corulus*, OIr., Welsh *coll*, hazel), *Corylus*. A genus of trees and shrubs of the natural order Cupuliferae, of which the fruit is a nut in a leafy and lacinated cup, the enlarged involucre of the female flower. The male flowers are in cylindrical catkins; the female flowers mere clusters of colored styles at the extremities of buds. The common hazel (*Corylus avellana*), Lambert's filbert (*Corylus tubulosa*), and the Constantinople hazel (*Corylus colurna*) are natives of all the temperate parts of Europe. Two species are native to the United States, the American hazel (*Corylus Americana*), and the beaked or California hazel (*Corylus rostrata*), neither of which is cultivated. Most of the cultivated varieties of the hazelnut are known by the names of cobnuts and filberts; the former generally of a roundish form, the latter characterized by the greater elongation and lacination of the fruit-

cup. The finer kinds of hazel are propagated by grafting and by layers. Hazel-plants for copses are obtained from seed. A Himalayan species of hazel (*Corylus ferax*) has a spiny fruit-cup and an excessively hard nut. Barcelona nuts are the nuts of a variety of the common hazel, kiln-dried before their exportation from Spain. This process preserves their agreeable flavor; indeed, without it the nuts could not be kept long, except in air-tight cases, a satisfactory method, without losing or exchanging this flavor for one of evident rancidity. The larva of a weevil (*Balaninus nucum*) feeds on the kernels of hazelnuts. The parent female makes a hole into the nut by means of her long snout, and there deposits an egg. Great numbers of nuts are thus destroyed.

HAZELNUT (LEAVES AND FRUITS).

Hazelnuts of improved varieties are grown to a considerable extent in the south of Europe, but only to a slight extent in America. Hazelnuts yield, on pressure, about half their weight of a bland fixed oil, often called *nut-oil*. Hazelnut oil has drying properties, and is much used by painters; it is also used by perfumers as a basis with which to mix expensive fragrant oils, and it has been employed medicinally in coughs. The wood of the hazel, although seldom large enough for the purpose of the carpenter, is very tough and flexible, and hazel rods are therefore much used for making crates, hurdles, hoops for small barrels, etc. The thicker stems of hazel are used for making charcoal, which is in demand for forges, and is much esteemed for the manufacture of gunpowder and for artists' crayons.

HAZELTINE, hä'zel-tin, MAYO WILLIAMSON (1841-). An American journalist and reviewer, born in Boston, Mass. A graduate of Harvard and post-graduate student at Oxford, England, he practiced law until 1878, when he became literary editor of the *New York Sun*. His original publications include *Chats About Books, Poets, and Novelists* (1883), but he is best and very widely known for his reviews in the *New York Sun*.

HA'ZEN, WILLIAM BABCOCK (1830-87). An American soldier. He was born in West Hartford, Vt.; graduated at West Point in 1855, and served for a time on the frontier. In the spring of 1861 he was promoted captain in the regular

infantry; but he raised the Forty-first Regiment of Ohio Volunteers and went to the front as its colonel. He defended the Ohio border, fought in Kentucky, commanded a brigade in the movement by way of Nashville to Pittsburg Landing, won distinction at Shiloh, Corinth, and the battle of Stone River, and at Missionary Ridge captured eighteen pieces of artillery. He served through the Atlanta campaign, and commanded the Second Division of the Fifteenth Corps in Sherman's march through Georgia. He was promoted major-general of volunteers in 1864, for his services at the capture of Fort McAllister, and in the summer of 1865 he commanded the Fifteenth Army Corps. At the close of the war he was brevetted major-general, United States Army. He served on the frontier as colonel of infantry from 1865 to 1880, except during his stay in France, in the Franco-Prussian War, and at Vienna, as military attaché to the United States Legation during the Turko-Russian War. In 1880 he became chief signal officer, with the rank of brigadier-general. He did much to raise the character of the signal service, by employing expert physicists, electricians, and meteorologists, and by cooperating with State weather bureaus and scientific societies. By his efforts the present standard-time meridians were adopted. He also introduced the 'cold-wave' signals and the system of hourly weather bulletins. His publications include: *The School and the Army in Germany and France, with a Diary of Siege Life at Versailles* (1872); *Our Barren Lands* (1875); and *A Narrative of Military Service* (1885).

HAZLETON. A city in Luzerne County, Pa., 104 miles northwest of Philadelphia; on the Lehigh Valley, and other railroads (Map: Pennsylvania, E 3). It has a picturesque site at an elevation of 1700 feet, and enjoys some popularity as a summer resort. It is the seat of a State hospital for miners, and has a park. Hazleton is the centre of the anthracite coal district, and is extensively interested in coal-mining. Its silk-mills have become of considerable importance, and there are also knitting-mills, cornice-works, and coffin and casket factories. Settled in 1820, Hazleton was incorporated as a borough in 1840, and in 1890 was chartered as a city. The government is administered by a mayor, elected every three years, and a bicameral council. Most of the subordinate officials are chosen by the executive with the consent of the council, or elected by the council. Town meetings are held frequently on matters of political and general public interest. Population, in 1890, 11,872; in 1900, 14,230.

HAZLITT, hāz'lit, WILLIAM (1778-1830). A distinguished English critic and essayist. He was born at Maidstone, in Kent, April 10, 1778, where his father was then a Presbyterian minister, though afterwards a Unitarian. The latter went to America when Hazlitt was five years old, but returned three years later and settled at Wem, in Shropshire. The son was at first privately educated, and then sent to the Unitarian College at Hackney. He did not take kindly to Dissenting theology, and, after leaving college in 1795, spent the next few years at his father's house, dabbling in metaphysics and painting. His intellectual life, on the one hand, was keenly stimulated by his meeting with Coleridge in 1798, and by hearing the last sermon preached by the

philosopher, which profoundly impressed him. His artistic tastes, on the other hand, led him to Paris in the winter of 1802. He spent his time there copying pictures in the Louvre, and, returning to London, took up the profession of portrait-painting. He attained no great success in this, but it brought him into literary and artistic society, of which on the latter side his *Conversations with Northcote* (1830), though belonging to a later period, are the best memorial, while on the former the association with Lamb, Hunt, and Godwin brought out the taste for pure literature, in which he was to win the triumphs denied him in the two fields of his earlier predilection. His grave *Essay on the Principles of Human Action* (1805), though his own favorite work, did not please the public. In 1808 he married, and settled at Winterslow, near Salisbury; but neither he nor his wife seems to have been well adapted for domestic life in the country. "Never, I suppose," writes his grandson, "was there a worse-assorted pair." The divorce, however, which finally separated them did not come until 1822. In 1812 Hazlitt came back to London, where at first he was Parliamentary reporter and dramatic critic for the *Morning Chronicle*. Presently, however, he found the line that suited him, and began to pour forth the remarkable series of literary criticisms on which his highest fame rests. With Leigh Hunt he tried in the *Examiner*, in 1815, to revive the glories of the *Spectator* and the *Tatler*; the best of the essays thus produced were published in 1817 under the title of *The Round Table*. Of high significance, also, are *Characters of Shakespeare's Plays* (1817); *A Review of the English Stage* (1818); *Lectures on the English Comic Writers* (1819); and *Lectures on the Dramatic Literature of the Reign of Queen Elizabeth* (1821). Coming at a time when Coleridge had just begun really to make people see what was in Shakespeare, and aiding Lamb and Hunt to recall to the memories of Englishmen the glories of their half-forgotten golden age, his criticism was of the highest importance; and he joined with the two last named in establishing an easy, flowing, familiar style of prose which was to have great results throughout the remainder of the century. Saintsbury has recently said unhesitatingly that "long before Sainte-Beuve, Hazlitt had shown a genius for real criticism, as distinguished from barren formula-making, which no critic has since surpassed;" and Stevenson, the most charming practitioner in the same prose style, takes his leave of him with "though we are mighty fine fellows nowadays, we cannot write like Hazlitt." He and his group show in criticism the effects of the Romantic movement—a widening of the judgment, an importation of human sympathy and the personal equation, and a combination of philosophic discussion of life with bookish details. His temperament was uneven and self-tormenting; it estranged him more or less from all his friends, even for a time from Lamb. One of the most curious episodes in his career is the romantic passion which he conceived for a very ordinary girl, Sarah Walker by name, of a menial station and no attractions that others could see; Hazlitt recorded his emotions during its progress in a little book of extreme interest as a psychological document, called *Liber Amoris, or the New Pyg-*

malion (1823; new ed. New York, 1902). Soon after his divorce, he married a widow, apparently on a sudden impulse, but after a year's travel on the Continent they, too, separated. The most important literary works of his later life are: *Table Talk* (1821); *The Spirit of the Age* (1825); *The Plain Speaker* (1826); and *Sketches and Essays* (1829). His *Life of Napoleon*, of whom he was an ardent admirer, was neither a literary nor a financial success. Disappointed and harassed by anxieties, he died on September 18, 1830, with Charles Lamb at his bedside; his last words, despite all that he had suffered, were, "Well, I've had a happy life." Consult: W. C. Hazlitt, *Memoirs* (London, 1867); an excellent volume of selections in the Cavendish Library (ib., 1889), with introduction by A. Ireland, who has also compiled a *List of the Writings of Hazlitt and Hunt* (ib., 1868); his *Life* by A. Birrell, in the "English Men of Letters Series" (ib., 1902); also essays by Saintsbury in *Essays in English Literature, 1780-1860*, 1st series (ib., 1890), and by Leslie Stephen in *Hours in a Library*, 2d series (ib., 1877). A complete edition of his works, in 12 vols., was published in 1902, with an introduction by W. E. Henley.

HAZLITT, WILLIAM (1811-93). An English writer, son of the essayist. He became a lawyer and was appointed registrar of the Court of Bankruptcy in London in 1854. He edited the writings of his father, and made translations of some of the works of Guizot, Thierry, Hue, and others. He also reëdited *Johnson's Lives of the Poets*, and assisted in compiling a *Manual of Maritime Warfare*. Consult W. C. Hazlitt (his son), *Four Generations of a Literary Family* (London, 1897).

HAZLITT, WILLIAM CAREW (1834—). An English man of letters, grandson of the essayist. He was born in London, studied law and civil engineering; but became a journalist, and finally devoted himself to literature, including bibliography, history, archæology, and numismatics. His works include: a *History of the Venetian Republic* (4 vols., 1860); *Memoirs of William Hazlitt* (2 vols., 1867); *Poems* (1877); *Offspring of Thought and Solitude*, essays (1884); *The Livery Companies of London* (1892); *Coins of Europe* (1893-97); *Coin Collector* (1896); *Four Generations of a Literary Family* (2 vols., 1897); *The Lambs: Their Lives, Their Friends, and Their Correspondence* (1897); and *Lamb and Hazlitt* (1899). He also edited a large variety of dramatic and poetical works, such as *Dodsley's Old Plays* (15 vols., 1874-76), and *Shakespeare's Library* (5 vols.); has edited *Lamb's Letters* (1886), and a number of volumes of *Bibliographical Collections and Notes* (1867-92).

HEAD. See SKULL; NERVOUS SYSTEM.

HEAD, BARCLAY VINCENT (1844—). An English numismatist, born at Ipswich, and educated there at Saint Elizabeth's School. He was made assistant in the British Museum in 1864, and in 1893 keeper of the department of coins and medals. He was a member of the Imperial German Archæological Institute, a *lauréat* of the French Institute, and joint editor of the *Numismatic Chronicle*. He wrote: a history of Greek coinage, in single volumes (1874-1901); a *Guide to the Coins of the Ancients* (1881); *The Young Collector's Handbook of Greek and Roman Coins*

(1883); the very valuable manual, *Historia Numorum* (1887); and *A Guide to the Principal Gold and Silver Coins of the Ancients in the British Museum* (4th ed. 1895).

HEAD, SIR EDMUND WALKER (1805-68). An English Governor-General of Canada. He was born near Maidstone, Kent, was educated at Winchester and Oxford, and was a fellow at Merton College (1830-37), a University examiner, and a law student. Succeeding to his father's title in 1838, he was a Poor-Law Commissioner in 1841, went to New Brunswick six years later as Lieutenant-Governor, and from 1854 to 1861 was Governor-General of Canada. By that time the different provinces controlled their own affairs, so that the personal character of the Governor was a matter of small moment; but during Sir Edmund's term of office the clergy reserves and seigniorial tenures were abolished, the Victoria Bridge at Montreal built, and Ottawa was chosen by the Queen as capital of Canada. After his return to England he was made a civil-service commissioner. He published a *Handbook of Painting of the German, Dutch, Spanish, and French Schools* (1848); *The Temple of Serapis at Pozzuoli* (1858); *Viga Glum*, a translation of an Iceland story (1866). His poetical contributions to *Fraser's Magazine* were published posthumously in 1868.

HEAD, SIR FRANCIS BOND (1793-1875). An English colonial Governor and author, of Portuguese-Jewish descent. He was born at the Hermitage, Higham, Kent, and was educated at Rochester and in the Woolwich Military Academy, where he was made first lieutenant of engineers in 1811. He saw service on the Continent, and was at the battle of Waterloo, but retired on half pay in 1825, when he went to South America to prospect in gold and silver mines. His first work recounted his experiences under the title, *Rough Notes of a Journey in the Pampas and Andes* (1828), and the rapidity of his traveling gained him the nickname 'Galloping Head.' In 1835-37 he was Lieutenant-Governor of Upper Canada. Knowing nothing of the political situation of the country, he opposed the union of the provinces, and assumed that a popular desire for responsible government merely indicated a desire for annexation to the United States. He fancied he could govern without the aid of his council, and through his bad judgment and want of tact seems to have been largely to blame for the Upper Canadian share in the rebellion of 1837. He was made a baronet in 1837. Among his published works are: *Life of James Bruce* (1830); *Bubbles from the Brunnen of Nassau* (1833); *The Emigrant* (1846); *Stokers and Pokers* (1849); *Defenceless State of Great Britain* (1850); *Fagot of French Sticks* (1852); *The Horse and His Rider* (1860); *The Royal Engineer* (1869); *Sketch of the Life of Sir J. M. Burgoyne* (1872).

HEAD, SIR GEORGE (1782-1855). An English traveler, elder brother of Sir Francis Bond Head. He was born in Higham Parish, Kent, was educated at the Charterhouse School, and went to the Peninsular War as a commissary clerk, rising gradually to be next to the head of the commissariat in 1814. This experience provided material for his *Memoirs of an Assistant Commissary-General* (1837), while from his five years' service in Halifax he gleaned *Forest Scen-*

ery and Incidents in the Wilds of North America (1829). William IV. knighted him (1831), and Queen Victoria made him her deputy knight-marshal. He was known best as the author of *A Home Tour Through the Manufacturing Districts of England*, and *A Home Tour Through Various Parts of the United Kingdom*, reprinted, in one volume, in 1840.

HEADACHE, medically termed CEPHALALGIA. A pain in any part of the head except the face. It is a symptom of heat-stroke, cerebral apoplexy, eye-strain, nasal disease, middle-ear or internal-ear disease, uterine disease, neurasthenia, etc. Treatment of headache as a disease, or by the use of 'headache powders' so commonly sold, is therefore ridiculous. The most severe headaches are those accompanying meningitis or brain diseases, tumor of the brain usually causing great suffering; these are generally brow or vertex headaches. Many fevers, such as typhoid, have a severe general headache as a symptom. Sufferers from Bright's disease have daily frontal headache in many instances. Eye-strain and gastric dyspepsia cause headache referred to the brows. The headache of constipation or of caries of front teeth is generally experienced over the brows and temples; that of anæmia, or bladder disease, or endometritis, at the vertex; that of carious back teeth, eye-strain, and middle-ear disease, at the temple as well as at the mastoid cells behind the ear; that of neurasthenia generally at the base of the occiput, though also at the brow; while derangement of the liver causes pain which may be felt over the whole occiput. Syphilis and malaria are also causes of headache of irregular distribution. Migraine (q.v.) is a headache affecting one side of the head and accompanied by nausea and vomiting and other symptoms, and is due to nerve fag, gout, indigestion, or eye-strain, or malaria in people of nervous diathesis. Gout is a frequent cause of headache, as is also alcoholic indulgence. Domestic treatment of headache should begin with copious draughts of water and a cathartic, with rest in the recumbent position in the dark, and abstinence from food for a few hours. Drugs, especially narcotics, should be taken only upon a physician's advice after study of the sufferer's environment, vocation, diet, and physical condition. Frequent use of strong alleviatives is often undermining and damaging. Among the drugs used are aconite, belladonna, antipyrin, acetanilid, codeia, morphia, phenacetin, bromides, chloral, cannabis indica, ergot, ichthyol, apiol, mineral acids, creosote, salol, salicylic acid, iodides, strychnine, nitroglycerin, quinine, alkalies, digestants, and cathartics. See HEMICRANIA.

HEADRESS. Among sociological badges, the headdress is of great interest. At first view its importance is not apparent, but its connections with the advancement of humanity are numerous and varied. As distinguished from the clothing of the body, which may arise from the desire for ornament, for comfort, or for protection, the headdress was a distinctive mark, representing the organization of groups of men in primitive times. The sexes also were thus discriminated. This feature has persisted to this day, though it is now giving way before the unifying powers at work on the race.

In the study of headdresses there must be taken into consideration the varieties of natural

head-covering, which determine the extent of the use of the artificial headdress, the environment regulating the materials and the need of protecting the head from cold, heat, rain, etc. To these must be added the degree and course of the advancement of the peoples, their religious beliefs and customs, and in greatest measure the æsthetic sense which pervades and modifies all these classes. It will be seen that the treatment of the headdress of different peoples requires the closest attention to these details, which render it one of the most difficult and elusive subjects connected with the study of man.

As Deniker remarks, the nature of the hair in the different divisions of mankind furnishes the broad groundwork for headdress. People with woolly hair, as the negroes, arrange it in the most complicated fashion. Smooth-haired peoples allow it to flow behind, as the Malays and some Americans, or gather it in plaits, whorls, chignons, rolls, as among the Eskimo, Koreans, Japanese, Chinese. The fuzzy-haired peoples of North Africa and Melanesia reach the acme with their great mops fantastically arranged. Following the almost instinctive desire of the human race to improve on nature, to alter and make distinctive the hair, we have dyeing, plastering with clay or oils, and the wearing of wigs practiced by many tribes. On the other hand, among lower tribes, as the Australians and Veddahs, little attention is paid to the hair, which remains in its primitive luxuriance and untidiness. To the hair are also attached feathers, flowers, etc., often as ornaments, but most frequently as a badge or token, familiar in the plumes of the North American Indians.

Perhaps the most primitive headdress, well nigh universal among smooth-haired peoples, is the fillet, originating in the need of securing the hair, and by its material, color, and other characters serving as a badge. The fillet thus appears to be the ancestor of all hats. The ancient Chinese, as well as the Greeks, were fillet-makers, and the custom survives in the present, while many people have discarded the custom within recent times. The turban is a development of the fillet. From the fillet most headdresses arose by additions horizontally or vertically, the structure remaining crownless for a long period. Witness the well-known intolerance of open-air peoples for that feature. It is probable that devices for holding the feather or bunch of feathers in the hair may have developed certain types of headdress. The types of headdress in most instances, instead of being the result of caprice or fashion, as the word is understood at present, have each an extended history. Petrie found recently in Egypt a specimen of headgear similar in style to the present Panama hat, dating about one century before the Christian Era. The history of this hat may, in geographical terms, be expressed thus: Egypt, Morocco, Spain, the New World, a line of the migration of customs and costumes that will answer for many transplantings in the Western Hemisphere. The more important of man's activities that have distinctive classes of headdress are the chase, war, rank, social position, and religious ceremony. Protection may also be mentioned as more particularly an outgrowth of environment, the ears rather than the head being covered from both heat and cold. The headdress of hunting tribes embraces features connected with stalking of

game and fetishism, as well as the shading of the eyes and of the head.

The headgear of war, originally designed to strike terror into the enemy, as well as to show rank, is represented by the helmet. A much wider range of headdress marks rank and social position. This class has its highest development in the Orient, as in Eastern Turkestan and Korea, for instance, where the headdress of each individual is an index of his standing. In ceremony the most extensive and interesting phase of this subject is presented. We have here repeated the ranks from priest-king, through priest to worshiper, the head-covering for different ceremonies, and as belonging to the hosts of spiritual beings. With this also are connected the class of masks, which are largely, if not entirely, to be taken as headdresses. It will be found that each of the divisions presented has its own ceremonial headdresses, as in the chase the Aleut hunter wears a large visor covered with ivory representations of game animals.

HEAD-HUNTING. See DYAK.

HEADLEY, häd'li, JOEL TYLER (1813-97). An American historical writer. He was born in Walton, N. Y.; graduated at Union College in 1839; studied at the Auburn Theological Seminary; and was for a time pastor of a church in Stockbridge, Mass. His health soon failing, he traveled in Europe, and then joined the editorial staff of the *New York Tribune*. Soon, however, he was compelled to spend a considerable portion of every year in the Adirondacks for his health. His newspaper letters on the region, afterwards published as *The Adirondacks, or Life in the Woods* (1849), are said to have been the first to attract attention to that region as a health resort. Among his works are: *Napoleon and His Marshals* (2 vols., 1846); *Washington and His Generals* (1847); *Life of Cromwell* (1848); *Life of Washington* (1857) which was at one time exceedingly popular; *Chaplains of the Revolution* (1861); *The Great Rebellion* (2 vols., 1864); *Grant and Sherman: Their Campaigns and Generals* (1865); *Farragut and Our Naval Commanders* (1867); and *The Achievements of Stanley and Other African Explorers* (1877).

HEADLEY, PHINEAS CAMP (1819-1903). An American clergyman and biographer, born in Walton, N. Y. He was admitted to the bar before studying for the ministry at Auburn Seminary. In 1850 he published *Historical and Descriptive Sketches of the Women of the Bible*, and his other publications include: *Empress Josephine* (1851); *Kossuth* (1852); *Lafayette* (1853); *Ericsson* (1863); *General Sheridan and Admiral Farragut* (1864); *General Sherman* (1865); *General Grant* (1866); and *Public Men of To-Day* (1882), besides contributions to periodical literature and books suitable for Sunday schools, such as *Half-Hours in Bible Lands* (1867).

HEADLONG HALL. A satirical novel, interspersed with lyrics, by Thomas Love Peacock, published in 1816.

HEAD-MONEY TAX. The term applied to a tax levied by an act of Congress, passed in August, 1882, which provided that there should be collected "a duty of fifty cents for each and every passenger, not a citizen of the United States, who shall come by steam or sail vessel

from a foreign port to any port within the United States. . . . The money thus collected shall be paid in to the United States Treasury, and shall constitute a fund to be called the Immigrant Fund, and shall be used, under the direction of the Secretary of the Treasury, to defray the expense of regulating immigration under this act, and for the care of immigrants arriving in the United States," etc. This act of Congress is similar in its essential features to statutes enacted by many States of the Union for the protection of their own citizens, and for the good of the immigrants who land at seaports within their borders. A statute of New York covering this ground was, however, held void as infringing upon the ground of national legislation (92 U. S. Rep., p. 259, and 107 U. S. Rep., p. 59). The questions arising under the act of Congress were considered by the Supreme Court of the United States in what were called the Head-Money cases (112 U. S. Rep., p. 580), and the act was held valid. In 1894 the tax was increased to \$1 per head. See IMMIGRATION.

HEADSMAN, THE. A novel by J. Fenimore Cooper (1833), the story of the hereditary executioner of Berne, in the course of which scenes in Switzerland and Italy are introduced.

HEADSTONE, BRADLEY. A schoolmaster in Dickens's *Our Mutual Friend*, with the physique of a giant and the sensitiveness of a child. As the teacher of young Hexam, he meets Lizzie, falls in love with her, and attempts to murder Wrayburn, her lackadaisical sweetheart, through jealousy.

HEALD. See HEDDLE.

HEALEY, GEORGE PETER ALEXANDER (1808-94). An American historical and portrait painter. He was born at Boston, July 15, 1808, and studied in Paris under Gros and Couture. At the Paris Salon in 1840 he received the third-class medal, and at the Exposition of 1855 the second-class medal. He returned to the United States in 1858, going to Chicago, where he resided until 1867. After this he went to Rome, and in 1885 he opened a studio in Paris, where the last years of his life were spent. He died at Chicago, June 24, 1894.

Healey is one of the best American portrait painters of the French school; his style is vigorous, but his color is not good. His chief historical works are: "Franklin Urging the Claims of the American Colonies Before Louis XVI." (1855); "Webster's Reply to Hayne," Faneuil Hall, Boston, containing 130 portraits. Some of the best-known portraits are: M. Guyot (1841, Smithsonian Institution); Pius IX. (1871); Louis Philippe, General Grant (1878); Webster, Clay, Calhoun; Presidents Quincy Adams, Jackson, Van Buren, Tyler, Taylor, Fillmore, Pierce, Polk, Buchanan, and Lincoln, all in Corcoran Gallery, Washington; William H. Seward, State Library, Albany; James Lenox (1851), in the Lenox Library, New York. In the Metropolitan Museum are the portraits of Archbishop Hughes, "A Lady," Comte de Paris, and "The Artist."

HEALTH (AS. *hælp*, from *hāl*, Goth. *hails*, OHG., Ger. *heil*, Eng. *whole*; connected with OChurch Slav. *cělŭ*, whole, OPruss. *kailüstikan*, health, OIr. *cél*, augury, and probably with Skt. *śiva*, healthful, kind). The condition of a living body in which all the tissues are in a state of

soundness or integrity, and the organs perform their functions normally; in which waste and repair go on progressively, and in which proper growth or retrograde metabolism occurs, according to the age of the individual, disease being absent. Disease is present when the integrity of the blood or of other tissues is impaired, where function is disordered, or where excessive growth or abnormal retrogression and decay occur. Perfect health is rarely seen, and never continues for any considerable portion of life in the artificial conditions of modern existence among civilized people. Health is therefore a comparative term.

Health officers are elected or appointed in all towns of any size in the United States, whose duty it is to limit the spread and prevent the invasion of disease, to enforce sanitary laws, and take all precautions to safeguard the health of citizens.

The reports of occurrence of disease and death are recorded by county, State, and national health officials. For the records of the most dangerous diseases, see VITAL STATISTICS. For the consideration of measures to safeguard the public health, see SANITARY SCIENCE; and for a consideration of the laws of health, see HYGIENE.

HEALTH, BILL OF. In shipping, a certificate of a consul, etc., as to the health of the crew, when the ship has come from a suspected port. A clean bill, a suspected bill, and a foul bill, are the three short names given to the several degrees of health.

HEALTH, BOARDS OF. Institutions organized under Government and deriving powers from the laws for the purpose of protecting the health of the citizens.

MUNICIPAL BOARDS OF HEALTH. These are created for the purpose of controlling and repressing agencies which undermine the health of the residents of a city or a municipality. The function of such a board is to adopt ordinances which compose a sanitary code, under which certain measures may be enforced, and the authority of the officers of the board may be maintained. Such a code includes provisions for the prevention of fraud and pretense in the preparation and sale of medicines, or of the sale of poisons except for lawful uses and purposes; of adulteration of coffees, teas, and other preparations from which beverages are made; for the control of the construction of buildings, ventilation, drainage, and plumbing; for the control of the sale of food and drink, to prevent stale, unwholesome, or unhealthy food, as well as adulterated or watered milk, from being offered in the market; to control the passage of cattle, horses, or any dangerous or offensive animals through the public streets; to regulate slaughtering and slaughter-houses; to exercise care over sidewalks in streets; to regulate the sanitary condition of pounds; to kill animals afflicted with hydrophobia; to prevent or limit offensive odors and liquids from any source; to provide for proper accumulation and removal of filth and dirt; to prevent diseased animals from being brought into the city, or dead, sick, or injured animals to be left in the streets; to provide for the notification of contagious and infectious diseases; to control the unloading of vessels, the removal of sick persons, vaccination, exposure to disease, handling and interment of dead bodies; to outline the duties of coroners; to secure the reporting of vital statistics; to regulate matters

relating to vehicles used for passenger transportation; and to control noise, expectoration in public conveyances, life-lines at bathing-places, etc.

As an example of a municipal board of health, the organization of the Health Department in New York City may be described, as it has existed since the adoption of the charter creating the Greater New York. In chapter xix. of this charter the several powers and duties of the health officers are set forth in detail. The head of the department is called the president of the Board of Health. The board consists of a single Commissioner of Health, Commissioner of Police, and the Health Officer of the Port. The Commissioner of Health is appointed by the Mayor (as is also the Commissioner of Police), and is the president of the board, and the executive officer. He may or may not be a physician. The first appointee in 1902 was a chemist and sanitary expert, Dr. Ernest J. Lederle.

Two bureaus have been established under the act of Legislature. The chief executive officer of one is called the Sanitary Superintendent, who at the time of his appointment must have been for at least ten years a practicing physician, and for three years a resident of the city. The chief officer of the second bureau is the Registrar of Records. An office of the Board of Health is established in each of the different boroughs of the city, wherein the business of the department is transacted. An assistant sanitary superintendent and an assistant registrar of records are appointed for each borough. Similar municipal boards of health exist in other cities.

STATE BOARDS OF HEALTH. These are institutions established by State legislative enactments, having many specific relations to the public health, and intended to have a central advisory relation to the local sanitary organizations, and also to supervise a State system of vital statistics. In 1900 there were 43 State boards in existence in the States and Territories of this country. The first organization under this name in the United States was established in Louisiana in 1855, but under the present acceptation of the term it was not to be classed with the average State Board of Health, as it was created for the sole purpose of maintaining a quarantine for the protection of New Orleans. Following are the dates in which boards of health were established in the different States and Territories: Massachusetts, 1869, under a law for which successive Legislatures had been asked since 1856; California, 1870; Virginia and Minnesota, 1872; Michigan, 1873; Maryland, 1874; Alabama and Georgia, 1875; Colorado and Wisconsin, 1876; Mississippi, New Jersey, Tennessee, and Illinois, 1877; Connecticut, Kentucky, Rhode Island, and South Carolina, 1878; Delaware and North Carolina, 1879; Iowa and New York, 1880; Arkansas, Indiana, West Virginia, and New Hampshire, 1881; Missouri, 1883; Maine, Kansas, and Pennsylvania, 1885; Ohio and Vermont, 1886; Florida and North Dakota, 1889; Nebraska, Washington, Oklahoma, and South Dakota, 1891; Nevada, 1893; New Mexico, 1895; and Utah, 1898.

As an example of the organization of a State Board of Health that of New York may be mentioned, which is composed of a single commissioner, assisted by a secretary, a chief clerk, a

medical expert, a pathologist and bacteriologist, a director of the Bureau of Chemistry, a director of the Cancer Laboratory, a director of the Antitoxin Laboratory, a registrar of vital statistics, a consulting ophthalmologist, and a consulting engineer.

NATIONAL BOARD OF HEALTH. A National Board of Health was organized in 1879. At the end of four years this board went out of existence, having investigated diseases of food-producing animals, adulteration of food and drugs, disposal of sewage, establishing quarantine, and securing consular reports regarding disease and sanitation. At present these labors are performed by the Bureau of Animal Industry, various food commissioners, and the United States Marine Hospital Service, which is connected with the Department of the Interior. Some Congressmen favor a proposition to create a National Board of Health, at whose head shall be a Secretary of Health, who shall be a member of the Cabinet.

HEALTH ASSOCIATION, AMERICAN PUBLIC. On April 18, 1872, an informal conference was held in the city of New York of representatives of five States and five cities, at which a committee was appointed to draw up a constitution for the organization of a national institution for the promotion of sanitary science. The committee made its report at a subsequent meeting, held September 12th and 13th, at which there were representatives from New York, Pennsylvania, Ohio, Illinois, Louisiana, Connecticut, Rhode Island, and the District of Columbia. A constitution was adopted and officers elected. This constitution was slightly amended at the next annual meeting, held in New York, November, 1873, and contained among its provisions the following: "The officers shall be a president, a first and second vice-president, a secretary, and a treasurer. All the officers shall be elected by ballot annually, except the secretary, who shall be elected for a term of three years." A standing executive committee consists of "the president, first vice-president, secretary and treasurer, and six members annually elected by ballot." The objects of the association are to a great extent served by annual meetings, when matters of importance relating in various ways to sanitary science are discussed, the essays and addresses being published in an octavo volume of from four to five hundred pages. Meetings of this body have been held regularly up to the time of the publication of this volume. Regular proceedings have been published, which may be consulted for the details concerning the papers read and discussed. The association has exerted considerable influence in the improvement of the sanitary condition of the country.

HEALTHS, DRINKING. See **DRINKING USAGES; TOASTS.**

HEALY, TIMOTHY MICHAEL (1855—). An Irish Nationalist and member of the British Parliament. He was born at Bantry, Ireland, and until thirteen years of age was educated at the Christian Brothers' School, Fermoy; after which he became a clerk in a business house, and then a stenographer on the North Eastern Railway, at Newcastle-on-Tyne. Previous to 1878 he had been a frequent contributor to the press, but in that year went to London to write a weekly letter for the *Dublin Nation*. In 1880, associated

with Mr. Parnell and Mr. Dillon, he made a lecture tour of the United States. On his return to England he was arrested for utterances made in a speech at Bantry; was elected unopposed from Wexford Borough; went to his trial in December, and was acquitted. The 'Healy Clause' in the Land Act in 1881, enacting that no landlord should levy rent on improvements made by the tenant, was due to him. He attended the Land League Convention in Chicago in 1881, when \$250,000 were voted to aid the Irish cause. After speaking in all the principal cities in America he returned to England, was cited to appear before the Queen's Bench, and, refusing to give bail, was sentenced to six months' imprisonment, but released at the end of four months. He has represented Wexford, Monaghan, South Derry, and North Louth in Parliament. In 1891 he opposed Mr. Parnell; and in 1895 was expelled from the Parliamentary Committee. He was made King's Counsel in 1899, having been admitted to the Irish bar in 1884. In 1900 he was instrumental in ending the Parnellite difficulties by the nomination of Mr. Redmond as chairman of the reunited Irish Party. He wrote *A Word for Ireland* (1886), and text-books on the Land Acts.

HEANOR, hē'nēr. A town in Derbyshire, England, 8 miles northeast of Derby (Map: England, E 4). It has important coal-mining and iron-manufacturing industries. Population, in 1891, 13,600; in 1901, 16,250.

HEAP, CHARLES SWINNERTON (1847—). An English musician, born at Birmingham. He won the Mendelssohn scholarship, and studied at the Leipzig Conservatory under Moscheles, Hauptmann, and Richter, and became on his return to England, in 1867, a pupil of the distinguished organist W. T. Best. He was conductor of the Birmingham Philharmonic Society (1870-86), the Stafford Society, the Wolverhampton Musical Festival, the North Staffordshire Festival (1888—), and in 1897 became chorus-master of the Birmingham Festival. He received the degree of Doctor of Music from Cambridge in 1872. Among his compositions are the cantatas, *The Maid of Astolat* (1886) and *Fair Rosamond* (1890), the oratorio, *The Captivity*; numerous sonatas, anthems, organ-pieces, and songs.

HEAP, DAVID PORTER (1843—). An American engineer, born in San Stefano, Turkey. He was educated at Georgetown College, District of Columbia, and at West Point, where he graduated in 1864. During the remainder of the Civil War he served with the engineer corps of the Army of the Potomac, and was brevetted captain on April 2, 1865. Two years afterwards he received his commission as captain; in 1883 he was made a major, and in 1895 a lieutenant-colonel of engineers. After the war he was chiefly employed in building fortifications and improving harbors. He explored the Yellowstone National Park in 1871, and ten years afterwards was the military representative of the United States at the Paris Congress of Electricians. His publications include: *History of the Application of the Electric Light to Lighting the Coasts of France* (1883); *Electrical Appliances of the Present Day* (1884); *Ancient and Modern Light-houses* (1887).

HEARING (from *hear*, AS. *hýren*, *hēran*, Goth. *hausjan*, OHG. *hōrren*, Ger. *hören*, to hear,

connected with Gk. ἀκούειν, *akouein*, to hear, and possibly ultimately with Eng. *ear*). In its broadest sense, any judicial examination of the issues in a legal proceeding, whether those issues are presented in a formal action at law, in a suit in equity, or upon a motion, or upon the appearance of one party only. Specifically, however, the term 'hearing' signifies the proceeding in an equity suit, which corresponds to a 'trial' in an action at law. See TRIAL; PROCEDURE.

HEARING. See AUDITION; EAR.

HEARN, hērn, LAFCADIO (1850—). An American author, born in the Ionian Islands, the son of an Englishman and a Greek woman. He was educated in England and France, came to the United States, and engaged in journalism, first in Cincinnati, then in New Orleans, and New York. After winning quite a reputation for his powers of picturesque description, he went to teach in the University of Tokyo, and became a citizen of Japan. Among his writings are: *Chita: A Memory of Last Island* (1889); *Two Years in French West Indies* (1890); *Youma, the Story of a West Indian Slave* (1890); and, since his going to Japan, *Out of the East* (1894); *Glimpses of Unfamiliar Japan* (1895); *Reveries and Studies in New Japan*, *Kokovo* (1896); *Hints and Echoes of Japanese Inner Life, Exotics and Retrospectives, Gleanings in Buddha Fields* (1897); *Shadowings* (1900); and *Kotto* (1902).

HEARNE, THOMAS (1678-1735). An English antiquary, born at White Waltham, Berkshire, and educated at Oxford, where he passed his life at Saint Edmund Hall. He was appointed second keeper of the Bodleian Library in 1712, but lost his post and all hope of university preferment, owing to his inability to swear allegiance to the House of Hanover. He superintended the publication of a large number of chronicle histories and similar works; as Leland's *Itinerary* (1710-12); Alred's *Annales* (1716); Camden's *Annales* (1717); and Robert of Gloucester's *Chronicle* (1724). From 1705 to within a few days of his death, he kept an extensive diary, the manuscript of which fills 145 volumes. The most valuable parts of it are being published for the Oxford Historical Society under the editorship of C. E. Doble. Pope gave Hearne an undeserved place in the *Dunciad* (iii., 185-90).

HEARSAY EVIDENCE. See EVIDENCE.

HEARSAY RULE. In the law of evidence, the rule that excludes hearsay testimony upon the trial of an action; i.e. second-hand evidence, or that in which the materiality depends upon facts stated to the witness by another and not those observed by himself. Thus, if A as a witness testifies that B told him that C was present at the scene of an accident, this evidence is inadmissible, if the material fact is the presence of C at the accident; but if the material fact were that B made the statement to A, the evidence would be material. See further under EVIDENCE.

HEARSE, or **HERSE** (OF. *herce*, Fr. *herse*, It. *erpice*, ML. *hercia*, *hersia*, harrow, from Lat. *hirpex*, harrow). A name now used to designate the conveyance in which a coffin is borne to the grave. It had originally quite a different meaning. The term was formerly applied to a metal grating or spike fence with upright spikes for the reception of candles for illumination and the

hanging of decorative draperies around a tomb, or at a gateway. Afterwards it was used at the ceremonies of the Church and at funeral services. It was very simple in form, but in the fifteenth and sixteenth centuries hearses of great splendor came into use, and were erected in the churches over the bodies of distinguished personages. They were often of metal, and the permanent adjunct to tombs. At other tombs they were around the altar. The framework was of wood, iron, or brass, sometimes of beautiful workmanship, square, octagonal, etc., in plan, with pillars at the angles and arched framework above forming a canopy. The whole was hung over with rich cloths and embroidery, banners, and coats of arms, and lighted up with hundreds of wax candles and decorated with wax images. Such hearses were used at public funerals and set up in the streets. They were temporary. From this the transition to the modern funeral hearse can be easily traced. In Roman Catholic churches of the present day the hearse still exists as a triangle with spikes, on which candles are placed.

HEART (AS. *hcorte*, Goth. *hairtō*, OHG. *herza*, Ger. *Herz*; connected with Lat. *cor*, Gk. *καρδία*, *kardia*, Lith. *szirdis*, OChurch Slav. *srǐdice*, Arm. *sirt*, heart; probably connected with Skt. *hrdaya*, Ar. *zardāya*, heart, or with Skt. *śraddhā*, Lat. *credere*, to trust). A muscular

ANTERIOR VIEW OF THE HEART WITH THE LARGER BLOOD-VESSELS.

i.j.v., internal jugular vein; *r.c.c.a.*, right common carotid artery; *r.s.t.v.*, right superior thyroid vein; *r.v.v.*, right vertebral vein; *i.j.v.*, internal jugular vein; *r.s.c.v.*, right subclavian vein; *t.b.*, thyroid body; *l.s.t.v.*, left superior thyroid vein; *l.c.c.a.*, left common carotid artery; *l.v.v.*, left vertebral vein; *e.j.v.*, external jugular vein; *l.s.c.v.*, left subclavian vein; *l.in.v.*, left innominate vein; *l.s.int.v.*, left superior intercostal vein; *d.a.*, ductus arteriosus; *l.p.a.-v.*, left pulmonary artery and vein; *l.au.ap.*, left auricular appendix; *p.a.*, left pulmonary artery; *l.vent.*, left ventricle.

organ situated in the thorax, occupying part of the space between the lungs, and acting as a pump for propelling the blood to all parts of the

body. It is a four-chambered organ, consisting of two upper parts, the right and left auricles, and two lower parts, the right and left ventricles. This article will be confined to a description of the human heart. It is cone-shaped and flattened, and in the adult lies obliquely behind the lower two-thirds of the sternum, projecting considerably to the left. Its base is upward, and directed somewhat backward, and is situated practically at the level of the third intercostal space. Its apex is directed to the left, downward and forward, and reaches the space between the fifth and sixth costal cartilages. The heart is so tilted that the margin of its right ventricle lies upon the central tendon of the diaphragm. The adult heart is about five inches from base to apex, by three and one-half inches across the base, by two and one-half inches thick. Its weight is, in the male eleven ounces, and in the female about nine ounces.

The right auricle receives the venous blood from the venæ cavæ and empties it into the right ventricle. The auricle presents a central cavity or sinus of nearly quadrangular shape and a

ANTERIOR VIEW OF THE RIGHT CHAMBERS OF THE HEART, WITH THE GREAT VESSELS.

in.v., innominate vein; *a.a.*, arch of aorta; *v.c.s.*, vena cava superior; *r.au.ap.*, right auricular appendix; *o.gal.*, orifice of vein of Galen; *an.ov.*, annulus ovalis; *fo.ov.*, fossa ovalis; *va.t.*, valve of Thebesius; *ant.t.va.*, anterior segment of tricuspid valve; *v.ci.*, vena cava inferior; *r.t.va.*, right segment of tricuspid valve; *ves.w.*, section of vestibular wall; *l.sc.v.*, left subclavian vein; *l.c.a.*, left carotid artery; *r.p.a.*, right pulmonary artery; *d.a.*, ductus arteriosus; *l.p.a.*, left pulmonary artery; *p.a.*, pulmonary artery; *p.sm.va.*, pulmonary semilunar valves; *l.au.ap.*, left auricular appendix; *s.p.m.*, small papillary muscle connected with septum; *col.car.*, columnæ carneæ; *cho.ten.*, chordæ tendineæ; *ant.p.m.*, anterior papillary muscle; *l.cor.a.*, left coronary artery; *post.p.m.*, posterior papillary muscle.

small appendix somewhat resembling a dog's ear, and called the auricular appendix. The walls of the auricle are composed of two layers of muscular fibre and are very thin. The left auricle resembles its fellow of the right side. It receives the blood from the lungs through the four pulmonary veins, which empty, without valves, by four distinct openings. It opens into the cor-

responding ventricle by means of the left auriculo-ventricular orifice. Each auricle holds within its cavity, moderately distended, about two ounces of fluid. The ventricles, which constitute the bulk of the heart, are characterized by the great thickness of their walls and their large capacity relatively to the auricles. The cavity of each ventricle is conoidal, that of the right being broader and shorter and a trifle more capacious than that of the left. Prominent muscular ridges and papillæ, the *columnæ carneæ*, arise from the inner surface of each ventricle, and from them the *chordæ tendineæ*, fibrous cords, pass to the free border of the valves which close the openings between auricles and ventricles. There are four valves in the heart. The mitral valve closes the left auriculo-ventricular opening, and consists of two segments. When these are closed together the blood is prevented from regurgitating from the left ventricle into the left auricle. The tricuspid valve, situated in the right ventricle, closes the right auriculo-ventricular opening. It consists of three segments, each triangular in shape and adherent to each

other at the portion of their free margins which is nearest the fibrous ring from which they arise. The largest of the segments is nearest the pulmonary artery. The semilunar valves are found at the aortic and pulmonary orifices of the heart. The aorta (q.v.) springs from the left ventricles, and through it passes the blood to the arterial system. The pulmonary artery springs from the right ventricle, and through it blood passes to the lungs. The closure of the flaps of the semilunar valves prevents regurgitation of the blood into the aorta and pulmonary artery when the heart expands during the diastole. These valves are well supplied with fibrous material and possess great rigidity, so that they retain their shape. They open out of the ventricles and not in their cavities.

The heart receives its nourishment from blood conveyed to it by the coronary arteries during the diastole of the heart. The veins of the heart accompany the arteries and return their blood into the cavity of the right auricle. The nerves of the heart run into the *deep* and *superficial cardiac plexuses*, and also the *posterior* and *anterior coronary plexuses*. These plexuses are formed by sympathetic nerve-fibres and by filaments from certain cranial nerves. The heart and the roots of the great vessels are enveloped in the pericardium (q.v.), a sac of conical shape with base below lined with serous membrane (which is reflected over the heart) and containing a very small amount of fluid.

The contraction of the heart, which occurs from 70 to 80 times a minute, begins in the auricles, which empty their blood into the ventricles. The ventricles then contract, the left to empty itself through the aorta, the right to empty itself through the pulmonary artery. The mitral valve

in the left heart prevents regurgitation of blood into the right auricle, and the tricuspid valve in the right heart prevents a like accident in the case of the left auricle. The semilunar valves, as stated, prevent regurgitation at the end of the contraction, or systole. The diastole, or expansion, of the heart begins at once, and the auricles dilate, the right one receiving blood from the two venæ cavæ, which carry venous blood from the upper and lower parts of the body; the left one receiving arterial blood from the lungs

to which it is ascribed by physiologists. Thus we have (1) the impulse of the apex of the heart against the side of the chest; (2) the contraction of the muscular walls of the ventricles; (3) the tension of the auriculo-ventricular (tricuspid and mitral) valves and of the chordæ tendinæ. (See CIRCULATION.) The second sound is caused by the sudden closure of the valves of the aorta and of the pulmonary artery as the currents of blood reverse at the instant the heart relaxes and begins to dilate.

through the four pulmonary veins. The ventricles then expand, and the blood passes through the auriculo-ventricular orifices from the auricles until they are full, and the diastole is then complete. (See CIRCULATION.) Previous to birth, the circulation in the infant differs, because of structural differences. See FÆTUS; EMBRYO.

SOUNDS OF THE HEART. On applying the ear to the cardiac region of a living man or mammal, in a state of health, two successive sounds are heard, each pair of which corresponds with one pulsation. These are known as the *first* and the *second* sound. The *first* sound is dull and prolonged, while the *second* is short and sharp, and the difference between them is well expressed by articulating syllables, lubb, düp. The first sound continues during three-tenths of the pulsation, then follows the 'short pause' lasting one-tenth, next the second sound lasting two-tenths, lastly the 'long pause' lasting four-tenths.

The cause of the first of these sounds has been a subject of much discussion. During the first sound several distinct actions are taking place,

When the valves are changed by disease, the sounds undergo special alterations, which are of the highest importance in diagnosis. The normal sounds may be intensified or weakened, or they may disappear entirely and be replaced by murmurs; or abnormal sounds may be heard simultaneously with, or in the intervals between, the normal ones. Thus we find murmurs of regurgitation in valvular insufficiency; murmurs of obstructed flow of blood in valvular stenosis; aneurismal murmurs; friction sounds in pericarditis, etc.

HEART, DISEASES OF THE. Heart disease is a term including many affections of the organ as well as disturbances in its action due to disease elsewhere. Galen (q.v.) was the first to write of disease of the heart, which Hippocrates (q.v.) had denied, though to Vesalius (q.v.) is due the credit of accurate and intelligent grasp of the subject. The discovery of the circulation of the blood by Harvey (q.v.) in 1628 led the way for the investigations which, nearly a century later, gave clinicians absolute knowledge of certain affections of the heart. Vicussens, Lancisi, Morgagni, Sénac, and Auenbrugger deserve mention in the history of this subject. Lænnec (q.v.), who, in 1819, added the method of auscultation to that of percussion, advanced by his teacher Corvisart, and who invented the stethoscope, opened the field to all explorers. Richard Bright (q.v.) detected the enlargement of the organ which accompanies Bright's disease of the kidneys. Kreysig and Bouilland recognized endocarditis. Virchow (q.v.), in 1856, elucidated thrombosis and embolism.

Diseases of the heart are either (1) functional, or (2) organic. In *functional* diseases there is no discoverable alteration in structure, and the disorder of function is due to nervous influences. In *organic* diseases structural alteration is present.

FUNCTIONAL HEART DISEASES.

These include disorders in the beating of the heart and in the nature of its contractions, as well as neuralgic pains in the heart. Palpitation is the term given to a rapid and more or less distressing beating of the heart, in which the pulse may be accelerated from the normal 75 to 80 beats a minute to 150 or more a minute. This condition may be due to organic

disease, or it may be due to emotional disturbance (as fright or embarrassment), or to excessive physical strain, or to indigestion, with a production of gas and toxins, or to nervous disorder such as neurasthenia, or to tobacco, tea, coffee, alcohol, or certain drugs, or to hemorrhage, or to certain diseases, such as Basedow's disease (q.v.). Generally nervous excitability, apprehension, shortness of breath, increased perspiration, and flushing of the face accompany palpitation. Acute pain in the heart is experienced by some patients during attacks of hysteria, for example; neuralgia of that organ also occurs. Cardiac pain also accompanies fermentative dyspepsia. Disease of the coronary arteries causes, it is believed, the exquisitely painful angina pectoris (q.v.).

ORGANIC DISEASES.

Besides angina pectoris, these include pericarditis, endocarditis, myocarditis, hypertrophy, dilatation, embolism, aneurism, and degenerative changes without inflammation. More than one disease may be found co-existing, and both functional and organic diseases may be present together.

PERICARDITIS is an inflammatory disease in which the pericardium is thickened and roughened. The pericardium is a loose sac in which the heart lies, and its lining membrane is reflected over the external surface of the heart. The disease often coexists with gout or articular rheumatism, and is due to the same cause; or it accompanies Bright's disease. It may also be caused by injuries, exposure to cold and dampness, infectious diseases, etc. The normal serous fluid which should exist in the pericardium disappears and a sero-fibrinous fluid exudes from the blood-vessels, sometimes greatly distending the pericardial sac, generally causing adhesions between the two layers of the pericardium. If the amount of pericardial distension be great, the patient suffers with rapid pulse, oppressed breathing, and faintness. Occasionally the fluid must be drawn off by tapping. The attacks are always serious; and, if recurring, are generally fatal. There is pain felt, from the rubbing of the roughened surfaces as the organ beats, accompanied by what is called a friction sound. The area of heart dullness, as shown by percussion, increases with the production of fluid. In favorable cases the fluid is absorbed, and the sac regains, in great part, its normal condition. In very bad cases the inflammatory exudate consists of pus; such cases usually terminate fatally; evacuation of the pus affords the only hope of recovery.

DEGENERATIVE CHANGES IN THE HEART MUSCLE. Parenchymatous degeneration, or cloudy swelling, as it is often called, is the form of degeneration which usually accompanies the infectious diseases such as diphtheria or typhoid fever. The heart walls are somewhat softer than normal, and rather paler in color. The changes in the heart muscle cells are quite similar to the changes of parenchymatous degeneration in the cells of other organs. (See DEGENERATION.) The heart cells become more granular than normal, and in proportion to the extent of the granulation lose part or all of their normal striated appearance. 'Hyalin,' 'amyloid,' and 'calcareous' degeneration may occur in heart muscle. *Fatty degeneration* of the heart muscle is a quite com-

mon lesion. Its causes are: anæmia, old age, wasting diseases, prolonged infectious fevers, certain poisons, such as phosphorus, etc. It consists in the replacement of the heart muscle cell protoplasm by, or its transformation into, fat, to a greater or lesser extent. The degeneration is often not distributed uniformly throughout the heart muscle, but occurs in patches. The degenerated muscle looks pale in color and is softer than normally. The fat droplets within the cells may be large or small, may be few in number, or in such numbers as to entirely destroy the normal appearance of the tissue. What is known as 'fatty infiltration of the heart' is not a lesion of the heart muscle itself, but consists in an accumulation of fat beneath the pericardium and in the connective tissue between the muscle-fibres. The amount of fat may be very large, causing atrophy of the muscle-tissue and interfering with the functions of the organ.

MYOCARDITIS. This is an inflammation occurring in the middle or muscular layer of the heart walls and involving also the blood-vessels and interstitial connective tissue. The acute form is frequently suppurative in character, and occurs as an extension from an ulcerative endocarditis or pericarditis, or as a complication of one of the infectious diseases. It may be diffuse, or, as is more commonly the case, circumscribed by the formation of abscesses. In the chronic form of myocarditis the lesion consists in an increase in the connective tissue elements of the heart, with more or less atrophy of the muscular elements. The condition is usually associated with lesions of the coronary arteries. Opinions differ as to the primary lesion, some holding that the atrophy of the heart muscle is dependent upon the increase in connective tissue, a true productive inflammation; others that the degeneration of the heart muscle occurs first, the connective tissue proliferation being of the nature of a replacement hyperplasia. Syphilitic myocarditis and tubercular myocarditis sometimes occur. Myocarditis may give rise to few or no symptoms.

ENDOCARDITIS. The lesion in endocarditis is an inflammation of the endocardium, or lining membrane of the heart. While any portion of this membrane may be involved, it is common for the inflammation to be confined to that part of it which covers the valves of the heart and to result in an impairment of their efficiency. For this reason it is often referred to as 'valvular heart disease' or 'valvular endocarditis.' *Simple acute endocarditis* is a frequent complication of rheumatism. It may also be caused by some of the acute infectious diseases, especially scarlet fever and pneumonia. There may be simply thickening of the valves of the heart, their surfaces remaining smooth; or the valves may be rough and either eroded or studded with new growths, called vegetations, which give them a warty appearance. Microscopically the vegetations are seen to be made up of granulation tissue, covered on the surface with a layer of fibrin. There is usually more or less proliferation of the cells in the subendothelial connective tissue. *Malignant or ulcerative endocarditis* is due to the action of bacteria. The streptococcus and staphylococcus pyogenes are the most common incitants. More rarely the pneumococcus, the gonococcus, or the bacilli of anthrax, tuberculosis, or typhoid fever are present. The condition may be either primary or, as is more frequently the case, it may

exist as a complication of one of the infectious diseases. The valves of the heart may be covered with vegetations, or there may be suppurative or necrosis with destruction of tissue. The vegetations consist of granulation tissue covered with fibrin and containing many micro-organisms. It is most common on the mitral and aortic valves. More rarely, instead of occurring on the valves, it involves the walls of the heart, when it may lead to perforation either of a septum or of the external wall itself. Detachment of bits of the vegetations or necrotic tissue is not uncommon. Entering the circulation, they form infectious emboli, setting up foci of infection in distant parts of the body. *Chronic endocarditis*, the usual forerunner of valvular diseases of the heart, consists in sclerosis of one or more of the valves of the heart. The sclerosis may be primary, but is usually secondary, to the acute form of the disease. In this again, the cause is primarily in most cases rheumatism; gout, syphilis, alcoholism, and Bright's disease are also important etiological factors. A common cause, especially in the case of the aortic valve, is constant and excessive muscular exertion. There may be small vegetations on the valves representing remains of acute inflammation. The valves are thickened, opaque, and shrunken. This shrinkage produces deformity; the edges become curled so that the valve is incapable of perfect closure. In this way the valve may become insufficient without any degree of stenosis (narrowing of the opening), or, as the process goes on and the thickening becomes greater, the stenosis may be marked. In the later stages of the disease lime salts are frequently deposited in the new connective tissue of the valves, forming a dense mass of calcareous tissue. Chronic endocarditis may affect the walls of the heart, forming patches of fibrous tissue. Tuberculous endocarditis sometimes occurs.

Endocarditis, whether due to rheumatic inflammation (and the heart complication is said to occur in over 40 per cent. of the cases of rheumatism), or whether due to other causes, produces difficulty with the action of the valves of the heart. The thickening of the cusps or flaps of the valves, due to deposits between the layers of endocardium which cover them, makes them clumsy and unyielding. They may obstruct the flow of blood through them, causing *stenosis*. The valve-flaps may become shortened from contraction of the fibrous structure newly developed, and allow the blood to flow back through the valves when they are shut as tightly as possible, causing *regurgitation*. Alteration of the normal heart sounds reveals to the trained ear information which will determine the condition. (See *Sounds of the Heart*, in the article HEART.) A rough surface on the valve-flaps may lead to a deposit of fibrin from the blood, and the formation of a thrombus (q.v.). A thrombus, or a vegetation (a fringe or small lump of granulation tissue), may become broken off and be carried up into an artery of the brain, plugging it, with dire results. Such a plug is called an *embolus*, and the occurrence is termed *embolism* (q.v.). The result of embolism of a cerebral artery may be immediate death, paralysis, convulsions, or secondary softening, with consequent mental deterioration in course of time. Chronic endocarditis may exist for a considerable length of time without causing any

symptoms; the heart becoming hypertrophied in one or another of its parts, and being thus enabled to meet the extra amount of work that is thrown upon it by the valvular stenosis or insufficiency. Sooner or later, however, the disease causes the appearance of symptoms, of which the most characteristic are: Shortness of breath, hemorrhage from the lungs, blueness of the lips and finger-nails, dropsy of the hands and feet, dyspepsia, headaches, vertigo, and fainting spells. The prognosis depends upon the particular valve affected, the existence or non-existence of compensatory hypertrophy, the age of the patient, etc.

HYPERTROPHY OF THE HEART. This consists in thickening of the heart walls, the cavity of the heart remaining of normal size (*simple hypertrophy*), contracting (*concentric hypertrophy*), or dilating (*eccentric hypertrophy*). The muscle tissue in hypertrophy of the heart is enlarged, probably both by increase in the number of fibres and by increase in size of the individual fibres. The hypertrophied muscle is dense, firm, and dark in color. If the hypertrophy affects both ventricles, there is an increase in both length and breadth of the heart. If the left ventricle alone is affected, there is an increase in the length of the heart, while hypertrophy of the right ventricle broadens the heart on the right side. Hypertrophied hearts may weigh from two to three pounds or more. Dilatation of the heart may, as already mentioned, be associated with hypertrophy. This is known as active dilatation. Or dilatation may occur with thinning of the heart walls, which is known as passive dilatation. The dilatation may affect any one or all of the cavities. The right side of the heart is more frequently affected than the left side.

Dilatation with compensating hypertrophy, if the valves of the heart are competent, is of little moment. The heart is the stronger for the hypertrophy. Mountain-climbing may cause it, as well as mental emotion with oft-repeated increase of the heart's action, or obstacle to the circulation. When the heart has become enlarged as a sequel of kidney disease, it is the latter that causes death when it comes. The ventricles are far more often dilated than the auricles, though all four cavities may be dilated. Should the hypertrophied heart become fatty, a grave danger arises; progressive cardiac failure may occur, with weakening of the circulation and dropsy of the lower extremities.

In the main, heart diseases are rare, and they are an infrequent cause of death. One with valvular trouble of a mild degree may fulfill the ordinary expectation of life, if he is content to live on a level, avoiding violent exercise, running or lifting, and avoiding anger, grief, and general emotional conditions. Cases of sudden death, called death from heart disease, are often due to cerebral embolism.

ANEURISM OF THE HEART is very rare. It is always fatal. Consult: Strümpell, *Text-Book of Medicine* (New York, 1901); Osler, *Practice of Medicine* (New York, 1901).

HEART-LYMPH. See CIRCULATORY SYSTEM, EVOLUTION OF.

HEART OF ENGLAND. A name of Warwickshire, as the middle county of England.

HEART OF MIDLOTHIAN, mid-lō'thī-an. One of Scott's *Tales of My Landlord*, purporting to have been written by a schoolmaster, Peter Pattison, and on his death to have been edited by his friend Jedediah Cleishbotham. It was published in 1818, and its title was taken from the popular name of the Tolbooth, an Edinburgh prison, which had been torn down the year before. It represents the best side of the Cove-nanting temper, and the scene opens in Edinburgh at the time of the Porteous Riots, September 7, 1736.

HEARTS. A game of cards, most frequently played by four persons. The whole pack is ordinarily dealt, in succession, one to each of the four, until each player has thirteen cards. The first player to the left of the dealer plays any card he likes, the rest following suit, if possible. The highest card of the suit played wins the trick. If the player cannot follow suit, he may play any card he pleases, and, when hearts are not led, he has the opportunity of getting rid of them. The winner of the first trick leads for the second; and so on until all the thirteen tricks have been taken. Then the players in turn expose their hands, count the number of the hearts, and pay into the pool one chip or unit for each one they have, and the pool is divided as provided for under the rules, or it remains, under some circumstances, as an added stake for the next hand. But if the settling is according to Hoyle's rule, each player also pays in addition as many other chips as there are other players (in every four-handed game there are, of course, three other players, and a player who has two hearts has to pay six chips, and so on all round). There will always, therefore, be thirty-nine chips in the pool. Then each player draws out of the pool one chip for every heart *not* taken by him in the play. Thus if one player has not taken any hearts he draws thirteen chips. The man who has taken three hearts takes ten chips, he who has taken four hearts takes nine chips, and he who has taken six hearts takes seven chips. This exhausts the pool. It is impossible to discuss in detail the reasons which will operate in a player's mind in the various heart games; even to the determination to endeavor to take all the hearts. 'Progressive hearts' is played after the manner of progressive euchre, so far as the arrangement of players, tables, and scoring is concerned. In the double, or *eagle game*, each player gives for an ace, 14; a king, 13; a queen, 12; a knave, 11; and for each of the other cards, the equivalent of the spots they stand for. This is instead of paying the pool one chip for each heart taken. It may also be played so that the ace counts 5; queen, 3; knave, 2; and all other cards 1. The variations of the game include 'six-handed hearts,' 'three-handed,' 'sweepstake,' 'auction,' 'spot,' 'drive,' 'joker,' and 'jack pot.'

HEART'S CONTENT. A port of Newfoundland on Trinity Bay (Map: Newfoundland, G 5). It is an excellent harbor and noted as the landing-place of three Atlantic telegraph cables from Valentia, Ireland. Population, in 1891, 1186; in 1901, 1079.

HEART'S-EASE. See VIOLET.

HEART-URCHIN. See SEA-URCHIN.

HEAT (AS. *hæu*, OHG. *heizi*, heat; connect-ed with AS. *hit*, Icel. *hiti*, Goth. *heito*, OHG. *hizza*, Ger. *Hitze*, heat, and AS. *hāt*, Icel. *heitr*,

OHG. *heiz*, Ger. *heiss*, Eng. *hot*). A definite sensation, known as 'warmth,' is felt when one places his hand near a flame, exposes it to the sun, rubs it with the other hand, etc. A different sensation is experienced when the hand is placed on a block of ice, or is when wet exposed to a draught of air, etc. These sensations are due to two sets of nerves, which correspond to the 'tempera-ture' sensations. If natural objects are exposed to conditions similar to those just described it is observed that they undergo certain changes; in fact, as a rule, all of their physical properties excepting inertia and weight are affected; their size, shape, state, electrical and magnetic prop-erties, elasticity, etc. These changes, when pro-duced in this manner, are called 'heat-effects.'

From the time of the Greek philosophers, Epi-curus and Democritus, until about 1800, heat-effects were believed to be due to the addition of a substance to the body experiencing the effects; or, in other words, heat was considered a form of matter. Such an idea was furthered when Pro-fessor Stahl (1660-1734), of the University of Halle, announced the theory of 'phlogiston,' which was represented as a material substance emitted from a burning body. That the theory of the material nature of heat, which in this form was called caloric, was generally accepted in the eighteenth century, is shown by the fact that prizes of the French Academy of Science, offered in 1738, for essays on the Nature of Heat, were granted to scientists who took this view of the question. Although the material idea of heat prevailed during the seventeenth and eighteenth centuries, it must be mentioned that, by some physicists of these and earlier times, it was con-sidered as a mode of motion in some form or other, just as a few philosophers at similar times believed in the undulatory theory of light, and in a crude way formulated their theories. Such men as Descartes, Amontons, Boyle, Francis Bacon, Hooke, and Newton believed that heat must be due to motion of the substance, but could not substantiate their theories by experimental proof, or urge them with such force as to secure their adoption. At a time when experimental knowl-edge was exceedingly limited, that these men should have arrived at such results by pure rea-soning, is a matter of great wonder, and if they had continued and verified their theories by actual experiments, it is safe to assume that the dynamical theory would have been established on a definite basis far earlier.

Caloric, according to the eighteenth-century physicists, was a fluid of an elastic and self-re-pellent nature, which permeated all matter. The various heat-effects were very plausibly explained on this basis, and it was a long time before the theory was overthrown. The first serious oppo-sition came from Count Rumford (1753-1814), whose experiments on the production of heat by friction were published in 1798. These led him to believe that heat, instead of being a material substance, was merely motion. In fact, in 1804 he wrote to Pictet: "I am satisfied that I shall live a sufficiently long time to have the satisfac-tion of seeing caloric interred with phlogiston in the same tomb." Experiments by Humphry Davy (1778-1829), in which two pieces of ice were melted by friction, caused him also to think that heat was merely the vibration of the corpus-cles of the body. In 1812 he asserted that the

immediate cause of the phenomenon of heat is motion, and "the laws of its communication are precisely the same as the laws of the communication of motion." Rumford and Davy were also assisted by Thomas Young (1773-1829) in their attempts to displace the theory of caloric, but, in spite of their efforts, the old theory continued to be accepted for many years, and, in fact, Sadi Carnot (1796-1832) in his famous treatise, *Reflexions sur la puissance motrice de feu*, reasoned on this basis, although later he became finally convinced of the truth of the dynamical theory. It is to the experiments of Joule, however, that we owe the most complete evidence in favor of the idea that heat-effects are due to energy. (It should be borne in mind that no experiments can prove this relation between cause and effect; they can simply be shown to be in accord with the theory.) The modern theory that heat-effects are due to energy alone is founded largely on the work of Carnot and Mayer. (See THERMODYNAMICS.)

The researches on heat are more or less closely connected with the development of the thermometer first made and used by Galileo (1564-1642), as described under THERMOMETER. There was also the stimulus of the invention of the steam-engine, and from the time of the construction of the first practical steam-engine (1711) many of the inventors who improved that machine carried on investigations in heat. Joseph Black (1728-99), who was among the foremost of these, was an assistant of James Watt, the great Scotch inventor, and later a professor of chemistry at Edinburgh. He derived the idea of latent and specific heats, and was the first to use proper methods for calorimetry (q.v.); Lavoisier (1743-94) and Laplace (1749-1827), working along lines somewhat similar, determined specific heats of a number of substances and devised calorimeters.

NATURE OF HEAT-EFFECTS. One of the simplest modes of producing heat-effects is by means of friction. If two pieces of ice are rubbed together they will melt; if two pieces of metal are rubbed violently their temperature rises—as detected by the 'temperature-sense'—they also increase in volume; if a paddle is turned rapidly enough in a vessel of water it may be made to boil. It requires work to produce friction; and the energy thus lost by the agency doing the work is gained by the bodies on which the work is done and which manifest the heat-effects. Similarly, in every known case, if such heat-effects as rise in temperature, expansion, boiling, melting, etc., are produced by any external agency, the latter can be proved to have lost energy; and the 'amount of the heat-effect' is proportional to the energy received. If, on the other hand, a body experiences the reverse changes, such as fall in temperature, contraction, condensation, freezing, etc., it may be proved that it loses energy. This energy which the body gains or loses is not kinetic energy of the whole body or of its visible parts, nor potential energy of strains of the entire body; it is energy associated with the minute portions of the body—its molecules and atoms. The energy of the body considered by itself—omitting any kinetic and potential energy of the whole body that it may have—is called its 'intrinsic' energy. This energy of the molecules and atoms is partly the kinetic energy of their irregular motions and vibrations, and partly potential

energy in case it requires work to change their relative positions. In ordinary language a flame is called a 'source of heat;' when a body is brought near it is said to receive 'heat;' and the effects produced are said to be due to heat. These expressions are most unscientific and misleading. A flame is a source of energy; when a body is brought near, energy passes from the flame to it; part of this energy is spent in increasing the intrinsic energy of the body, and part in enabling the body to do external work, e.g. if it expands it pushes back the atmosphere or whatever rests against it, thus doing work. It is proper to speak of the energy which the body receives as 'heat-energy;' and in accordance with the conservation of energy one may say that 'heat-energy received' = 'increase in intrinsic energy' + 'external work done.' One can speak of the intrinsic energy in a body (although no idea can be formed of its amount or even nature); but it is as improper to speak of the amount of 'heat' in a body as it is to refer to the amount of sound in a horn or the amount of light in a candle.

ENERGY OF A GAS. One of the most important facts in regard to a gas is that, if it is allowed to expand under such conditions that it does no external work, there is no sensible change of temperature, showing that it has required no work to separate the molecules, and that the molecules themselves have not lost energy. In other words, there are no sensible forces either of attraction or of repulsion between the molecules of a gas, and so the energy of the molecules is entirely kinetic. This fact was first shown by Gay-Lussac and later by Joule; and, although the more elaborate experiments of Thomson and Joule showed that there were minute changes in temperature when a gas expanded freely, they indicate that the molecular forces are extremely small. If a gas is allowed to expand in such a manner as to do external work, the energy required for the work is taken from the kinetic energy of the molecules; a fall in temperature is always observed under these conditions when external work is done; and therefore the temperature of a gas depends upon the kinetic energy of its molecules.

TEMPERATURE. The units to be used in the measurement of the quantities involved in heat-effects are in most cases self-evident: the 'heat-energy' itself should be expressed in ergs or joules (q.v.); changes in volume, in cubic centimeters; melting or boiling, in number of grams experiencing the change, etc. The difficulty comes in giving a numerical value to 'temperature.' Primarily this is a question of sensation; and, although our senses give us a rough idea as to hot and cold bodies, they do not enable us to give numbers to the property of these bodies which corresponds to these sensations. Recourse must be had to the changes which some natural object undergoes under the conditions when the senses recognize differences in temperature, changes which may be measured. One of the simplest of these changes is alteration in volume. Two standard thermal states must be chosen arbitrarily, e.g. the thermal state of a mixture of pure water and ice at normal barometric pressure, and that of the vapor rising from pure water boiling under normal barometric pressure, because experiments have shown that these conditions are perfectly definite and unvarying. Let v_1 and v_2 be the volume of any definite body, e.g. a piece of

iron or nitrogen gas initially at a certain density; under these two thermal conditions, no other external condition having changed—in particular the pressure on the body must remain unchanged. Let v be the volume of the selected body under the thermal condition for which a numerical value is desired, e.g. a vessel of water, the air of a room. Let it be agreed to take n 'degrees' or steps between the two standard thermal states, then $\frac{v_2 - v_1}{n}$ is the change in volume corresponding to one degree; and the number of degrees corresponding to the change in volume $v - v_1$, is

$$\frac{v - v_1}{v_2 - v_1} \quad \text{or} \quad n \frac{v - v_1}{v_2 - v_1}.$$

Therefore, if it is agreed to give the number t_1 to the first thermal state, the proper number for the temperature of the state to which the volume v corresponds is

$$t = t_1 + n \frac{v - v_1}{v_2 - v_1}.$$

In this method for giving a numerical value to the temperature the following steps are arbitrary: (1) Choice of property of body, which varies with the temperature. (2) Choice of body to serve as 'thermometric substance.' (3) Choice of two standard thermal states. (4) Choice of number of degrees between the temperatures of these states. (5) Choice of number for first state. There are, consequently, an indefinite number of methods for giving numerical values to temperature. (See THERMOMETRY.) The scientific world has agreed to use numbers depending upon the change in volume or pressure of hydrogen gas initially at a pressure of 100 centimeters of mercury, the standard thermal states being those of melting ice and vapor rising from boiling water under normal atmospheric pressure, the number of degrees between the temperatures of these states being taken as 100, and the temperature of melting ice being taken as 0. (Therefore the temperature of the other standard state is 100.) Then, in the above formula, the numerical value of t becomes

$$t = 100 \frac{v - v_0}{v_{100} - v_0}.$$

This is, then, the temperature on a constant pressure hydrogen thermometer, Centigrade scale.

[If change in pressure of a gas kept at constant volume is the property measured, the temperature is

$$t = 100 \frac{p - p_0}{p_{100} - p_0},$$

where p_0 , p_{100} , p are the pressures of the gas at 0° , 100° , t° . Experiments show that using hydrogen the temperature defined this way has the same numerical value as that defined by the change in volume at constant pressure.]

It is seen, then, that in order to give a numerical value to a thermal state, e.g. to that of water in a vessel, three measurements are necessary, those of the volume of the hydrogen when the bulb containing it is immersed in melting ice (v_0), in vapor rising from boiling water (v_{100}), and in the water (v). The fact should be emphasized that temperature is not 'measured' in the proper sense—the volume is measured; we have

simply defined a method for giving a number to temperature. In ordinary laboratory practice mercury-in-glass thermometers are used; and divisions with numbers are marked on them, which are designed to correspond to proportionate increases in volume. These numbers have no meaning until the instrument is compared with a hydrogen thermometer; and a table of values connecting the numbers and the true temperatures—as defined above—is prepared. See THERMOMETER.

MECHANICAL EQUIVALENT OF HEAT. Since, in practice, heat-effects are rarely produced by mechanical work, the erg is not a convenient unit in terms of which to measure heat-energy. Almost invariably the energy required to produce a given heat-effect or the energy given out when the opposite effect occurs, is measured in terms of the change in temperature of water: thus, to find how much energy is required to make ice melt, a quantity of ice of known mass is put into a known mass of water at a known temperature, and the fall in temperature is observed. Therefore a practical unit for the measurement of heat-energy is the "energy required to raise the temperature of one gram of pure water from 15° to 16° Centigrade;" this is called the 'calorie.' The limiting temperatures must be defined, because it is not necessarily true that the same amount of energy would raise the temperature of one gram of water from 10° to 11° , or from 60° to 61° , as from 15° to 16° —in fact, it does not. This definition of a practical unit for measuring heat-energy is not an ideal one, because it makes the unit of energy depend upon so many extraneous conditions, viz. all those involved in the definition of temperature. It would be much better theoretically to choose some heat-effect which was independent of temperature, e.g. the energy required to make one gram of water boil away at normal atmospheric pressure; but such a unit could not be used practically. Experiments show that the amount of energy required to raise the temperature of one gram of water one degree at any temperature is nearly one calorie; and so for all practical purposes this is assumed. The number of ergs equivalent to one calorie has been called the 'mechanical equivalent of heat.' Its value is 4.187×10^7 , according to the best determinations. There are in general two experimental methods for measuring this most important quantity: a mechanical one, depending upon the production of the rise of temperature of the water by a paddle revolving in it; an electrical one, in which the rise in temperature is produced by the heating effect of an electric current. In the first method the amount of work done is measured directly in ergs by a suitable dynamometer; in the second, the electrical quantities, current resistance, and electro-motive force are measured and the number of ergs calculated (energy = Eit). (See ELECTRICITY.) The mechanical method was first used accurately by Joule (1843-45), and more recently by Rowland (1878), and by Reynolds and Moorthy (1897). (The last two investigators did not measure the calorie directly, however.) The electrical method was also first used by Joule; and within recent years it has been perfected by Griffiths (1893), Schuster and Gannon (1894), and Calendar and Barnes (1899). (For a full discussion of these experiments reference should be made to an article by Ames in *Reports of the*

International Congress of Physics, vol. i., Paris, 1900.) It should be noted that previous to the experiments of Joule both Carnot and Mayer had made calculations of the mechanical equivalent of heat, using the numerical values found for certain properties of gases.

SPECIFIC HEAT. It is found by experiment that the heat-energy required to raise the temperature of bodies varies greatly with the material of the body, with the external conditions, and slightly with the initial temperature. The number of calories required to raise the temperature of 1 gram of a substance from t° to $(t+1)^\circ$ under given conditions is called the 'specific heat' of that substance at t° and under the specified conditions. Ordinarily, these conditions are those of constant atmospheric pressure; but it is possible to make the condition one of constant volume in the case of gases. (Methods for the measurement of specific heats are described under CALORIMETRY.) The specific heat of a gas at constant pressure is greater than that at constant volume by an amount equivalent to the energy required to expand the gas against the constant pressure, because, as has been stated, no appreciable work is necessary to produce the expansion of the gas itself. The ratio of these two specific heats of a gas is a most important constant for that gas, and may be determined directly by several methods. Its value for hydrogen, oxygen, and nitrogen is almost exactly 1.4. (See ELASTICITY.) The specific heat of a substance varies with its temperature. Its value for water at different temperatures is now known quite exactly owing to the recent experiments of Callendar and Barnes. Its value for solids at different temperatures is hard to obtain; and under ordinary conditions the variations are not important. Boron, carbon, silicon, and iron, however, have specific heats, which increase markedly with increase of temperature. The specific heat of a substance which can exist in several allotropic forms varies with the modification: thus at ordinary temperatures the specific heat of graphite is 0.202, of charcoal is 0.241, of diamond is 0.147. When a substance changes its state from solid to liquid and then to vapor its specific heat changes too; thus the specific heat of ice is about 0.50, of water it is 1.00, of steam it is 0.48. Owing to this change in the specific heat of a substance when its molecular arrangement is altered, there is a curious property observed in the case of iron. If an iron wire is raised to a 'red heat' in a flame, then removed and allowed to cool, its color disappears, then reappears, and soon disappears again for good. This is called *recalcescence*. It is due to the fact that as the iron first cools from its red heat it comes to a state when the molecules rearrange themselves owing to some internal condition of instability, and in so doing liberate energy, which is at once manifest by the iron becoming red-hot again, but at a lower temperature than before.

It was observed by Dulong and Petit that, if the specific heats of different solids are compared, there is an approximate connection between them and the atomic weights of the solids. In fact, the product of the specific heat of a substance in the solid condition and its atomic weight is approximately the same for all substances, viz. 6.4. This product for any substance is called its 'atomic heat,' because by the definition of 'atomic weight' it is proportional to the heat-energy re-

quired to raise the temperature of one atom one degree. The agreement between the values of the atomic heat for different substances is not very exact, partly no doubt due to the fact that the conditions of temperature under which the specific heats were measured were not such as to make the other conditions of the solids comparable, e.g. one solid is nearer its melting-point than is another at the same temperature. This law of Dulong and Petit has been extended by Woestyn to the idea of 'molecular heats;' he thinks it probable that the heat-energy required to raise the temperature of a molecule one degree equals the sum of the amounts of energy required to raise the temperature of the individual atoms. This extension of the law is not verified in the case of most compounds.

TABLE OF SPECIFIC HEATS

SUBSTANCE	Specific heat	Temperature
Water.....	1.000	15°C

EXPANSION. In general when heat-energy is added to a body its volume is changed; and experiments prove that an approximate relation connects the change in volume of any substance and its change in temperature. If v_0 is the volume at 0° , and v is the volume at t° , the external pressure remaining constant, $v - v_0 = v_0 \beta t$ or $v = v_0 (1 + \beta t)$, where β is approximately a constant for any one substance (with certain marked exceptions). It is called the *coefficient of cubical expansion at constant pressure*, referred to 0° . [A more exact relation would be $v = v_0 (1 + a_1 t + a_2 t^2 + a_3 t^3 + \text{etc.})$.] If the change in length of a linear dimension of the body—e.g. an edge of a cube, if it is in that form—is considered, it will satisfy a similar formula. Let l and l_0 be the final and initial lengths; then $l = l_0 (1 + a t)$, where a is called the *coefficient of linear expansion*. If the body is in the form of a cube, whose edges have the length l_0 at 0° and l_1, l_2, l_3 , respectively at t° , $v_0 = l_0^3$, $v = l_1 l_2 l_3$. Hence, if

$$l_1 = l_0 (1 + a_1 t), l_2 = l_0 (1 + a_2 t), l_3 = l_0 (1 + a_3 t) \\ v = v_0 [1 + (a_1 + a_2 + a_3) t + (a_1 a_2 + a_2 a_3 + a_3 a_1) t^2 + a_1 a_2 a_3 t^3].$$

But since a_1, a_2, a_3 are all extremely small in general this may be written $v = v_0 [1 + (a_1 + a_2 + a_3) t]$; and it follows that $a_1 + a_2 + a_3 = \beta$. If the body is isotropic, $a_1 = a_2 = a_3 = \frac{1}{3} \beta$; but if the body is crystalline the coefficients of linear expansion in different directions may be different, and may even be of opposite sign. In this last case it might happen that the contraction in one direction would be so great as to make β negative, i.e. produce a diminution of volume with rise in temperature. The change in volume of

water as the temperature changes is peculiar, inasmuch as it decreases while the temperature increases from 0° to about 4° C., and then it increases as the temperature continues to increase. This fact plays a most important part in the economy of nature, as, owing to it, when the temperature at the surface of a pond or lake falls below 4°, the cold water, being lighter, stays on the surface, and ice is formed. Ordinarily, of course, the colder a liquid is the denser it is; and so, if the surface of a liquid standing in a tall vessel is cooled, the top layers will sink and the lower ones will rise. There will thus be *convection currents* until the whole liquid is at the same temperature. Similarly, if the bottom of a vessel of an ordinary liquid is warmed, there will also be convection currents. The motion of these liquid masses is evidently due to the force of gravity, making the denser liquid come below the lighter. The coefficients of cubical expansion at constant pressure are different for different liquids and solids; but for all gases they are practically the same, viz. 0.003662. This most important property of gases is called the 'law of Gay-Lussac,' although its accurate verification is due to Regnault. If Boyle's law is true for a gas, viz. at constant temperature the product of the pressure and volume of a given mass of gas remains constant, it follows at once that the change in pressure of a constant volume of a gas as the temperature is raised from 0° to *t*° obeys the law $p = p_0(1 + \beta t)$, where p_0 is the pressure at 0°; p that at *t*°; and β is the same coefficient as that for changes in volume, viz. 0.003662. The law that the coefficient of change in pressure at constant volume for all gases is practically the same is sometimes called the 'law of Charles.' If both the pressure and temperature of a gas are changed—assuming Boyle's and Gay-Lussac's laws—it may

be shown that under all conditions $\frac{p}{\rho(t + 273)}$ is a constant for the gas, where ρ is the density at *t*° and pressure *p*. This may be written

$$\frac{pv}{m(t + 273)} = R,$$

where R is a constant for any one gas, and evidently equals $\frac{1}{273} \frac{p}{\rho_0}$ where ρ_0 is the density of the gas at 0° C., and at pressure *p*. It is evident further from the formula that, if it could be supposed to apply to gases at very low temperatures, at $t = -273^\circ$, $pv = 0$, an equation which in itself is meaningless. A lower value of *t* would lead to a negative value for *pv*, which is absurd. Therefore, the temperature -273° C. is sometimes called 'absolute zero on the gas scale of temperature;' and $t + 273$, or *T* as it is written, is called the 'temperature on the absolute gas scale.' (A more accurate determination of the coefficient of expansion makes the absolute zero -273.1° C.)

Methods for the measurement of coefficients of expansion are described in all treatises on heat. See Preston, *Theory of Heat*.

CHANGES IN STATE. FUSION AND VAPORIZATION. If a flame is applied to a vessel, such as a glass beaker, in which there is a block of ice at a low temperature, at first the temperature will rise, but finally a temperature is reached when there is no longer any change and the ice begins to melt. If during the process the mixture of ice and water is stirred the temperature will remain unaltered until all the ice is melted; then the temperature will again rise until the water begins to boil, when the temperature is again constant until all the water is boiled away; and then the temperature of the steam will rise. Conversely, if the steam is cooled, it will begin to condense into water at the same temperature as that at which it boiled, *provided its pressure is the same*; but so long as it is condensing there is no change in temperature; then when all is condensed the temperature of the water will fall until it begins to freeze, as it will at the same temperature as that at which the ice melted, *provided the pressure on it is the same*; and during the process of freezing there is no change of temperature, but when it is completed there is again a fall. This course of events is common to all crystalline solids; but many solids, such as waxes, have no definite temperature at which they melt, but pass through a pasty condition from solid to liquid, the temperature continually rising; and the converse happens when they become solids. There is, then, in the case of ice and similar bodies, a temperature at which the solid and liquid states are in equilibrium together, unless there is addition or withdrawal of heat-energy. This is called the 'fusion-point.' There is also a temperature at which the liquid and the vapor are in equilibrium unless there is addition or withdrawal of heat-energy. This is called the 'boiling-point.' Both these equilibrium temperatures vary with the pressure on the bodies. As the pressure is increased on a liquid its boiling-point is raised, and conversely, e.g. in the case of water, a change of pressure from 76 to 77 centimeters of mercury changes the boiling-point from 100° to 100.37°. As the pressure on most solids is increased, their melting-point is increased also; but there are certain exceptions, viz. those substances which on melting occupy smaller volumes in the liquid than in the solid states. Such solids are ice, cast iron, bismuth. This change in the freezing-point is, however, most minute. In the case of ice, the melting-point is changed from 0° to -0.0075° C. if the pressure on the ice is increased from one to two atmospheres.

FUSION AND BOILING POINTS

Fusion-point		Boiling-points at normal pressure	
Platinum.....	about 1800° C.	Sulphur.....	444.5° C.
Copper.....	1096	Mercury.....	357.

Silver.....	985	Ethyl alcohol.....	78.
Zinc.....	416	Ethyl ether.....	34.6
Bismuth.....	268	Carbon dioxide.....	-79.
Sulphur.....	115	Oxygen.....	-183.
Mercury.....	-39	Nitrogen.....	-194.
		Hydrogen.....	-258.

The phenomenon of 'regelation' is due to this last fact. When the pressure on a piece of ice is

increased its melting-point is lowered. Therefore, if two blocks of ice at 0° are pressed together, the ice under pressure at the point of contact has a melting-point less than 0°, but being at 0° is at a temperature which is higher than its melting-point, and so melts. The water which results from this is at a temperature lower than 0°; and so as it flows out from under the pressure it freezes again, because now its freezing-point is 0°. The motion of glaciers depends on this phenomenon.

The presence of nuclei greatly facilitates the processes of solidification, boiling, and condensation. A drop or a bubble cannot be formed without some nucleus (see CAPILLARITY); and a liquid can be cooled far below its freezing-point if there is no nucleus and if the liquid is not disturbed or jarred. A liquid exposed in an open vessel will evaporate, i.e. will pass slowly into the form of vapor, at all temperatures below its boiling-point. If, however, a large closed vessel is placed over the one containing the liquid, the evaporation will soon cease apparently—there is equilibrium between the liquid and the vapor. The process does not in reality stop; but the evaporation of the liquid is exactly balanced by the condensation of the vapor. Experiments show that this state of equilibrium is reached at a certain temperature when the pressure of the vapor is a definite quantity, viz. at the 'boiling-point' for that pressure; if the temperature is changed, so is the pressure which corresponds to equilibrium. If the temperature in the above experiment is lowered, some vapor will condense; illustrations of this are the formation of dew, formation of drops of water on ice-pitchers, etc. Again, if in the above experiment the volume of the space over the liquid is made smaller, some of the vapor will be condensed. Thus there are two methods for the liquefaction of a gas or vapor: to lower the temperature and to decrease the volume. It was established by Andrews in 1869 that a vapor cannot be liquefied by any decrease in volume, however great, unless the temperature is below a certain limit, which is different for different substances, and which is called the 'critical temperature.' But by lowering the temperature sufficiently and by making the volume small enough, all known gases have been liquefied with the exception of helium. (See LIQUEFACTION OF GASES.) The critical temperatures of a few gases are given below:

CRITICAL TEMPERATURES

Carbon dioxide.....	30°.92	Hydrogen.....	-234
Sulphur dioxide.....	156.	Oxygen.....	-118
Sulphuric ether.....	194.4	Nitrogen.....	-146
Water.....	365		
Ammonia.....	130		

If substances are dissolved in a pure liquid, both its freezing and its boiling points are altered; the former is lowered and the latter is raised, the amount of the change varying directly with the quantity of substance dissolved. In most cases, however, both the solid and the vapor formed are those of the pure liquid. If the dissolved substance is volatile, then it will evaporate also. Common salt and water serve as an illustration. If salt is added in small amounts to a vessel of water, a time will come when the water will no longer hold the salt in solution, but will deposit it; the solution is said to be 'saturated.' The amount of salt required to produce saturation varies directly with the temperature.

If an unsaturated solution has its temperature lowered below 0°, the freezing-point of the solution will finally be reached, pure ice will separate out, leaving the solution more concentrated; the freezing-point of this solution is lower than that of the first; and so as the temperature gets lower and lower, the solution becomes more and more concentrated until finally it is saturated. If now heat-energy is removed, ice will form, but salt will be deposited also in equivalent amounts; this mixture of ice and salt is called the 'cryohydrate,' and the temperature of its formation is -22° C. (Other salts and liquids have different cryohydrates and different temperatures of formation.) In this cryohydrate of common salt there are 23.8 parts by weight of the salt and 76.2 parts of ice. Therefore, if a mixture is made of salt and ice in this proportion, it will form a solid whose melting-point is -22° C.; and if it actually is at the temperature -5° or -10°, it will of course melt, and in so doing heat-energy will be abstracted from surrounding bodies, because energy is required for two reasons, to melt the ice and to make the salt dissolve in the water. For this reason such a mixture is called a 'freezing-mixture.'

The fact that heat-energy is required to make a solid melt or a liquid evaporate is familiar from many experiments. Similarly heat-energy is liberated when a liquid freezes or vapor condenses. The number of calories corresponding to the change in state of one gram of a substance under a definite pressure is called the *latent heat* for that change at the given pressure. Similarly, when one substance dissolves in another, there are as a rule changes in temperature showing that heat-energy is liberated or absorbed. The 'heat of solution' is defined to be the number of calories produced when one gram of a substance dissolves in a great mass of a given solvent, a quantity so great that any further increase in it would not affect the heat-energy liberated or absorbed. Values for latent heats and heats of solution are given in the following tables:

LATENT HEATS

SUBSTANCE	Fusion	SUBSTANCE	Vaporization
Water.....	80.02	Water.....	536.6

+ Means rise in temperature.

- Means fall in temperature.

There are, of course, other changes of state than those mentioned; among these are sublimation, when a solid passes directly into the state of vapor; dissociation of a gas, when the molecules of a gas break up into other parts; etc. It is found, however, in all these cases that there will be equilibrium at a definite temperature only when a certain pressure is reached, and conversely.

TRANSFER OF HEAT. There are three processes

by which the energy used in producing heat-effects is conveyed from one point to another: convection, conduction, radiation. It should be particularly noted that in all cases a difference of temperature is essential for a transfer of energy, and that it is the body at the lower temperature which gains heat-energy, while the body at the higher temperature loses it. *Convection* has already been described. It consists in applying a flame or 'source of heat' to the lower portion of a column of some fluid; this portion expands, becoming less dense; then under the influence of gravity it rises to give place to some heavier portion of the fluid above it. The motion of the wind, of draughts of smoke in chimneys, of water in hot-water systems of heating, etc., are illustrations of this process. *Conduction* is illustrated when one end of a long metal rod is raised to a high temperature, while the other is maintained at a lower one. There may be observed a steady increase of temperature from the latter end up to the former; the heat-energy required to produce this temperature coming from the 'source of heat' which keeps the hot end at its high temperature by a process of 'conduction' from particle to particle down the rod. Some bodies conduct better than others, meaning that the effect of the source of heat at the hot end is felt farther down the rod. Metals are all good conductors; but silver, copper, and aluminum are the best. Woods and cloths are poor conductors; so are all liquids, with the exception of molten metals, and gases also, relatively to their volumes. The principle of the miner's safety lamp depends upon conduction, because the temperature of the gases escaping from the flame through the gauze envelope of the lamp is made so low by the conduction away of heat-energy by the gauze and the metal base that the exterior gas is not ignited. *Radiation* is the process by which heat-energy is conveyed from one body to another by a wave-process in the luminiferous ether. (See RADIATION; ABSORPTION; ETHER.) Illustrations are afforded when the hand is held beside a stove or exposed to the sun. All bodies in the universe, so far as is known, are emitting these ether-waves, owing to vibrations inside the molecules. These waves have lengths varying from less than 0.00002 of a centimeter to a few hundredths of a millimeter. They carry energy; and if they are absorbed by any body upon which they fall, this energy is as a rule distributed throughout the minute portions of the body, and it manifests heat-effects. The total amount of energy radiated by a body increases as the temperature is raised; and, further, as the temperature rises, the body emits shorter and shorter waves—finally the body may become visible. If two bodies are allowed to radiate to each other, each loses energy by radiation and gains it by absorption until finally there is equilibrium of temperature. It may be shown (see RADIATION) that the radiating and absorptive powers of any body are the same at any one temperature; and in general a body which is a good absorber is a good radiator, e.g. a body painted black; while, if a body is a poor absorber, and therefore a good reflector, it is a poor radiator, e.g. a piece of polished metal. Some bodies are transparent to ether-radiations of certain wave-lengths and opaque to others; they are called diathermanous if the waves which are transmitted by them carry

a large amount of energy, which may be transformed into heat-energy if absorbed. See DIATHERMANCY.

Consult: Preston, *Theory of Heat* (London, 1896); Tyndall, *Heat as a Mode of Motion* (6th ed. London, 1880); Maxwell, *Theory of Heat* (London, 1875). For heat considered as a factor of organic evolution, see EVOLUTION.

HEATH (AS. hæþ, Icel. heiþr, Goth. haiþi, OHG. heida, Ger. Heide, heath, OWelsh, Bret. coit, Corn. cuit, forest, Gall. cêto- in *Cêto-briga*, *eto-cêtum*, Lat. *cetum* in *bu-cetum*, cow-pasture, *quer-cetum*, oak-forest). A term of varied significance, applied originally to various members of the Ericacæ (see below), and long used to designate areas covered by such plants. It has been still further extended to include most sterile uncultivated tracts, covered with low shrubs. In its more proper ecological sense, however, a heath may be defined as a plant society on sterile and commonly dry soil in which the dominant plant types are evergreen shrubs, chiefly ericads or ericad-like plants. The heath, defined in this way, is much less common in America than in Europe, although in the Northern United States and Canada small areas of low evergreen shrubs are often found in which the bearberry (*Arctostaphylos*) and junipers dominate. Small heath areas are also found in mountain (even alpine) districts. In the far northern regions and sometimes locally in the Northern States, habitats like the above are often covered with coarse mosses like *Polytrichum* or lichens of the genus *Cladonia* (including the reindeer lichen); these areas may be called moss or lichen heaths, since the soil conditions are those of the true heath, though the exposure is perhaps too great for the shrubs.

The origin of the heath is twofold: it may arise from a moor or undrained swamp (q.v.), or from a dry sandy area, as a beach or dune. This fact is of great ecological interest, since so far as water content is concerned, a dune is xerophytic, while a swamp is hydrophytic. That dune, heath, and moor are closely related as to their ecological conditions, however, is shown not only by the twofold origin of the heath, but also by the fact that all typical dune, heath, and moor plants have identical and xerophytic structures (see XEROPHYTES); not only this, but the dominant plant families, conifers and ericads, are the same throughout. On the dune transpiration is great, perhaps because of the excessive exposure; on the heath and in the swamp, transpiration is great in relation to absorption, probably because of the soil acids and the relative absence of bacteria. Hence in all three cases only those plants can thrive which are able to reduce transpiration by protective structures, and those structures are peculiarly prominent in conifers and ericads.

The heaths are small shrubs, distinguished by a calyx of four leaves and a bell-shaped or ovate corolla. The leaves are small, linear, and evergreen. The genus has been separated by some botanists into a number of genera, but the old name, *Erica*, is still commonly retained. The name heath, however, is in popular language extended to many plants of genera nearly allied to *Erica*. The little shrub which chiefly covers the large tracts named moors or heaths (Ger. *Haide*) in Great Britain and on the Continent of Europe, is the common ling or

heather (*Calluna vulgaris*), the only known species of the genus *Calluna*. It is also found in a few places in the Eastern United States, where it was probably introduced. It is found on arid places, and also in bogs.

HEATHER.

The flowers, which have much the appearance of being in spikes, are of a lilac rose color, rarely white. They afford abundance of honey, and the beehives are therefore transported to the moors when the heather is in bloom. In bogs it contributes much to the formation of peat. In some of the Hebrides a decoction of heath is used for tanning leather. The plant is applied to various other uses in the Highlands of Scotland. About 500 species of *Erica* are known, and these, with few exceptions, are natives of the south of Africa. None are found in America. The British Isles produce seven species, of which some have been found only in Ireland and some in the southwest

of England; cross-leaved heath (*Erica tetralix*) and fine-leaved heath (*Erica cinerea*) are common plants in most parts of Great Britain, and, like most of the genus, are very beautiful when in flower. The heather-bells of Scottish song are the flowers of one or both of these species. *Erica Mediterranea* and *Erica carnea*, common in the southern parts of Europe, are very frequent ornaments of British flower borders, hardy plants, producing their flowers in great profusion in April. Many of the African species, remarkable for the size and beauty of their flowers, are much cultivated in greenhouses. Some of the South African or Cape heaths attain in their native region a much greater size than any European heath. The roots of *Erica scoparia* are known as bruyere, and furnish the true brier pipes of France.

HEATH, JAMES (1629-64). An English historian, born in London, and educated at Westminster School, and for two years at Christ Church, Oxford, from which he was expelled by the visitors from Parliament in 1648. He was an ardent Royalist, and lived in exile with Charles II. 'Carrión Heath,' a 'dreadfully dull individual,' according to Carlyle, wrote: *A Brief Chronicle on the Late Intestine War* (1661); *The Glories and Magnificent Triumphs of the Blessed Restitution of King Charles II.* (1662); *Flagellum: or, the Life and Death, Birth and Burial of Oliver Cromwell* (4th ed. 1669).

HEATH, NICHOLAS (c.1501-79). An English prelate and jurist, born in London, and educated at Saint Anthony's, in London, possibly at Corpus Christi, Oxford, and certainly at Christ's College, Cambridge. In 1539 he was made Bishop of Rochester. He 'oversaw and perused' the Great Bible of 1541, and was made Bishop of Worcester after Hugh Latimer's resignation. In 1550 he refused to accept Cranmer's form for the Prayer-Book, and was imprisoned and deprived of his see, but was restored at the accession of Mary,

and in 1555 became Archbishop of York. When Mary died, Heath did all in his power to bring about the immediate and peaceful accession of Elizabeth; but when the question of Elizabeth's supremacy came before Parliament, Heath opposed her claim to the headship of the English Church, and later refused to take the oath required by the Act of Supremacy. For this contumacy he was again deprived of his see (1659), imprisoned for a short time in the Tower, and then permitted to retire, on the understanding that he was not to meddle with politics, profane or ecclesiastical.

HEATH, SIR ROBERT (1575-1649). An English jurist, born at Brasted, in Kent, and educated at Tunbridge and at Saint John's, Cambridge. He studied law, rose rapidly, became Solicitor-General in 1621, was knighted in the same year, and in Parliament (1624-25) showed himself a thorough Royalist, and was appointed Attorney-General as a reward for his services. In this office he was active and severe; he arrested in 1629 Holles, Eliot, Selden, and other members of the Commons, arguing that privilege did not protect after the close of a session, and carried their prosecution through successfully, and was equally strenuous and successful in his prosecutions before the Star Chamber. But there was a rumor that he was Puritan in secret, and he was removed without cause. But his loyalty did not waver; he accompanied the King to York in 1642, and later to France, where he died at Calais. Consult the autobiography in vol. i. of the *Philobiblon Society Miscellany* (New York, 1861).

HEATH, WILLIAM (1737-1814). An American soldier. He was born at Roxbury, Mass., and was brought up on a farm, upon which he lived up to the outbreak of the Revolutionary War. He was a member of General Court of Massachusetts in 1761, entered enthusiastically into the political movement that culminated in the Revolution, and from 1771 to 1774 was a member of the committees of Safety and Correspondence. In the latter year he was elected to the Provincial Congress. His interest in the organization of the militia, of which he had made a special study, obtained for him in December, 1774, an appointment as a brigadier-general of militia, and as such he was present at the British retreat from Concord after the battle of April 19, 1775. Thereafter he was made major-general of militia, and on June 22, 1775, was commissioned by Congress a brigadier-general of the Continental troops. In March, 1776, he was ordered to New York; on August 9th was promoted major-general, and after the battle of White Plains, in the following October, was placed by Washington in command of the troops in the Highlands. In 1777 he became commander of the Eastern Department, with headquarters at Boston, and in June, 1779, was transferred to the command of Hudson River posts, where, with the exception of his cooperation with the French in Rhode Island in 1780, he remained until the close of the war. After the war he was a member of the Massachusetts Convention that ratified the Federal Constitution, was a State Senator in 1791-92, and was probate judge of Norfolk County in 1793. In 1806 he was elected Lieutenant-Governor of Massachusetts, but declined to serve. His *Memoirs*, which contain

much valuable material on the Revolutionary period, were published in 1798 by authority of Congress, and were last republished under the editorship of William Abbatt in New York in 1901.

HEATH/COAT, JOHN (1783-1861). An English inventor, born at Duffield, near Derby. He worked with a hosier, and later with a stocking-maker and frame-smith at Nottingham. In 1808 and 1809 he patented his complicated machinery for the manufacture of lace. His factory at Loughborough was attacked by the Luddites, and most of his machinery and lace destroyed. Rather than continue at Loughborough, Heathcoat refused an award of £10,000 for damages. He built a new plant at Tiverton, and for twenty-six years (1832-59) represented that constituency in Parliament. He built schools at Tiverton, and planned many charities, which were carried out by his daughters.

HEATH-COCK, HEATH-HEN. See BLACK-COCK; GROUSE.

HEATH/COTE, CALEB (1665-1721). An American merchant, born in England, where his father was Mayor of Chester. He established himself with his uncle, Capt. George Heathcote, a large ship-owner, in New York, and upon Heathcote's death inherited his fortune. He was a zealous churchman, and was one of the petitioners for a license to build the first Trinity Church. He held many offices, among them those of Mayor of New York (1711-14); judge of Westchester County; commander-in-chief of the forces of the Colony; surveyor-general of the province; and receiver-general of the customs for all North America. His large estates near Mamaroneck were erected into the manor and lordship of Scarsdale in 1701, and on his death passed with his title to his son.

HEATHEN CHINEE, THE. A celebrated satiric poem by Bret Harte (1869), in the metre of the threnody in Swinburne's *Atalanta in Calydon*, selected, as Harte says, because "it was just the kind of thing which Truthful James would be the last man in the world to adopt in expressing his views." The poem is based on the imitative faculty of the Chinese, especially in cheating at cards, and its points appealed at once to the East as well as the West, although it was originally intended only as a local satire on Western political conditions. It is probably the best-known and most-quoted of the author's writings.

HEATHER, hēth'ēr. See HEATH.

HEATHER-BLEATER. A provincial name in England for the common snipe (q.v.), in allusion to the love-cry of the cock bird in the breeding season.

HEATH/FIELD, GEORGE AUGUSTUS ELIOT (or ELIOTT), first Baron (1717-90). A British soldier, born at Stobs, Roxburghshire, Scotland. He was educated at the University of Leyden, afterwards attended the French military college of La Fère, and served in the War of the Austrian Succession, being present at the battles of Dettingen and Fontenoy. As colonel of a regiment of light horse, he took part in the Seven Years' War in the years 1759-61. In 1762 he was second in command in the English expedition to Cuba, and for his services there was raised to the rank of lieutenant-general. In 1775, when, because of the *pacte de famille* between France and

Spain, it was thought very probable that one or both of these countries, taking advantage of the rebellion in America, would attack England, an experienced soldier was deemed necessary for the command of Gibraltar, and Eliot received the appointment. Ample time was given him to repair the defenses, as it was not until 1779 that the Spanish undertook a regular siege. In the attacking force of French and Spaniards were the greatest engineers of the age, but their efforts to reduce the stronghold, including the terrific cannonade with the floating batteries of the Chevalier d'Arcon in 1782, were futile. Eliot and his little garrison, though at the verge of starvation, because of the blockade, held out until relief came from a force in command of Lord Howe, who succeeded in breaking through the Spanish lines with supplies. At the conclusion of peace, in 1783, Eliott returned to England, where he was richly rewarded for his bravery. He was made Knight of the Bath, and in 1787 advanced to the peerage as Lord Heathfield, Baron of Gibraltar. Consult Drinkwater, *History of the Siege of Gibraltar* (new ed., London, 1844).

HEATING AND VENTILATION. These topics are so closely related in sanitary and engineering discussions, as well as in the actual planning and erection of buildings, that they are generally considered together. Where artificial heat is seldom if ever required little attention need be given to ventilation, since the people spend most of their time either out of doors or in loosely constructed buildings, with plenty of exposure to the outer air. In cold climates ventilation becomes as essential for complete healthfulness as heating is for comfort, a fact that is not generally recognized; moreover, where much artificial heat is required, the fresh air provided as a part of ventilation must also be heated, which may add greatly to the expense of fuel. In general it may be said that the object of heating is to provide a uniform moderate temperature, and the aim of ventilation is to displace foul air with pure. Both heating and ventilation have an important relation to the moisture of the air, hot-air furnaces, for instance, giving an over-dry air, while the atmosphere of a poorly ventilated, over-crowded room gradually becomes saturated with watery vapor.

Heating has for its standard in the colder parts of the United States and in Canada a temperature of about 70° Fahrenheit, against some 60° in England. The difference is largely due to the more uniform and humid climate of England. Heat for warming is produced by the combustion of fuel (q.v.), except in those few rare cases where electricity generated by water-power or the stored heat from underground waters (as at Boise, Idaho) is utilized. Coal and wood are most commonly employed as fuel, but oil and gas are also used. Open fireplaces, stoves, or furnaces may be employed for burning any of the fuels named, except that oil is rarely if ever burned in open fireplaces.

The methods of heating are classified as direct and indirect radiation. Direct radiation takes place when the heat is generated either in the room, as with open fireplaces, stoves, and furnaces, or when hot water or steam is produced by means of central furnaces and then conveyed through pipes to radiators located in the various compartments to be heated. Indirect radiation

involves the bringing in of air warmed by passing it over some central heated surface, generally a furnace, but sometimes a coil of steam or hot-water pipes. It will be noted that direct radiation heats the air already in the room, while indirect radiation brings in heated air. Thus, indirect radiation may be a means of ventilation, also, by seeing that pure air is secured for heating and distribution. The same end may be effected by locating the heating surface in the room and passing the fresh air over it, which is known as direct-indirect radiation. Strictly speaking, fireplaces only heat solely by direct radiation, or by sending the heat out in straight lines until it is deflected or absorbed by something other than air. With stoves and radiators most of the heat is made available by convection, or the heating of the air that impinges upon or passes over the heated surface.

HISTORY. The first application of artificial heat consisted, most likely, in lighting a fire of dried sticks and leaves in a grove, a cave, or other natural shelter. Where tents or wigwags came to be erected, the fire would be lighted on the middle of the floor, with perhaps a hole in the roof for smoke to escape. The Romans warmed their apartments chiefly by portable stoves, without any regular exit for the smoke and fumes. A brazier of charcoal is still the chief means of heating sitting-rooms in houses in Spain and Italy, which are in general without chimneys, which are comparatively a modern invention. The early fireplaces were without chimneys and the flues extended only a few feet up in the thickness of the wall. They were then turned out through the wall, to the back of the fireplace, the openings into the outer air being small oblong holes. There is no evidence of chimneys earlier than the twelfth century, and brick was not used for their construction till late in the fifteenth century. Of the modern methods of heating dwellings by fireplaces, stoves, furnaces, steam and hot-air apparatus, the fireplace is the oldest, having been employed during the Middle Ages, and becoming, in Northern Europe, an important feature of its architectural development. The fireplace, at first wholly of masonry, was afterwards framed in elaborately carved oak, and the settle, which soon became an essential part of mediæval furniture, was built into the angle of the chimney. Stoves are said to have been used for the first time in Alsace, in 1490, but they did not come into general use as a means of heating until three centuries later. In 1744 Benjamin Franklin invented a cast-iron open heater, which projected out from the chimney, and so radiated heat into the room from the back and sides as well as from the front. The cast-iron box stove was invented in 1752. Early in the nineteenth century cylindrical sheet-iron stoves were made. About 1830 the first base-burner was put upon the market in America, and since that time the different types of stoves have been developed, by successive patents, to their present state of perfection.

The first attempt to construct a hot-air furnace for supplying pure heated air to rooms was probably made by Franklin. In 1744 he built a box-shaped stove for burning wood. "The smoke escaped over the top of a flat chamber behind its fire, passing downward between it and the real back of the stove, and thence into the chimney. This flat, hollow chamber communi-

cated underneath the stove with a tube opening into the external atmosphere, and a quantity of air was thus passed through the flat chamber into the room through small holes left in the sides." Early in the nineteenth century the method of warming by hot air was developed. The first hot-air furnace in New England is said to have been built in Worcester, Mass., in 1835. Heating by hot water was an invention of great antiquity. According to Seneca, the baths of Rome were warmed by water running through brass pipes, which at one point were heated in a fire. With the fall of Rome this method of warming the air seems to have been forgotten, for we next hear of it as a fresh discovery made in 1777 by M. Bounemain for warming the hot-houses of the Jardin des Plantes in Paris. Heating by hot water was introduced into England in 1816 by the Marquis de Chabonne. It was used in Canada for many years before it became popular in the United States, where it was not generally adopted till the last quarter of the nineteenth century. Heating by steam was proposed, in the middle of the eighteenth century, by William Cook, of Manchester, England. In the United States it was not introduced till nearly a century later. The first building in America warmed in this way was the Eastern Hotel of Boston, and the first factory the Burlington Woolen Mill, Vermont.

FIREPLACES. The open fire glowing in a grate, which is still the prevalent mode of warming dwelling-houses in Great Britain, and the more common wood fire in America, have an air of cheerfulness and comfort that make them almost objects of worship. Unfortunately, only 10 to 25 per cent. of the value of the fuel burned in fireplaces is utilized as heat; such fires give a partial kind of warmth, heating the side of the body next to it, but leaving the rest cold, and producing draughts into the rooms which are anything but safe or agreeable. Nevertheless, the fireplace holds its own, for besides its cheerfulness and sentimental features it is, or may be, ornamental, while as an efficient aid to ventilation it is most useful. The substitution of brick-lined for non-lined fireplaces conserves some of the heat. Much also depends upon the shape of the fire-box, or grate itself, where coal, rather than wood, is burned. The chief object is to present as large a surface as possible of glowing fire to the front in order to secure as much radiant heat as possible. With this view, the grate is made long and deep, in proportion to its width from front to back. This principle, however, is carried too far in many grates. The stratum of fuel is too thin to burn perfectly, especially in the narrow angles at the sides, where the coal seldom gets to a red heat, and is only warm enough to distill away in smoke. Such fires are constantly going out, and are further from being economical than a square box.

Placing grates almost on a level with the floor is a mistake. The floor and the lower part of the person receive no share of the radiant heat. The chimney throat, instead of a gulf drawing in a constant wide current of the warm air of the room, and causing draughts from windows and doors toward the fireplace, should just be sufficient to admit the burned gases and smoke. Fireplaces are sometimes so arranged in connection with an air-inlet as to introduce a current of

warmed air into the room. In cold climates fireplaces must be supplemented by more effective means of heating.

A STOVE is simply an inclosure of metal, brick, or earthenware, heated by burning a fire within it, and then giving out its heat to the air by contact, and to surrounding objects by radiation. The simplest, and, so far as mere temperature is concerned, the most effective and economical of all warming arrangements is simply a hollow cylinder or other form of iron standing on the floor, closed at top, and having bars near the bottom on which the fire rests. The door by which the coals are put in being kept shut, the air for combustion enters below the grate, and a pipe issuing from near the top carries the smoke into a flue in a wall. If this pipe is made long enough by giving it, if necessary, one or more bends, the heated gases from the fire may be made to give out nearly all their heat into the metal before they enter the wall; and thus the whole heat of the combustion remains in the room. The great objection to this form of stove is that the metal is apt to become overheated, which not only gives rise to accidents, but deprives the air of or increases its capacity for moisture, thus parching the skin and lungs, unless means be taken to supply the necessary moisture. An evaporating-pan or other contrivance is an essential part of stoves and furnaces. Improvements on this simple and rude form of stove aim at avoiding a high heat in the warming surface, by inclosing it in several casings, so as to enlarge the heated surface.

FURNACES. In ordinary hot-air furnaces the fire is burned in a small compartment within the inner case, and the air is warmed by cir-

and the warm air is conveyed to the different parts of the building in pipes or flues, while fresh air is drawn to the furnace through a fresh-air inlet and duct from outside the building to the openings in the outer casing of the furnace. The heat-pipes are generally of tin, suspended

FIG. 2. HOT-AIR SYSTEM.

from the ceiling of the cellar, or from the beams supporting the floor above, in their horizontal course, and carried upward in the partitions to the higher floors to be heated.

The heat is admitted to the several rooms through registers. Each room to be heated should have a separate line of heat-pipes, provided with a damper at the furnace. Each register should be supplied with a damper, so the heat may be regulated in the room. The several small openings in the registers should have an aggregate area at least as great as the cross sectional area of the heat-pipe. The supply of fresh outdoor air to be heated and distributed should be ample, for otherwise air will be drawn in from the cellar or some room in the house. The fresh-air box should be as nearly air-tight as possible, and both it and the inlet should be kept well away from any source of contamination. Economy and health alike demand that furnaces be large enough to serve their purpose without being forced, since forcing is wasteful of fuel and overheats the room air-supply. The latter is not only bad in itself, but increases the danger of contamination by the gases of combustion. Some means of mixing cold air with hot is desirable, in order to prevent the shutting off of the fresh-air supply when the room becomes too warm.

STEAM AND HOT-WATER HEATING. Either steam or hot water is the most common medium for heating the better class of residences and large buildings and groups of buildings. Either may be conveyed long distances with ease, and both are practically unaffected by the direction or the strength of the wind, freedom from a limitation which is one of the greatest drawbacks to the use of hot-air furnaces. Another advantage of steam and hot water is that they may be produced in connection with a steam plant for power purposes, but this is of less account

culating between the inner and outer cases. When placed in the apartment or hall to be warmed, the outer casing has perforations about the top for the issue of the warm air. For heating churches and large buildings generally the furnace is placed in a separate room or cellar,

FIG. 3. HOT-WATER HEATING—USUAL METHOD OF PIPING.

now than before electric power became so common. The great disadvantage of either steam or hot water, when employed in direct radiation systems, is that they merely warm the air already in the room, instead of bringing in a constant supply of fresh warm air. This matters little where an independent system of ventilation has been provided and is intelligently used; but in small buildings, particularly houses, there rarely is a system of ventilation. It is to meet this objection that either the indirect system or the direct-indirect radiation is often employed in place of direct radiation. Both steam and hot-water systems require a boiler or heater, a pipe system, and radiators. As the hot water is circulated at 140° F., against 212° F. for low-pressure steam, the radiating surface for hot water must be larger than for steam. Hot-water fitting requires greater care in design and construction than steam, which, coupled with the fact that steam-

fitting has been practiced extensively for many years, has rendered the adoption of hot water less common than steam. Of late, however, hot water has been coming to the front. It has this great advantage over steam, namely, that it begins to yield heat very soon after the fire is started and continues to do so until the water cools, while there can be no heat from steam plants until a water temperature of 212° F. has been attained, and none after it falls below that point. On the other hand, steam heat may be shut off more quickly than water, since the latter continues to give off its heat for a much longer period.

Steam boilers and hot-water heaters alike require a furnace, with a grate surface for burning the fuel and a heating surface for imparting the heat thus derived to the water in the boiler or heater. Where steam for both power and heat is to be generated, the boiler

FIG. 5. STEAM-HEATING—PARTIAL-CIRCUIT SYSTEM.

FIG. 4. STEAM-HEATING—TWO-PIPE SYSTEM.

will be chosen principally for its suitability for power; or wholly so if the exhaust steam from the engine is to be used for heating. Where the boiler is employed for heating only, low-pressure steam is likely to be used, and the boiler need not differ very much from a water heater, except that the former has a reservoir for steam mounted above the heating surface, while the latter has not. Low-pressure steam systems, it may be explained, show some 5 to 10 pounds pressure at the boiler, and lower through the pipes and radiators. The choice of a boiler, from the many types and styles available, will depend upon a variety of local and even individual conditions. Thus a vertical boiler may be chosen where horizontal space is scarce and vertical space is ample; or a water-tube boiler may be selected where a high pressure is to be carried for power purposes. Where fuel is cheap or the service is likely to

be temporary, a boiler of low efficiency may be permissible, to save a relatively large capital outlay. The character of labor readily available as boiler attendants may have a very important bearing upon the choice of a boiler. Thus for

have been largely replaced by vertical radiators, of either cast or wrought iron. For direct heating, cast-iron radiators are most commonly used.

For steam, the connections enter and leave the vertical radiators at the base, but hot-water

FIG. 6. STEAM-HEATING—DIRECT-CIRCUIT SYSTEM.

heating most residences and many school buildings simplicity, coupled with a maximum of safety, even under neglect, may be of more importance than economy of fuel. Sectional boilers are advantageous here, since a small portion, instead of the whole boiler, may give way in case of accident. Under other conditions fuel economy may be put first, with the understanding that the continuous service of a skilled fireman will be insisted on. In large heating plants, particularly central heating stations (see below), automatic stokers may be used to feed coal to the furnaces and also mechanical means for removing the ashes. See BOILER.

PIPING AND RADIATORS. Pipes for distributing both steam and hot water and for returning the condensed steam and the partially cooled water to the boiler and heater, respectively, are

FIG. 7. SECTIONAL RADIATOR FOR HOT-WATER HEATING.

generally of wrought iron, with screw joints formed by means of couplings. The pipe-lines and radiators are controlled by various steam, water, and air valves, some of which are automatic. In most isolated plants the circulation is maintained wholly by gravity. Originally the radiating surfaces were mostly of cast-iron pipe, in horizontal lines, but this was superseded by coils of wrought-iron pipe, and these, in turn,

off. The indirect radiators are of either cast or wrought iron, placed in a chamber, so the fresh-air supply to be warmed may be passed over or through them. Some of the essentials of radiator designs are ample radiating surface, free passages to minimize friction, and good drainage in the case of steam radiators. To prevent the escape of heat where not needed for warming, steam and hot-water pipes are covered with asbestos, felt, or other insulating materials. Where high-pressure steam is used for heating it is generally reduced before entering the distributing system, since steam at much over 212° F. would be unpleasant if not dangerous to those coming near or in contact with the radiators. Recent improvements in heating include the securing of a partial vacuum in the pipes and radiators before admitting the steam, thus lessening the trouble with air. It may also be mentioned that fans are employed to aid the circulation of air in the indirect systems of steam and hot-water heating.

ELECTRIC HEATING. Heat is developed by the passage of an electric current through any conductor; the greater the resistance of the conductor the higher will be the temperature to which it is raised by the passage of the current. This is the principle upon which all electric heaters are constructed. These heaters have come into considerable use since 1895 for heating street cars. Their general construction is as follows: Wire of high resistance is imbedded in asbestos, fire-clay, or other refractory material and built up into plates of large radiating surface, these being generally inclosed between iron plates. The current is passed through the resistance wire, which at once becomes very hot and in turn heats up the refractory material and the inclosing iron. When the heater has been brought up to the required temperature the current may be turned all or partly off, and, owing to the nature of materials used, the heater will retain its heat for a long time. To heat water

FIG. 8. RADIATOR FOR INDIRECT SYSTEM.

or other liquids the resistance coils or the cases which contain them may be placed in the liquid to be heated. Electric heating is used but slightly, except in electric street-railway cars, where current is more readily available than any other means of heating. The heaters are placed beneath the seats, running throughout the length of the car; thus a good distribution of the heat is possible, making a pleasant contrast with the heat derived from the small red-hot coal-stove formerly used. In special cases, where economy is of relatively small importance in comparison with, say, advertising effects or convenience, electric heating is used for apartments in buildings. In a few restaurants and clubs it is also used for cooking. Its cost is so much greater than the more direct utilization of fuel that the general use of electric heating is a luxury in which even the very rich do not indulge. This may be the better appreciated when it is remembered that there is a loss at every step in the process of developing heat by electricity, and that the steps are many. Thus, there is a loss in the combustion of fuel, in the transformation of the heat so obtained into steam, in the utilization of steam in the engine, in the conversion of the power thus obtained to electric energy, in the transmission of that energy through wires to the electric heater, and finally in the reconversion of the electric energy to heat.

One of the great advantages of the electric current for cooking is that though there is great loss during the power of transmission, there is very little loss of heat at the point where it is applied, while only a small proportion of the fuel burned in ordinary cook-stoves is utilized for cooking. See ELECTRIC HEATER.

HEATING WITH ARTIFICIAL GAS is far less expensive than electric heating, but with illuminating gas at \$1 per 1000 feet it costs some four to ten times as much as heating with coal. Where cheap fuel gas is available the case for artificial gas heating is not so bad. Gas may be used in fireplaces, stoves, hot-air furnaces, and steam and hot-water systems. For occasional use in fireplaces or other heating apparatus placed in living-rooms gas is often advantageous. It makes no dust, and thus possesses a great advantage over coal or wood. But without good ventilation it vitiates the atmosphere; or at least it consumes much of the available oxygen and may give off objectionable gases. Gas for cooking is rapidly growing in favor, particularly for summer use.

THE CHOICE AND DESIGN OF HEATING PLANTS. The factors entering into both the choice and design of heating plants are many and various, including range of temperature through which the air is to be raised, the size and character of the building to be heated, the sort of fuel to be used, the heating system to be employed, and the amount of ventilation, if any, to be provided.

As to temperature, the usual basis for all American calculations is the attainment of 70° Fahr., the original temperature varying with the locality and season, sometimes falling to -20° Fahr., or even lower. In the matter of the individual buildings there must be considered the area of the ground plan, the number of stories, the number and cubical contents of the several rooms, the areas of exposed or outer wall and window surfaces, and the material of which the outer walls are built, whether of wood, brick, or stone. A large ground plan, for instance, pre-

cludes heating with hot air, unless a fan or blower is used, or many furnaces are employed. The character and area of the outer walls of the buildings have an important bearing upon the amount of heat lost by passage through them. The choice of fuel depends largely upon local prices, but there are other important considerations, such as the smoke nuisance from soft coal, which may be (but often is not) avoided with large plants, but cannot be avoided in most plants for heating private residences. In the design of a specific heating plant the relation of grate to heating surface of the hot-air furnace, steam boiler, or hot-water heater must first be considered, having in mind the fuel and the type of furnace or boiler to be employed. Next comes the relation of the heating surface to the radiating surface, when steam or hot water is used, and finally the proportion of the radiating surface to the cubical space to be warmed. Any skimping on the various proportions named means either insufficient warmth in very cold weather, or overworking the heating apparatus, a practice which is wasteful of fuel, may injure the heating plant, and, worst of all, be a menace to health. The foregoing factors in the choice or design of heating apparatus are by no means the only ones, but are sufficient to show the technical nature of many of the problems involved, and the desirability of intrusting the solution of the latter to persons of skill and experience. In fact, the possible savings in fuel and doctor's bills are so great, to say nothing of matters of comfort and convenience, that a thoroughly competent engineer or architect may well be consulted in the selection, or design, and installation of heating plants for all buildings, from moderate-sized residences up. For all but very small heating plants, and for all systems of ventilation, this will be essential to the securing of the best possible result.

CENTRAL HEATING PLANTS are employed to heat a number of buildings from a common source. Steam or hot water is conveyed from the central station to the several buildings through underground pipes. Within the buildings the heat is distributed in the same manner as when generated on the premises. Hot water must be returned to the central station, but the condensed steam is drawn out of the system in each building and discharged into the sewer. By first passing the exhaust through an economizer indirect heating and ventilation may be afforded. The central station equipment consists of boilers for steam and heaters for hot water, or else utilizes the exhaust steam from electric light and power stations, as explained below. The large size and greater efficiency of the central, as compared with isolated for private heating plants, results in economy in both construction and operation, in addition to which there are the savings due to the use of cheaper fuel and automatic devices for feeding the coal to and removing the ashes from the furnaces. The consumer reduces his fire risk, avoids the dirt and dust incident to isolated heating, the bother of getting coal into and ashes out of his cellar, and all possible vitiation of the air of his house by furnace gases. The community at large may be benefited by a marked reduction in both the ashes and the smoke nuisance, the latter being of great possible importance where soft coal is used for domestic fuel. Finally, the consumer may be assured of an

equable temperature, night and day. As an offset to the economy of central heating there is the cost of installing and maintaining the distribution system, and of making good the losses of heat in transmission. Then it must be remembered that the care of isolated heating plants involves, oftentimes, no extra expense for labor, since they are tended by some member of the family, or some employee whose time is not fully occupied. Few central heating plants, except for colleges and other institutions having groups of buildings, were constructed until there came into vogue the utilization, for this purpose, of the exhaust steam from electric lighting and power plants. The occasional early installations were most frequent where a number of large customers could be secured near the station, particularly if steam could also be sold for power purposes. The latter was quite possible, since live steam was supplied to the mains, and reduced in pressure at the premises to be heated. From 1895 to 1900 many heating installations were added to central electric lighting plants. Although still largely an experiment, at least in many details, this departure seems sure to extend rapidly. The combination adds stability to both the electric and the heating industry: (1) By enabling the former to utilize a large percentage of the heat value of the fuel, which would otherwise go to waste; (2) saving the entire fuel bill of the latter, so long as the exhaust steam is sufficient for the heating demand; (3) by making it easier to secure customers for both current (light and power) and heat, since many possible consumers either went without electric light and power, or maintained isolated plants, because they required a steam plant for heating purposes. On the other hand, where the exhaust steam is used for heating, non-condensing engines, with lower efficiency than condensing, are generally employed. At present the majority of electric stations use non-condensing engines, so they are at liberty to choose between the more efficient condensing engine as a means of utilizing a portion of their exhaust steam and central heating installation to utilize the whole of it. The basis for choice rests upon a variety of local circumstances, including the cost of fuel, and the number and character of the population near the electric station.

STATION EQUIPMENT for central plants is much the same as for isolated ones, only on a larger scale. When combined with electric plants, live steam must be made available when the demand for heat is greater than can be supplied by the exhaust steam. In such cases the pressure of the live steam is reduced before admitting it to the mains. Back pressure on the engine must be eliminated as far as possible. This may be effected, at times of low demand for exhaust steam, by wasting a part of the exhaust. If hot water is the heating medium, the exhaust steam is passed through a heater, then condensed and the warmed water distributed by pumping.

DISTRIBUTION SYSTEMS consist of supply pipes for the steam or hot water and return pipes for the latter, and corresponding branches, or services, for the several consumers, all of which must be carefully installed to prevent loss of heat in transmission. The pipe is generally of wrought iron. Special provision must be made for expansion and contraction. The expansion joints are known as *variators*. They are made

without packing, both to save the trouble and expense of its renewal and to diminish the number of manholes. Insulation is secured in a variety of ways. One of the most effective and cheapest means of insulation is bored pine logs. The large pipe is inclosed in regular compartments, often formed of brick side walls and plank tops. The space between the walls and the pipe is packed with some non-conductor of heat, in addition to which the pipes may be wrapped with asbestos felt. More expansion joints, better insulation, and more thorough protection against ground water are required for steam than for hot-water pipes, on account of the higher temperature and consequent greater heat losses of steam, and also to prevent condensation. Inside the building line there is a shut-off valve, and beyond that there may be a reducing or a regulating valve, to maintain the pressure at the desired point, regardless of its amount or variation in the street pipes. Next in order comes the meter, where the steam is sold by direct measurement, or the condensed steam may be passed through a hot-water meter on the main waste pipe leading to the sewer.

A hot-water supply may be metered, provided its temperature is kept fairly constant at the station. In some plants, however, the temperature, rather than the volume, of the water is increased when more heat is required. Steam may be supplied to either steam or hot-water radiators, but the lower temperature of hot water renders a previous installation of steam radiators inadequate for hot-water service, besides which a change in the piping system may be required. The temperature in hot-water systems is sometimes regulated at the central station and sometimes it is left to the customer. In either case the regulation may be effected by a thermostat. In fact, thermostats may be employed to a greater or less extent on nearly all systems of heating, isolated as well as central. The charges for central heating are most frequently based on the service for a whole season, modified by either the radiating surface supplied or the cubical space which that surface is designed to heat. Seasons, of course, vary both in length and in range of temperature, and the amounts of heat desired by different consumers also vary. On these and other accounts it is a convenient basis, and it is more attractive to new consumers than any system of metering, with its indefinite promise as to the cost of service.

The introduction of central heating plants for general municipal service was largely due to Birdsill Holly, of Lockport, N. Y. The first trial of his idea was made at Lockport, about 1880, when he organized a company for that purpose. Soon after, a plant with five miles of mains was installed in New York City. These, and a number of other Holly plants, supply steam for power, as well as for heat. At present a large number of both steam and hot-water plants are in use. They are operating under a great variety of conditions and their location ranges from Atlanta, Ga., to Seattle, Wash. Some of the plants are serving customers in towns with only a few thousand inhabitants.

VENTILATION.

HISTORY OF VENTILATION. Although special openings were left in the roofs of Roman buildings for the escape of air, their object was to

regulate the temperature rather than the air-supply of the building. Later the necessity of securing a supply of fresh air in mines served to call attention to the necessity of ventilation independent of heating. In the sixteenth century George Agricola (q.v.) wrote a treatise, *De Re Metallica*, in which he describes the methods employed to ventilate the mines of Saxony and Bohemia.

In France ventilation was formerly studied chiefly from the standpoint of securing a fresh-air supply for hospitals. In 1843, according to Pecht, there was but one hospital in France having a regular ventilating apparatus. In 1853 two systems were tried in the construction of the Hospital Lariboisière, one of aspiration, the other of inflation. Both were unsatisfactory because neither of them supplied a sufficient quantity of fresh air. In Germany, as in France, the early history of ventilation is connected with hospital construction. In England attempts at securing a fresh-air supply began much earlier, and consisted in repeated attempts to secure ventilation for the English Houses of Parliament. In 1660 Sir Christopher Wren made the first attempt, and the history of the subsequent efforts made would be an epitome of the advance of the science of ventilation. In 1856 the General Board of Health of England appointed a commission to inquire into the best methods of warming and ventilating dwellings. About the same time, owing to the heavy losses by sickness in the Crimean War, the question of barracks-room ventilation was under discussion.

In the United States, as in England, the early attempts at ventilation were directed toward securing fresh air for the meeting-places of legislative assemblies, the first report on the subject having been made on April 2, 1849.

Ventilation has for its object the maintenance of a pure-air supply indoors. This can be effected only by the removal of foul air and the introduction of an equal amount of pure air. Unfortunately, the fact that these two processes go together is often overlooked. Considered from the standpoint of the air in the room, ventilation removes or dilutes such impurities as have been introduced by man, regulates the moisture, cools the air, and may be instrumental in warming it, although the latter, properly speaking, pertains to heating. Ventilation has no effect on the quality of the air introduced. Therefore, it alone can give no better air than that surrounding the building to be ventilated. It is sometimes practicable to remove dust from the fresh-air supply, in case dust cannot be avoided, by filtering the air through cotton cloth or fibre, or through fine meshes of wire. The moisture of the air-supply may be lessened by drying, and air which is too dry may be moistened by spraying with water. The chief impurities in the air of houses and public assembly rooms are those thrown off by the lungs and skin. Next in importance are the gaseous products of the combustion of oil and gas for lighting, and of these two substances and coal when used for heating. Dust, also, is found everywhere, some being due to the processes already mentioned, some being brought in on the feet and clothes, or blown in through doors and windows, while large quantities of it are due to the wear and tear of clothing, carpets, and the like. In shops and factories the air is

contaminated in most of the ways already mentioned, some of which, like dust, may be intensified many fold. In addition, the air of manufactories is liable to be made impure by the gases given off by the chemicals employed or produced, or by the decomposition of organic matter. The number of hours in a day during which a room is occupied, as well as the number of occupants in proportion to the cubical contents of the room, has a most direct bearing upon the vitiation of the air and the means to be employed to rectify it. Thus, dwellings of the better class have some of their rooms continuously occupied for one-half the day, and still other rooms for the remaining half, the air-space to each person being large. Churches may be crowded, but generally only for one to two hours at a time. School buildings, legislative assemblies, and factories may be crowded for hours together, then as completely emptied as churches. Hospital wards are liable to be fully and continuously occupied, in addition to which there are various well-known special ways of contaminating the air of hospitals. Wherever rooms are used intermittently, it is generally possible to give them a thorough airing by throwing the windows wide open; but, beneficial as this may be, its effect is not permanent, and, with the best of intentions, it is quite sure to be neglected, particularly in cold weather. Even in the summer time the ventilation of crowded assembly halls and hospitals cannot be left with safety to the interchange of air due to open windows, since the air may be stagnant outdoors as well as in. In capacious dwelling-houses, with walls, doors, and windows not too tight, the natural interchange between the inner and outer air may suffice during a large part of cold weather, while open doors and windows will give as much fresh air in summer as it is practicable to provide; but there will be times in cool weather when even these favorable conditions will be lacking.

It is pretty clearly shown by the foregoing that ventilation should be made an essential feature in the design and use of practically all classes of buildings in which people live, work, are instructed, or amused. The quantity of air to be supplied and removed, and the proper means of doing both, can be best understood after considering in more detail the nature and amount of the chief impurities which it is desired to avoid. The vital principle of air is oxygen. Normal air contains about 20.9 per cent., in volume, of oxygen, 79 per cent. of nitrogen and argon, and 0.1 per cent. of other substances, including some 0.03 or 0.04 per cent. of carbonic acid (carbon dioxide). After having been passed through the lungs the oxygen has been diminished to 16 per cent., and carbonic acid has been increased to 4.4 per cent. of the total volume, the nitrogen rising slightly to some 79.5 per cent. This exhaled air is rapidly diffused throughout the room, so unless the room is crowded the percentage of total oxygen is not greatly diminished for some time. With the reduction in the oxygen comes a change in the gaseous pressure in the lungs, as well as a lowering of the amount of the vital principle of the air-supply, both of which cause serious disturbances when carried far. Associated with the diminished oxygen there is also an increase in watery vapor, in the effete and putrescible organic contents of the air, and possibly in the number of harmful bacteria

which it contains. Another cause of diminished oxygen is the burning of oil and gas for illumination. As an index of the impurities present, and of the diminution of oxygen, carbonic acid has been chosen. For convenience it is generally expressed in parts per 10,000, thus giving 4 parts per 10,000, instead of 0.04 per cent., as the normal average amount in the air. In the purest air the carbonic acid may fall to 2.2 parts; in cities it may be normal at 4.5 parts; in occupied rooms it may go to 33 parts per 10,000, or even higher. Without going into the calculation involved, or considering the other impurities, it may be said that when the air of a locality shows an excess of carbonic acid above the normal for the locality as great as 2 parts per 10,000 it is considered to be polluted; also that it has been found desirable to supply each person in a room with at least 30 cubic feet of fresh air per minute, or 1800 cubic feet per hour. Obviously, the actual amount of air required will vary with the character of the rooms and their occupants, two very important considerations being whether or not the occupants are engaged in physical exercise, and the number of hours of continuous occupancy. After a careful consideration of the subject, including a weighing of authorities, Dr. John S. Billings, in his work on ventilation, gives the following table:

	Cubic feet of air per hour
Hospitals.....	3,600 per bed
Legislative assembly halls.....	3,600 per seat
Barracks, bedrooms, and workshops.....	3,000 per person
Schools and churches.....	2,400 per person
Theatres and ordinary halls of audience.....	2,000 per seat
Office rooms.....	1,800 per person
Water-closets and bathrooms.....	2,400 each
Dining-rooms.....	1,800 per person

These figures are for use in planning new buildings, where no allowance is placed "on leakage through crevices or on bad construction of the building as a source of air-supply," and where it is "assumed that the walls will be rendered more or less impermeable by paper and paint." In the case of old buildings, where for any reason it is difficult to supply so much air as recommended above, Dr. Billings says one-half the amount may be made to do, but it will be unsatisfactory. He also emphasizes the fact that the whole ventilating and heating system must be proportioned in accordance with the figures given, or any modification of them which may be adopted, including all air-ducts, inlets and outlets, blowers, and heat-generating apparatus.

Ventilation may be divided into two classes, gravity and mechanical. *Gravity ventilation* is based on the fact that warm air is lighter than cold, and hence is overbalanced and replaced by the latter. In cold weather the inner is warmer than the outer air, so, if sufficiently capacious inlets and outlets are provided, the warm, foul air will be displaced by cool, fresh air. But in warmer weather the differences in temperature, and consequently in pressure, are less and the interchange lags. The currents in the ventilating ducts may then be aided by a slight heating, which may be effected in a variety of ways, such as a light fire, or even a gas jet or jets in the base of the ventilating shaft; or a coil of steam or hot-water pipes, where feasible. Even if there be no ventilating flues, there will be a more or less constant inter-

change of air through the walls and the cracks around chimneys and doors; but in well-constructed houses this may be very small in fairly cold weather, and practically nothing in mild weather, while for schools, churches, and the like it is of little consequence except on very cold or windy days. This interchange may well be called *natural ventilation*, a term which may also be extended to include all ventilation depending solely on the difference between the inner and outer air. It may be added that natural ventilation has been used quite extensively in contradistinction to *forced ventilation*, and in place of the term *gravity ventilation* employed in this article; but when *gravity ventilation* is assisted by fires at the base of the stocks it, also, seems to belong properly under *forced ventilation*. The more recent nomenclature adopts *gravity* in place of *natural*, and *mechanical* in place of *forced ventilation*. *Mechanical ventilation*, as the name implies, depends upon machinery for the movement of the air. It may be used to introduce fresh air, to remove foul air, or both. Where indirect heating is employed the warm-air and the fresh-air supplies may be identical, but in mild weather the combined supply does not move readily by gravity alone, so mechanical aid may be advantageous. With direct heating an independent air-supply is required, and in cold weather it, also, must be heated. When not heated, such a supply may need to be urged along by mechanical power. With either indirect or direct heating an air-blast has the great advantage of perfect control of the fresh-air supply. If a hot-air blast is employed, both heating and ventilation are under equally good control, and it is claimed that the heating is more economically done. For the removal of foul air mechanical means are also advantageous, as being more reliable than gravity. The most common mechanical aids employed are blowers or fans, placed in the air-ducts, and either forcing the air ahead of them or creating a vacuum into which it rushes. Screw propellers and pumps may also be used to force the air. The terms *plenum*, or inflating, and *vacuum*, or aspirating, are applied, respectively, to blowing in and to sucking out air. The great danger in either system is that the fans, blowers, or other air-movers will be too small, in which case the friction losses will render them expensive to operate, and the air current will be so rapid as to cause draughts, or else an insufficient amount of air will be moved. There is also danger that a desire to economize in first cost will lead to air-ducts deficient in size, with the same general results. The proper elevations for introducing fresh and removing foul air are still mooted questions. It is certain, however, that the relation of the inlets and outlets should be so placed as to give the most perfect diffusion of the fresh air and to leave no stagnant foul air in the rooms, which will also tend to avoid heavy draughts. Many authorities favor the location of the inlets and outlets on the same side of a room, the inlets to be above the heads of the occupants. The theory is that the fresh air will ascend to and pass along the ceiling, and that the foul air will pass along the lower part of the room and then out. One of the chief objections to locating inlets, for either heating or ventilation, in the floor is that the ascending air carries up floor-dust with it; and another is that unless the

inlets are very numerous the inrush of air will be unpleasant to those near by.

BIBLIOGRAPHY. Consult Billings, *Ventilation and Heating* (New York, 1893), which is particularly full in its discussion of ventilation, and includes descriptions of the ventilation of a number of hospitals and other public buildings; Carpenter, *Heating and Ventilating Buildings* (New York, 1895), which goes more fully into heating and develops the mechanical phases of both subjects; Baldwin, *Hot Water Heating and Fitting* (New York, 1890); Richards and Woodman, *Air, Water, and Food* (New York, 1900), which sets forth the physiological side of ventilation briefly and clearly, and has a valuable chapter on methods of air analysis, and the determination of carbonic acid; Putnam, *The Open Fireplace in All Ages* (Boston, 1881); Dwyer, on "Stoves and Heating Apparatus," in *One Hundred Years of American Commerce* (New York, 1895); *Proceedings American Society of Heating and Ventilating Engineers* (New York, 1894-1900).

HEATON, AUGUSTUS GEORGE (1844—). An American painter, born in Philadelphia, Pa. He was the first United States student admitted to the Ecole des Beaux-Arts in Paris (1863). He studied under Cabanel there, and afterwards became a pupil of Bonnat, and exhibited several times at the Salon. Among his works are: "Washington at Fort Duquesne;" "The Recall of Columbus," which was bought by the United States Government and engraved for the 50-cent stamp of 1893; "Hardships of Emigration," engraved on the 10-cent stamp, celebrating the Trans-Mississippi and International Fair; and "The Promoters of the New Congressional Library" (1888). He also painted portraits of Mrs. Jefferson Davis and Amélie Rives.

HEATON, MARY MARGARET (1836-83). An English art critic, the daughter of a silk-printer, James Keymer, who was a friend of Douglas Jerrold. She wrote: *Masterpieces of Flemish Art* (1869); *Life of Albrecht Dürer* (1870); and a valuable *Concise History of Painting* (1873); and in Bohn's *Artist's Library*, 1888; as well as contributions to Bryan's *Dictionary of Painters and Engravers*.

HEAT-STROKE, SUNSTROKE, or THERMIC FEVER, also called INSOLATION, HEAT APOPLEXY, SUN FEVER, and SIRIASIS. The effect produced upon the body by exposure to intense heat, whether from the sun, from furnaces, or from the atmosphere. Another form of affection resulting from exposure to heat is HEAT EXHAUSTION, or HEAT PROSTRATION, in which there is a very different set of symptoms. In the commoner, mild form of heat prostration, the patient exhibits exhaustion, weakness, faintness, and occasionally nausea; in the severe form, pallor, great depression, collapse, and loss of consciousness, with a subnormal temperature dropping sometimes as low as 95° F. All cases recover in a few hours. Heat-stroke, on the contrary, usually comes on abruptly, or is preceded by some weakness and anxiety. Unconsciousness supervenes early, with flushing of the whole body and profuse sweating, delirium or even mania, vomiting and diarrhœa, and a temperature of 108° to 115° F. Death may ensue speedily, from cessation of respiration or from cerebral anæmia; the sweating ceasing, the full rapid pulse becoming imperceptible, and asphyxia, coma, or convulsions fol-

lowing. Laborers in the open, laundresses in an overheated kitchen, bakers, and firemen in engine-rooms, present most of the cases. Many cases occur at night among those exposed to indoor heat who have not been in the sun at all; others who have been in the sun during the day are stricken at night in the vitiated atmosphere of crowded tenement-house rooms, after drinking alcoholic beverages and eating hearty meals.

Two and six-tenths per cent. of the heat produced by the chemical metabolism within the body is lost from the body in warming substances taken in as food and drink, 2.6 per cent. in warming the inspired air, 14.7 by evaporation, and 80.1 per cent. by radiation and conduction from the skin. With the inspired air hotter than the body, radiation and conduction abolished, and evaporation rendered impossible in an atmosphere nearly saturated with vapor, the constant production of heat by muscular action must result in a great strain upon the inhibitory cerebral centres that preside over heat regulation. Any previous ill health, alcoholic indulgences, or other excess is followed by a failure of these centres under such strain, and heat-stroke is the result. The combined influence of heat and auto-intoxication constitute the combined cause of heat-stroke, with the possibility of a germ poison. Sambon, of Rome, in a paper on heat-stroke published in 1898, asserted the infectious character of the disease as produced by a specific germ. He classes it with yellow fever, dengue, and other tropical affections, all germ diseases requiring high atmospheric temperature for their development. This view has yet to be substantiated. Van Gieson, of New York, however, during an extensive examination of brains of victims of heat-stroke, found changes in the chromophilic plaques of the ganglion-cells. These plaques were changed in shape, fewer in number, replaced by fine dust, or entirely absent. The nucleus of the brain-cell stained very deeply, and within the nucleus membrane were found minute spherical granules not normally present. Van Gieson says: "There seems to be no other interpretation open as to the significance of this degeneration than the operation of a toxic substance upon the ganglion-cells. . . . There is in insolation a toxic cytolysis or cell resolution of the neurons." He considers the morphologic changes in the ganglion-cells similar to those produced by alcohol, lead, and the microbe poisons; and that heat-stroke is "a species of auto-intoxication, the neural symptoms finding a clear and definite explanation in the acute parenchymatous degeneration induced by an autogenous poison."

The treatment of heat prostration, the mild form of thermic exhaustion, consists in securing elevation of the temperature of the body by the use of external heat and in supporting the heart by the use of alcoholic stimulants, strychnine, and similar drugs. In heat-stroke, on the other hand, rapid reduction of temperature must be secured at the earliest possible moment. Sprinkling ice-water over chest and body or rubbing with ice is imperative. It has been urged that ambulances carry ice and a sprinkler, that treatment may begin as soon as the patient is reached, and continued during his trip to the hospital. Here the patient is placed on a Kibbé cot or a Walton bed, and the cold affusion is continued till the temperature falls to 102.5° F. He is then rubbed dry, removed to a bed and wrapped

in warm blankets, with as little disturbance as possible during the operation. If the temperature rises, the ice-water treatment is to be repeated. Acetanilid and antipyrine have been used with success as antipyretics, adjuvant to the ice-water. Venesection has been practiced with great relief in some cases. Ether or chloroform has been used to control convulsions, anaesthesia being continued for several hours. Morphine is very valuable in many cases. Flagellation of the extremities, sinapisms to the legs, stimulating rectal injections, atropine, digitalis, and nitroglycerin all have been used, in addition to the drugs mentioned.

The sequelæ of heat-stroke possible are headache, tinnitus, deafness, insomnia, impaired memory, insanity, epilepsy, paralysis, meningitis, and many functional irregularities, especially of the heart. Heat-stroke is often preventable. Laborers should dress in thin, loose clothing in place of woolen; sleeping-rooms should be ventilated, stimulants should be avoided, shelter from the sun should be provided when possible, and plenty of water should be drunk by those exposed to the heat. Troops, as well as gangs of laborers, should be inspected, and when sweating ceases and the skin becomes hot and dry, relief from duty, rest, and a cold bath should be ordered.

HEAUTON TIMORUMENOS (Lat., from Gk. *ἑαυτὸν τιμωρούμενος*, *heauton timoroumenos*, the self-tormentor). A comedy by Terence, based on a play with the same title by Menander, and first performed in B.C. 163 at the Ludi Megalenses. In it Terence developed the intrigue of the original into an extravagant plot. The play is lacking in life and in delineation of character. It contains the famous line, "Homo sum; humani nihil a me alienum puto."

HEAVEN (AS. *heofon*, OS. *heban*, Icel. *hifinn*; connected with Goth. *himins*, Icel. *himenn*, OS. *himil*, OHG. *himel*, Ger. *Himmel*, heaven, ceiling). In theology, that portion of infinite space in which the Lord of all things, although present throughout all, is supposed to give more immediate manifestations of His glory. Of the belief in the existence of some such special scene of the presence of the Deity, most of the known religions of the world, ancient and modern, present abundant evidence. Aristotle declares that all men, whether Greeks or barbarians, have a conception of gods; and all agree in placing the habitation of the gods in the most elevated region of the universe. Plato is equally explicit. Even Epicurus teaches the same doctrine; and one of the treatises deciphered from the papyri of Heracleum is a treatise by him, in which the position and the other characteristics of the habitation of the gods are minutely

discussed. The same may be said of the Persian, the Egyptian, the German, the Scandinavian, and in general, of all the ancient religions in which the belief of the existence of a supreme being assumes any other form than the pantheistic; and even in the pantheistic religions, although the philosophers may have adhered to the strict pantheistic view, and may have denied that any special locality could be regarded as the peculiar seat of the Deity, yet we find the popular belief and the popular worship even of such religions plainly founded upon the contrary supposition. In addition, however, to the idea of its being the special scene of God's glory, the word heaven also designates the place, or the state or condition, of the blessed spirits, and of the souls of just men who are admitted into the participation or the contemplation of the divine beatitude. In the religious system of the Greeks and Romans, none were supposed to be admitted to the heaven of the gods except the deified heroes or demigods; but with them the elysian fields (q.v.) of the lower world held, morally speaking, the same place in relation to the great doctrine of the divine retribution for the good and evil actions of human life. The elysium of the classic mythology is in all essential respects the natural equivalent of the heaven of the just. The Pythagorean doctrine of metempsychosis approached nearer to it in form; for it supposed that the soul, after the purification of successive transmigrations, was elevated to a higher and incorporeal condition in the cosmos. The doctrine of Plato was still more explicit. It may be said in general that all the philosophical systems which included the belief of the immortality of the soul, also involved, at least in substance, the idea of a state of happiness as the reward of a virtuous life. The happiness, however, of the heaven of these various creeds differed widely from the spiritual delights of the heaven of Christianity, each nation and each class forming to itself its own ideal of enjoyment. The delights of the classical elysium were, at all events in part, delights of sense. The German warrior had his war-horse and his armor laid in his grave, that he might be able to pursue, after death, the fierce enjoyments in which he had delighted while in the world of the living. The paradise of the Indian hunter is but a richer and more extensive hunting-ground. The paradise of the Mohammedans is grossly sensual. Still, not only these, but even the more groveling conceptions of other races, must be regarded as a natural manifestation of the same instinct. *The Testament of the Twelve Patriarchs* (see *ΑΠΟΚΡΥΦΤΑ*) contains a very curious exposition of the same notion.

The Hebrews conceived of the sky as a solid firmament, upholding the celestial reservoirs of water. (See **FIRMAMENT**.) They invariably used a plural noun for heaven indicating a belief in a plurality of heavens, Gen. i. 1; Deut. x. 14; I. Kings viii. 27; Ps. cxlviii. 4. It is probable that the conception of seven heavens, based on a division of the celestial spaces between the seven planets, existed already in early times in Israel. In the beginning of the Christian Era this idea finds expression in the Slavonic Enoch (q.v.), and some parts of the Testaments of the Twelve Patriarchs, where the character of each of the seven heavens is described in detail. It is noticeable that in Enoch vii. the sinning angels are

imprisoned in the second heaven, and that in chapter x. the sinners among men are punished in the northern part of the third heaven. Substantially the same conception is found in the Ascension of Isaiah, the Apocalypses of Moses, Ezra, John, Isaac, Jacob, and the Acts of Callistratus. In view of these facts, it becomes probable that in the Pauline Epistles the heavens are also assumed to be seven in number. Thus paradise is in the third heaven in II. Cor. xii. 2, 3, as in Slavonic Enoch viii.; in Eph. vi. 12 there are spiritual hosts of wickedness in the heavens; in Col. i. 20 the kings in heaven as well as on earth have to be reconciled to God; in Heb. iv. 14 the great high priest passes through the heavens. The Jewish apocalyptic sketch in Rev. xii. describes a war in heaven, between Michael and his angels and Satan and his angels. While ultimately the old Semitic doctrine of seven heavens and of battles and places of punishment in one of these heavens was suppressed in Christian thought, it continued in the religious systems of the Mandæans (q.v.) and in the Koran. As the storm-cloud was the celestial abode of Yahweh, Israel's god, so the translation of such heroes as Enoch and Elijah originally implied only that they were carried alive from earth to be with Him among the clouds. But as the conception of the Deity expanded, His heavenly dwelling-place began to occupy more fully the imagination. In the Ethiopic Enoch (see ENOCH, BOOK OF) and the Slavonic Enoch this antediluvian patriarch describes minutely the heavens through which he is permitted to pass. The hope awakened through the Persian doctrine of resurrection, of a release from sheol, in the case of all Israelites or of the pious in the nation, offered the possibility either of a new life on earth or of a translation to heaven. In the recorded sayings of Jesus there is no description of heaven. His answer to the question of the Sadducees touching the resurrection seems, however, to imply that He considered those who had been accounted worthy of being raised from the dead as living in heaven, being like angels, neither marrying nor being given in marriage (Luke xx. 33 sqq.). The dominant view in the early Church seems to have been that until the return of the Lord upon the clouds of heaven to raise the dead, those who had died were asleep, and that they would be suddenly awakened to be given their new bodies, after which they would reign with Him on earth for a thousand years before their final translation to heaven. But, largely under the influence of Greek thought, other conceptions prevailed. The fate of the patriarchs, prophets, and pious men of the old dispensation naturally occupied much attention and led to the idea that they were detained in a preparatory abode which the fathers called *limbus patrum*, awaiting the advent of the Redeemer. The general belief of Christians has been that since the resurrection of Christ the just who are free from sin are admitted immediately after death into heaven, where their chief joy consists in the unclouded vision of God. But especially since the sixteenth century there have been many who have returned to the millennial views of a part of the early Church. (See MILLENNIUM.) While Christians generally have maintained that since the coming of Christ no human being can be admitted into heaven without some identification with Him or His Church, through

personal faith, or the sacraments, it has been held by some that access to Heaven would not be denied to unbaptized infants, pagans, or others having had insufficient opportunities of embracing the gospel, while others have believed that all souls would ultimately reach heaven. See ESCHATOLOGY; IMMORTALITY.

HEAVES (from AS. *hebban*, Goth. *haffjan*, OHG. *heffan*, Ger. *heben*, to lift), or BROKEN WIND. A disease or unsoundness of the respiratory organs of the horse, which, from the French *pousse*, was termed by some of the old English writers on farriery *pursiness*. The nature of the malady is not well understood, though difficult expiration by a spasmodic or extraordinary effort is characteristic. The air is inspired with ease.

A broken-winded horse does not generally thrive, is lean, and has a dependent belly, the muscles of which are usually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised. The breathing becomes very labored, the nostrils dilated, the eyes bloodshot, and even blue, an indication of imperfect blood purification. On watching the chest and flank, the ribs are observed very actively moved, and after collapsing, when the air is expelled from the lungs, are further depressed by a spasmodic jerk brought about by the abdominal muscles. A broken-winded horse has the hollow cough referred to by veterinarians as characteristic of unsoundness. When the animal is oppressed by fast work, or by dragging a load up a hill, the pulse is excessively rapid, a symptom regarded by some as indicating disease of the heart, and by others an affected diaphragm. In reality it is a dietetic disease, and is due to the irritation in the stomach caused by indigestible food, being reflected from the nerves of the stomach to those of the lungs. On post-mortem examination the stomach is found to be much distended with food of a dry nature, and to have thinner walls than is normal. The lungs are lighter in color, and float much more buoyantly than in health; little or no blood is seen in them, but they contain a large quantity of air, which makes them crackle when pressed.

The treatment of heaves is very unsatisfactory, and a palliation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised, is all that can be recommended as remedies; but turning out to pasture, or feeding on cornstalks or other laxative food, sometimes produces a cure in mild cases. Only the best quality of hay should be fed, and that in small quantities. Some veterinarians have vaunted their power to cure this disease, and recommend large doses of camphor, digitalis, and opium; but these potent narcotics only operate for a very short time, and as their effects pass off the symptoms return, often with increased severity. It is generally conceded that the disease is incurable. Horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

HEAVYSEGE, CHARLES (1816-76). A Canadian poet, born in Liverpool, England. For some time after his arrival in Canada (1853) he followed his trade, that of a cabinet-maker, but later branched off into wood-carving, and thence went into journalistic work for the *Montreal Witness*. After publishing anonymously *The Revolt of Tartarus* (1853), and a volume of sonnets, he produced his best work, a three-part tragedy entitled *Saul* (1857), followed by *Count Filippo, or the Unequal Marriage: A Drama in Five Acts* (1860); *The Dark Huntsman* and *The Owl* (1864); *Jephtah's Daughter* and a novel called *The Advocate*, in 1865.

HEBEL, FRIEDRICH (1813-63). A German poet and dramatist of peasant birth and cosmopolitan education. He was born at Wessluren. As a vestryman's clerk he printed poems in journals and found patrons who enabled him to study at Hamburg, Heidelberg and Munich. In 1841, having gone back to Hamburg, he published *Judith*, a tragedy. Then, going to Denmark, where he had closer acquaintance with Thorwaldsen and Oehlenschläger, he received a traveling scholarship from the King, visited Paris, stayed several years in Italy, and on his return (1846) married and settled in Vienna. Already he had written two noteworthy dramas, *Genoveva* (1843) and *Maria Magdalene* (1844). His best later works are *Julia* (1851), *Agnes Bernauer* (1855), and *Die Nibelungen* (1862), all of which show dramatic instinct, powerful character-drawing, and an intensity of passion that is sometimes extravagant and sometimes uncouth or gruesome. His smaller poems are most attractive. Hebbel's works include the dramas *Herodes und Mariamne* (1850); *Michel Angelo* (1855); and *Gyges und Sein Ring* (1856). Hebbel more or less followed Grabbe, with whom he shares a liking for the uncouth, but Hebbel is more poetic and more conversant with theatrical requirements. He is also distinguished for love of psychological enigmas. His *Tagebücher* are in 2 vols. (1885-87). Consult: Kuh, *Biographie Friedrich Hebbels* (Vienna, 1877); Kulke, *Erinnerungen an Friedrich Hebbel* (ib., 1878); Bartels, *Friedrich Hebbel* (Leipzig, 1899). His works were edited by Krumm (12 vols., Leipzig, 1900) and by Werner (12 vols., Berlin, 1900).

HEBURN. A town in Durham County, England, on the south shore of the Tyne estuary, four miles east of Newcastle. It is an important industrial centre, with ship-building and supplementary establishments, engineering and chemical works. The public buildings include a mechanics' institute, an armory, and isolation hospital; among modern municipal improvements are a new drainage system, a public park, and electric lighting. Population, in 1891, 16,645; in 1901, 20,901.

HEBE, Ἥβη (Lat., from Gk. Ἥβη). The goddess of youth, the daughter of Zeus and Here, or, according to others, of Here alone, the wife of Heracles after he had been deified. She was the cup-bearer of Olympus before Zeus conferred that office upon Ganymede (q.v.), and she always retained the power of restoring the aged to the bloom of youth and beauty. In the cult she usually appears joined with Hera or with Heracles; but in Phlius she was worshiped as Gany-

mede, and at Sicyon as Dia, as one who frees from all bonds, apparently through the joys of life. Statues of Hebe are rare, but on vases and reliefs she often appears with Heracles or as cup-bearer of Zeus. The representations of Hebe and the eagle are probably all modern. Consult: Kekulé, *Hebe* (Leipzig, 1867); Preller-Robert, *Griechische Mythologie* (Berlin, 1894). See JUVENTAS.

HEBEL, hä'bel, JOHANN PETER (1760-1826). A German dialect poet. He was born at Basel, studied at Erlangen, and in 1791 became professor in the gymnasium at Karlsruhe. In 1805 he was appointed Church counselor, and in 1819 prelate. He is chiefly known for his *Allemanische Gedichte* (poems in a Swabian dialect, 1803; last ed. 1894), which, reviewed by Goethe in the *Jenaische Allgemeine Litteraturzeitung*, made him famous. He also wrote for his periodical, *Der Rheinländische Hausfreund*, a number of short stories afterwards published as *Schatzkästlein des Rheinländischen Hausfreundes* (1811). Consult: Schultheiss, *Hebels Leben* (Heidelberg, 1831); Längin, *Johann Peter Hebel, ein Lebensbild* (Karlsruhe, 1874); and Giehne, *Studien über Hebel* (Würzburg, 1894).

HEBER, REGINALD (1783-1826). An English poet, second Bishop of Calcutta, born at Malpas, Cheshire. In 1800 he entered Brasenose College, Oxford, and three years afterwards produced his prize poem, "Palestine," one of the very few prize poems that have lived. In 1805 he became a fellow of All Souls. In 1807 he was inducted into the family living at Hodnet. In 1812 he was made prebendary of Saint Asaph, and published a volume of poems; in 1815 he was appointed Bampton lecturer at Oxford, and in 1822 preacher at Lincoln's Inn. The next year he was consecrated Bishop of Calcutta. During his three years in India he labored with great zeal, traveling through his vast diocese, healing dissensions, and encouraging his fellow-missionaries. His prose writings include the Bampton lectures on *The Personality and Office of the Christian Comforter* (1816); *A Life of Jeremy Taylor* (written in 1822); *Sermons* (1829, 1830); and *Journey Through India* (1828). His fame, however, rests chiefly on his beautiful hymns, as "From Greenland's Icy Mountains," and "Holy, Holy, Holy! Lord God Almighty!" Most touching is the poem addressed to his wife: "If thou wert by my side, love." Consult: *Life*, by his widow (London, 1830), and by G. Smith (ib., 1895). The poems, collected in 1841, were reprinted in 1881.

HEBER, RICHARD (1773-1833). An English bibliophile, son of Reginald Heber, and half-brother of Bishop Reginald Heber, born at Westminster. He was educated by George Henry Glass, and at Brasenose College, Oxford. Closely following his early devotion to Latin poetry, especially to Persius, Claudian, and Silius Italicus, whom he labored to edit, came an interest in Early English drama and poetry; and he became the intimate friend of Walter Scott, who frequently alludes to him in his notes and dedicated to him the sixth canto of *Marmion*. He was chosen member for the University of Oxford in 1821, and resigned from Parliament five years afterwards. His wonderful collections of books were not mentioned in his will, and were sold at auctions in London, Ghent, and Paris; they in-

cluded more than 145,000 volumes, and formed a matchless library of Early English literature.

HEBERDEN, WILLIAM (1710-1801). An English physician, born in London. He graduated at Saint John's College, Cambridge, in 1728; studied medicine in London, and practiced for ten years in Cambridge and for more than thirty years in London, where he was prominent in the College of Physicians. A remarkably original thinker, Heberden took minute notes on his more important cases, and published them under the title *Commentarii de Morborum Historia et Curatione* (1802), of which an English translation, possibly by his son William, appeared in 1803. His contributions to the *Medical Transactions* of the College of Physicians include a description of the first recorded case of angina pectoris, and other original matter.

HÉBERT, á'bar', ERNEST (1817—). A French painter, born at Grenoble. He was a pupil of David d'Angers and Paul Delaroche, and won the Prix de Rome in 1839. He was director of the French Art School in Rome from 1866 to 1873 and from 1885 to 1890; was elected a member of the Institute in 1874, and was chosen commander of the Legion of Honor in 1874. Although classic and elegant in style, and an excellent colorist, Hébert has often a cloying sentimentality. His best-known pictures are: "A Slave who has Freed Himself;" "La malaria" (1850); and "Le baiser de Judas" (The Kiss of Judas) (1853), in the Luxembourg, and a number of portraits, among which are those of Roberty and a young woman (in the Luxembourg). He received first medals at the Salon of 1851 and the Paris Exposition of 1855, and the medal of honor at the Paris Exposition of 1889.

HÉBERT, JACQUES RENÉ (1755-94). A journalist and politician of the French Revolution. He was born at Alençon, November 15, 1755, of respectable parents, and was educated at the local college; but disgracing his family by his wild conduct, he quitted Alençon, went to Rouen, and subsequently came to Paris. There he dragged out a miserable existence from 1780 to 1790. He finally emerged from obscurity in the latter year as a pamphleteer and editor of a rabid republican paper, *Le Journal du Soir*. He first became famous, however, as the editor of the journal *Le Père Duchesne*, started in opposition to a publication of the same name edited by Lemaire. Knowing the tastes of the class of people he addressed, he displayed such an exaggeration of principles and cynicism of language as not only ruined the enterprise of his honest rival, but caused Hébert to become a popular idol, and earned for him the name of 'Père Duchesne.' After the events of August 10, 1792, he became a member of the Revolutionary Commune, and as such approved of the September massacres. In December, 1792, he became a substitute procureur for the Commune, and in 1793 actively advocated the overthrow of the Girondist party. The Convention, alarmed at the violence of the Communists, ordered Hébert and three others to be arrested. His popularity was so great, however, that he had to be set at liberty a few days later, and he was presented with a civic crown by the Commune. With Chaumette he inaugurated the worship of Reason, and as a member of the commission appointed to examine

Marie Antoinette, he added to her sufferings by accusing her falsely of scandalous offenses. His party were called *les enragés*, and advocated the most extreme measures; but the Committee of Public Safety, under the control of Robespierre and Saint-Just, caused the Hébertists to be arrested, March, 1794, and after a summary trial Hébert, together with many of his adherents, was guillotined, March 24, 1794. His wife perished on the scaffold a month later with Gabel and Chaumette. Consult: Duval, "Hébert chez lui, dans la révolution française." *Revue Historique*, vols. xii. and xiii. (Paris, 1880-81); Brunet, *Le Père Duchesne d'Hébert* (ib., 1859); Tridan, *Les Hébertists* (ib., 1864); Mater, *J. R. Hébert avant la journée du 10 Avril, 1792* (Bourges, 1888); Aulard, *Le culte de la raison et le culte de l'être suprême* (Paris, 1892).

HÉBERT, LOUIS PHILIPPE (1850—). A Canadian sculptor, born at Sainte Sophie d'Hali-fax, Quebec. He early manifested a taste for art, and studied several years in a studio before he went to Paris, where he afterwards settled. His works include several historical statues for public buildings in Ottawa, Montreal, and Quebec. He won the Confederation medal presented by the Canadian Government in 1894.

HÉBERT, PIERRE EUGÈNE EMILE (1828—). A French sculptor, born in Paris. He was the son of a sculptor, who taught him the art. He had a bust in the Salon by the time he was twenty-one, reappeared there with a bronze group (1863), and exhibited at the international exhibitions of 1855 and 1867, and at Vienna in 1873, besides doing special work—"Bacchus" for the Tuileries (1866): a bronze statue of Rabelais for the city of Chinon; a stone statue of Regnard for the Hôtel de Ville, Paris; a marble bust of Cabet for the Museum of Dijon; "La comédie et la drame" for the Vaudeville; bas-reliefs and busts of Davau, Balzac, and others.

HEBERT, THÉODORE MARTIN (1829—). A French sculptor, born in Paris. He was a pupil of Chevillon, and after 1848 exhibited such works as an equestrian statue of Napoleon; an African hunter fighting with an Arab on horseback; "Faust et Marguerite" (1861); "L'Innocence" (1864); "Renaud et Armide" (1866); besides busts, bas-reliefs, and groups in plaster and in marble. He received honorable mention in 1859.

HEBRA, há'brá, FERDINAND, Ritter von (1816-80). An Austrian dermatologist, born at Brünn. He was educated at the University of Vienna; in 1842 became instructor in the medical faculty; was appointed consulting physician of the general hospital of the city in 1848, and professor of dermatology in 1849. He was the first great German dermatologist, and entirely reformed the therapeutics of the science. He strongly indorsed local treatment. He wrote: *Atlas der Hautkrankheiten*, with Elsinger and Heitzmann (1856); *Lehrbuch der Hautkrankheiten*, with Kaposi (1872-76); and a third and smaller work under the former title, with Bärensprung (1867-68).—His son, HANS VON HEBRA (1847-1902), was a specialist in the same branch, and wrote: *Lehrbuch der Hautkrankheiten* (1884), and *Die krankhaften Veränderungen der Haut mit Beziehung auf die Krankheiten des Gesamtorganismus* (1884).

HEBREW LANGUAGE AND LITERATURE. See JEWS; SEMITIC LANGUAGES.

HEBREW MELODIES. A collection of poems by Lord Byron which, with music by Braham and Nathan, was published in 1815 by Murray, who gave £500 for them. Among them are "The Destruction of Sennacherib," "Jephtha's Daughter," and "She Walks in Beauty."

HEBREW MUSIC. Our knowledge of ancient Hebrew music is perhaps more limited and unsatisfactory than what we know of any other civilized nation of antiquity. From the Egyptian frescoes and relics, from the Greek treatises and descriptions, and from the modern Chinese instruments and theoretical works, we gain a fairly complete idea of the music of those nations; but, with the exception of a few reliefs on coins, practically our sole source of knowledge about Hebrew music is the Bible, which must be supplemented by constant reference to the musical instruments of the Assyrians and Egyptians.

In view of the late redaction of those books (like Genesis) which relate to the earliest traditions, great care must be exercised in using the notices about the supposed antiquity of music among the Hebrews. Such a notice, e.g. as is found in Gen. iv. 21, where Jubal is said to be "the father of all those who handle the harp and organ" ('organ' being obviously a mistranslation), has of course no historical value; and similarly the description of Miriam dancing and singing after the deliverance of the Hebrews from Pharaoh and his army (Exod. xv. 20-21) is probably part of the later embellishment of the exodus of some of the Hebrew tribes from Egypt, although it is quite probable that something of the kind took place under the circumstances. On the other hand, an incidental reference to "songs, drum, and lyre," in connection with friendly leave-taking, such as is found in Gen. xxxi. 27, is of decided value as pointing to a popular custom associated with a comparatively primitive form of life. The instruments themselves must have been correspondingly primitive; and with this restriction clearly understood, there is no objection to the assumption that Hebrew tribes, even during the nomadic period, had some music, and, like the ancient Arabs, had their battle-songs, their songs of triumph, their songs celebrating the exploits of their favorite heroes, which they chanted or sang to the accompaniment of primitive forms of drums and of simple stringed instruments, while for the purpose of calling the people together for battle or assembly, some simple form of wind instrument perhaps existed in very early days. Through foreign influence—notably from Egypt and Babylonia, and later from Greece—the simple instruments gave way to more elaborate ones, and a large variety of percussion, wind, and string instruments was gradually introduced into Palestine. That the earliest use of music among the Hebrews was largely if not exclusively secular seems reasonably certain; but the religious bearings of events of a secular character, such as battle and victory songs, rejoicings at harvest-time and wedding festivities, lend to music even when thus employed also a certain religious significance. On all the occasions named, with the exception perhaps of wedding festivities, the tribal or national deity would come in for a share at least of recognition. His help was sought before proceeding to battle: to him thanks were offered for the victory, and it was his favor that had blessed the fields with plenty. From such considerations it

did not require many steps for the introduction of music as part of the organized worship. To what extent, however, music was introduced in the pre-exilic temple at Jerusalem it is difficult to say. Certainly the elaborate description furnished by the chronicler (I. Chron. xv. 11-24; II. Chron. v. 12, etc.) of the temple service and organization in the days of David and Solomon applies to the second temple (and even here only in a measure), and not to the first. Similarly the melodies and musical directions connected with the Psalms belong to the later phases of post-exilic worship among the Jews, though all this does not preclude the possibility that in pre-exilic days music on occasions formed part of the temple service in Jerusalem, and perhaps also in connection with some of the sanctuaries outside Jerusalem.

Only a few of the musical instruments mentioned in the Old Testament are genuinely Hebrew in character. (1) Of stringed instruments the most common and probably the oldest was the lyre (Hebrew *kinnor*), the form of whose sounding-board, as also the number of its strings, varied considerably. Three to six strings appears to have been the ordinary number, but there are lyres depicted on Jewish coins with as many as twelve strings. Next to the lyre, the harp (Hebrew *nebel*) is most frequently referred to; but we must not suppose that the ordinary harp was a large affair, such as the Egyptians used. It was probably a small triangular instrument, consisting ordinarily of not more than ten strings. (2) The most common wind instrument among the Hebrews was the flute (Hebrew *khalil*), which, like the lyre, dates from very early times. It was the ordinary instrument at weddings and funerals, and in the second temple was played before the altar on festival occasions. It is probable that the Hebrews, like the Egyptians and the Assyrians, had both the long flute, held straight before the player, and the oblique flute, which was played by blowing into a hole at the side. The horn (Hebrew *shophar*) was a ram's horn, whose limited compass (never over an octave) made it unsuitable for other purposes than signals to assemble the people, to give the order to disperse, etc. In the Jewish ritual it was retained as a solemn rite, and to this day in orthodox synagogues the ram's horn is blown during the services on New Year's Day, at the close of the Day of Atonement, on the day of the Feast of Tabernacles, and during the entire month of Elul, after the recital of the supplications. The Hebrew trumpet (*khososerah*), of which there is a representation on the Arch of Titus, was a very long instrument, and was used by the priests in the later temple service. (3) The chief percussion instruments were (a) the drum (*toph*), of which there were numerous forms, though ordinarily the hand drum is intended; (b) the cymbals (*mesiltayim*), which were made of metal; and (c) the sistrum (*menanim*), which appears to have been introduced from Egypt. Besides the above list, there are quite a number of instruments mentioned in the Old Testament (cf. especially Dan. iii. 5-10), which have not yet been identified. For example, the *symphony* (Dan. iii. 5, margin) may have been a species of bagpipe, while the *shalishim* (I. Sam. xviii. 6) appears to have been a sort of triangle.

HEBREWS. The name given to a group of clans of Aramean stock, who trace their origin to Southern Babylonia. The ultimate home, however, of these groups, and of the Arameans and Arabs, is in general to be sought rather in the steppes of Arabia. Hence they passed to the north in two steady streams, one by a direct route into Palestine and Syria, the other by the Euphrates Valley, where some made more or less permanent settlements, attracted by the higher culture prevailing in that region, while others continued northward and passed into Syria and ultimately Palestine. The name Hebrew is first applied to Abraham (Gen. xiv. 13); but there is an earlier eponymous ancestor, Eber (Gen. x. 21), to whom it properly belongs. The designation of Abraham as 'the Hebrew' already reflects the later conditions when the Hebrew confederacy was organized. Where the name originated is, therefore, a problem for which no satisfactory solution has yet been proposed. Some have supposed that the name originally designated a nomadic people of invaders, and that the Habiri of the Amarna tablets are Hebrews in this sense. Inasmuch as the term is generally used by foreigners in designating the Hebrew confederacy (Gen. xl. 15; Ex. ii. 6; I. Sam. iv. 6), it has been interpreted as the name given to the people, and denoting those who had 'come from beyond.' The stem from which Hebrews is formed has this meaning; but the explanation is not acceptable, since in that case the name would hardly have acquired such importance as to give rise to an eponymous ancestor, Eber. The fact is that, since the literature of the Old Testament is for the great part written from a religious point of view, the distinctively religious designation of the confederacy as *Bene Israel* (or Israelites), or as Israel and Judah, receives the preference over *Ibrim* or Hebrews, and hence the latter is introduced only on special occasions and for some special reason. For the history, language, literature, and institutions of the Hebrews, see JEWS; SEMITIC LANGUAGES.

HEBREWS, EPISTLE TO THE (Gk. ἡ πρὸς Ἑβραίους ἐπιστολή, *hē pros Hebraiōus epistolē*, Lat. *epistola ad Hebræos*). An anonymous book of the New Testament. The questions concerning its author, the readers to whom it was addressed, and the place where, as well as the time when, it was written have all been points of critical debate, and it cannot be said that any one of them is yet positively settled.

I. The time of composition could not have been

later than A.D. 95, since the book was used freely by Clement of Rome in his letter to the Corinthians, which is assigned to about this date. How much earlier than this it was written depends largely upon what is to be understood by the persecutions referred to in x. 32-34. If they are to be identified with the Claudian edict (see PERSECUTIONS OF THE CHRISTIANS), it cannot be dated earlier than 48; if they are to be identified with the Jewish War (see JEWS), it cannot be dated before 65. In fact, whichever event is intended, it is likely that the writing was long subsequent to it, since the persecutions are referred to as belonging to the 'former days' (x. 32). As between these two events, however, the statement in xii. 4 that the readers had 'not yet resisted unto blood' would seem to make it unlikely that they had passed through the horrors of the Jewish War. But the force of this argument is dependent largely on the assumption that the readers were resident in Jerusalem or some part of Palestine. If resident elsewhere, then a new viewpoint of the persecutions is possible, and the above limits may not be necessary. It would seem to be certain that the author belonged to a generation later than the Gospel times (ii. 3; cf. Luke i. 1-4), and that the readers were under rulers different from those who had founded and had originally been in charge of the Church (xiii. 7). It would further seem to be clear that the persecutions mentioned in x. 32-34 as belonging to the 'former days' are to be separated from those in the midst of which the readers were at the time of writing, and in which they had not yet come to the shedding of blood (xii. 4), though the crisis of their troubles was not far beyond them (x. 25; cf. xii. 25-29). Anything more definite than this, however, must depend upon the consideration of the remaining points.

II. The place of the Epistle's composition would seem largely to depend on the interpretation of xiii. 24b. If 'they of Italy' is to be understood as referring to those who had come from Italy, then the Epistle was written somewhere outside of that country; if it is to be understood as referring to those who belonged to Italy, then the place of writing was most naturally somewhere within that land. As to which of these two usages the author had in mind, it may, perhaps, be impossible definitely to say; although, from the grouped character of the salutations in the verse, it would seem that he was sending a greeting to all those who were associated with the readers—both officers and fellow Christians—from all those who were associated with himself. But this would seem to imply that these latter were the Christians generally of the land from which he was writing, since otherwise they must be merely Christian sojourners who were accidentally in the place where he was. In this case we should have a general greeting on the one side and a strangely partial greeting on the other—a greeting from a group of Christian travelers in a city, but none from the Christians of the city itself. There would, consequently, seem to be something in favor of the Epistle's having been written within the land of Italy. If so it was probably at some other place than Rome, since Timothy's release from prison and his expected arrival at the place where the author was (xiii. 23) would indicate a coming from Rome, as the most probable place of imprisonment, to some other place where the author was awaiting him.

III. The readers of the Epistle have generally been considered Jewish Christians—a conclusion which would appear to be clearly evidenced by the distinctively Hebrew character of the argument employed in the Epistle. Recently, however, critics have claimed a Gentile Christian readership, saying that a Hebrew argument might have been formulated for Christians who were not Jews. Theoretically this is true; but were it so in this particular case, the Epistle would become a purely academic essay, lacking all the significance which would otherwise come from its appeal to the Jewish race from the point of view of its peculiar institutions and its distinctive Scriptures. It amounts to nothing in support of such Gentile readership to contend that the Epistle contains no direct statement of the fact that the readers were in danger of an apostasy to Judaism, for the readers might not have come to the point of apostatizing and yet have been Jews. Jewish Christians as well as Gentile might have been simply weak in the faith and in need of exhortation to hold fast to their profession. In fact, if this weakness of faith and insecurity of profession was the condition of the readers, it is difficult to understand why such a Jewish background to the strengthening exhortation given them was selected, unless they were Jewish themselves. In view of this background, such passages as vi. 1, 2, and xiii. 4 are of no significance, since they are both specifically applicable to Jewish Christians, the latter especially, in view of Paul's arraignment of the race in Rom. ii. 17-29.

Admitting the probability, therefore, that the readers were Jewish, their habitation would seem to be most naturally in a place of Jewish surroundings such as Palestine and Jerusalem. Against this, however, is the strong Alexandrian mode of thought which quite plainly underlies the Epistle's argument. This would not be natural in the places mentioned above. On the contrary, it would suggest Alexandria itself and Egypt. Against this latter location the only argument would be our general ignorance of the condition of early Christianity in this region. Rome is urged by modern critics, and, as far as the Alexandrian mode of thought is concerned, there might not be much against the place. As a matter of fact, however, the critics base their contention largely on the specifically Jewish character of the Roman Church—an argument which is so clearly against the facts of the Roman Epistle as to be impossible of acceptance. There would, consequently, seem to remain only some such locality as the Phrygian region of Western Asia—a region largely inhabited by Jews and largely under the influence of Alexandrian thought. With such a locality Timothy's relationship (xiii. 23, 'our brother Timothy'), and the evident tendencies of the readers to angel-worship (chs. i. and ii.), an eclectic spirit and a false asceticism (ch. xiii.) would be significant.

In view, therefore, of the probable Jewish character of the readers and their most natural location in Western Asia Minor, the strong probability of an Italian place of composition is greatly strengthened; since to Jewish readers resident in Phrygia a salutation from mere Italian sojourners would have no meaning. And in view of all three points, a date some time after the Jewish War would seem most reasonable; for

then the Jewish colonies in the Diaspora would be largely increased and such independent Hebrew congregations more possible. We could also thus understand by the persecutions of the 'former days' the Jewish War, whose horrors were not likely to have faded from the exiles' minds; while the newer persecutions, in the beginnings of which the readers were (xii. 4), could quite easily be the rise of the Domitian anti-Christian aggressiveness. This supposition is favored by two considerations—the distinctive Jewish rivalry to Christianity after the destruction of Jerusalem, and the general Christian disappointment at the non-return of Christ, which had been widely expected in connection with this catastrophe, in view of the common understanding of the words of Christ as promising it. These two facts would almost seem to account for the troublous situation of the readers, at least from its Jewish side; for it is clear they were suffering from oppression by their unbelieving countrymen—an oppression which gathered an irritating strength largely from the failure of the expected return of their Christ. This oppression might be more or less connected with the Government's hostility, and shows the situation to have been one of peculiar danger, because of the combination of evil which threatened them. We might place the writing of the Epistle, therefore, somewhere about A.D. 90.

IV. The question of author has been generally held to be the most important point connected with the criticism of the Epistle. It is, in fact, the least important, since the even approximate settling of the above questions gives us practically all the critical knowledge of the Epistle which we need for working purposes. The fact, therefore, that there is no certain answer to this question is of no significance. At the same time it can be safely said that, whoever the author may have been, he was not Paul. This is universally accepted by critics to-day. Outside of Paul, evidence would seem, in some respects, to point to Barnabas, whose name was apparently attached to the manuscripts of the Epistle with which Tertullian was acquainted, and was considered by him in his day as an accepted tradition. Any definite conclusion, however, is impossible. The attempt of Harnack to credit it to Prisca and Aquila, chiefly Prisca, is not supported by the facts.

HEBREWS, GOSPEL OF. See APOCRYPHA, NEW TESTAMENT.

HEBRIDES, hēb'ri-dēz. The name applied to all the islands of the western coast of Scotland, popularly known as the WESTERN ISLES (Map: Scotland, A 2). They are classified as the Outer and Inner Hebrides. To the Outer belong Lewis-with-Harris, North Uist, Bembecula, South Uist, Barra, and the remote Isle of Saint Kilda. The principal of the Inner islands are Skye, Coll, Tiree, Eigg, Mull, Iona, Staffa, Ulva, Lismore, Kerrera, Easdale, Colonsay, Jura, and Islay. Bute, Arran, and the Cumbræes, though lying in the Firth of Clyde, are usually classed with the Hebrides.

The total number of the Hebrides is about 521; of these not more than 120 are inhabited. The entire area is estimated at upward of 3000 square miles, and the population, in 1901, was 95,739. Only about 200,000 acres are arable; the rest is in pasture land, and in morasses, peat-mosses, lakes, and barren sands and rock. Geologically the Hebrides are divided into groups, of which the more important are the gneiss, trap, and slate. The scenery is grand and picturesque; Mull is noted for its lofty mountains, Jura for its peaks, and Arran for its high, rugged hills. Islay and Bute are comparatively level and arable. Staffa is remarkable for its basaltic columns and great cavern. Iona derives interest from its ruins and historical associations. Politically all the Hebridean isles are attached to Scotland. The counties among which they are distributed are those of Ross, Inverness, Argyll, and Bute. The principal Hebridean towns are Stornoway in Lewis, Portree in Skye, Tobermory in Mull, and Rothesay in Bute. Though situated on the mainland of Argyll, Oban (q.v.) is usually considered a town of the Hebrides, and, along with Rothesay, is best known to tourists. Sheep, cattle, and pony rearing, herring fisheries, and the manufacture of kelp are the chief industries. Live stock, fish, kelp, wool, and stone are the principal exports; iron and groceries the imports.

Enjoying the benefit of the Gulf Stream (q.v.), the climate, although humid, is mild, pleasant, and healthful, and is recommended for certain classes of invalids. The poorer class of natives for the most part speak Gaelic. The establishment of several distinct lines of steamer communication with Glasgow, and the opening up of remote tracts formerly reached with difficulty, have developed the resources of the islands and brought them, with the neighboring coast, within the sphere of trade and the reach of tourists. Under modern proprietorship real estate has improved, and large tracts of moorland are annually rented to sportsmen as shooting-grounds.

The Hebrides are the *Ebude* of Ptolemy, the *Hebudes* of Pliny, and the *Sudreyjar* of the Norwegians. The Hebrides were first colonized in the ninth century by emigrants from Norway. They settled in the greatest numbers on the Shetland and Orkney Islands and Outer Hebrides, but soon wandered as far south as the Isle of Man, colonizing as they went. This resulted in the absorption of the Celtic into the Norse element in the northern islands, while southward the Celtic element remained predominant. The

colony extended to the north and west coasts of Scotland, Cumberland, and Westmoreland, and probably founded the Norse kingdoms of Dublin, Waterford, and Limerick; it also sent a colony to Iceland in 874. The settlers became sufficiently powerful to annoy the mother country, whereupon Harald Haarfagr (King of Norway, c.866-933) fitted out a great expedition and subdued the Hebrides and Man. They remained subject to Norway till 1266, three years after the battle of Largs, and were then transferred to Scotland. In 1346 one of the chiefs, named Macdonald, reduced the whole under his authority, and took the title of 'Lord of the Isles;' but in 1540 they were finally annexed to the Scottish Crown by James V. The Hebrides were ecclesiastically dependent on Norway as late as 1374. Scott's *Lord of the Isles* contributed materially to create popular interest in these islands, which has been added to by William Black's novels. Consult: Buchanan, *Hebrid Isles* (London, 1883); Gordon-Cumming, *In the Hebrides* (ib., 1883).

HEBRON (Heb. *Khebrōn*). A very ancient sacred city of Southern Palestine, the modern El-Khalil, about 21 miles south-southwest of Jerusalem. Hebron figures in tradition as one of the oldest cities of Palestine (cf. Num. xiii. 22), and was originally called Kirjath Arba, 'four-city' (Gen. xxiii. 2; Joshua xiv. 15; cf. Josephus, *Bel. Jud.*, iv. 9, 7). As one of the famous sanctuaries of the south, it became associated in the traditions and legends of the Hebrews with the beginnings of their history. All three patriarchs, Abraham, Isaac, and Jacob, are represented as sojourning in Hebron (Gen. xiii. 18; xxxv. 27; xxxvii. 14), and tradition locates here the cave of Machpelah, where all three, as well as Sarah and Rebecca, were buried (Gen. xxiii.; xxv. 9; xxxv. 27-29; xlix. 29-32; l. 13). The spies sent out by Moses before entering the promised land came hither (Num. xiii. 21, 22). Joshua is said to have destroyed the city, given it to Caleb for an inheritance, and made it a city of refuge (Joshua x. 36-37; xiv. 13; xx. 7). Hebron figures prominently in the history of David (q.v.); it was here that he was anointed King, first over Judah, later over all Israel (II. Sam. ii. 1-4; v. 1-3). The popularity of the Davidic dynasty probably had much to do with the production of legends regarding Hebron and the reshaping of old traditions of the place to make them conform to the later scheme of Hebrew historiography. It was from Hebron that Absalom made his attempt to secure the throne (II. Sam. xv. 7 sqq.). After this time it is seldom mentioned in biblical history. Judas Maccabæus captured it from the Edomites, and the Romans stormed it. It was held for a time by the Crusaders, but fell into the hands of Saladin (1187), and since then has belonged to the Mohammedans, who have always respected its sanctity and regard it as one of the four sacred cities of the world, Mecca, Medina, and Jerusalem being the other three. Its association with Abraham, who is called by the Mohammedans *Khalil Allah*, 'friend of God,' has given it its modern name. The modern city has a population of about 18,000 Mohammedans and 1500 Jews. The alleged sepulchres of the patriarchs are still shown, and an ancient oak at the neighboring Mamre is pointed out as the oak of Abraham. In the neighborhood are the so-called tombs of Ruth, Jesse, and Abner.

HEBRON. A city and the county-seat of Thayer County, Neb., 65 miles southwest of Lincoln; on the Little Blue River, and on the Burlington and Missouri River and the Chicago, Rock Island and Pacific railroads (Map: Nebraska, G 3). It is the commercial centre for a farming and stock-raising district. Population, in 1890, 1502; in 1900, 1511.

HEBRUS, hē'brūs. The ancient name of the river Maritza (q.v.).

HEC'ATÆ'US (Lat., from Gk. Ἑκαταῖος, *Hekataios*). The most important of the Greek logographers (q.v.), son of Hegesander of Miletus. He flourished about B.C. 500. At the time of the Ionian revolt (c.501-493 B.C.) he strove in vain to keep his countrymen from entering upon the war with Persia, and after their defeat he went as an ambassador to Artaphernes, the Persian satrap, and induced him to treat the Ionians kindly. Like most of the logographers, he was an extensive traveler; to judge from the fragments of his work, he must have visited Greece, Thrace, the countries bordering on the Euxine, a great part of Persia, Africa, and possibly Italy and Spain. He wrote a work called *Genealogies* (Ἑκαταίολογία), which was little more than a prose version of the poetical legends of the Greeks. His *Tour of the World* (Ἱεροδοσὸς Ἰῆς), in two books, is interesting from the fact that it was accompanied by a map, probably based upon that of Anaximander (q.v.). The fragments of these two works are published by Müller, *Fragmenta Historicorum Græcorum*, i. and iv. (Paris, 1841-70). Consult, also: Atenstädt, *De Hecataei Milesii Fragmentis quæ ad Hispaniam et Galliam Pertinent*, *Leipziger Studien*, xiv. (1891); Tropea, *Ecateo da Mileto ed i frammenti della periegesis (estratto degli Atti dell' Acad. Peloritana)*, 1896-97).

HECATE, hēk'ā-tē (Lat., from Gk. Ἑκάτη, *Hekate*, the far-working goddess, from ἕκας, *hekas*, afar). An ancient moon goddess, as is clear, not only from her functions, but from the direct statements of the ancients. She is first mentioned by Hesiod, as the only daughter of the Titan Perseus, and of Asteria, or night. The poet praises her as a mighty goddess ruling earth, heaven, and sea, the helper of hunters and fishermen, giver of victory in battle and council. Like other moon goddesses, she appears as helper of women in their confinement, guardian of children, and a goddess of marriage; she also possesses the power of purifying from sin, like Apollo. Mysteries were celebrated in her honor at Ægina, and in conjunction with the Corybantes in the Zerynthian cave of Samothrace. The special seats of her worship are found in Asia Minor and on the east coast of Greece, though in later times she was widely honored. Hecate in the general belief of antiquity was associated with the guardianship of doors and roads, and her sanctuaries seem in general to have been little more than wayside shrines. A statue of the triple Hecate by Alcámenes stood near the entrance to the Acropolis of Athens, and she was worshiped in private houses. The crossroads were under her special protection, and at them sacrifices, especially of dogs, were offered. At each new moon, also, the rich set out in her honor food, which was eaten by the poor. As a goddess of the night Hecate is also associated with the lower world, a companion of Persephone, and guardian of her

door. She had control of the spirits of the dead, goblins, and spectres, her coming was greeted by the howling of dogs, and she was invoked by magicians and witches. From these varied functions, it is not strange that she became closely connected with Persephone, and especially with Artemis. In art she was at first represented as a maiden carrying torches, and this type persisted through the classical period. The common type, however, derived probably from her epithet Τριπίτις (Lat. *Trivia*, 'where three roads meet'), was that of three bodies, joined so as to face in three directions. In the frieze of the great altar at Pergamum, Hecate is shown as having three heads and six arms, but a single body, and this type appears occasionally in later works. Consult: Preller-Robert, *Griechische Mythologie* (Berlin, 1894), and especially Roscher, "Hekate," in *Lexikon der griechischen und römischen Mythologie* (Leipzig, 1886-90).

HEC'ATOMB (Lat. *hecatombe*, from Gk. ἑκατόβη, *hekatombē*, from ἑκατόν, *hekatón*, hundred + βῶς, *bous*, ox). Strictly, a sacrifice of 100 oxen, but even in the Homeric poems a term for any sacrifice of a large number of animals; thus we hear of a hecatomb of 12 oxen or of 50 rams. The belief that the favor of the gods was dependent upon the size of the offering probably was one factor in inducing such large numbers of victims; but a powerful influence was also exerted by the desire to feed the populace, since only a small part of each victim was actually consumed upon the altar. See also SACRIFICE.

HECK, BARBARA (1734-1804). One of the founders of the Methodist Church in America. She was born, of German parentage, in Ballygarry County, Limerick, Ireland, a district which early felt the influence of Wesley's preaching. She and her husband, Paul, came to America in 1760, and in 1766, with Philip Embury, organized a Methodist society in New York City. The building of the famous old John Street Methodist Church was due, in great part, to her tireless energy. During the Revolution the Hecks retired to northern New York, and finally to Canada, to be among Loyalists. They founded the earliest Methodist society in Canada.

HECKER, FRIEDRICH KARL FRANZ (1811-81). A German revolutionist and American soldier. He was born at Eichersheim, in Baden, September 28, 1811, and after studying law in Heidelberg became, in 1838, advocate of the Supreme Court in Mannheim. Elected, in 1842, a member of the second Chamber in Baden, he abandoned his profession for political life, and soon grew popular among the more advanced elements of the opposition. He sat and voted with the Extreme Left, and his influence helped to oust the Blittersdorf Ministry from office. In 1845, in conjunction with Itzstein, he conducted a democratic campaign in Germany, during which he was arrested at Berlin and expelled from Prussia. In 1848 he employed his eloquence in revolutionary agitation, and he and Struve became leaders of the advanced Revolutionary party. When the preliminary convention of the German nation (*Das Vorparlament*) met at Frankfort, Hecker endeavored, with the influence of his whole party, to constitute it into a permanent republican assembly. The frustration of this effort led him to attempt to surprise the smaller governments

of Southern Germany with the bands of artisans which had come from France. Defeated at Kandern, in Baden, April 20, 1848, he fled into the Canton of Basel, where he conducted a radical newspaper, and wrote his work, *Die Volkserhebung in Baden*. On being refused admission to the National Assembly at Frankfort, though twice elected to represent Thiengen, he emigrated to America, where he bought a farm at Belleville, Ill. The Baden Revolution (1849) brought him back to Europe; but finding the revolution over on his arrival, he returned to America. He was a colonel and brigadier-general in the Union Army during the Civil War. During his later years Hecker watched with interest the founding of the new German Empire, and was a staunch supporter of German interests in America. He died at Saint Louis, March 24, 1881. His *Reden und Vorlesungen* were published in Germany in 1872, and were followed two years later by *Betrachtungen über den Kirchenstreit in Deutschland und die Infallibilität*.

HECKER, ISAAC THOMAS (1819-88). An American priest of the Roman Catholic Church, founder of the Paulist Fathers. He was born in New York City, and early in life engaged in business. In 1843 he was a member of the socialistic community at Brook Farm, and later of that at Fruitlands, Mass. He also lived for some time with Henry D. Thoreau at the latter's 'Hermitage.' In 1845 he was converted to the Roman Catholic faith, and four years later was ordained to the priesthood by Cardinal Wiseman. He joined the Redemptorists, but with others was released from his vows, and in 1858 founded the Congregation of Saint Paul the Apostle, or Paulists (q.v.), in New York. Father Hecker was the founder and director of the Catholic Publication Society, and also founded and edited from 1865 until his death the *Catholic World*, the chief popular Roman Catholic magazine in America. His writings also included: *Questions of the Soul* (1855); *Aspirations of Nature* (1857); and *Catholicity in the United States* (1879). Consult Elliott, *Life of Father Hecker* (New York, 1891). The appearance of an abridged and incorrect anonymous French version (1897; 6th ed. 1898) of Father Elliott's volume evoked an attack by Abbé Maignan, of the Congregation of Saint Vincent de Paul, in *La Père Hecker, est-il un Saint?* (1898). This was succeeded by the so-called 'American' controversy, for the settlement of which Pope Leo XIII. in 1899 addressed an apostolical letter to Cardinal Gibbons. For an account of the matter, consult Sedgwick, *Father Hecker* (Boston, 1900).

HECKER, JOHANN JULIUS (1707-68). A German educator, born at Werden, Prussia. At the command of Frederick II. of Prussia, he drew up a system of regulations for the government of common schools, parts of which are still in force. Consult Fr. Ranke, *Johann Julius Hecker* (Berlin, 1861).

HECKER, JUSTUS FRIEDRICH KARL (1795-1850). A German physician and writer of medical history, born in Erfurt, Prussian Saxony. He was professor of medicine in the University of Berlin, and wrote: *Geschichte der Heilkunde* (1822-29); *Der schwarze Tod im 14. Jahrhundert* (1832); *Die Tanzzeit, eine Volkskrankheit im Mittelalter* (1832), translated into English by B. G. Babington, under the title, "The Dancing

Mania of the Middle Ages" (1875); *Der englische Schweiss. Ein ärztlicher Beitrag zur Geschichte des 15. und 16. Jahrhunderts* (1834); *Geschichte der neuern Heilkunde* (1839); *Kinderfahrten, eine historisch-pathologische Skizze* (1845).

HECK'EWEL'DER, JOHN GOTTLIEB ERNESTUS (1743-1823). An American pioneer missionary and orator, born in Bedford, England. He settled in Pennsylvania in 1754, studied theology, and entered the Moravian ministry. In 1771 he became assistant to David Zeisberger (q.v.), who had charge of the missionary work of that Church among the Indians in the Ohio country, whither Heckewelder proceeded in that same year. In this service he remained for fifteen years. In 1792 and 1793 he assisted in drawing up treaties between the United States and the Indians, by whom he was greatly loved and trusted. He remained in Ohio until 1810, when he settled at Bethlehem, Pa., and engaged in writing the history of his labors and observations. He published: *An Account of the History, Manners, and Customs of the Indian Nations Who Once Inhabited Pennsylvania and the Neighboring States* (1818), a work of great value which was translated into both German and French; *Narrative of the Mission of the United Brethren Among the Delawares and Mohegan Indians* (1820); *Names Which the Lenni Lenape or Delaware Indians Give to Rivers, Streams, and Localities* (1822). Consult Rondthaler, *Life of Heckewelder* (Philadelphia, 1847).

HECKLE, HATCHEL, HETCHEL. A wooden frame studded with iron teeth used for separating the shine or boon of flax and hemp from the fibre; also the operation of cleaning the fibre with this tool.

HECKMONDWIKE, hək'mond-wik'. A manufacturing town in the West Riding of Yorkshire, England, 10 miles southwest of Leeds (Map: England, E 3). It has coal-mines, iron-works, machine-shops, and is an important centre of carpet, blanket, and heavy woolen manufactures. The town has improved in recent years; has good drainage, an ample water-supply, and electric lighting. Population, in 1891, 9700; in 1901, 9460.

HECKSCHER, hək'shēr, JOHANN GUSTAV WILHELM MORITZ (1797-1865). A German politician, born in Hamburg. He served during the War of 1815 as a volunteer in the Hanseatic Corps, and then studied at the universities of Göttingen and Heidelberg. Upon completing his studies he settled in Hamburg, where he practiced law, and, after 1840, directed the politics of the *Hamburger Nachrichten*. In 1848 he was elected to the Vorparlament, in which he opposed the propositions of the Democratic Party. In the National Assembly at Frankfort (1848-49) he was at first a member of the Left Centre, but inclined more and more to identify himself with the Right. He advocated the election of Archduke John of Austria as Vicar of the Provisional Government, in which he himself was appointed Minister of Justice, and opposed the proposition to exclude Austria and erect a German empire with a Prussian King as hereditary Emperor. Later he helped to organize the Pan-German Party.

HECLA, or HEK'LA. A volcano in Iceland, situated in the southwestern part of the island,

about 20 miles from the coast. It has an irregular cone built of lava, scoriæ, and ashes, and bare of vegetation, which rises to a height of 5100 feet above the sea. There are several subsidiary craters, besides the principal crater on the summit, and the cone is dissected by deep ravines, through which torrents rush down from the snow-fields above. The volcano has an extremely wild and desolate appearance. Eruptions take place at irregular intervals, the total number on record since the discovery of Iceland being 28. The most violent outbursts occurred in 1157, 1300, 1597, 1636, and 1766. In the last-named year a large area was buried beneath the ejected lava and ashes. The volcano was again active from September, 1845, to April, 1846, and in March, 1878. See ICELAND.

HECTARE, HECTOGRAM, HECTOLITER, HECTOMETER. See METRIC SYSTEM.

HECTIC FEVER (from Gk. *ἥκτικός*, *hektikos*, consumptive, from *ἔχειν*, *hechein*, condition, from *ἔχειν*, *echein*, to have). A type of fever, usually associated with tubercular disease, abscess, or septicæmia, distinguished by an afternoon or evening rise of temperature, during which the patient has bright eyes, flushed cheeks, and some nervous excitement, while afterwards the temperature falls and profuse perspiration occurs. The treatment must be directed toward the existing disease, of which it is generally a grave symptom.

HECTOGRAPH. See COPYING MACHINES.

HECTOR (Lat., from Gk. *Ἑκτωρ*). The leader and mightiest warrior in the Trojan army, son of Priam and Hecuba, husband of Andromache, and father of Astyanax or Scamandrius. In the *Iliad* he appears as brave in battle, but hasty, and often imprudent; he is also full of reverence for the gods, tender love for his family, and devoted patriotism. During the absence of Achilles from the fight he storms the Greek camp and penetrates even to the ships. Driven back by Patroclus, the friend of Achilles, he at length slays him, by the help of Apollo. Roused by his thirst for vengeance, Achilles is reconciled with Agamemnon, and in divine armor routs the Trojans with fearful slaughter, and finally, after chasing Hector three times round the walls of Troy, slays him by the help of Athena, and drags the body at his chariot-wheels to the Greek ships. Here the corpse is miraculously preserved by the gods, and finally ransomed by Priam. With the mourning and burial of Hector the *Iliad* closes. In the post-Homeric literature little is added to the picture of Hector. At Ilium he was worshiped as a hero, and similar offerings were made at Thebes, whither it was said an oracle had commanded the removal of his bones. In art the combats of Hector with various Greek heroes, his death, the maltreatment of his body, and his ransom, are favorite subjects.

HECTOR, ANNIE (FRENCH) (1825-1902). A British novelist, best known by her pseudonym of 'Mrs. Alexander,' born in Dublin, Ireland. She began writing at an early age, but with so little success that on her marriage she laid aside her pen and resumed it only when the death of her husband obliged her to seek some means of maintenance. Among her novels, some of which met with considerable success, are: *The Wooing O't* (1873); *Her Dearest Foe* (1876); *By Woman's Wit* (2 vols., 1886); *Mona's Choice* (1887);

A Life Interest (3 vols., 1888); *A Winning Hazard* (1896); and *Barbara: Lady's Maid and Peeress* (1897).

HECTOR, or ECTOR, SIR. The name of two knights in Arthurian legend.

HECUBA (Lat., from Gk. *Ἑκάβη*, *Hekabê*). The second wife of Priam, King of Troy, to whom she was said to have borne nineteen children, including Hector, Paris, Helenus, Cassandra, Deiphobus, Polydorus, and Troilus. In the *Iliad* Hecuba appears as bringing offerings to Athena, trying to restrain Hector from the battle, and lamenting his death. The tragedians, and especially Euripides, basing their work on the later epics, developed her story, and it served as a source for still later poets. Before the birth of Paris she dreamed that she bore a blazing torch which fired the whole city. From dread of the meaning of this omen, Paris was exposed. Another episode was her vengeance on Polymestor, King of Thrace, to whom Priam had sent his son Polydorus and much treasure for safe-keeping. Polymestor murdered his ward, and threw the body into the sea, which bore it to the shore of the Troad, where it was discovered by a servant of the now captive Hecuba. She then enticed Polymestor to her tent, and with her attendants slew his sons before his eyes and blinded him. The loss of Polydorus was only one of her sufferings after the capture of Troy, for she saw her husband and her sons slain, her grandson, Astyanax, son of Hector, thrown from the walls of Troy, and her daughter Polyxena sacrificed at the tomb of Achilles, while the lot assigned her as slave to her most hated enemy, Odysseus. The legends of her end varied, as in one version she was transformed into a dog, which sprang into the sea and was drowned, while in another her lamentations and curses so angered the Greeks that they stoned her. Her name became proverbial for a sorrowful fate.

HECUBA, or HEC'ABE. A tragedy by Euripides, produced about B.C. 424. It deals with the revenge of the Trojan matron on Polymestor, King of Thrace, who had murdered her youngest son, Polydorus, previously consigned by Priam to his guardianship. The tragic pathos of the play is also heightened by the introduction in the first part of the story of Polyxena, the daughter of Hecuba, who was sacrificed by the Greeks to the shade of Achilles. The play is somewhat lacking in unity.

HECYRA, hēs'ī-rā (Lat., from Gk. *Ἑκυρά*, mother-in-law). A comedy by Terence, produced in B.C. 165. The play, which is based on an unknown Greek comedy, lacks plot, and was at first unsuccessful.

HEDA, hā'dā, WILLEM CLAESZ (1594-c.1678). A Dutch painter, born probably at Haarlem. He was one of the most famous of the still-life painters, and also attempted historical subjects, but with little success. He was dean of the Haarlem Guild in 1631 and in 1651, but aside from this nothing is known of the events of his life. There is a "Dessert" by him in the Louvre, dated 1637. His other pictures are in the German galleries, notably some breakfast subjects in Munich, Dresden, and Nuremberg.

HEDBERG, hēd'bēr-y', FRANS TEODOR (1828—). A Swedish dramatist, born at Stockholm. He had tried various professions, including that of actor and wig-maker, before he set seriously to

work as a dramatist (1854). Afterwards he was appointed reader, and then teacher, at the Royal Theatre in Stockholm (1861), and later director of the New Theatre, Gothenburg (1881). In 1883 he gave up this position to devote himself entirely to writing. His works include comedies, tragedies, adaptations, translations, vaudevilles, and poems. The best known of his plays is *Brölloppet på Ulfåsa* (1865). He also wrote: *Karaktärstikter och Porträtter af Svenska Skådespelare* (1884), and *Karaktärstikter och Porträtter af Svenska Operasångare* (1885), besides other works dealing with theatrical subjects.

HEDDA GABLER, héd'dá gä'blér. A play by Hendrik Ibsen (1890), and the name of its heroine, an eccentric woman who, disappointed in her marriage with a young savant, attempts to regain her influence over a former lover, Eilert, now under the good influence of a former school friend of Hedda. He loses the manuscript of a new work which is to make him famous, and Hedda's husband finds it, but she destroys the work. When Eilert, in despair, thinks of suicide, she gives him a pistol with which he ends his life in a low resort, and Hedda kills herself.

HED'DING, ELLJAH (1780-1852). An American clergyman, bishop of the Methodist Episcopal Church. He was born in Pine Plains, Dutchess County, N. Y., and began to preach in Vermont when nineteen years old. During most of the time between 1807 and 1824 he was presiding elder in New Hampshire, in Portland, Maine, and in Boston. In 1824 he was elected bishop, and during the formative period of the Church's growth he exercised a powerful influence. He was one of the founders of *Zion's Herald*, the first Methodist paper in the country, and author of a *Manual of Discipline*.

HEDDLE, or **HEALD** (of Scandinavian origin; cf. Icel. *hafald*, thrum for holding the weft). In weaving, the threads of the warp are so arranged that at each passage of the shuttle backward and forward, a certain number of the warp threads are raised up, and the remainder drawn down; this is done with vertical threads, cords, or wires, with a small loop in the middle through which the warp thread is passed, there being one of the vertical threads for each horizontal or warp thread. These threads or wires are known as heddles or healds. See **LOOM**.

HEDENSTIERNA, hä'den-styér-ná, KARL JOSEPH ALFRED (1852—). A Swedish author, born at Wedåsa (Småland province). In 1879 he became connected with the staff of the *Smålands Posten* at Wexjö, and in 1890 was made editor-in-chief of that journal. In addition to several volumes descriptive of Swedish peasant life, he wrote a series of humorous articles, published weekly in the *Posten* over the name 'Segurd,' and in part collected in a translation into German by Krusenstierna and Langfeldt, entitled *Allerlei Leute* (Leipzig, 1892-97).

HEDGE (AS. *hecg*, *hege*, OHG. *hecga*, *hegga*, Ger. *Hecke*, hedge; connected with AS. *hege*, Eng. *hay*, and AS. *hēawan*, Eng. *haw*). A fence formed generally of growing shrubs or trees and cultivated either for defense or ornament. Hedges are much used in England, Italy, and in other countries where wood for fences is scarce. For many situations, they are particularly adapted, owing to the protection which they af-

ford from high winds. The height to which they are permitted to grow should be accommodated to the requirements of the locality. Hedges in Great Britain are generally formed of hawthorn (q.v.). Beech hedges are very common around gardens and pleasure grounds, and a hedge of beech and hawthorn mixed is common in many places. Holly makes an excellent ornamental hedge, much in use for gardens and pleasure grounds. Ornamental hedges are sometimes formed of yew, hornbeam, lime, and other trees. In the United States, osage orange (*Maclura aurantiaca*) and honey-locust (*Gleditsia triacanthos*) are considered the best hedges for fence purposes. For ornamental hedges California privet (*Ligustrum ovalifolium*); Norway spruce (*Picea excelsa*), American arbor-vitæ (*Thuja occidentalis*), common hemlock (*Tsuga Canadensis*), Japan quince (*Cydonia japonica*), *Deutzia scabra*, and some spiræas and viburnums are used.

HEDGE, FREDERIC HENRY (1805-90). An American clergyman, critic, and philosopher, born at Cambridge, Mass. He was a son of Levi Hedge, professor of logic and metaphysics in Harvard College. He studied in Germany under the care of George Bancroft from 1818 to 1823, and graduated at Harvard (1825), and from the Divinity School at Cambridge in 1828. He was a Unitarian pastor successively at West Cambridge (1829), Bangor, Maine (1835), Providence, R. I. (1850), Brookline, Mass. (1856), and in 1857 was made professor of ecclesiastical history in the Harvard Divinity School, and editor of the *Christian Examiner* (1857-60). From 1872 to 1881 he was professor of German at Harvard. To literary criticism he contributed *Prose Writers of Germany* (1848), and *Hours with German Classics* (1886); to religious and philosophical criticism: *Reason in Religion* (1865); *The Primeval World of Hebrew Tradition* (1870); *Martin Luther and Other Essays* (1888). He wrote also several hymns and translations from the German poets, and prepared a liturgy for the Unitarian Church (1856). His chief significance to American thought was his introduction of German scholarship and literature.

HEDGEBOTE. See **HAYBOTE**.

HEDGEHOG. One of a genus (*Erinaceus*) of insectivorous quadrupeds, the type of the family Erinaceidae. The muzzle is rather elongated, the neck short, the limbs short, the feet five-toed, the claws strong, the tail short, the body covered with short spines on the upper part, and with hair below, and capable of being rolled up into a ball. The teeth are 36 in number, 20 in the upper jaw and 16 in the lower; the middle incisors are very long, and stand forward. Like many other insectivora, hedgehogs are by no means limited to insect food, but prey on larger animals, as reptiles, small quadrupeds, and birds; they are fond of eggs and of milk, and in confinement will readily eat soaked bread, cooked vegetables, or porridge. Their power of rolling themselves into a ball, from which the spines project on every side, is their means of protection from enemies. The spines are curiously bent near the root, and so set, that on the contraction of the muscles by which the animal rolls itself up they are held firmly in their position, their points toward the adversary. They are very strong and sharp, and their elasticity is so great that the animal

can sustain falls from considerable heights without apparent injury.

The common hedgehog (*Erinaceus Europæus*) is a native of all Europe and of Western Asia. Its short ears are one of its distinctive specific characters. It is seldom more than nine and a half inches in length. Its spines are about an inch long. It readily kills snakes, and even vipers, which it eats, beginning always at the tail. It brings forth from two to four young at a birth, and provides for the occasion a curiously constructed nest, mostly of dry leaves, of which the roof is capable of throwing off the rain. The young are blind at first, their ears are closed, and their bodies are covered with soft, incipient spines. In winter the hedgehog becomes torpid, retiring to a hole at the base of a tree, beneath roots, or in some such situation. It provides no winter store, and few animals hibernate so completely. The hedgehog is easily tamed, becomes very familiar, and is very useful in houses where cockroaches are troublesome. Night is its period of activity. Its flesh is eaten in some parts of Europe, but in Great Britain only by gypsies, who roll the animal up in a ball of clay, and so roast it. About eighteen other species of hedgehogs are found in different parts of Asia and Africa, but no closely related animal is included in the American fauna. See Plate of PORCUPINES AND HEDGEHOGS.

HEDGEHOG PLANT (so called from the shape). A name given to those species of medic (Medicago) in which the pods are spirally twisted and rolled up into a ball, beset with spines. The peculiar appearance of the pods makes them objects of interest, on which account they sometimes find a place on flower borders. Like other medics, they are useful as sheep and cattle food in countries where they abound. They are particularly plentiful on sandy grounds near the sea in some parts of South America, and their bur-like pods are often abundant in South American wool. See MEDIC.

HEDGE-HYSSOP. See GRATIOLA.

HEDGE-MUSTARD, *Sisymbrium*. A genus of plants of the natural order Cruciferae, mostly annual or perennial herbs, with various foliage, yellow or white flowers, and long, roundish or six-angled pods. Several species are natives of Europe, of which one, the common hedge-mustard (*Sisymbrium officinale*), was once employed in medicine for catarrh and other ailments, and still is sometimes cultivated as a pot-herb on account of its mild pungency. It is abundantly introduced into the United States, where it is considered a troublesome weed. Broad-leaved hedge, or London rocket (*Sisymbrium irio*), is said to have sprung up in great abundance on the ground desolated by the fire of London in 1666. There are a number of other species, nearly all of which are weedy in habit. *Sisymbrium Alliaria* is noted for its strong garlic-like odor.

HEDGE-NETTLE. See STACHYS.

HEDGE-SPARROW, HEDGE-WARBLE, OR DUNNOCK. A familiar European warbler (*Acceptor modularis*). It is not quite as large as the house-sparrow, which it somewhat resembles in dull brownish plumage, but in little else. It feeds principally on insects. It is one of the earliest spring songsters, having a sweet plaintive song. The nest, of green moss, roots, and wool,

lined with hair, is usually placed rather low in a bush or hedge. The eggs are four or five in number, of a delicate and spotless bluish green.

HEDIN, hē-dēn', SVEN ANDERS (1865—). A Swedish explorer, born at Stockholm, and educated there and at Upsala (1885), at Berlin and at Halle, where, in 1892, he received the doctorate. He traveled in Southwestern Asia in 1885-86, and gave an account of his journey in *Genom Persien, Mesopotamien och Kaukasien* (1887); was a member of the Swedish commission to Teheran, which he described in *Konung Oscar's beskickning till Schahen af Persien* (1891); and in *Genom Khorasan och Turkistan* (1892) told of his experiences in Central Asia in 1890-91. In the years 1894 to 1897 he traveled through East Turkestan, the Pamir, the Takla-Makan Desert, northern Tibet, and the Desert of Ordos, reaching Peking and returning west through Mongolia and Siberia, and in the latter year won the Karl Ritter medal from the Berlin Geographical Society. These remarkable journeys, performed at times amid extraordinary hardships, were described in the book, *Through Asia* (1899), which made the author's reputation in England and America; and, less popularly, in *Petermanns Mitteilungen* (1900); "Die geographisch-wissenschaftlichen Ergebnisse meiner Reisen in Central Asien, 1894-97." Hed-in's expedition of 1899 to 1902 explored the lower course of the Tarim, the country between it and the Tchertchen-Darya, the region of Lob-Nor, the Desert of Gobi, and the greater part of Tibet. He made two unsuccessful attempts to enter the sacred city of Lhasa. Hedin accepted invitations to visit America for a course of university lectures for the early part of 1903.

HEDJAZ, hē-jāz' (Turk., land of pilgrimage). A Turkish vilayet of Arabia (q.v.), extending along the northeast shore of the Red Sea from the Gulf of Akabah to about the parallel of 20° N. (Map: Turkey in Asia, P 10). It reaches to the Nefud Desert on the east. Its area is estimated at 96,500 square miles. The district is barren, being covered with sand and eruptive material. In parts of the interior there are mountains reaching an altitude of about 6000 feet. The country is traversed by numerous wadis. The climate is hot and dry, and vegetation is found only in a few oases. The population is estimated at about 300,000, consisting of Bedouins, many of whom are engaged in the plundering of caravans. Hedjaz is important in the Mohammedan world, for within its confines are the two sacred cities of Mecca and Medina. The chief port is Jeddah.

HEDLINGER, hēd'ling-ēr, JOHANN KARL (1691-1771). A Swiss stamp-cutter, born at Schwyz. He completed his studies in Paris, and then went to Sweden, where he was appointed royal medalist in 1718. His pupil, Fehrman, succeeded him as a medalist to the King, and finished from his designs a series of portraits of Swedish sovereigns. His works were published with a French text by C. de Michel (1778, forty plates), and with a German text by J. C. Füzli and J. E. Haid (1781-82, eighty plates).

HEDONISM (from Gk. ἡδονή, hēdonē, pleasure; connected with ἡδύς, hēdys, Lat. suavis, Goth. *suts*, OHG. *suoz*, Ger. *süss*, Eng. *sweet*, Skt. *svādu*, sweet, from *svad*, to make pleasant, to taste). The theory that pleasure is the high-

est good in human life. (See ETHICS.) In Occidental speculation this view appeared very early, and was vigorously asserted by many sophists (q.v.). Aristippus (q.v.) and his school (see CYRENAIC SCHOOL) made hedonism their central doctrine. Aristippus seems, at least at times, to have insisted upon the supreme value of the pleasure of the moment, and to have lost sight of the necessity, even according to hedonism, of taking account of the future. But while many of the sayings attributed to him have this irrational character, the value he set upon insight would seem to indicate that it was not his intention to hold up as ideal the man who completely ignored all the hedonic consequences of his action. Epicurus (q.v.) laid more emphasis on the desirability of choosing 'productive' pleasures, to use Bentham's nomenclature; i.e. pleasures whose consequences are not painful. But however they differed in other points, all the ancient hedonists were agreed that the pleasure of the agent was, for the agent himself, the supreme end. A disinterested desire for some one else's good was not recognized as possible; or, if possible, it was regarded as perverse. Early modern hedonists (see HOBBS and LOCKE) were almost or quite as individualistic as the ancients. But with Cumberland, Hutcheson (q.v.), and Hume (q.v.), a new phase of hedonism was introduced, viz. the theory that not the agent's greatest pleasure, but "joy in widest commonalty spread," is the supreme end of mortal action (Universalistic hedonism, or Utilitarianism, q.v.). There is also another distinction between ancient and modern hedonism. It was characteristic of Greek and Roman pleasure theories that they rested on the principle that every man, or at least every normal man, always seeks his own pleasure. In other words, the ancient theory rested on an alleged psychological fact, and has therefore been called *psychological* hedonism. Some modern authors take the same position; but the prevailing tendency in modern hedonism is to assert, not that every man always *actually* seeks his own pleasure, but that he *ought* to seek the greatest pleasure, whether of himself or of humanity, or of all sentient creatures. This is *ethical* hedonism.

Psychological hedonism is controverted by well-known facts. So far as man from always seeking pleasure, that in most of his actions he has no thought of pleasure. He acts from automatic impulse, from instinct, from habit, from desire for certain objective ends, as well as occasionally from desire for pleasure. It has even been denied that there can be any desire for pleasure, although this is, without doubt, an extreme position. The tendency among many writers at the present day is to maintain that the affections, i.e. pleasantness and unpleasantness, are the motives or main-springs of *voluntary* action, and not that pleasure and the avoidance of pain is the *end* of action. The difference between a motive and an end is that between an efficient and a final cause (see CAUSALITY), although it should be remarked that motive is often used as synonymous with end. This view that the affections are the motives of actions, so far as these actions are voluntary, is not to be confused with hedonism, which is a theory of ends, not of cause.

Ethical hedonism is beset at the outset with

one great difficulty. It is often argued that hedonism is not practicable unless all pleasures can compare in some way with each other. Who shall say whether the pleasures of the table are greater or less than those of the opera? The question can be only approximately answered by each individual according to his own tastes. And even such an answer can claim no uniform applicability. At one time, e.g. when extremely hungry, even the most enthusiastic lover of music might prefer beefsteak to Wagner, while just after an epicurean banquet the gourmand might temporarily prefer music. The greatest sum of pleasures either for the agent or for the race would be a very difficult ideal to set before one, except in the abstract—too difficult, perhaps, to make it the criterion of morality for the ordinary man. But the difficulty of it must not be a bar, if, on sufficient ground, it can be proved that man *ought* to seek the greatest pleasure either of himself or of others. What obligation means and how it relates itself to pleasures and desires is discussed elsewhere. (See ETHICS.) After that discussion it may be said that hedonism has no scientific basis. Consult the authorities referred to under UTILITARIANISM; ETHICS.

HÉDOUIN, á'dwǎn', EDMOND (1820-89). A French painter, born at Boulogne-sur-Mer. He studied under Delaroche and Nanteuil, and first attracted attention by his "Woodcutters of the Pyrenees," exhibited in 1844. His best works are scenes of Spanish peasant life. He also produced some decorative paintings for the foyer of the Théâtre Français in Paris. One of his landscapes is "Gleaners Overtaken by Storm" (1857), in the Luxembourg. In engraving, Hédouin's work for an edition of Molière (1881-89) may be noted.

HÉDOUVILLE, á'dōv'vèl', GABRIEL MARIE JOSEPH THÉODORE, Count d' (1755-1825). A French general and diplomat, born at Laon, and educated at La Flèche and at the Military School. In 1797 he was made Governor of Santo Domingo, but was unable to cope with Toussaint L'Ouverture, and returned to France two years afterwards. In 1801 he was made Minister to Russia, in 1805 went on diplomatic missions in Italy, and, with Josephine, to Strassburg and Munich. After the peace with Austria he was Plenipotentiary at Frankfort, but in 1814 voted for the overthrow of the Empire. He was made count in 1818, and was appointed to the commission on the disputes between France and the Grand Duchy of Warsaw.

HEDWIG, héd'vīk (1174-1243). The patron saint of Silesia, a daughter of Berthold IV. of Meran. In her twelfth year she was married to Duke Henry I. of Silesia, who died in 1238. She entered a Cistercian cloister which she had founded near Breslau, and died there.

HEDWIG, or **JADWIGA**, yád-vē'gá (1371-99). A Queen of Poland, daughter of Louis the Great of Poland and Hungary. After his death (1382) the Poles put her on the throne. In 1386 she married Jagellon of Lithuania, who embraced Roman Christianity and became known as Wladislaw (Ladislas).

HEEL-FLY. A local name in the Southern and Western States for the ox bot-fly (*Hypoderma lineata*), derived from the fact that the

adults hover around the heels of cattle for the purpose of laying their eggs on the hairs, whence they will be licked off. See Bot.

HEEL-FLY.

HEEM, hām, JAN DAVIDSZ DE (1606-84). The most celebrated painter of 'still life' that the Dutch School has produced. He was born at Utrecht, and studied under his father, a painter of still life. We know but little of his life. In 1620, and during the years following, he was active at Leyden, and in 1635 he became a member of the Painters' Guild of Antwerp. In 1667 he returned to Utrecht, but during the French invasion of 1672 he fled to Antwerp, remaining there until his death in 1684. Heem's pictures represent for the most part splendid vases of fruits and flowers, musical instruments, and ornaments of various kinds. His work was popular and commanded high prices. His works are to be found in nearly all the principal galleries of Europe, especially in those of Holland, Belgium, and Germany. They show exquisite coloring, unsurpassable chiaroscuro, faultless arrangement, and a fine observation of nature, which he imitates with microscopic fidelity.

HEEMSKERK, hāms'kērk, or **HEMSKIRK**, MARTIN VAN (1498-1574). A Dutch painter, whose name was Martin van Veen, but who was called Heemskerk from the place of his birth. He studied under Scorel, from whom he got a liking for Italian art which he displayed, particularly in his imitation of Michelangelo, whose works influenced him strongly when he saw them on his visit to Rome in 1532. Many of his pictures were destroyed by the Spaniards during the sack of Haarlem (1572). Among those still existing are: "Saint Luke Painting the Virgin" (1532), "Adoration of the Shepherds," "The Brazen Serpent," "Last Judgment," and "Triumph of Silenus."

HEEP, URIAH. A very 'umble' person and a most egregious hypocrite in Dickens's *David Copperfield*. He is a clerk in Mr. Wickfield's law office, gains absolute ascendancy over that benevolent but singularly weak character, and is prevented from ruining him only by being exposed by Micawber.

HEER, hār, OSWALD (1809-83). A Swiss naturalist, born at Nieder-Utzwyl. He was director of the botanical gardens at Zurich (1835-83), and also professor of botany at the university and at the Polytechnicum. His earliest publications were on entomology, but his most important contributions to science were his works on the fossil plants and insects of the Tertiary period, notably *Flora Tertiaria Helvetiae* (1854-56); *Die Urvwelt der Schweiz* (1865-79); *Flora Fossilis Helvetica* (1877); *Flora Fossilis Arctica* (1865-83). Consult: J. J. Heer and Schröter, *Oswald Heer, Lebensbild eines schweizerischen Naturforschers* (Zurich, 1885-87); and Malloizel, *Oswald Heer. Bibliographie et table iconographique* (Berlin, 1888).

HEEREN, hā'ren, ARNOLD HERMANN LUDWIG (1760-1842). An eminent German scholar, born

at Arbergen, near Bremen, where his father was at that time pastor, and educated at the cathedral school of Bremen, and at the University of Göttingen. His first published work was an edition of Menander's *De Encomiis* (1785), and somewhat later appeared the *Eclogæ Physicæ et Ethicæ* of Stobæus (1792-1801). In collecting materials for the latter he visited Italy, the Netherlands, and France. In 1794 he was appointed professor of philosophy, and in 1801 professor of history at Göttingen. In 1793-96 appeared at Göttingen his *Ideen über Politik, den Verkehr und den Handel der vornehmsten Völker der alten Welt* (4th ed. 1824-26). This work has secured him a place among the most eminent modern historians, and is still of much value. If his *Geschichte des Studiums der Klassischen Litteratur seit dem Wiederaufleben der Wissenschaften* (1797-1802) proved less satisfactory to scholars, his *Geschichte der Staaten des Alterthums* (5th ed. 1826) and his *Geschichte des europäischen Staatensystems und seiner Colonien* (4th ed. 1822) abounded in new views and acute expositions. For his *Versuch einer Entwicklung der Folgen der Kreuzzüge* (1808) he received the prize from the Institute of France. His *Vermischte historische Schriften* (1803-08) contain some very interesting treatises. In 1821-26 he published an edition of all his historical works (*Historische Werke*) in fifteen volumes.

HEEREN, FRIEDRICH (1803-85). A German chemist, nephew of the historian Arnold Herman Ludwig Heeren, and born at Hamburg. Educated at Göttingen and Paris, he was for two years engaged with his brother in the manufacture of stearin and whale-oil candles in Hamburg, and in 1831 became professor of chemistry in the institute of technology at Hanover. He patented a machine for testing milk, wrote on chemical dyes, and published a *Technisches Wörterbuch* (with Karmarsch, 1841-44; revised by Kick and Gintl, 1874-92), a free translation of Ure's *Dictionary of Arts, Manufactures, and Mines*, and a standard work of reference.

HEFELE, hā'fe-le, KARL JOSEPH VON (1809-93). A Roman Catholic bishop and scholar. He was born at Unterkochen, not far from Stuttgart, Württemberg, March 15, 1809; graduated at Tübingen, and in 1840 received a professorship in the Catholic theological faculty, where he lectured on Church history, Christian archæology, and patrology. From 1842 to 1845 he was a member of the Württemberg Chamber of Deputies. He was consecrated Bishop of Rottenburg in 1869, and took a prominent part in the Vatican Council, where he was foremost among those who spoke and voted against the dogma of Papal infallibility. At first he refused to proclaim it in his diocese, but on April 21, 1871, did so, and in 1872 gave his public assent to it. In 1874 he declined the Archbishopric of Freiburg offered to him by the Baden Government, on the ground that he could not take the oath which was demanded from the bishops in Prussia and Baden. His most important work, based on the study of original materials, is the *Conciliengeschichte*, a history of the councils of all grades, in nine volumes. Hefeles part of the work extends to the Council of Florence, but with Hergenröther's appendix, the work goes to Trent. The English translation (Edinburgh, 1871-96, 5 vols.), goes as far as 738. Hefeles *Life of Ximenes*

(1844) has been translated (London, 1860). He died in Rottenburg June 5, 1893.

HEFFERNAN, MR. MICHAEL. The non-deplume which Samuel Ferguson signed to *Father Tom and the Pope, or a Night at the Vatican*.

HEFFTER, hēf'tēr, AUGUST WILHELM (1796-1880). A German jurist, educated at Berlin and Leipzig. He was made professor at Bonn (1823), at Halle (1830), and at Berlin (1832). From 1849 he was a member of the First Chamber; in 1861 was appointed Crown Syndic and became as such life member of the Prussian Upper House. He wrote: *Institutionen des römischen und deutschen Civilprozesses* (1825); *Das europäische Völkerrecht der Gegenwart* (8th ed. by Geffken, 1888); *Lehrbuch des gemeinen deutschen Strafrechts* (6th ed. 1857); and *Die Sonderrechte der souveränen und mediatisierten Häuser Deutschlands* (1871); and, on current history, *Der gegenwärtige Grenzstreit zwischen Staats- und Kirchengewalt* (1839).

HEFNER-ALTENECK, hēf'nēr äl'te-nēk, JAKOB HEINRICH VON (1811—). A German historian and art critic. He was born in Aschaffenburg, and while still a child he lost the use of his right arm, but nevertheless became an excellent draughtsman. He made a specialty of the history of art, especially of the Middle Ages. He was made successively professor of designing (1835), conservator of the art collection of Munich (1853), of the Royal Museum of Engravings (1863), and conservator-general of the art collections of Bavaria and director of the National Museum (1868). His retirement in 1886 did not put a stop to his literary activity. The more important of his works are: *Trachten, Kunstwerke und Gerätschaften vom frühen Mittelalter bis Ende des 18. Jahrhunderts* (2d ed. 1879-90); *Hans Burgkmaiers Turnierbuch* (1854-56); *Eisenwerke oder Ornamentik der Schmiedekunst des Mittelalters und der Renaissance* (1861-87); *Originalentwürfe deutscher Meister für Prachtrüstungen französischer Könige* (1865); *Originalzeichnungen deutscher Meister des 16. Jahrhunderts zu ausgeführten Kunstwerken für Könige von Frankreich und Spanien* (1889); *Deutsche Goldschmiedewerke des 16. Jahrhunderts* (1890); and *Lebenserinnerungen* (1899).

HEGAR, hā'gār, FRIEDRICH (1841—). A German composer, born at Basel. He studied at the Leipzig Conservatory under several famous teachers, and in 1860 became leader of the Bilsle Orchestra at Warsaw. In 1863 he settled in Zurich, where he became a well-known conductor, and in 1876 founded a school of music. He composed some piano and violin music, but became best known for his male choruses and songs. His oratorio, "Manasse," was highly successful, and is a striking work.

HEGEL, hā'gel, GEORG WILHELM FRIEDRICH (1770-1831). One of the greatest German philosophers. He was born August 27, 1770, at Stuttgart, and became in 1788 a student in the University of Tübingen, where his speculative abilities, however, were outshone by his younger companion, Schelling, who, together with Hölderlin, exercised a great intellectual influence on him. In the university he studied theology, philosophy, and natural science, and was interested in political events and theories. His diploma described him as having good parts, but did not mention him as

distinguished for his knowledge, philosophical or otherwise. After leaving the university in 1793, he was a private tutor at Bern and Frankfort-on-the-Main for seven years, during which period he continued his studies in philosophy and theology, and wrote a *Life of Jesus*, which, however, was never published. In the beginning of 1801 he left Frankfort for Jena, where he published his first work, *Ueber die Differenz des Fichteschen und Schellingschen Systems der Philosophie* (1801), and entered the university as privat-docent. Next year he joined Schelling, to whose philosophy he seems at this time to have adhered, in the editorship of the *Kritisches Journal der Philosophie*. This alliance did not last long, and soon turned into philosophical antagonism. His lectures in Jena did not attract much notice, but it was at this place, while the din of the battle in 1806 was sounding through the town, that he completed his first important work, *Phänomenologie des Geistes* (1807), which he used afterwards to call his voyage of discovery. Shortly before the battle he had been made professor extraordinary of philosophy; but the disaster which the war brought upon Jena compelled him to seek means of subsistence elsewhere, and he went, accordingly, at Niethammer's request, to Bamberg, where he edited a political paper for a year or two. In 1808 he was appointed rector of the gymnasium at Nuremberg, and there he had just completed the first edition of his *Wissenschaft der Logik* (1812-16), when he was called in 1816 to a professorship of philosophy in Heidelberg. There he published his *Encyclopädie der philosophischen Wissenschaften* (1817), in which he first developed his complete system. In 1818, however, he was called to Fichte's place in Berlin, and it was here that he first began to gather around him a new philosophical school. His lectures, which were delivered without rhetorical ornament, yet with an impressiveness due to the expression of laborious thought, attracted hearers from all ranks and professions. He rose to great political influence by reason of his defense of existing political institutions. This defense subsequently led his critics to charge him with time-service; the charge, however, does him a great injustice. In 1821 he published his *Grundlinien der Philosophie des Rechts*, in which he gave expression to his ethical and political views. He demands in that work, among other things, representation of the people, freedom of the press, publicity of judicial proceedings, trial by jury, the administrative independence of corporations, and, above all, a monarch who shall "put the dot over the i," i.e. complete the constitution of the State. In the midst of an active life he was suddenly cut off by cholera, November 14, 1831. He was buried beside Fichte. A complete collection of his works was published in eighteen volumes (Berlin, 1832-41), some of them compiled from notes taken by his students. Of his works translated into English may be mentioned: *Philosophy of Mind* (Oxford, 1894), and *Logic* (ib., 2d ed. 1892), translated by Wallace, both of which are portions of the *Encyclopädie*; *Philosophy of Right*, translated by Dyde (London, 1896); *Philosophy of Religion*, translated by Spiers and Sanderson (ib., 1895); *Philosophy of History*, translated by Sibree (ib., 1857); *History of Philosophy*, translated by Haldane and Simpson (ib., 1892); *Hegel's Doctrine of Reflection*, translated by W. T. Har-

ris, book ii. of *Greater Logic* (New York, 1881); and portions of book i. of the *Greater Logic* by J. H. Stirling in his *Secret of Hegel* (2d ed., Edinburgh, 1897).

It is impossible in this article to give any detailed account of Hegel's system of philosophy. He called it the system of the Absolute Idea. The idea is, for him, the indissoluble unity of the universe, existing in the two polar distinctions of subject and object. This idea is absolute because all-inclusive. The method by which Hegel arrived at this result he called dialectic (*Dialektik*), and by this he meant the process of exhibiting the incomplete character of any conception except the all-inclusive conception of the Absolute Idea. Thus in his *Logik*, which expounds the method, Hegel begins with the conception of Being (*Sein*), and shows that it is not a complete conception; i.e. that it cannot be thought by itself. It is always only a part conception and has no independence. The other part conception is Naught (*Nichts*). These two parts are not put together in any external way, but each is originally connected with the other. The organic unity of the two part conceptions he calls Becoming (*Werden*). In the same way Becoming is not a complete thought; it is only part of a larger thought, which in its turn is part of a still larger, till at last we reach the thought of the Absolute Idea. But the *thought* of the Absolute Idea is itself only a partial fact if it is conceived as a mere conception, i.e. as something that has existed only "in the abstract medium of pure thought." Thought must have its objects. These objects we may try to conceive as existing apart from thought, but this conception is in its turn shown to be as incomplete as that of thought without object. The Absolute Idea then is not a conception in the ordinary sense of the word, but it is a fact, the fact of the inevitable union of thought and object of thought. Again, the inseparability is not spatial, but temporal. That is to say, Hegel does not mean that the act of thinking and the object thought must be in the same place or at the same time. All that he means is that whatever may be the temporal relation between the act of thinking and the object thought, the latter cannot be conceived as existing except either as an actual object of thought or as standing in intelligible relation to some actual object of thought, just as the act of thinking cannot exist except in thinking some object. Though an interval of time may separate subject and object, an object which stands out of all relation to a subject or a subject which stands out of all relation to an object is inconceivable. In other words, all reality is one, in the sense that all real things, physical or psychical, are interconnected in such ways that their several reality is not something they have in isolation from the system of real things of which each is an integral part. Hegel's theology and the other parts of his system, such as the philosophy of law, of nature, of art, and of mind, are too subtle to admit of treatment here. Indeed, even the short sketch of the system as a whole, given above, would be rejected by many students of Hegel as inaccurate, so difficult is the task of interpreting Hegel. Hegelianism is a term commonly employed to denote some supposed agreement with his views, but most thinkers who stand close to Hegel fight shy of the term because of the in-

definiteness of its connotation. A thinker of the present day, therefore, hardly ever calls himself an Hegelian. Four years after Hegel's death, a controversy was raised among his followers by Strauss's *Leben Jesu* (see STRAUSS), and was further embittered by Strauss's *Christliche Glaubenslehre*. The Hegelians then split into three sections, called severally, the right, the left, and the centre, accordingly as they represented supernaturalism, naturalism, or a mediating tendency. The first section was represented, among others, by G. A. Gabler, H. T. W. Hinrichs, and K. T. Göschel; the leftists, by Bruno Bauer, Feuerbach, Strauss, and K. L. Michelet; the centrists, represented by J. K. Rosenkranz, J. E. Erdmann, and W. Vatke, Weisse, I. H. von Fichte, the younger Ulrichi, Fischer, and Carrière, were named pseudo-Hegelians, because, though retaining a large element of Hegel's doctrine, they did not follow closely the Hegelian tradition as represented by the three schools. Hegel's philosophy has had great influence in other countries than Germany, notably on British and American thought. T. H. Green (q.v.), J. Caird, E. Caird, W. Wallace, J. H. Stirling, B. Bosanquet, F. H. Bradley, H. Jones, J. Watson, D. G. Ritchie, A. S. Pringle-Pattison, in Great Britain, and G. S. Morris, W. T. Harris, and J. Dewey, in the United States, have been more or less influenced by Hegel, although many of these thinkers have attacked Hegelianism. In Germany the encouraging patronage extended by the Prussian Government created in the later years of his life a great professorial constituency of Hegelians. But the metaphysical excesses of these Hegelians led to a violent reaction, the effects of which have lasted to the present day. For various views of his system, consult: Trendelenburg, *Logische Untersuchungen* (Berlin, 1840, 3d ed. 1870); Ulrichi, *Ueber Princip und Methode der Hegelschen Philosophie* (Halle, 1841); A. Schmid, *Entwicklungsgeschichte der Hegelschen Logik* (Regensburg, 1858); Janet, *Etudes sur la dialectique dans Platon et dans Hegel* (Paris, 1865); Stirling, *The Secret of Hegel* (Edinburgh, 2d ed. 1897); Harris, *Hegel's Logic* (Chicago, 1890); Caird, *Hegel* (London, 1883); Bosanquet, *Introduction to Hegel's Philosophy of Fine Art* (London, 1886), containing also translations of selected portions of Hegel's writings on aesthetics; Morris, *Hegel's Philosophy of the State and of History* (Chicago, 1888); Seth (Pringle-Pattison), *Hegelianism and Personality* (Edinburgh, 2d ed. 1893); McTaggart, *Studies in the Hegelian Dialectic* (Cambridge, 1896); Noel, *La logique de Hegel* (Paris, 1895); Schmitt, *Das Geheimniss der Hegelschen Dialektik* (Halle, 1888); Baillie, *Hegel's Logic* (London, 1901); Stibben, *Hegel's Logic* (New York, 1902); the philosophical works of Rosenkranz and of K. L. Michelet; and the histories of modern philosophy by Ueberweg and Heinze, *Wandelband*, Höffding, and Erdmann. For his life, consult Rosenkranz, *Hegel's Leben* (Berlin, 1844); Haym, *Hegel und seine Zeit* (Berlin, 1857).

HEGEL, KARL VON (1813-1901). A German historian, elder son of the philosopher. He was born at Nuremberg; studied philosophy, theology, philology, and history at Berlin and Heidelberg; was assistant at the Köllnische Gymnasium in Berlin, became professor of history at Rostock (1841) and at Erlangen (1856). He was chief editor of *Chroniken der deutschen*

Städte vom 14. bis ins 16. Jahrhundert (1862-99). His principal work is *Geschichte der Städteverfassung von Italien* (1847); and among his other works the more important are: *Die Chronik des Dino Compagni* (1875); *Ueber den historischen Wert der ältern Dante-Kommentare* (1878); *Briefe von und an G. W. F. Hegel* (1887); *Städte und Gilden der germanischen Völker im Mittelalter* (1891); *Die Entstehung des deutschen Städtewesens* (1898); and *Leben und Erinnerungen* (1900).

HEGELUND, hä'ge-lun, PEDER JENSEN (1542-1614). A Danish dramatist, born at Ribe. He studied at Copenhagen, Leipzig, and Wittenberg, was made rector of the school at Ribe (1569), dean of the cathedral, and Bishop of Ribe (1595). A number of his plays and an historical work are lost, but several of his poems, and a play, *Susanna*, translated from Xystus Bitulejus, which he arranged for pupils, and which was acted at Ribe (1576), have been edited by S. Birkit Smith (1890-91).

HEGE'SIAS (Lat., from Gk. Ἡγήσιος, *Hēgēsias*). A Cyrenaic philosopher, who flourished about 300 B.C. He was a Hedonist and a follower of Aristippus, but taught that a life of pure pleasure was unattainable, and therefore not to be sought. The chief aim of life was freedom from pain. Therefore, it was the part of true wisdom to cultivate a state of absolute indifference to all pleasure. In his doctrine he set forth the desirability of suicide as a means of escaping the sorrows of this life so eloquently that Cicero tells us Ptolemy forbade his teaching as pernicious. From this advocacy of suicide he was given the nickname *πεισι-θάνατος*, or 'Death's advocate.'

HEGESIPPUS (Lat., from Gk. Ἡγήσιππος). A Christian writer of the second century. He was probably of Jewish descent and born in the East, whence he went to Rome, stopping at Corinth on the way. He is supposed to have died about 189. While at Rome he composed a work, *Hypomnemata*, in five books, which was probably directed against the Gnostics, and may have been in some sense a history of the early Church. It is known only from fragments, mainly in Eusebius. Another work on the wars of the Jews (also in five books), ascribed to Hegesippus, is confessedly spurious. The most complete collection of the fragments of his writings is that of Galland, *Bibliotheca*, vol. ii. (Venice, 1765-81); they are also in Migne, *Patrol. Græca*, v., and are translated in the *Ante-Nicene Fathers*, viii.

HEGESIPPUS. An Athenian orator of the fourth century B.C., an ally of Demosthenes against Philip of Macedon. The oration *De Halonaso*, ascribed to Demosthenes, probably is the work of Hegesippus.

HEGESO, hē-jē'sō, MONUMENT OF. One of the most beautiful of the monuments in the Street of Tombs, at Athens. It belongs to the fourth century B.C., and is decorated with a relief representing a lady at her toilet with a female slave in attendance.

HEGIRA, hēj'ī-rā. See HEJIRA.

HEGIUS, ALEXANDER (c.1433-98). A humanist, teacher of Erasmus. He was born at Heek (whence his name), in Westphalia, and was taught by Thomas à Kempis at Zolle. In 1469 he taught at Wesel; in 1474 at Emmerich and at

Deventer, where Erasmus, the future Pope Adrian VI., Conrad Goelenius, afterwards professor at Louvain, and Hermann von dem Busch were among his pupils. His methods were novel; he did not use the mediæval text-books, but made classic Latin his standard, and tried to introduce Greek. His works, comprising treatises on pedagogy, morals, and psychology, together with hymns, elegies, and letters, and an essay, *De Utilitate Græcæ Lingvæ*, now very rare, were originally published by Jakob Fabri in 1503.

HEGNENBERG-DUX, hēg'nen-bērK-dux', FRIEDRICH ADAM JUSTUS, Count (1810-72). A Bavarian statesman, descended from Georg Dux, a natural son of William IV. of Bavaria. He was educated at Würzburg, and in 1845 was elected to the Bavarian Lower House. He was a member of the National Assembly at Frankfurt, and from 1848 to 1865 was president of the Bavarian House of Deputies. Always independent in politics, he was a leader of the opposition up to 1848, then for a short time was allied with the Government, only to oppose it again. In 1871 he was made Prime Minister; but he died less than a year after.

HEGNER, hāg'nēr, ULRICH (1759-1840). A Swiss author, born at Winterthur. He wrote: *Auch ich war in Paris* (1803-4); *Berg-, Land- und Seereisen* (1818); *Die Molkenkur* (3d ed. 1827), a descriptive novel; its sequel, *Suschens Hochzeit* (1819); and *Salys Revolutionstage* (1814), an historical novel; also the biographical and critical works: *Hans Holbein, der jüngere* (1827), and *Beiträge zur nähern Kenntnis und wahren Darstellung J. K. Lavaters* (1836). His collected edition of his works was published at Berlin (1828-30). Consult: Schellenberg-Biedermann, *Erinnerungen an Ulrich Hegner* (Zurich, 1843), and Waser, *Ulrich Hegner* (Halle, 1901).

HEGO'LEH, or MADOQUA. See DUIKER.

HEHN, hān, VIKTOR (1813-90). A German-Russian writer and teacher, born at Dorpat. He studied there (1830-33) and at Berlin (1838-40). After extended travels, especially in Italy, he became teacher of German at Parnau (1841), and afterwards at Dorpat. Here he fell under suspicion politically, and, after a long consideration of his case, was by Czar Nicholas ordered to serve in an inferior position in the Province of Tula in the interior of Russia. But Alexander II. summoned him to Saint Petersburg and made him chief librarian of the Imperial library (1855). In 1860 and 1863 he traveled again in Italy, and from 1874 on lived at Berlin as Russian Imperial Councillor. His works are: *Zur Charakteristik der Römer* (1843); *Zur Physiognomie der italienischen Landschaft* (1844); *Italien: Ansichten und Streiflichter* (6th ed. 1900); *Kulturpflanzen und Haustiere in ihrem Uebergang von Asien nach Griechenland und Italien sowie in das übrige Europa* (7th ed. by O. Schrader, 1902), the most important of his works and the most important work on the subject; *Gedanken über Goethe* (4th ed. 1900); and, posthumously, *Hehns Briefe an seinen Freund Wichmann* (1890); *De Moribus Ruthenorum Zur Charakteristik der russischen Volksseele. Tagebuchblätter, 1857-73* (1892, edited by Schiemann); *Ueber Goethes Hermann und Dorothea* (1898, edited by Leitzmann and Schiemann); and *Reisebilder aus Italien und Frankreich* (1894, edited by Schiemann). For his *Life*, consult Schrader

(Berlin, 1891), and Schiemann (Stuttgart, 1894).

HEI, hā, or **HEISHI**, hā'shē. See **TAIRA**.

HEIBERG, hī'bĕrk, **HERMANN** (1840—). A German novelist, born in Schleswig, and educated there. He succeeded his father in his publishing house, sold it in 1870, and went to Berlin, where he was editor of the *Norddeutsche Allgemeine Zeitung* and of the *Spencerschen Zeitung*, and, after a few years as a banker, devoted himself to literature. His novels are modern and realistic, dealing mostly with family life; among the nearly threescore titles the following may be mentioned: *Acht Novellen* (2d ed. 1895); *Apotheker Heinrich* (2d ed. 1890); *Eine vornehme Frau* (2d ed. 1889); *Esters Ehe* (2d ed. 1890); *Menschen untereinander* (2d ed. 1896); *Höchste Liebe schweigt!* (2d ed. 1894); *Zwischen drei Feuern* (1895); *Merkur und Amor* (1898); *Vieles um Eine* (1900); *Dreissig Geschichten* (1901). Consult **Merian**, *Hermann Heiberg* (Leipzig, 1891).

HEIBERG, **JOHAN LUDVIG** (1791-1860). A Danish poet and critic, born in Copenhagen. He was the son of Peter Andreas Heiberg, and of a famous novelist who later became Baroness Gyllembourg-Ehrensverd (q.v.). The father was exiled in 1800, and the mother cared for the son till he entered the University of Copenhagen in 1809. He spent four years in study and travel, and in 1813 wrote at Stockholm "Hjemkomsten" (The Return Home), a poem of much strength. This was followed by a drama, *The Theatre for Marionettes* (1813), and other work that brought Heiberg after his graduation (1817) a grant from the Government for travel. He passed 1819-22 at Paris with his exiled father. For three years he was professor of Danish at Kiel, and lectured on the comparative merits of the Eddas and Oehlenschläger (German trans., 1827). In 1825 he returned to Copenhagen, endeavored vainly to propagate Hegel's metaphysics, and produced in rapid succession national dramas, comedies, vaudevilles, and farces, while editing the *Copenhagen Flying Post*, and writing also poems collected in 1841, two of which, "A Soul After Death," and "The Newly Wedded," are masterpieces. Much of all this work was satirical, and Heiberg grew increasingly unpopular, especially for a malicious dramatic skit, *The Nut-Cracker* (1845). Yet in spite of this he was made director of the National Theatre in 1849, a post from which he was forced by intrigue in 1856, after which he was made theatre censor. He died in Paris. Heiberg's *Works* are in twenty-two volumes (Copenhagen, 1861-62).

HEIBERG, **PETER ANDREAS** (1758-1841). A Danish writer, born at Vordingborg, on the island of Seeland. From 1788 he was active at Copenhagen as a translator, and, with Malte-Brun (q.v.), as an exponent of liberal ideas and a scathing critic of the Danish Government. In 1799 he was accused of a series of offenses against a newly enacted press law, and was banished the kingdom. He went to France, was there appointed by Napoleon to a post in the Ministry of Foreign Affairs, and obtained a pension from Louis XVIII. In his *Rigdaalersdens Hændelser* ("Adventures of a Bank-Note"), and more particularly in his operettas and comedies, he unsparingly satirized the existing régime for its obscurantist tendencies and its unfairness. As

a dramatist he was perhaps second to **Holberg** (q.v.) in influence, but was greatly inferior to him in merit. One of his comedies appeared in an English rendering, by C. H. Wilson, as *Poverty and Wealth* (London, 1799). He further wrote political treatises in Danish and French. Consult the study by Schwabenflügel (Copenhagen, 1891); also Heiberg's own *Erindringer af min politiske og literaire Vandel i Frankrige* (Christiania, 1830), and Longfellow, *The Poets and Poetry of Europe* (New York and London, 1855).

HEIDEGGER, hī'dĕg-ĕr, **JOHANN HEINRICH** (1633-98). A Swiss theologian, born at Bärenschwiel, in the Canton of Zürich. He was a student at Marburg and Heidelberg, and afterwards returned to the latter town as professor of Hebrew and then of philosophy. In 1665 he was made professor of moral philosophy at Zürich. An ardent reformer and expert controversialist, he was the author, with Turretin, of the *Formula Consensus Helvetica* (1675), the object of which was to effect a league of the Reformed churches. This plan, however, failed. He was the author of a number of other works of little interest now, mostly directed against the Romish Church, and including *Anatome Concilii Tridentini* (2 vols., 1672), and a *Historia Papatus* (1684), published under the pseudonym *Nicander von Hohenegg*.

HEIDELBERG, hī'dĕl-bĕrk. A city of Germany, formerly capital of the Palatinate, situated in the northern part of Baden, on the left bank of the Neckar, 12 miles southeast of Mannheim, and 55 miles south of Frankfurt (Map: Germany, C 4). It is renowned for its romantic picturesqueness and historic environs. The old town lies on a beautiful slope between the castle hill and the river. It consists mainly of one street (Hauptstrasse) about one and a half miles long, and is architecturally very interesting. The newer portion of Heidelberg extends westward. The interesting Rathaus was built in 1704. Among the ecclesiastical edifices, the most prominent are the late-Gothic Hellig-Geistkirche, of the fifteenth century, erected under the Emperor Rupert, whose tomb it holds, and the Protestant Church of Saint Peter, restored in the ornate Gothic style in 1867.

In addition to the famous university (q.v.), Heidelberg is celebrated for its castle, one of the most interesting in Europe, now to a great extent a ruin. It overlooks the town on the east and is surrounded by a splendid park. It was probably founded by Conrad of Hohenstaufen in the twelfth century, and was enlarged at various times by the rulers of the Palatinate, the palatial portions dating from the sixteenth century and the earlier part of the seventeenth. The castle was well-nigh destroyed in the desolating wars waxed by Louis XIV. toward the close of the seventeenth century. It was largely rebuilt, then ruined by lightning in 1764 and left in its present condition. This ivy-clad, moated castle, reached by a bridge, and rising with careless grandeur in the midst of beautiful trees and foliage, consists of a number of buildings constructed at different periods. The yard is faced by the highly decorated façades of the castle's two finest buildings—the Friedrichs-Bau and the Otto-Heinrichs-Bau. The former is a grandiose, late-Renaissance building, dating from 1601. The latter, dating from 1556, with a striking portal,

is a rare example of German Renaissance, its front being lavishly covered with medallions, and with symbolical statues, both biblical and pagan. There are vast princely halls, the great watch tower, a beautiful balcony, dungeons, cellars, one containing the well-known Heidelberg tun (q.v.), the museum with pictures and historic relics, and a magnificent terrace which commands a splendid view. On the terrace is a statue of Victor von Scheffel, unveiled in 1891.

The environs of Heidelberg abound in ancient, often prehistoric ruins, foundations, ring-walls, and cisterns, and are rich in legendary and literary associations, and romantic haunts of the feudal nobility. Among the conspicuous objects of interest are the Molkencur, a lovely hill whose top commands a view of the castle from above; the Heiligenberg, the Mons Piri of the Romans; the old and new bridges over the Neckar; the Philosophenweg, a long, charming walk through vine-clad slopes, with views reaching to the distant Speyer Cathedral and the Hardt Mountains; and the famous student's inn and dueling-grounds in the vale of the Hirschgasse.

The educational institutions of Heidelberg comprise, besides the university, one gymnasium, an 'oberreal,' and an industrial school, and several private schools. There are also a museum and a number of scientific and art societies. The manufactured products include cement, artificial wood, scientific instruments, fire-department apparatus, etc. There is considerable trade in the hops, tobacco, fruits, and nuts grown in the vicinity. The town is equipped with electric railways. The population was 31,739 in 1890, and 40,121 in 1900, including 14,194 Protestants. The number of foreign residents, many of whom are English and American students in the university, is about 1000.

Heidelberg stands on the site of a Roman colony, but the town dates only from the latter part of the Middle Ages. From the thirteenth century, when it was an insignificant place, down to 1720 it was the capital of the Palatinate. After the Reformation Heidelberg was long the headquarters of German Calvinism, and gave its name to a famous Calvinistic catechism. The town suffered much during the Thirty Years' War. Tilly captured and plundered it in 1622. It was severely treated by the French in 1688, and was in 1693 almost totally destroyed by them. It passed to Baden in 1803. Consult: Hautz, *Geschichte der Universität Heidelbergs* (Mannheim, 1862-64); Oneken, *Stadt, Schloss und Hochschule Heidelbergs* (Heidelberg, 1885).

HEIDELBERG, UNIVERSITY OF. The oldest of the German universities within the present German Empire, founded in 1386 by Rupert I., Elector Palatine. The first rector and the real organizer was Marsilius von Inghen, who modeled the university after that in Paris, where he had been a lecturer. The organization was ecclesiastical, the mode of teaching scholastic. From the beginning the university was well attended and successful. In the middle of the sixteenth century Melancthon gave his aid to a complete reorganization; scholasticism gave way to humanism, and from being Catholic the university became Protestant and a stronghold of Calvinism. At this time the staff included Ursinus and Olevianus, the authors of the Heidelberg Catechism, published in 1563. A period of great prosperity followed, lasting till 1622, when

Tilly captured the town and sent to Rome the famous collection of manuscripts known as the Bibliotheca Palatina. The university was much crippled, and in 1626 suspended altogether. In 1652 it was restored, with freedom of confession for all teachers. In the French wars at the end of the century, however, the town again suffered, and the university was again broken up. Some of the professors, it is true, set up instruction at Frankfurt-on-the-Main in 1694, removed to Weinheim in 1698, and two years later returned to Heidelberg once more; yet for a century the university led a dead-and-alive existence under the influence of Catholic reactionaries, and after the Peace of Lunéville (1801) nearly all its possessions and endowments were lost. When Heidelberg became a part of Baden in 1803, its new sovereign restored the foundation, and it has since in a measure recovered its former fame. In 1886 the five-hundredth anniversary was celebrated. There were 1600 students in 1901, the largest number in any one faculty being in jurisprudence. The library has about 400,000 volumes, including incunabula, and 3500 manuscripts. Consult Hautz, *Geschichte der Universität Heidelberg* (Mannheim, 1862-64).

HEIDELBERG CATECHISM. See CATECHISM.

HEIDELBERG TUN. An enormous copper cask in the cellar beneath Heidelberg Castle, set up in 1751 by the Elector Charles Philip. It has a capacity of 49,000 gallons, and measures 36 × 24 feet. Until 1769 it was constantly kept full of Rhine wine, but the custom was abandoned in that year.

HEIDELBURG UNIVERSITY. An educational institution situated at Tiffin, Ohio. It was incorporated as a college in 1851 and reorganized as Heidelberg University in 1890. Its endowment in 1902 was \$125,000, its income \$15,000, and the approximate value of its buildings and grounds \$150,000. In the same year its faculty numbered 30, and its student body 350, of whom 100 were enrolled in the collegiate department. Its departments include summer and preparatory schools, and schools of music, art, oratory, commerce, and theology. The library contains about 25,000 volumes.

HEIDELOFF, hî'de-lôf, KARL ALEXANDER VON (1788-1865). A German architect and painter, born at Stuttgart. He studied in Stuttgart and was called to Nuremberg as municipal architect (1818). His knowledge of the early Gothic made him particularly successful in restorations; examples of this are the churches of Saint Sebald and Saint Laurent, and Albert Dürer's fountain. He was made professor in the polytechnic school, and conservator of the monuments of art in Nuremberg. He was an historical painter of some note, and the author of several important works on architecture, among which are: *Die Lehre von den Säulenordnungen* (1827); *Der Kleine Vignola* (1832); *Nürnberg's Baudenkmale der Vorzeit* (1838-54); *Die Ornamentik des Mittelalters* (1838-42); *Die Kunst des Mittelalters in Schwaben*; and *Baudenkmale aus Schwaben* (1854-61).

HEIDEN, hî'den, EDUARD (1835-88). A German agricultural chemist, born and educated at Greifswald. He went to Eldena in 1855 and became assistant in the chemical laboratory there

(1857). He was professor of agricultural chemistry at Waldau (1862-67) and at Berlin; and, in 1868, was appointed to the superintendency of the experimental station at Pommritz. He wrote: *Die Phosphorsäure* (1864); *Lehrbuch der Düngerlehre* (2d ed. 1879-87); *Die landwirtschaftlichen Versuchsstationen* (2d ed. 1874); *Leitfaden der gesamten Düngerlehre und Statistik des Landbaues* (3d ed. 1892); *Ueber die swackmässigste Ernährung des Schweins* (1879); and, with Müller and Langsdorff, *Die Verwertung der städtischen Fäkalien* (1885).

HEIDENHAIN, hi'den-hin, RUDOLF PETER HEINRICH (1834-97). A German physiologist, born at Marienwerder, and educated at Königsberg, Halle, and Berlin. He spent several years in experimental research with Du Bois-Reymond, and became doцент at Halle (1857) and professor at Breslau (1859). Besides many contributions to the foremost German technical journals of histology, anatomy, and physiology, he published: *Physiologische Studien* (1856); *Mechanische Leistung, Wärmeentwicklung und Stoffumsatz bei der Muskelthätigkeit* (1864); *Der sogenannte tierische Magnetismus* (1880); *Die Vivisektion im Dienste der Heilkunde* (1879); *Die Vivisektion* (1884); and *Beiträge zur Histologie und Physiologie der Dünndarmschleimhaut* (1888). Consult Grütznier, *Zum Andenken an Rudolf Heidenhain* (Bonn, 1899).

HEIDENHEIM, hi'den-him. A town of Württemberg, Germany, situated on the Brenz, a short distance from the Bavarian frontier (Map: Germany, D 4). It has a number of large manufacturing establishments, including cotton-mills, machine-shops, cigar-factories, chemical-works, etc. Population, in 1900, 10,510.

HEIDENMAUER, hi'den-mou'ér (Ger., heathen wall). (1) A name given in Germany to the remains of various prehistoric fortifications of German and Roman origin. Such ramparts are found on the Ottilienberg, a hill of the Vosges in Lower Alsace, and on the Kastanienberg near Dürkheim, in the Palatinate. (2) A novel by James Fenimore Cooper (1832). The scene is laid in the Vosges during the Middle Ages.

HEIDENSTAM, hi'den-stäm, WERNER VON (1859—). A Swedish littérateur, born at Olshammar (Nerike Province). He studied painting at the Stockholm Academy, but later turned to literature; took prominent rank among contemporary Swedish verse-writers by his collections, *Vallfärd och Vandringsår* (1888) and *Dikter* (1895), and wrote further, among various works, the volumes of prose sketches, *Från Col di Tenda till Blaxberg* (1888) and *Saint Göran och draken* (1900; in a German rendering, 1902). His poetical work is original in content, but unequal and often crude in technical structure.

HEIGEL, hi'gel, KARL AUGUST VON (1835—). A German poet, born in Munich, and educated at the university there. In 1863 he went to Berlin, and from 1865 to 1875 was editor of the *Bazar*. From 1875 on he lived a wandering life in Munich, the Tyrol, and Italy, occupying himself with literary work under the patronage of Louis II. of Bavaria. After the death of the King, Heigel lived at Riva, on Lake Garda. His principal works are: The dramas, *Marfa*; *Vor hundert Jahren*; *Freunde*; *Die Zarin*; *Die Heimkehr*; the novels, *Die schöne Zarin*; *Josephine Bonaparte*; the epic, *Bar*

Cochba, der letzte Judenkönig (1857); the stories, *Ohne Gewissen* (1871); *Die Dame ohne Herz* (1873); *Benedictus* (1875); *Das ewige Licht* (1877); *Es regnet* (1878); *Der Karneval in Venedig* (1878); *Mosaik* (1886); *Das Geheimnis des Königs* (1891); *Der reine Thor* (1891); *Der Roman einer Stadt* (1893); *Glück-Glück* (1894); *Der Herr Stationschef* (1897); *Am blauen Gardasee* (1898); *Der Mahradtscha* (1900); *Die neuen Heiligen* (1900); and the biographies, *Karl Stieler* (1890) and *König Ludwig II. von Bayern* (1892).

HEIGEL, KARL THEODOR VON (1842—). A German historian, brother of Karl August von Heigel. He was educated at Munich, his native city; became doцент of history (1873), member of the Academy (1876), professor extraordinary in the university (1879), full professor (1883) in the polytechnic institute, and in 1885 professor and director of the historical seminary in the university. His works include: *Das Herzogtum Bayern, zur Zeit Heinrichs des Löwen und Ottos von Wittelbach* (with Riezler, 1867); *Ludwig I. König von Bayern* (1872); *Der österreichische Erbfolgestreit* (1877); *Quellen und Abhandlungen zur neuern Geschichte Bayerns* (1890); *Nymphenburg* (1891); and *Deutsche Geschichte vom Tode Friedrichs des Grossen bis zur Auflösung des alten Reichs* (1892—). With H. Granert he became editor of *Historische Abhandlungen* (Munich, 1891 et seq.).

HEIGHTS, MEASUREMENT OF. See LEVELING; HYPSONOMETRY.

HEIJN, hin, or **HEYN**, PIET (1578-1629). A Dutch admiral. He was born at Delftshaven near Rotterdam. In 1626 he engaged and utterly defeated the Portuguese in All Saints Bay, Brazil, and returned to Holland with an immense booty. Only two years after this he captured, in the Bay of Matanzas, almost without a blow, the grand Spanish silver flotilla, the value of which was estimated at 12,000,000 Dutch guilders. As a reward he was named admiral of Holland, in 1629. Shortly after, he met his death in a naval encounter off Dunkirk.

HEILBRONN, hil-brön'. A manufacturing town of Württemberg, Germany, situated on the Neckar (here navigable), 33 miles by rail north-east of Stuttgart (Map: Germany, C 4). The old section of Heilbronn is surrounded by a fine avenue laid out on the site of the ancient fortifications. In this part are the interesting Gothic Church of Saint Kilian, begun in the eleventh century, and recently restored, with a rich carved altar; the late Gothic Rathaus of the sixteenth century, with a remarkable clock, and associated intimately with the history of Götz von Berlichingen, as is also the Götzenturm where he was imprisoned, a remnant of the old fortifications; the administration building, originally an Imperial palace and afterwards occupied by the Teutonic Order; and the Schönthaler Hof where Charles V. once sojourned for the sake of the Heilbronn waters. Schiller lived in Heilbronn for a time, and his house is shown. There are an historical museum, a theatre, interesting archives (among which are letters from Gustavus Adolphus, Charles XII., Schiller, and others), a gymnasium founded at the beginning of the seventeenth century, a splendid post-office, schools of music and of agriculture, and a meteorological observatory. The

town is lighted by gas, supplied by a municipal plant, and by electricity.

Industrially it is of great importance. It produces chemicals, silver articles, machinery, sugar, cigars, soda, chicory, coffee, etc. In the vicinity are situated extensive salt works and numerous vineyards. The town has four harbors and a large trade in groceries, agricultural products, wood and coal. The magnificent views in the vicinity embrace the mountains of Middle Germany, the Black Forest, and the Vosges. Heilbronn is of considerable antiquity. After an existence of some 500 years it became a town in 1225 and a free city in 1360. It suffered greatly from war through the Middle Ages. Here, in 1633, in the course of the Thirty Years' War, a treaty of alliance was concluded between the German Protestant States and Sweden. Heilbronn came into the possession of Württemberg in 1802. Population, in 1890, 29,939; in 1900, 37,891, mostly Protestants.

HEILBUTH, hil'boot, FERDINAND (1826-89). A genre painter born at Hamburg, but naturalized as a Frenchman. He traveled and studied in Italy, and finally settled in Paris. His pictures are charming in color and full of humor and grace. Among them may be mentioned the following: "Palestrina's Rehearsal" (1857); "Luca Signorelli by the Body of His Slain Son" (1859), in the Hamburg Gallery; "Mont de Piété" (1861), in the Luxembourg; and "On Monte Pincio," in the Corcoran Gallery, Washington, D. C. He also painted some excellent portraits. He received second-class medals at the Salons of 1857, 1859, and 1861, and the Legion of Honor in 1881.

HEIL DIR IM SIEGERKRANZ, hil dër im zë'gër-kränts (Ger., Hail to thee with victor's crown). The Prussian national hymn, the original words for which were written by Heinrich Harries. They were published in the *Flensburger Wochenblatt* of January 27, 1790, as "A Song for the Danish Subject to sing on his King's Birthday" to the melody of the English national hymn, "God Save Great George, the King." In 1793 B. G. Schumacher published a revised version in five stanzas which soon became the national hymn.

HEILPRIN, hil'prin, ANGELO (1853—). An American naturalist and traveler, son of Michael Heilprin. He was born in Hungary, and came to the United States in 1856. In 1876-78 he prosecuted his studies at the Royal School of Mines, London, at Geneva, and at the Imperial Geological Institution of Vienna. He was professor of invertebrate paleontology and geology at the Academy of Natural Sciences, Philadelphia (1884-1900), executive curator of that institution from 1883 to 1892, and the first president of the Geographical Society of Philadelphia. In 1886 he made a journey to Florida and determined the geological structure of the peninsula. In 1888 he investigated the structure of the Bermuda Islands, and in 1890 made a journey to Mexico which yielded valuable results in connection with the geology of the great central plateau, and in the course of which he ascended Orizaba, Popocatepetl, and Iztaccihuatl, making new barometric measurements of their altitude. In 1892 Professor Heilprin led the Peary Relief Expedition to Greenland. After the destruction of Saint-Pierre, Martinique, by the eruption of Mont Pelée, in 1902, he made two journeys to the

island, and repeatedly climbed to the crater while the volcano was in eruption. Among his publications are: *Contributions to the Tertiary Geology and Palæontology of the United States* (1884); *The Geographical and Geological Distribution of Animals* (1887); *The Geological Evidences of Evolution* (1888); *The Bermuda Islands* (1889); *Principles of Geology* (1890); *The Arctic Problem* (1893); *The Earth and Its Story* (1896); *Alaska and the Klondike* (1899); *Mont Pelée and the Tragedy of Martinique* (1902).

HEILPRIN, LOUIS (1851—). An American scholar and encyclopædist, brother of Angelo Heilprin. He was born in Hungary. He became connected with various American encyclopædic publications, including the *New International Encyclopædia*, and is the author of the *Historical Reference Book* (1884; 6th ed. 1899).

HEILPRIN, MICHAEL (1823-88). A biblical scholar, critic, and writer. He was born at Piotrkow, Russian Poland, of Jewish parents. He belonged to a family whose members were distinguished in the field of Hebrew lore as far back as the sixteenth century. His father, Phineas Mendel Heilprin, a Hebrew scholar of note, left Poland with his family in 1842, in consequence of the oppressive measures of the Russian Government, and settled in Hungary. On the outbreak of the Hungarian Revolution of 1848, Michael Heilprin threw himself ardently into the movement for national independence headed by Kossuth, whose friend he became. He published stirring war songs in the Magyar language, of which he had made himself master, and was appointed secretary of the literary bureau attached to the Ministry of the Interior under Szemere. After the collapse of the Revolution, Heilprin lived for a short time in exile, and in 1856 he settled in the United States. He was connected with the *New American Cyclopædia* from 1858, and was one of the associate editors of the new edition of that publication (1873-76). On the establishment of the *New York Nation* in 1865, he became one of the regular contributors, his articles embracing a wide range in current European history and literary criticism. In 1879 he published the first volume of *The Historical Poetry of the Ancient Hebrews, Translated and Critically Examined*, a work of profound original research, which at once took a position both in America and Europe as a most valuable contribution to advanced biblical criticism. The second volume appeared in 1880, the work being left incomplete at the author's death. Heilprin devoted the last years of his life in great measure to furthering Russian-Jewish agricultural colonization in the United States. He was a scholar of encyclopædic knowledge, and was familiar with more than a dozen languages.

HEILSBRONN, hils'brön. A small town in the Bavarian circle of Middle Franconia, situated 20 miles from Nuremberg. The Cistercian Abbey of Heilsbronn, the burial place of the Hohenzollern burgraves of Nuremberg, of the first Hohenzollern Electors of Brandenburg, and of a number of Franconian princes of the house, owed its origin in 1132 to Bishop Otho of Bamberg. The church contains monuments commemorative of ancient German history, and illustrative of the progress of art in Germany during the Middle Ages. Population, in 1900, 1208.

HEIM, him, ALBERT (1849—). A Swiss geologist, born at Zurich, where he was educated, and after further study at Berlin, was made docent, and, in 1873, professor in the Polytechnic Institute. In 1875 he became also professor in the university. In 1881 he was appointed director of the department of natural sciences in the Polytechnic and head of the geological museum. He traveled to New Zealand in 1901. Heim wrote: *Untersuchungen über den Mechanismus der Gebirgsbildung* (1878); *Handbuch der Gletscherkunde* (1885); *Beiträge zur geologischen Karte der Schweiz* (1890); *Geologische Excursion -quer durch die östlichen Schweizer Alpen* (1894). He also published a *Geologische Karte der Schweiz* (1894, with Schmidt), as well as several panoramic views and reliefs of Switzerland.

HEIM, än, FRANÇOIS JOSEPH (1787-1865). A French historical painter, born at Belfort. He studied under Vincent and won the Prix de Rome in 1807. His classic style was unsympathetic to the art world, newly converted to romanticism, and it was not until the end of his career that he gained the recognition he deserved. In the Louvre there are several large historical subjects by him, such as "Charles X. distribuant les récompenses aux artistes à la fin de l'Exposition de 1824" ("Charles X. Distributing Prizes at the Salon of 1824"), and "La brise du temple de Jérusalem" ("Taking the Temple of Jerusalem"). He also painted a number of portraits and executed some decorative works for the Hall of Conference in the Chamber of Deputies, and two ceilings in the Louvre. He received a first-class medal at the Salon of 1812, and the medal of honor at the Paris Exposition of 1855, and became a member of the Institute in 1829, and an officer of the Legion of Honor in 1855.

HEIM, him, or **HEIMR**, himr (Icel. *home*). In Norse mythology nine worlds are named: Muspelheim, Asaheim, Ljosalfaheim, Vanaheim, Mannaheim, Jötunheim, Svartalfaheim, Helheim, and Niflheim. The highest is Muspelheim (world of fire) the home of Surt, in the highest region of which was Gime (heaven). The lowest is Niflheim (mist-world), the home of cold and darkness, having in its midst the fountain Hvergelmer, where the dragon Nidhogg dwells. Midway between Muspelheim and Niflheim is Mannaheim (man's world), the round plane of the earth surrounded by the ocean. Above Mannaheim is Asaheim (world of the gods), forming an immense vault above the earth. In the midst of this is Idavoll, the place where the gods assemble. Beyond the ocean is Jötunheim (home of giants), separated from Asaheim by the river Ifing, which never freezes over. Next above the earth is Ljosalfaheim (home of the elves of light), and between it and Asaheim is Vanaheim (home of the vans). Farther down is Svartalfaheim (world of dark elves); further still Mannaheim, and lastly Helheim (world of the dead, or *hel*).

HEIMBURG, him'boörk, GREGOR VON (c.1400-72). A German jurist and diplomat, born at Würzburg. About 1430 he became secretary to Æneas Silvius, afterwards Pope Pius II., and accompanied him to the Council of Basel; but they soon quarreled because of Heimburg's opposition to the Papal policy of interference in German affairs, and the young man became syn-

dic of Nuremberg, and took a great part in the declaration of the neutrality of the German Church in the quarrel between the Council and Pope Eugene IV. (1438). He was a member of the commission demanding from the Pope the reinstatement of the electors of Cologne, Mainz, and Treves (1446); and as minister of Duke Sigismund of Austria opposed the Pope and was put under the ban. Eventually Sigismund made his peace with the Pope and Heimburg left his service for that of the Hussite King, George Podiebrad, of Bohemia. The latter died in 1471 and his Minister went to the court of the Duke of Saxony, where he died in the following year, only a few months after Pope Sixtus IV. had removed the excommunication against him. His collected works, showing well the polemic character of the man, were published at Frankfort in 1608. Consult: Pfizer's poem, *Der Welsche und der Deutsche* (Stuttgart, 1844); Brockhaus, *Gregor von Heimburg* (Leipzig, 1861); and Joachimson, *Gregor von Heimburg* (Munich, 1889).

HEIMBURG, WILHELMINIE. See BEHRENS, BERTHA.

HEIMDAL, him'däl, or **HEIMDALER**, him'dä-lër (Icel., world-bow). In Norse mythology, a son of Odin, whose mother was of the Jötun race, often said to be the son of nine virgin sisters. He is the guardian of Asgard, for which position he is peculiarly fitted; for he can see as well by night as by day, requires as little sleep as the birds, and can hear the grass grow. Before the last conflict he will rouse the gods by blowing on his horn jallarhorn. According to a later myth he is regarded as the god of the rainbow.

HEIMSKRINGLA, hims'kring'lä (Icel., world-circle). One of the most important works in early Norse literature, being a history of the Norse Kings from the earliest times, by Snorri Sturluson (q.v.).

HEINE, hi'ne, HEINRICH (1797-1856). The greatest lyric poet of modern Germany, born in Düsseldorf, December 13, 1797. He was called by himself the last of the Romanticists, and by Matthew Arnold the continuator of Goethe, and was the only writer of primary importance with whom German literature has to reckon since Goethe's death. "Your grandfather," he says he was told, "was a little Jew, and had a big beard." He had shrewd sons, for all of them won a competence, and Heine's uncle Salomon became one of the wealthiest bankers of Hamburg. His father had but small part in his life. His mother (named von Geldern), to whom he showed a constant devotion till his death, gave to his fantastic and romantic nature a joy of life and a spirit of naturalism that make him akin to Goethe. He was a precocious boy, educated in a desultory way by Roman Catholic monks and French 'philosophes,' with the result that he became a skeptic before he had any faith to lose. He seems to have suffered little from race prejudice in youth, and for that he was grateful to France and to Napoleon, for whom he retained a kind of hero-worship, and so had little sympathy with the War of Liberation (1813-14), that "contracted the heart so that men learned to hate what was foreign and in ceasing to be citizens of the world became only narrowly German." No reproach belongs to him

that he found small inspiration to patriotism in the thirty years that followed Waterloo.

While preparing himself to become a merchant and learning English, French, and Italian, he began to write poetry under the inspiration of a child-love for 'Veronica,' probably also the 'Reseda' of early poems. He conceived a passing affection, too, for an executioner's daughter, Josepha, the subject of several poems, of his "Dream Pictures," and of the most exquisite passage in his memoirs. She was, he says, his 'love's purgatory' before he fell into love's hell in his unrequited affection for his cousin Amalie at Hamburg, whither he went in 1816. He tried to set up a business there in 1818, but he liked neither the business nor the city. For Amalie, under the names Ottilie, Maria, Clara, Evelina, Agnes, Juliana, he voiced his passion in many beautiful songs, and it has since been made the subject of two novels, Zianirtza's *Heinrich Heine der Liederdichter* (1864), and Dietz's *Heinrich Heine's erste Liebe* (1870). He failed in business, and at the expense of his uncle and Amalie's father, who aided him generously through life, he went in 1819 to study law at Bonn, where he came under the influence of A. W. Schlegel, and the Romantic School, in so far as it stood for the reawakening of the poetic spirit of the Middle Ages. He shared with them also a gift of irony, though in him this sprang from the incompatibility of two elements in his nature, a Greek joy of life inherited from his mother, and fostered by the influence of Goethe, and a congenital Hebrew earnestness. There was never harmony between these antinomies of his character, and from their jarring came a mocking spirit that he possessed in higher degree than any writer of the century. At Bonn under this new influence Heine wrote more lyrics and had begun a tragedy, *Almansor*, when he left Bonn for Göttingen, and being soon suspended from the university there for participation in a frustrated duel he went to Berlin, where he came under the philosophic influence of Hegel and associated with Grabbe, Immermann, Willibald Alexis, Gans, Moser, Zuz, Chamisso, Fouqué, and particularly with Varnhagen and his Rahel, who led him to a juster appreciation of Goethe, though he never became one of his unqualified admirers.

In Berlin, Heine's genius found warm appreciation. He essayed journalism, and in 1822 published a volume of poems (*Gedichte*), which for delicacy, fancy, conciseness, originality, and depth of lyric expression had no equal in Germany. A second volume (1823) contained the *Lyrisches Intermezzo*, which served to carry off two tragedies, *Almansor* and *Ratcliff*, his sole dramatic efforts. The *Intermezzo* is more bitter, reckless, sensual, than the *Poems*, but contains some of his most perfect lyrics. At home, Heine tells us, his mother read it and did not like it; his sister tolerated it; his brothers did not understand it, and his father did not read it at all. In 1823 a visit to the North Sea inspired *Heimkehr*, which with the later North Sea cycle (*Nordsee*) are Germany's best poems of the sea, worthy to rank with the best of Byron or Shelley. The year 1824 brought him to Göttingen again, and in June, 1825, he submitted to baptism that he might obtain an advocate's license. "I assure you," he writes to a friend, "if the law had

allowed stealing silver spoons instead, I should not have been baptized." This dishonor, forced on him by the State, makes a melancholy close to a brilliant university career. During the second stay at Göttingen Heine made the tour of the Harz Mountains and wrote the *Harzreise* (1826), the best known of his prose works. After taking his degree he revisited the North Sea and wrote *Nordeney*, incorporated with the *Harzreise* in the *Reisebilder* (Pictures of Travel), which later embraced also *Das Buch Le Grand* and *Die Bäder von Lucca*. Such light, easy, sparkling prose, such graceful, daring, bubbling wit, had never yet been known in Germany, and the *Reisebilder* remains an unapproached model. Heine in this field has never been equaled save by himself, and he has not always maintained the level of the *Harzreise*. The *Buch Le Grand*, written in 1826, was revolutionary in tendency and in its admiration for Napoleon. Heine thought it safer to abide its publication in England (1827). It was enthusiastically received and generally prohibited by the police. It was graceful, grotesque, cynical, naïve; it had a brilliancy, a vigor, a keenness of scorn, a fire of enthusiasm that have seldom been surpassed. Heine made but a short stay in England, which was not congenial to him. He said, "The ocean would have swallowed it long ago if he had not been afraid it would make him seasick." He admired, however, the liberty of England. In September, 1827, he was again in Hamburg, seeing through the press his collected lyrics, the now famous *Buch der Lieder*. Thence he went to Munich, tried journalism, hoped in vain for a Government post, and in July, 1828, went disappointed to Italy, a journey that he describes after his manner in *Die Bäder von Lucca*—brilliant, witty, entertaining, immoral, coarse, revolutionary, and atheistic. After this Prussia was closed to him; influential men had been made his mortal enemies wantonly, and in the case of the poet Platen Heine's enmity assumed an utterly indefensible shape. Having been recalled to Hamburg by his father's death, Heine went in 1829 to Heligoland, where he gave himself up for two months to the fascination of the sea. He returned to his family in Hamburg famous throughout Germany as the author of the *Reisebilder*, the third volume of which appeared early in 1830, but as much feared as admired, and fiercely attacked on the part of those whom his reckless satire had wounded. Prussia, where the government had prohibited the circulation of the third volume of the *Reisebilder*, was now closed to him, and the thought of a professorship, which he had long cherished, had to be abandoned. He turned his thoughts to Paris. The news of the French Revolution of 1830 reached him in Heligoland, where he spent the summer of that year, and filled him with enthusiasm. May, 1831, saw Heine in Paris, which remained his home till death.

Heine's first years in Paris were busied with journalism and dreary feuds with German Liberals. He soon found himself at home in the French capital, and enjoyed the society of Madame Récamier, Balzac, Dumas, George Sand, Béranger, Thiers, Chopin, Liszt, Berlioz, and many lesser celebrities. He considered it his mission to draw Germany and France closer together, and wrote a series of papers on French conditions for the Augsburg *Allgemeine Zeitung*, which

he republished in French. But not a few of his letters to the German press, even his art critiques, fell under the censor's pencil. In 1833, however, his acute critical study, *Die romantische Schule*, established his fame in France and opened to him the great *Revue des Deux Mondes*, in which he printed his *History of Religion and Philosophy in Germany since Luther*, a work of brilliant suggestiveness, which afterwards appeared in Heine's own German version as *Zur Geschichte der Religion und Philosophie in Deutschland*. The satiric *Memoiren des Herrn von Schnabelewopski*, half autobiographic, belong to this time. The scandal caused by his irregular life was checked by his "conscience-marriage" with Mathilde Mirat (1834). They were legally married in 1841, and remained closely attached till the poet's death. He had provided for her and she lived till 1883. Financial embarrassments now led Heine to seek a pension from the French Government. Though he had always criticised his patrons freely, the fact was bitterly remembered against him when it became known in 1848. From 1834 to 1842 his literary work is comparatively unimportant. A fragment of a novel, *Florentinische Nächte*, an essay on German mythology, and a slanderous attack on his fellow exile and journalistic critic Börne, may be merely mentioned. But in 1842 he wrote *Atta Troll* (Hamburg, 1847), a brilliant poetic satire on German politicians and on the Romantic School, and in 1843 a brief visit to Germany evoked *Neue Gedichte und Deutschland, ein Wintermärchen* (1844) keenly satiric, which became immensely popular. Disease now laid an unrelaxing hand on him. His eyes were affected, then his vocal cords, then his spine. The death of his patron, Salomon Heine, and the disgraceful meanness of his heir added to his sufferings. But these years of patiently borne sufferings show Heine in a nobler light than any in which he had yet appeared. In sleepless nights he composed wonderful songs on his 'mattress-grave.' His legs were paralyzed; to see he was obliged to hold up an eyelid with an emaciated finger; his hearing was weak. It was, he said, "a grave without rest, death without the privileges of the departed." But it brought a deeper, almost a spiritual earnestness into his life. He "returned to God like a Prodigal Son, after tending swine with the Hegelians." In this mood he wrote the poems of *Romancero* (1851), so tender, so melodious, so exquisite in fancy, that it seems almost past belief that they should have been the product of the sleepless nights of a bedridden sufferer; humorous pieces, like "The White Elephant," fierce political songs, like "The Weaver's Marseillaise," and the weird "Lazarus Cycle," written under the very shadow of death. Never had Heine been so many-sided as now. He continued to work as long as he could hear and speak. Many friends cheered him, among them, as poems testify, the talented Camille Selden and his 'little fairy,' the motherly Caroline Jaubert. Two miscellaneous volumes, headed by *Geständnisse*, appeared in 1854. His *Memoirs*, of which some parts have been published, occupied him to the eve of his death. His last words were, "Paper and pencil." He died February 17, 1856, and was buried in Montmartre Cemetery, without religious service.

Heine was essentially a realist, a revolutionary

reformer, but never a blinded partisan. He speaks for a restless, questioning, dissatisfied age that has lost for the moment its ethical moorings. He is the most delicate and graceful song-writer and incomparably the wittiest, clearest, and keenest satirist of Germany, and so he is read with delight by an introspective and critical generation.

Heine's *Works* appeared in twenty-one volumes (1861-63) and in twenty volumes (1865). They have been often reëdited. Translations of the *Poems* by E. A. Bowring are in Bohn's library. There is an American translation of the *Pictures of Travel* and a version of the *Works* (incomplete) by Leland. *Wit, Wisdom, and Pathos of Heinrich Heine*, by J. Snodgrass (London, 1888), is a collection of excerpts. The best English critique of Heine is in Matthew Arnold's *Essays*. There is an English *Life, Work, and Opinions of Heinrich Heine*, by Stigand (London, 1876). The most complete German biography is by Strodtmann (3d ed., Berlin, 1884). Consult also those by Prölss (Stuttgart, 1886); Karpeles (Berlin, 1888); also his *Heine. Aus seinem Leben und aus seiner Zeit* (Leipzig, 1899). Keiter (Cologne, 1891), besides Brandes, *Das junge Deutschland* (Leipzig, 1890), and id., *Die Litteratur des 19. Jahrhunderts*, vol. vi. (ib., 1891); Zetz, *Heine in Frankreich* (Zurich, 1895); Mietzki, *Heinrich Heine als Dichter und Mensch* (Berlin, 1895); Nassen, *Heinrich Heines Familienleben* (Fulda, 1895); Kaufmann, *Heines Liebesleben* (Zurich, 1898); id., *Heines Charakter* (ib., 1901); Steinmann, *Heinrich Heine; Denkwürdigkeiten und Erlebnisse aus meinem Zusammenleben mit ihm* (Prague, 1757); Hüffer, *Aus dem Leben Heinrich Heines* (Berlin, 1878); Franzos, *Heines Geburtstag* (Berlin, 1900).

HEINECCIUS, hī-nēk'tsi-us, JOHANN GOTTLIEB (1681-1741). A learned jurist of Germany, born at Eisenberg. He studied theology at Leipzig, and law at Halle, where, in 1713, he was made professor of philosophy, and in 1720 professor of law. In the latter capacity he went, in 1723, to Franeker, and in 1727 to Frankfort-on-the-Oder; but in 1733 returned, as professor of law and philosophy, to Halle, where he died August 31, 1741. His works display a thorough acquaintance with all departments of jurisprudence, but especially with Roman and German law; and their varied learning, logical arrangement, and elegant Latin, long maintained for them a classical character. His *Antiquitatum Jus Romanum Illustrantium Syntagma* was reëdited as recently as 1841 by Mühlenbruch, and his *Elementa Juris Civilis secundum Ordinem Institutionum* (edited by Biener, 1815); his *Elementa Juris secundum Ordinem Pandectarum*, etc., are still studied by jurists.—Heineccius's son, JOHANN CHRISTIAN GOTTLIEB HEINECCIUS, born 1718, at Halle, died 1791 at Sagan, was for a long time professor in the academy for young noblemen at Liegnitz, and edited, besides several of his father's works separately, a complete collection of them (*H. Opera Omnia*, 9 vols., Geneva, 1771), and wrote an account of his father's life and work, *Commentarius de Vita et Scriptis J. G. Heineccii*.—Heineccius's brother, JOHANN MICHAEL HEINECCIUS, born at Eisenburg, 1674, died September 11, 1722, was a celebrated pulpit orator in Halle, and also the first who studied seals scientifically. His theological writings are forgotten, but he is remembered by his *De Veteribus Germanorum aliar-*

umque Nationum Sigillis (Leipzig, 1710; 2d ed. 1719), and by the work edited in conjunction with Leuckfeld, *Scriptores Rerum Germanicarum* (Frankfort, 1707).

HEINITZ, hī'nīts, **FRIEDRICH ANTON**, Baron (1725-1802). A Prussian statesman, born at Dröschkau, near Torgau. He studied mining and smelting at Kösen, Dresden, and Freiberg, filled several government positions, and planned the Freiberg Academy of Mines. He also took great interest in forestry and in road-building. In 1777 he left the Saxon for the Prussian service on his appointment as head of the Departments of Mining and Smelting, and in this capacity did much to develop the iron and coal industries. He published: *Mémoire sur ma gestion des 4e et 5e départements* (1788), a defense of his administration of the Bureau of Commerce and Manufacture; and anonymously, *Essai d'économie politique* (1785), and *Mémoire sur les produits du règne minéral de la monarchie prussienne* (1786). Consult Reimann, *Abhandlungen zur Geschichte Friedrichs des Grossen* (Gotha, 1892).

HEINLEIN, hīn'līn, **HEINRICH** (1803-85). A German landscape painter, born at Weilburg, Nassau. He studied drawing and architecture at Mannheim and Munich, and then devoted himself to the painting of landscape, and became one of the first German artists in that genre. His pictures include: "Poachers Attacked in Their Camp" (1823); "View in Grisons" (1839), Leipzig Museum; "The Valley of the Engadine," "Landscape with Castle Tyrol" (Karlsruhe Gallery); "Two Alpine Views" (New Pinakothek, Munich); "Mountain Landscape After Storm" (Vienna Museum).

HEINRICH, hīn'rīk, **GUSTAV** (1845—). An Hungarian literary critic, born at Budapest and educated at Leipzig and Vienna. He was appointed professor of German philology in the university at Budapest, and became a prominent educator and a special student of the interrelation of German and Hungarian literature. He has edited many German classics for Hungarian readers, and has written: *Bankban in der deutschen Dichtung* (1879); *Boccaccio's Leben und Werke* (1882); *Etelburg und die ungarische Himmensage* (1882); *Deutsche Verslehre* (2d ed. 1878); *Faust-Studien* (1888); *Kudrun* (1885), and a valuable history of German literature, in Hungarian.

HEINRICH DER GLÛCHEZARE, dēr glēk'-e-tsā're (The Hypocrite). A German poet of the twelfth century, and possibly a traveling player. He wrote (1170) the earliest German poems on Reynard the Fox, patterned after French models. Of this poem, *Isegrim's Nôt*, in its original form, nothing is left save a few fragments, edited by Grimm, *Sendschreiben an K. Lachmann über Reinhart Fuchs* (1840); a revision, only a little later in date, was published by Reissenberger (1886). Consult Büttner, *Studien zu dem Roman de Renart und dem Reinhart Fuchs* (Strassburg, 1891).

HEINRICH DER TEICHNER, dēr tīk'nēr. An Austrian didactic poet of the latter half of the fourteenth century. His poetry consists largely of proverbs in rhymed couplets, valuable for their record of the reconstruction of Austrian

life of the period. Consult Karajan, *Ueber Heinrich den Teichner* (Vienna, 1855).

HEINRICH VON DEM TÛRLIN, fōn dām tyr'lēn. A Carinthian poet of the earlier half of the thirteenth century. His poems deal with the legends of the Round Table, and are modeled after Chrétien de Troyes. His *Der Aventure Krone*, the story of Sir Gawain, was edited by Scholl (1852); and *Der Mantel*, which relates the story of the marvelous cloak that will fit none but a pure woman, has been published by Karnatsch (1883). Consult Martin, *Zur Gralsage* (Strassburg, 1880).

HEINRICH VON DIESENHOVEN, dē'sen-hō'fen (c.1300-76). A mediæval German historian, canon of the cathedral at Constanz, and chaplain of Pope John XXII. at Avignon. His history completes the ecclesiastical chronicle of Ptolemy of Lucca, and deals with the pontificate of John. It is edited by Böhmer in *Fontes Rerum Germanicarum*, vol. iv. (Stuttgart, 1863).

HEINRICH VON FREIBERG, fōn frī'bērk (or **VRIBERG**). A German poet of the early part of the fourteenth century. He wrote a spiritual poem, *Vom heiligen Kreuze*, probably from a Latin source, edited by Fietz (1881); *Ritterfahrt Johanns von Michelsberg*, written about 1305, edited by Kraus (1888); and a continuation of Gottfried's epic *Tristan*, composed about 1300, in style like Gottfried, but following other originals for material. The farce entitled *Vom Schrätel und vom Wasserbär*, edited in Von der Hagen, *Gesamtabenteuer*, No. 65 (1850), is attributed to Heinrich von Freiberg. Consult Wiggers, *Heinrich von Freiberg als Verfasser des Schwankes vom Schrätel und vom Wasserbären* (1877).

HEINRICH VON HERFORD, fōn hēr'fōrt (?-1370). A German Dominican monk, author of many theological works and of a valuable chronicle, *Liber de Rebus Memorabilibus*. Its latter part is one of the most important sources for the history of the thirteenth and fourteenth centuries, and was edited by Potthast (1859).

HEINRICH VON LAUFENBERG, fōn lou'fen-bērk (c.1390-1460). A German monk and poet, born in Switzerland. He lived at Freiberg and Strassburg, and wrote numerous hymns in honor of the Virgin, of which many are to be found in Wackernagel, *Das deutsche Kirchenlied* (1864-77); a collection of *Carmina Figurata* (1441), also praising Mary; and a German translation of the *Regimen Sanitatis*, under the title *Spiegel menschlichen Heils* (1437).

HEINRICH VON MELK, fōn mēlk. A German satirist of the twelfth century, a monk in the Austrian cloister of Melk. He wrote a vivid, bitter satire on the morals of the time, and especially on the condition of the clergy, *Von des Todes Erinnerung*, sometimes called, from its opening line, *Von dem gemeinen Leben*. The *Papaffenleben*, a poem of like character, but probably not by Heinrich, was published with it (by Heinzel, Berlin, 1867). Consult: Lorenz, *Heinrich von Melk* (Halle, 1886), and Kochendörffer, in the *Zeitschrift für deutsches Altertum*, vol. xxxv. (Berlin, 1890).

HEINRICH VON MORUNGEN, fōn mō'rūng-en. A German minnesinger, of the end of the twelfth and the first quarter of the thirteenth

century, ranking in beauty and originality next to Walther von der Vogelweide. His poems, showing slightly the influence of classic models and very strongly that of the troubadours of Provence, are edited by Von der Hagen in his *Minnesinger* (1838), and in Lachmann and Haupt's *Des Minnesangs Frühling* (4th ed. 1888). Consult: Michel, *Heinrich von Morungen und die Troubadours* (Strassburg, 1880), and Rössner, *Untersuchungen zu Heinrich von Morungen* (Berlin, 1898).

HEINRICH VON MÜGELN, fôn mu'gêln (c.1310-c.1375). A German author and scholar, a counselor of Charles IV. at Prague, and later of Rudolph IV. of Austria. His works include translations of Valerius Maximus (first printed 1489), and of the commentary on the Psalms written by Nikolaus of Lyra; an Hungarian chronicle in Latin (edited by Engel, in *Monumenta Ungrica*, 1809); an allegory, *Der meide cranz*; and fables and *minne* poetry (edited by Müller, 1848), which won him a place among the twelve founders of the art of the minnesingers.

HEINRICH VON NEUSTADT, fôn noi'stât. A German poet, born at Wiener-Neustadt, who practiced medicine in Vienna in the first quarter of the fourteenth century. His works, imitative of Wolfram von Eschenbach, include a long romance, patterned after the Latin story of Apollonius of Tyre, but with a curious coloring from Arthurian story; and, on the second advent, *Von Gottes Zukunft*, reminiscent of Alanus ab Insulis's *Anticlaudianus*. Excerpts from the two poems are published in Strohl, *Heinrich von Neustadt* (Vienna, 1875).

HEINRICI, hin-rê'tsê, KARL FRIEDRICH GEORG (1844—). A German Protestant theologian, born at Karkeln, in East Prussia, and educated at Halle and at Berlin, where in 1871 he became doctent. In 1873 he became professor at Marburg, and went to Leipzig in 1892. He wrote: *Die Valentinianische Gnosis und die Heilige Schrift* (1781); *Erklärung der Korintherbriefe* (1880-87); the commentary on Corinthians in Meyer's *New Testament Commentary* (last ed. 1896 and 1900); *Schriftforschung und Schriftautorität* (1890); *Theologische Encyclopädie* (1893); and *Beiträge zur Geschichte und Erklärung des Neuen Testaments*, vol. i. (1894).

HEINSE, hin'se, JOHANN JAKOB WILHELM (1749-1803). A German novelist, translator, and critic of art, born at Langewiesen in Thuringia. He studied at Schleusingen, at Jena, and at Erfurt, where he met Wieland, who greatly influenced his poetry, and Gleim, who procured for him a place as private tutor at Halberstadt, where he lived under the name of Rost. In 1774 he went to Düsseldorf as editor of *Iris*. Here he became so interested in art that he spent three years in Italy, giving most of the time to Rome. He made the acquaintance of the painter Müller, learned much of Italian art and literature, and widened his knowledge of the art and literature of antiquity. While he was in Italy he translated Tasso's *Gerusalemme Liberata* and the *Orlando* into German prose. On his return to Düsseldorf (1784) he wrote *Ardinghello*, his masterpiece. The Elector of Mainz, Friedrich Karl Joseph, now (1786) made him his lector, and (1787), at Aſchaffenburg, his private secretary. On Friedrich's death his library became the property of the State, and Heinse was made librarian. His

earliest work was *Sinngedichte* (1771). This was followed by translations and works in classic vein: *Begebenheiten des Enkolp, aus dem Satyrikon des Petron übersetzt* (1773); *Die Kirschen* (1773), a work of equal obscenity; and *Laidon, oder die eleusinischen Geheimnisse* (1774), with the form of a romance, describing the apotheosis of Lais. Like the last-mentioned work, *Ardinghello, oder die glückseligen Inseln* (last ed. 1838), is little more than a series of dazzling pictures, like Pompeian wall paintings. In *Hildegard von Hohenthal* (last ed. 1838), Heinse gives his ideas on music, and in *Anastasia und das Schachspiel* (last ed. 1831) on chess. *Fiormona, oder Briefe aus Italien* (1803), though usually ascribed to Heinse, is not his work. Consult: *Briefe zwischen Gleim, Heinse und Johannes von Müller*, edited by Körte (Zurich, 1806-08), which gives a good picture of the man, and contains his criticism of the paintings in the Düsseldorf Gallery, and Schober, *Heinse, sein Leben und seine Werke* (Leipzig, 1882).

HEINSIUS, hin'si-ōos, ANTONIUS (1641-1720). A Dutch statesman, celebrated as a formidable opponent of Louis XIV. of France. He was born at Delft, November 22, 1641, and after pursuing the study of law at the University of Leyden entered the service of the State, and became in 1679 pensionary of Delft. He was the confidential friend of William of Orange, upon whose accession to the throne of England, in 1689, Heinsius, as Pensionary of Holland, succeeded to the virtual control of the foreign policy of the Dutch Republic. The friendship between William and Heinsius continued till the former's death, and their correspondence is of capital importance for the light it throws on the intricate political problems of the period from 1688 to the outbreak of the War of the Spanish Succession. Heinsius was instrumental in bringing about the partition treaties of 1698 and 1700 concerning the devolution of the Spanish throne, and contributed to the formation of the Grand Alliance in 1701. Into that struggle against France he entered heart and soul, and after William III.'s death, in 1702, became the virtual leader of the European combination against Louis XIV. The victories of Marlborough and Prince Eugene were due in no little measure to Heinsius's restless activity in the prosecution of the war. Determined upon the total humiliation of France, he spurned the French King's overtures of peace, made as early as 1706, and only the defection of England and the recrudescence of French resistance that followed induced him to agree to the terms of peace at Utrecht. He died August 3, 1720.

HEINSIUS, DANIEL (1580-1655). A Dutch scholar of distinction, and a pupil of Scaliger, born in Ghent. He was a leading figure of the Dutch Renaissance, professor of Greek and Latin at Leyden, and a facile Latin poet. He wrote *Iambi* (1602); *Elegiæ* (1603); *Emblemata Amatoria*, with Dutch verses (1604); *Poemata* (1605). He edited Theocritus, Bion, Moschus, Horace, Aristotle, Seneca, Terence, and Livy, and published Latin *Orationes* (1609 and 1621) and other learned works as well as a Dutch tragedy, *The Massacre of the Innocents* (1613), and Dutch *Poems* (1616).—NICOLAAS HEINSIUS (1620-81), a son of Daniel, was born in Leyden, and educated in the university of his native town. For more

than twenty-five years he led the busy life of traveler, scholar, diplomat, and poet. He ransacked the libraries of France and Italy in search of classical manuscripts. In 1650 he entered the service of Christina of Sweden, and in 1654 became Dutch Minister at Stockholm. In 1669 he visited Russia, and two years later retired to private life. He published editions of Vergil, Ovid, Prudentius, Vellius Patereulus, and Valerius Flaccus, based on manuscripts in his possession. He was also the author of commentaries on many other poets of antiquity. He is said to have supplied Milton with facts for use against Salmasius (q.v.). His Latin poems were published at Amsterdam in 1666. He died at The Hague, October 7, 1681.—His illegitimate son NICOLAAS (1655-?) was a scapegrace of remarkable talent, who wrote the only original Dutch romance of the seventeenth century, *The Delightful Adventures and Wonderful Life of Mirander* (1675), a curious anticipation of *Gil Blas*. He fled from Holland a disowned criminal in 1677, and died in obscurity.

HEINTZELMAN, hin'tsel-män, SAMUEL PETER (1805-80). An American soldier, born at Manheim, Lancaster County, Pa. He graduated at West Point in 1826, and was assigned to the Second Infantry, with which he served on the frontier. He took part in the wars with the Florida Indians from 1835 to 1841, becoming a captain in 1838; served with his regiment in the Mexican War, and received the brevet of major for gallantry at the battle of Huamantla, October 7, 1847. Later he served in California, accompanying the expedition against the Yuma Indians in 1852, and in Texas. He attained the rank of major in 1855, and at the outbreak of the Civil War became colonel, and inspector-general of the Department of Washington. On May 17, 1861, he was commissioned brigadier-general of volunteers, and was in command of the forces which occupied Alexandria, Va. In McClellan's Peninsular campaign of 1862 he commanded the Third, and later also the Fourth, Army Corps, and participated in all of the important battles. He received his commission of major-general of volunteers on the day of the battle of Williamsburg (May 5, 1862), and for gallantry at the battle of Fair Oaks received the brevet rank of brigadier-general in the Regular Army. He fought also at Savage's Station, Glendale, and Malvern Hill, and later in the year at the second battle of Bull Run and at Chantilly. In the winter of 1862-63 he was in command of the defenses of Washington, and from February to October, 1863, of the Department of Washington. During the remainder of the war he was not in the field, serving as commander of the Department of the West in 1864, and on court-martial duty in 1865. In March, 1865, he was brevetted major-general in the United States Army for his conduct at Williamsburg, and in 1869 was retired, on account of age, with the full rank of major-general.

HEINZE, hin'tse, KARL FRIEDRICH RUDOLF (1825-96). A German criminologist, born at Saalfeld, and educated at Leipzig. He served successively in the judiciary of Meiningen and of Saxony; in 1865 was appointed professor at Leipzig, and eight years afterwards at Heidelberg. He was three times representative of the University of Leipzig in the Saxon Diet, and was a prominent member of the party of the opposition.

He wrote: *Parallelen-Zwischen der englischen Jury und dem französisch-deutschen Geschworenengericht* (1864); *Ein deutsches Geschworenengericht* (1865); *Das Recht der Untersuchungshaft* (1865); *Verhältnis des Reichsstrafrechts zu dem Landesstrafrecht* (1871); and a report for the International Congress for Prison Reform at Saint Petersburg, *De quelle façon l'ivresse peut-être envisagée dans la législation pénale* (1890).

HEINZEL, hin'tsel, RICHARD (1838—). An Austrian philologist, born in Capo d'Istria, and educated at Vienna. After teaching in gymnasia at Triest, Vienna, and Linz, he was appointed professor of German at Gratz (1868), and then at Vienna (1873). His work comprises discussions of Germanic phonetics, Teutonic myths, and the relation of German poetry to French. Among his writings are: *Heinrich von Melk* (1867); *Ueber den Stil der altgermanischen Poesie* (1875); *Beschreibung der isländischen Saga* (1880); *Ueber die Nibelungensage* (1885); *Ueber die Herwarasaga* (1887); *Ueber die Walthersage* (1888); *Ueber die ostgotische Heldensage* (1889); *Abhandlungen zum altdeutschen Drama* (1896); *Beschreibung des geistlichen Schauspiels im deutschen Mittelalter* (1898); *Ueber die französischen Grotromane* (1891); *Ueber das Gedicht von König Orendel* (1892).

HEINZEN, hin'tsen, PETER (better known as KARL) (1809-80). A German-American author, born at Grevenbroich, and educated at Bonn, whence he was expelled because of his radicalism. After two years in the Dutch Army he returned to Germany, and entered the Prussian Government service. But his contributions to the *Leipziger Allgemeine Zeitung* and to the *Rheinische Zeitung* excited the displeasure of the Government; both journals were suppressed; his book, *Die preussische Bureaokratie* (1845), was confiscated, and he escaped trial by flight to Belgium, Switzerland, and finally to America. He returned to take part in the Revolution of 1848; then came once more to the United States; lived in New York, Louisville, Cincinnati, and Boston, and published the very radical organ, the *Pionier*. His collected works were published at Boston (1868-72), and include: *Gedichte*; *Sechs Briefe an einen frommen Mann*; *Die Teutschen und die Amerikaner*; and *The True Character of Humboldt*. Many of his writings were published by the Society for the Propagation of Radicalism in the United States—e.g. *Rights of Women* (1891), and *Teutscher Radikalismus in Amerika* (1898).

HEIR (Lat. *heres*). At Roman law, the estate of a deceased person always passed as an entirety (by 'universal succession') to one or more persons described as heirs. The heir or heirs, if not appointed by testament, were designated by the law; and, in the later development of the Roman law, certain near relatives of a testator were entitled to a share of his estate even against his will, unless they had so acted as to give him legal ground for disinheriting them. (See SUCCESSION.) If the heir, whether appointed by testament or designated by law, was under the decedent's household authority, the inheritance vested in him immediately. If, on the other hand, the inheritance was given by testament or assigned by law to a person out of the household, the latter became heir only by

an act of entry. The chief practical importance of the distinction lay in the fact that inheritance established a merger, or 'confusion,' of the inherited estate with the personal estate of the heir, and that the heir was accordingly personally liable for the debts of the estate. If these exceeded the assets, the forced succession of the household heir was an injury to him. The prætors accordingly, toward the close of the Republican period, gave such heirs protection against the creditors of the estate, if they abstained from interfering with the assets—a change which practically abolished the forced or 'necessary' succession. Justinian went further; he allowed the heir who promptly made an accurate list of the assets to take the inheritance without incurring any personal liability for its debts (*beneficium inventarii*). See INVENTORY.

The position of a testamentary heir at Roman law was substantially identical with that of an English executor who is also a residuary legatee. The testamentary heir paid the debts and all special bequests (*legata*), and kept the remainder of the estate. The position of the intestate heir was substantially identical with that of an English administrator who is also next of kin. If the Roman heir was an infant or a lunatic, his guardian administered the inheritance.

MEDIEVAL LAW. To the Germanic peoples, including the English, testaments were originally unknown. They received them through the Church. Even then they were reluctant to admit that a person could dispose by testament of the real estate, which in the Germanic view belonged to the family rather than to its head. The direct heirs, the 'born' heirs, had rights in the land of which they could not be deprived. The development of the feudal system emphasized in the law of succession, as in other fields of the law, the distinction between realty and personality. To the Church authorities, accordingly, mediæval custom assigned not only the execution of testaments disposing of the personality, but also, in many countries, the administration and distribution of the personal estate in cases of intestacy. On the Continent and in Scotland, at the close of the Middle Ages, the reception of the Roman law (see CIVIL LAW) effaced these distinctions; but in England they still underlie the whole law of inheritance and distribution (q.v.). See also DESCENT.

MODERN CIVIL CODES. The modern codes of Europe have reestablished the principle of the universal succession; the estate of a decedent passes as an entirety to the testamentary or legal heir or heirs. The Roman distinction between household heirs and outside heirs has disappeared; in both cases the inheritance vests at the moment of death; in both cases there is a right of renunciation, and usually a right of entry, with the 'benefit of inventory.' In cases of intestacy, the legal heirs administer the estate; the courts appoint administrators only when 'he intestate heirs cannot be found, or when they all renounce the inheritance. Unless a testator has appointed special executors, the testamentary heirs liquidate the estate and pay the legacies and statutory shares. In this matter, however, the French law is different. In France, if there be near relatives who are entitled to statutory shares, these, and not the testamentary heirs, administer the estate. The latter are termed 'universal legatees,'

and they have the rights of heirs only in the absence of the 'legitimate heirs.'

ENGLISH AND AMERICAN LAW. The feudal separation of real and personal property has maintained itself in the common-law system, even to the present time. It appears in its extreme form in the law of inheritance. The personal property of one who dies intestate passes to a person who may or may not be of the blood of the decedent, and only for purposes of administration, the distribution of the surplus after the payment of debts, etc., being determined by statutes of distribution. Only the real property 'descends,' according to fixed canons of inheritance, to the next of blood of the decedent, under the description of the heir. In our legal system, then, the term heir has reference always to the person or persons to whom the real (not the personal) property passes, and that not by will, but only on intestacy. In the main the English canons of descent laid down by Blackstone still govern the determination of the heirship or inheritance of estates, though these have been considerably modified by statute both in England and the United States. See DESCENT.

In Scotch law, the term heir is often used in a loose sense to denote the persons entitled to succeed to the heritable as well as to the movable estate. In Scotland the same rule exists as in England, that if a person do not by deed *mortis causa* (which operates like an English will) dispense or convey his estate to some other person, the law points out who is to take such estate, and that person is the heir-at-law. The rules by which the heir to heritable estate in Scotland is pointed out differ considerably from the English rules. These rules are the same as to the descendants of the deceased person, A. But after A's descendants are exhausted, differences begin; for then it is not the father, nor yet the eldest brother of A, but the next younger brother of A, who next succeeds; then the next younger again, until the youngest brother—after whom and his descendants comes A's next elder brother, and so on upward to the eldest brother of all. In Scotland, when females succeed equally, they are called heirs-portioners. The mother never succeeds in any event, or any relatives, except brothers and sisters german who trace their descent through her.

Formerly, upon the death of the owner, his heritable estate did not immediately vest in the heir, but lay in an intermediate state, then called the *hereditas jacens*, and the person entitled to be the heir had to be summoned to the inheritance, and enter upon the estate. This was altered by statute in 1874, and the estate now vests at once upon the death of the former owner (37 and 38 Vict., c. 94). The civil-law rule also exists in Scotland, that the heir-at-law takes the estates subject to his ancestor's debts. Formerly, indeed, he used to be liable for all the debts, though far exceeding the property left, provided that he did not take certain precautions to escape this passive representation, as it was called; for the barbarous maxim prevailed, *hæres est eadem persona cum defuncto*.

HEIR APPARENT. In the common-law system, the person who is entitled to succeed to the inheritance of real property if he outlive his ancestor. The term heir alone is not properly applicable to any one so long as the ancestor from whom he expects to inherit is still alive

(*nemo est hæres viventis*). The expectant heir may be either the person first entitled under the canons of descent, as the eldest son, and who cannot be displaced by the subsequent birth of a nearer relative of the ancestor, or he may be a person in the second or any later degree of consanguinity—in which case he is liable to be displaced by the birth of a son or other person having a prior claim to the inheritance. The expectant heir in the former case is known as the heir apparent, in the latter case as the *heir presumptive*. Under the rule of primogeniture, which still obtains in England, a daughter would be only an heir presumptive, as the subsequent birth of a son to the father would displace her; whereas the eldest living son is, while the father lives, the heir apparent. A younger son, however, is not entitled to the designation of heir-presumptive so long as his elder brother lives, although by the death of the latter he would at once become heir apparent.

In Scotland the phrase is also sometimes used popularly in this sense but the words 'apparent heir,' when used technically there, mean quite a different thing, viz. the person who, after his ancestor's death, is entitled to succeed, provided he make up his titles, but who has not yet actually done so. The apparent heir has a year to deliberate, called the *annus deliberandi*, whether he will enter upon the property, because the responsibility is so much greater in Scotland than in England.

Consult the authorities referred to under CIVIL LAW; DESCENT; LAW; REAL PROPERTY, etc.

HEIR-AT-LAW, THE. A comedy by George Colman the Younger, in five acts, produced in 1797, and still occasionally brought out.

HEIRESS. In heraldry (q.v.), a lady having no brothers who leave issue. The husband of an heiress is entitled to bear her arms in an escutcheon of pretense—i.e. a small escutcheon in the centre of his paternal shield—and the children of an heiress may quarter her arms with their paternal coat. Neither practice is of very early date in heraldry.

HEIRLOOM. In English law, chattels which in some localities go to the heir-at-law by special custom, instead of passing, like other personal property, to the executor or administrator of the decedent. The chattels usually comprehended within this description are such homely but necessary articles as the best bed, table, pot, pan, cart, and the like. But articles of honor and ornament may fall within the category of heirlooms, such as family portraits, ducal coronets, the Crown jewels, etc. The origin of the right is obscure, and it is of rare occurrence. In America it is wholly unknown. In Scotland a somewhat similar, but by no means identical, phrase is used, viz. *heirship movables*, which connotes a wider right, and includes the best articles of furniture in the house of a person who dies leaving heritable property. The extent of this right is also not clearly settled. Consult the *Commentaries* of Blackstone and Erskine.

HEIR OF LINNE, lin. A ballad of unknown date and authorship, preserved in Percy's *Reliques*. It contains the story of a spendthrift who, having sold his patrimony and spent the proceeds, betakes himself to a lodge which alone he has preserved, and by the breaking of the rope with which he tries to hang himself dis-

covers a hidden treasure, and with it redeems his inheritance.

HEIS, his, EDUARD (1806-77). A German astronomer, born at Cologne, and educated at Bonn. He taught at Cologne and Aix-la-Chapelle, and in 1852 was appointed professor of mathematics and astronomy at Münster. Heis edited *Wöchentliche Unterhaltungen aus dem Gebiete der Astronomie und Meteorologie*, and was author of: *Atlas Cælestis Novus*, marking all stars visible to the naked eye (1872); *Zodiacallicht-Beobachtungen* (1875); *Sammlung von Beispielen und Aufgaben aus der allgemeinen Arithmetik und Algebra* (95th ed. 1896); and, with Schweiler, a *Lehrbuch der Geometrie*, in three volumes.

HEISE, hi'ze, PEDER (1830-79). A Danish composer, born at Copenhagen. He studied under Lund, Berggreen, Hauptmann, and Gade. He was a teacher in Copenhagen, and at the Academy of Sorøe, and is the author of a number of songs, overtures, cantatas, and sonatas, besides two successful operas, *Pashaens Datter* (1869) and *Drot og Marsk* (1878). He also wrote a ballet, and the incidental music to dramas by Ibsen, Munch, and Von der Recke.

HEISS, his, MICHAEL (1818-90). An American prelate, Archbishop of Milwaukee. He was born at Pfahldorf, Bavaria, studied at Munich, and was ordained in 1840. Two years later he came to the United States, engaged in missionary work in Kentucky and Ohio, and afterwards at Milwaukee, where he founded the Seminary of Saint Francis, of which he was first rector. He was consecrated first Bishop of La Crosse, Wis., in 1868, and established Saint John's College and other schools in his diocese. In 1880 he was appointed coadjutor to the Archbishop of Milwaukee, and two years later became second Archbishop. He was a member of the Vatican Council of 1869-70.

HEJIRA, hej'î-râ (Ar. *hyra*, flight, from *hajara*, to abandon). The flight of Mohammed from Mecca to Medina to escape the persecution of his kinsmen, the Koreish (see MOHAMMED), and the starting-point of the Mohammedan Era. The exact day of the flight is uncertain. The custom of dating events with reference to it originated with Mohammed himself, but the calendar was first instituted by Omar, seventeen years after the event, and was made to begin, not with the day of the flight, but with the first day of the year (i.e. the first of the month Muharram) in which it took place, which corresponds with July 16, 622, of the Christian Era. The Mohammedan year is a lunar year, of 354 days, 9 hours, hence about 11 days shorter than the Christian year, and this fact must be borne in mind in computing the date of the Christian calendar corresponding to any given Mohammedan date. An easy rule, which will give the year approximately, is to deduct three per cent. from the Mohammedan year and add the result to 622. Thus the year of the Hejira 1321 will be found to correspond roughly to the year 1903 of the Christian Era (1321 - 40 + 622 = 1903). For more accurate results, consult Wüstenfeld, *Vergleichungstabellen der mohammedanischen und christlichen Zeitrechnung*, continued by Mahler (Leipzig, 1854-87).

HEL, hāl (Icel., probably meaning hidden, sc. goddess). The Northern goddess of the dead, who dwelt beneath one of the three roots of the sacred ash Yggdrasil, and was the daughter of Loki (q.v.), by the giantess Angurboda. Hel, together with her brothers, the wolf Fenrir and the serpent Jormungand, was bred up in the giant's home of Jötunheim, where she remained till, at the request of the Æsir, or gods, the All-father sent for her and her brothers. Knowing that by their origin these children must prove a source of calamity, he resolved upon their destruction, and after casting the serpent into the deep ocean which surrounds all lands, and where it has grown so large that it encircles the whole world and bites its own tail, he hurled Hel into Niflheim (q.v.), over which he gave her authority, and in which she was to assign places to all who die of sickness and age. Her abode is surrounded by a high inclosure with massive gates. Her dwelling is *clindnir* (dark clouds); her dish, *hungur* (hunger); her knife, *sullt* (starvation); her servants, *ganglāti* (slow moving); her bed, *kör* (sickness); and her curtains, *blikvandaböl* (splendid misery); and she is easily recognized by her fierce aspect and her half black, half flesh-colored skin; and she rides a horse with only three feet. Faith in this goddess is not yet extinct. Helshoes (hell-shoon) are still put on the feet of the dead, and her dog is heard barking to give warning that death is at hand. In Norway, when any one recovers from dangerous illness he is said to have given Hel a bushel of oats, in allusion to the belief that she wanders around in the form of a horse.

After the introduction and diffusion of Christianity, the ideas personified in Hel gradually merged, among all the races of Northern and German descent, in the local conception of a hell, or dark abode of the dead. Consult: Thorpe, *Northern Mythology* (London, 1863); Grimm, *Mythologie*, edited by Meyer (Berlin, 1875-78).

HELBIG, hēl'bīk, WOLFGANG (1839—). A German archaeologist. He was born at Dresden, and was educated at Göttingen and Bonn. After he had taught one year in the Joachimsthaler Gymnasium of Berlin, he went to Rome as scholar in the German Archaeological Institute, of which he was made second secretary in 1865. This office he resigned in 1885, but did not leave Rome, save for occasional trips through Italy, Greece, Northern Africa, France, and Russia. His more important works are: *Wandgemälde der vom Vesuv verschütteten Städte Campaniens* (1868); *Untersuchungen über die campanische Wandmalerei* (1873); *Beiträge zur altitalienischen Kultur- und Kunstgeschichte* (1879); *Das homerische Epos aus den Denkmälern erläutert* (1887); *Führer durch die öffentlichen Sammlungen klassischer Altertümer in Rom* (last ed. 1899); *La collection Barracco d'après la classification et avec le texte de G. Barracco et W. Helbig* (1893).

HELD, hēlt, ADOLF (1844-80). A German economist, born at Würzburg, and educated there, at Munich, and at Berlin, where, in 1880, he became professor. He was drowned in the same year. A 'Socialist of the chair,' Held wrote: *Careys Sozialwissenschaft und das Merkantilssystem* (1866); *Die Einkommensteuer* (1872); *Die deutsche Arbeiterpresse der Gegenwart* (1873);

Grundriss für Vorlesungen über Nationalökonomie (1876); *Sozialismus, Sozialdemokratie und Sozialpolitik* (1878); and, edited by Knapp, *Zwei Bücher zur sozialen Geschichte Englands* (1881).

HELD, HANS HEINRICH LUDWIG VON (1764-1842). A Prussian patriot, born at Auras, and educated at Frankfort-on-the-Oder, Halle, and Helmstedt. For his open attack on the integrity of the Minister, Count Hoym, he was removed from his post in the customs service at Posen (1797); but four years afterwards he published the famous 'Black Book'—so called from its binding—a second attack on the Ministers Hoym and Goldbeck, under the title *Die wahren Jakobiner im preussischen Staat, oder aktenmässige Darstellung der bösen Ränke und betrügerischen Dienstführung Zweier preussischen Staatsminister*. For this publication, after a long trial, he was sentenced to eighteen months in prison. His later writings were two pamphlets attacking Napoleon, and, in 1805, a eulogy of his patron, Struensee. In 1812 he received a minor appointment from the Minister Hardenberg; but the ill fortune of the preceding years had broken his spirit, and when the State money in his possession was stolen from him he despaired of life and committed suicide. He wrote a *Geschichte der drei Belagerungen Kolbergs im Siebenjährigen Kriege* (1848). Consult Grünhagen, *Zerboni und Held in ihren Konflikten mit der Staatsgewalt* (Berlin, 1897).

HELDENBUCH, hēl'den-bōō (Ger., book of heroes). A collection of old epic poems, connected with the heroic legends of Germany. No manuscript exists, and the oldest printed edition is without date. The second copy was printed in 1491, and was afterwards reprinted in 1509, 1545, 1560, and 1590, and edited by A. von Keller at Stuttgart in 1867. It is an adaptation preserving the general characteristics of the older poetic form, and contains the poems "Ornit," "Hugdietrich," "Wolfdietrich," the "Great Rosegarden," and the "Little Rosegarden, or King Laurin." A similar but inferior adaptation of the same material, with additions from the tales of Attila and Dietrich, appeared about 1472. Of the latter work one manuscript exists, now in Dresden. The collection is known by the name of one of its two writers, Kaspar von der Rhön (Gaspard de la Roen).

HELDER, hēl'dēr. A strongly fortified seaport town of the Netherlands, situated on the narrow passage of Marsdiep which separates the mainland of the Province of North Holland from the island of Texel (Map: Netherlands, C 2). The city and surrounding country are protected from the inroads of the sea by an enormous dike nearly 5 miles long and 30 feet wide at the top, built of Norwegian granite. A road on the top of the dike connects Helder with the harbor of Nieuwediep, the sea entrance to the North Holland Canal, which connects Helder with Amsterdam. Nieuwediep is one of the chief naval stations of the Netherlands, where are large docks, ship-yards, barracks and magazines, a naval hospital, and the royal cadet school. Owing to its position at the northern end of the North Holland Canal, Helder has rapidly developed from a small fishing village into a city. Population, in 1900, 25,159. Helder is noted for the famous naval battle which took

place there in 1673 between the united fleets of England and France, on one side, and the Dutch, on the other. The latter, led by Tromp and De Ruyter, were victorious. The fortifications of the town were begun in 1811 by Napoleon, and completed afterwards by the Dutch.

HELE, hä'le, PETER (1480-1542). A German clockmaker of Nuremberg, who is credited with having made the first pocket timepiece, about 1511. His name is also spelled 'Hell' and 'Henlein.'

HELEN (Lat., from Gk. 'Ἑλένη). The daughter of Zeus and Leda (q.v.), wife of Tyndareus, King of Sparta, or, according to the epic poem *Cypria*, of Zeus and Nemesis, whom the god pursued in the form of a swan. Nemesis brought forth an egg, which was found by Leda, who on the birth of Helen reared her as her foster-child. According to the ancient legend she was so exceedingly beautiful that at the age of ten she was carried off by Theseus and Pirithous, but was recovered subsequently by her brothers, Castor and Pollux. Tyndareus afterwards engaged her suitors, who numbered about thirty, in a solemn oath to unite together to aid the husband whom Helen should choose, in case of any attempts being again made to carry her off. In accordance with this oath, her husband, Menelaus, when she was afterwards carried off by Paris, son of Priam, King of Troy, summoned all the princes of Greece to avenge the injury he had sustained, and thus gave rise to the Trojan War. The ordinary legend states that after the death of Paris she voluntarily married his brother, Deiphobus, and that on the taking of Troy, in order to recover the favor of Menelaus, she betrayed Deiphobus into his hands. Another version told how she fled to the temple of Aphrodite, and was pursued with drawn sword by Menelaus, but such was the power of her beauty that he laid aside his thought of vengeance, and took her once more as his wife. Their voyage home was long, as they were driven to Egypt, but at last reached Sparta in safety, where the *Odyssey* shows them living in happiness. By her husband Menelaus she had one daughter, Hermione, but some writers said that by Theseus she was the mother of Iphigenia. Of her death also there were many versions. Her grave was shown at Therapne, near Sparta, where she and Menelaus were worshipped. On the other hand, the Rhodians told how she was driven out of Sparta after the death of Menelaus, and came to her friend, Polyxo, in Rhodes. Polyxo, however, had lost her husband in the Trojan War, and consequently forced Helen to hang herself. Hence she was worshipped at Rhodes in connection with this tree, as Helena *δενδρίτιος*. Another story told how she was translated by the gods to the Islands of the Blest, where she was wedded to Achilles. She received divine honors at many places, and was believed by the sailors to appear in the single flame of Saint Elmo's fire, which was regarded as a sign of disaster, while the double flame, or Castor and Pollux, was believed to insure safety. In art, scenes from the story of Helen are frequent, and represent almost all the episodes in her eventful life. It was a curious variation that Stesichorus introduced, in that he made Helen remain in Egypt, whither she had come with Paris on her way to Troy, detained by the King, who later restored her to her husband. Paris

took to Troy only a phantom, for whom Greeks and Trojans fought. Much in the nature of the legends of Helen, and in the characteristics of her worship, seems to originate that she was originally a moon-goddess, who has been superseded by Selene and Artemis, and thus transferred to the heroic legends. For a full collection of the ancient material relating to Helen, consult Engelmann's article in Roscher, *Lexikon der griechischen und römischen Mythologie*, vol. i. (Leipzig, 1886-90).

HELEN: A TALE. A novel by Maria Edgeworth, published in 1834. It was her last story, and, though not lacking in power, had not the success of her earlier work.

HELENA. A city and the county-seat of Phillips County, Ark., 82 miles south by west of Memphis, Tenn.; on the Mississippi River, and on the Arkansas Midland, the Saint Louis, Iron Mountain and Southern, and the Yazoo and Mississippi Valley railroads (Map: Arkansas, E 3). It is an important shipping point for lumber, cotton, and cottonseed oil; and has lumber-mills, cotton-compresses, cottonseed-oil mills, foundries, etc. Here on July 4, 1863, General Holmes, commanding a Confederate force of 9000, attacked General Prentiss with a Union army of about 4500, but was repulsed with a loss in killed, wounded, and prisoners of one-fifth his number. Population, in 1890, 5189; in 1900, 5550.

HELENA. A city, the capital of Montana, and the county-seat of Lewis and Clarke County, 73 miles north by east of Butte; on the Great Northern and the Northern Pacific railroads (Map: Montana, D 2). It lies at an elevation of 4200 feet, in Prickly Pear Valley, a fertile agricultural district, and is surrounded by a highly productive mineral region. It is the commercial centre of the State; is extensively engaged in gold, silver, and iron mining; and has foundries and machine-shops, flour, saw, and planing mills, quartz-crushing plants, and smelters. From the famous Last Chance Gulch which traverses the city, it is estimated that more than \$30,000,000 worth of gold has been mined. Helena was settled as a mining camp in 1864, and laid out as a town in the same year, and was incorporated in 1881. The city is the seat of the Montana Wesleyan University (Methodist Episcopal), opened in 1890, and has public, State, and other libraries, and a United States Assay Office. The State Capitol is an imposing structure. Under the general code provision passed in 1895, the city government is vested in a mayor, elected biennially, and a unicameral council which confirms the executive's nominations to all subordinate offices except those of police magistrate and city treasurer, which are filled by popular election. Population, in 1890, 13,834; in 1900, 10,770.

HELENA (Lat., from Gk. 'Ἑλένη, *Helenē*). The name of several saints of the Catholic Church, the most celebrated of whom is the Empress Helena, wife of Constantius Chlorus, and mother of Constantine the Great. She was born probably in Dardania, about 248, became concubine to Constantius and bore him Constantine about 274, when she became his wife; but in 292 when he became Cæsar, Constantius divorced her so that he might marry another. In 306 Constantine succeeded his father, and it is likely re-

called his mother to the Court. It is also probable that late in life Helena became a Christian through Constantine's influence, and won the gratitude of the Christian community by her zeal for the advancement of religion, and her acts of piety and munificence. Among the public events of her Christian life, the most remarkable is the discovery (according to the belief of the time) of the cross of the Lord during the memorable visit she made to the Holy Land, after 326. (See CROSS, INVENTION OF; HOLY SEPULCHRE.) She died in the year 328, or later. Other saints of the same name are Olga, wife of the Grand Prince Igor of Kiev (died 969), who is honored in the Russian Church; and Helena of Sköfde, Sweden, who suffered martyrdom in the twelfth century.

HELENA. A fantastic tragedy by Euripides (B.C. 412), founded on the story that the real Helen never was at Troy, but was represented there by a phantom, while she was carried to Egypt by the gods. There she was found by Menelaus after the Trojan War and rescued from the Egyptian King, and the phantom Helen vanished.

HELENA. (1) The leading character in Shakespeare's *All's Well that Ends Well*, in love with Bertram, who leaves her on their wedding day. (2) An Athenian lady, enamored of Demetrius, in Shakespeare's *Midsummer Night's Dream*.

HELENA, THE. A name given in Germany to Act iii., Part 2 of Goethe's *Faust*, which was begun in 1800 and published separately in 1827, under the title of *Helena: A Classic-Romantic Phantasmagoria*. It is a complete allegorical poem in itself, and only slightly connected with the action of the drama. In it Helen marries Faust, signifying the fostering of Hellenism in German literature, and bears him a son Emphorian, typifying Byron, who soon destroys himself by his restless activity. Helen also disappears, leaving Faust only her veil and garments.

HÉLÈNE, à'lân', LOUISE ELISABETH, Duchess of Orleans. See ORLEANS.

HELENSBURGH, hæl'enz-bür'ü. A favorite watering-place in Dumbarton, Scotland, on the right bank of the Firth of Clyde, opposite Greenock, from which it is four miles distant (Map: Scotland, D 3). Population, in 1891, 8409; in 1901, 8554.

HELENUS (Lat., from Gk. Ἠλενος, *Helenos*). The one son of Priam to survive the siege of Troy. After the death of Paris, he vainly wooed Helen, and either withdrew to Mount Ida, where at the instance of Calchus he was captured by Odysseus, or deserted to the Greeks outright. He was the twin brother of Cassandra, and, like her, gifted with prophecy. He declared that Troy could not be subdued without Neoptolemus and Philoctetes, and his was the suggestion that the Greeks steal the Palladium and build the wooden horse. Fallen, along with Andromache, to the share of Neoptolemus, he won this prince's good will by foretelling the tempest which the embarking Greeks should encounter, and by dissuading him from starting. He was taken to Phthia, but advised his master to settle in Epirus. Grateful for his fidelity, Neoptolemus bestowed upon him Andromache, by whom he had a son, Cestrinus. After the death of his King,

Helenus ruled over a part of Epirus which he called Chaonia.

HELFERT, hël'fërt, ALEXANDER, Baron (1820—). An Austrian author and politician, born at Prague, where his father, an ecclesiastical historian, was professor. After serving as assistant to his father and as instructor at the University of Cracow, he was elected to the Austrian Parliament of 1848. He soon became connected with the Ministry of Education, of which (1860-61) he was provisional head, and then was made head of the educational bureau in the Ministry of State, and president of the Imperial Commission on Art and Archæology. He became prominent as leader of the Clerical Federalist Party in the Austrian House of Peers, which he entered in 1881. He was editor of the *Oesterreichische Jahrbuch* (1885 sq.), and of a popular *Oesterreichische Geschichte* (1863); author of many historical works, of which the following may be mentioned: *Huss und Hieronymus* (1853); *Die österreichische Volksschule* (1860-61); *Die Schlacht bei Kulm, 1813* (1863); *Geschichte Oesterreichs vom Ausgange des Wiener Oktoberaufstandes 1848* (1869-86); *Maria Luise* (1873); *Joachim Murat* (1878); *Fabrizio Ruffo* (1882); *1814. Ausgang der französischen Herrschaft in Oberitalien* (1890); *Gregor XVI. und Pius IX.* (1896); and *Kaiser Franz I. von Oesterreich und die Stiftung des lombardo-venetianischen Königreichs* (1901).

HELGOLAND, hël'gö-länt, or **HELIGOLAND.** A small German island in the North Sea, situated about 35 miles off the western coast of Schleswig-Holstein, in latitude 54° 10' N., and longitude 7° 53' E. (Map: Germany, B 1). It covers only a little over one-fifth of a square mile. A few centuries ago the island had five times its present area, but the sea is fast consuming it. Helgoland has two good ports, one on its northern and another on its southern side. The inhabitants are supported chiefly by fishing and commerce, by serving as pilots, and by catering to the needs of the strangers who come for sea-bathing. A lighthouse stands on the cliff near the village. Helgoland is important strategically, and is strongly fortified. The population in 1900 was 2307. The natives are of Frisian origin and speak a Frisian dialect, although German is the official language. Helgoland was anciently sacred to the goddess Hertha, and was known as Fosetisland, from the Frisian goddess Foseta, who had a temple on the island. From the middle of the tenth century it was an independent republic, but came into the possession of the dukes of Schleswig in the fourteenth century, and was captured in the beginning of the eighteenth century by Denmark. In 1807 it was occupied by Great Britain, to whom it was officially ceded by Denmark in 1814. By treaty between England and Germany the island became a German possession in 1890.

HELI'ACAL RISING (from Lat. *heliacus*, Gk. ἡλιακός, *hēliakos*, pertaining to the sun, from ἥλιος, *hēlios*, sun; connected with Lat. *sol*, Goth. *sawil*, AS., Icel. *sól*, Ir. *sul*, Lith., Lett., OPruss. *sauls*, Skt. *sāra*, *svar*, sun). A star is said to rise heliacally when it rises just before the sun. When the sun approaches a star which is near the ecliptic, the star becomes for a season invisible—the heavens being too bright in the quarters of sunrise and sunset, at the time of its

rising and setting, to allow it to be seen. But when the sun, progressing in its apparent orbit, separates from the star, and the latter begins to rise first, it in time rises so much earlier than the sun as just to be visible before daylight. The heliacal risings of various bright stars, such as Sirius, were used by the ancients to mark definite dates in the year. See CANICULA.

HELIADE-RADULESCU, ɛl'i-ád rá'doo-lés'-koo, JOAN (1802-72). A Rumanian author, born at Targovistea, and educated under Lazare at Saint Sava until this school was closed by the Government, in 1821. Then he went to Bucharest, as professor and publisher; founded the *Curierul Roman* (1831-48) and the *Curierul de Ambe Seze* (1840-44) the earliest Rumanian literary periodicals, and busied himself with almost endless translations—of the Bible, of Dante, Aristotle, Tasso, Molière, Ossian, Byron, and Lamartine. He took so active a part in the Revolution of 1848 that he became a member of the Provisional Government, and in consequence was banished when the Russians and Turks overthrew the Government. He returned to Bucharest with Omer Pasha in 1854. In his later years he lost much of his national influence, and became insane shortly before his death. He wrote: *Paralelismul între dialectele roman si italian* (1841); *Souvenirs et impressions d'un proscrit* (1850); *Le protectorat du Czar* (1850); and a *Mémoire sur l'histoire de la régénération roumaine* (1851); an heroic drama, *Mircea* (1844), and many other plays; a national epic, *Mihaida* (1846); and *Cursu de poesie generală* (1868 sqq.).

HELIADES, or **HELIADÆ** (Lat., from Gk. Ἡλιάδες). The daughters of Helios and the oceanid Clymene. They made ready the sun-chariot for their brother Phaëthon without the command of Helios, and at his death were changed into poplars, while their tears became amber. Some accounts name three Heliades—Ægle, Phaëthusa, and Lampetie; others mention seven.

HELIÆ'A (Lat., from Gk. ἡλιαία, *hēliaia*). A higher court at Athens composed of 5000 citizens over thirty years of age chosen by lot annually. It was divided into ten sections, each of which constituted a court by itself. Its sessions were public.

HELIAND, hē'lē-ānd (OS. *Heliand*, Saxon). A Saxon poem of the ninth century. The portion still preserved relates the life of Christ as told by the four Evangelists, whose various narratives the author seeks to harmonize. It is thought to have been composed by a Saxon writer of unknown name at the request of the Emperor Louis the Pious. Like all early Germanic poems, the *Heliand* is written in alliterative verse, in the use of which the author shows marked skill. Until the publication by Zangenmeister and Braune in 1894 of fragments of a Saxon paraphrase of Genesis, the *Heliand* was the only important monument of Saxon known to the present age. Apart from its great value to the student of language, the *Heliand* is of interest because of its spirited and sympathetic treatment of the Gospel narrative. The author shows himself to be no mere slavish transcriber, but a true poet. In accordance with the taste and knowledge of the age, scenes and incidents are strongly localized, the spirit of the whole work being Ger-

manic rather than Christian. To modern readers the intense reality of the characterization often seems irreverent, suggesting the later treatment of biblical narratives in the religious drama; but the purpose of the poet is evidently earnest and extremely reverent. It is doubtful whether an historically correct treatment of the New Testament would have appealed to the primitive audience for whom the poem was composed. The most recent and the fullest edition of the *Heliand* is that of Piper, the first volume of which, containing the text, appeared in 1897. The latest German translation is by E. Behringer (Aschaffenburg, 1898).

HELIANTHUS. See ARTICHOKE, JERUSALEM; SUNFLOWER.

HELIAS, HELIS, or **HELYAS**, hē'lē-ās. See SWAN, KNIGHT OF THE.

HELICE, hē'l'i-sē (Lat., from Gk. Ἑλικη, *Helikē*). (1) In Greek mythology, the daughter of Lycaon, beloved by Zeus and transformed by Hera into a bear. Zeus thereupon placed her in the heavens as the constellation of the Great Bear. (2) The daughter of Selinus and wife of Ion. She gave her name to the town of Helice, in Achæa.

HELICIDÆ, hē-lis'i-dē (Neo-Lat. nom. pl., from Lat. *helix*, Gk. ἕλιξ, spiral). A large cosmopolitan family of terrestrial pulmonate gastropod mollusks, the land-snails. They have a part of the mantle-cavity formed into an air-breathing organ, or lung, and the shell coiled. See SNAIL.

HELICOCERAS, hē'l'i-kōs'ēr-as (Neo-Lat., from Gk. ἕλιξ, *helix*, spiral + κέρας, *keras*, horn). A curious fossil ammonoid shell found in Cretaceous rocks of Europe, Asia, and America, characterized by the looseness of the turreted shell, the last coil of which is of irregular curvature. It is one of the peculiar aberrant forms evolved in the last stages of a race that began in Jurassic time with closely wound discoid shells of the normal ammonoid form. See AMMONOIDEA; CEPHALOPODA.

HELICON (Lat., from Gk. Ἑλικὼν, *Helikōn*). A mountain, or rather a mountain range, in the southwest of Bœotia, in Greece, forming a continuation of the range of Parnassus. The loftiest summit (now called Palæovouno) is 5738 feet high. At the foot of Helicon stood the village of Asera, now Pyrgaki, the native place of Hesiod (q.v.), and the seat of an early school of didactic epic. The mountain was the seat of a very ancient worship of the Muses, and with this is probably to be connected the poetic school at Asera. The grove of the Muses was at the northern foot of Helicon, in a valley near the Monastery of Saint Nicholas; higher up the mountain (20 stadia according to Pausanias) was the fountain of Hippocrene (q.v.), probably the modern Kryopigadi or cold spring. Near Asera was the celebrated fountain of Aganippe.

HELICON (Gk. Ἑλικὼν, *helikōn*, musical instrument with nine strings, from ἕλιξ, *helix*, spiral, from ἑλίσσειν, *hēlissein*, to turn; connected with Lat. *volvare*, to turn, Eng. *wallow*). (1) An ancient stringed instrument for illustrating the theory of musical intervals. (2) The lowest of all brass instruments. It is constructed in various pitches (F, E♭, C, B♭) and has much the quality and range of the bass tubas. The

helicon is built in the form of a circle and carried around the body. For this reason it is generally used in military bands in preference to the tuba, because it can be carried with less effort when marching. See ΣΑΧΗΟΝ.

HELICON'IDÆ. A family of butterflies noted in the study of mimicry. See MIMICRY.

HE'LIOCEN'TRIC (from Gk. ἥλιος, *hēlios*, sun + κέντρον, *kentron*, centre). A term in astronomy, signifying that the sun is taken as the centre of reference or view. It is opposed to geocentric (q.v.), which indicates that the earth is taken for centre.

HEL'IODOR'US (Lat., from Gk. Ἡλιόδωρος). A Greek romance-writer, born at Emesa, in Syria. He flourished, probably, at the end of the third century A.D., and is not to be confused with Heliodorus, the Bishop of Triikka in Thessaly, who, according to the Church historian Socrates (q.v.), wrote a romance in his youth. His work, in ten books, entitled *Ἔθιοπικά* (*Althiopia*), narrates the loves of Theagenes and Charicleia. At times the work shows almost epic beauty and simplicity. The descriptions are excellent, and the interest of the reader is in general well maintained; but in the presentation of the emotions the work is far less successful. The language betrays the Semitic origin of the author, and the style shows his rhetorical training and adherence to the Neo-Pythagorean School. Heliodorus was strongly influenced by Homer and Euripides, and in his turn has been a favorite model of many French dramatists—for example, of Racine (q.v.). There are editions by Bekker (Leipzig, 1855), and Hirschig (Paris, 1856); English translations by Rowland Smith (London, 1855) and Underdowne (1857; last printed London, 1895). Consult Rhode, *Der griechische Roman* (Leipzig, 1900).

HE'LIODOR'US, treasurer of Seleucus IV. of Syria (B.C. 187-175). Seleucus sent him to Jerusalem to rob the temple, but he was refused admittance by Onias, the high priest, on the first day, and on the next was driven away, according to the story (II. Macc. iii.), by a terrible angel. He murdered his master and usurped the throne, from which he was driven by Attalus and Eumenes, princes of Pergamus, after a few months.

HE'LIOGAB'ALUS. See ELAGABALUS.

HELIOGRAPH (from Gk. ἥλιος, *hēlios*, sun, γράφω, *graphia*, writing, from γράφειν, *graphēin*, to write). An instrument used for communication between distant stations by reflections of the sun from a mirror or system of mirrors. The great advantage of this method over the ordinary signal system is that the apparatus is more portable and can be used over greater distances, but only with success in regions where the atmosphere is clear of clouds for considerable periods of time. There are two methods of using the heliograph, which are based in the main on the dot and dash: the reflection may be obscured except when the screen is temporarily removed to produce a flash or letter; or the reflection may be kept exposed except when it is obscured to produce a letter. The first method is said to be the easier for the beginner, but the second less fatiguing to the eye. The distance through which this mode of communication may be carried on varies with the size of the mirrors and

the clearness of the atmosphere. In 1890 messages were signaled along the Arizona mountains for 215 miles. When the signaling station forms an angle greater than a right angle between the sun and the receiving station, two mirrors are used to prevent too great a loss of rays by oblique reflection. The mirrors are mounted on tripods, and are held by a socket, or a universal joint. Besides its use as a signaling instrument, the heliograph has served to define distant points in a geodetic survey, and for this purpose has been employed in triangulation. Perhaps the chief use of the heliograph is in military operations in the field. It formed the sole means of communication between the besieged British garrisons and the relief columns attempting to relieve them during the Boer-British War. See SIGNALING AND TELEGRAPHING, MILITARY.

HELIOLITES, hē'li-ō-lī'tēz (Neo-Lat., from Gk. ἥλιος, *hēlios*, sun + λίθος, *lithos*, stone). A genus of fossil alcyonarian corals found in Ordovician and Silurian rocks and less abundantly in the Devonian formations. Heliolites is the type of an important family, Heliolitidæ, comprising about 10 genera and 45 species. All the members of the family have rounded coral masses that consist of larger tubes surrounded by smaller tubes. The genera and species are based upon modifications of the horizontal and vertical walls that traverse the interior of the mass. They have been found in all countries where Silurian and Lower Devonian formations exist and they often form fossil coral reefs of considerable extent. Heliolites interstinctus, the best-known species, is of world-wide distribution. Consult Lindström, "Remarks on the Heliolitidæ," in *Kongliga Svenska Vetenskaps-Akademiens Handlingar*, vol. xxxii. (Stockholm, 1899). See CORAL; OCTOCORALLA.

HE'LIOM'ETER (from Gk. ἥλιος, *hēlios*, sun + μέτρον, *metron*, measure). An instrument originally intended for measuring the angular diameter of the sun. It is a telescope in which the object-lens is in two halves, each of which will form a perfect image in the focus of the eyepiece; and the images may be made to diverge, coincide, or overlap each other by varying the distance between the half-lenses. If the diameter of the sun is to be measured, the two lenses are adjusted so that the images will touch each other, then the distance between the centres of the two object-glasses measured in seconds gives the diameter of the sun. Fraunhofer made many remarkable improvements in the heliometer, but the perfected type of instrument as used to-day is the work of A. Repsold & Sons of Hamburg. The original use of the heliometer has been greatly extended, especially in the hands of Gill at the Cape of Good Hope Observatory. As now made, angular distances above two degrees can be measured on the sky with extreme precision. On the whole, the modern heliometer is considered the most precise measuring instrument known to astronomy.

HE'LIOPHYLLUM (Neo-Lat., from Gk. ἥλιος, *hēlios*, sun + φύλλον, *phyllon*, leaf). A fossil coral very common in the Hamilton shales of central and western New York and other localities in America. This coral is usually simple, of conical form, with a large shallow cup in which a great number of slender septa or walls radiate from the centre toward the elevated edge.

Perfect specimens, which are quite common, are really beautiful objects. Sometimes the coral branches, and then two or more cups or calyces are found on the same stem. *Heliophyllum Halli* is the common species. See CORAL.

HE'LIOP'OLIS (Lat., from Gk. Ἡλίου πόλις, *Hēliou polis*, City of the Sun). The Greek name of the ancient Egyptian city On, situated on the east side of the Pelusiac branch of the Nile near the apex of the delta. Its site is occupied by the modern village of Matariah. Heliopolis was the seat of worship of the god Tum or Atum, who later came to be regarded as one of the forms of the sun-god Rē. Its sacred name was Per-Rē, 'house or city of Rē,' and of this the Greek name is a translation, as was also the Hebrew name *Bethshemesh*. As On, it is often mentioned in the Bible. Although a very ancient and important city—according to Manetho, it existed in the time of the Second Dynasty—it is seldom mentioned in Egyptian texts before the Twelfth Dynasty. Amenemhat I. built here a splendid temple, on the site of an older sanctuary, and his son and successor, Usertesen I., erected before it two great obelisks, of which one is still standing. The obelisks known as Cleopatra's Needles, of which one is now in New York and the other in London, were originally erected at Heliopolis by Thothmes III. Under Rameses III. (about B.C. 1200) the temple was at the height of its influence, standing second only to that of Amon at Thebes; 12,693 persons are said to have been engaged in its service. The theological school of Heliopolis had a strong influence upon Egyptian religious thought, and to it is due a very considerable portion of the religious literature of ancient Egypt. Greek writers mention the great reputation for wisdom enjoyed by the Heliopolitan priests, and Thales, Solon, and Plato are said to have studied under them. Under the later dynasties Heliopolis seems to have declined, since Herodotus speaks only of the wisdom of its priests, not of the splendor of its buildings; and Strabo, at the beginning of the Christian Era, states that the place was practically deserted, though the temple and college still existed. The ruins of the city and temple existed in a fair state of preservation far down into Arab times, but now little remains except the obelisk of Usertesen I.

HELIOPOLIS (in Syria). See BAALBEK.

HE'LIOS (Gk. Ἥλιος, or in the epic Ἡέλιος, *Hēlios*; connected with Lat. *sol*, Goth. *sauil*, AS., Icel. *sól*, Ir. *sul*, Lith., Lett., OPruss. *saulė*, Skt. *sāra*, *svar*, sun). The Greek name of the sun-god. He was, according to the *Theogony*, a son of the Titan Hyperion and of Thea or Euryphaëssa, and is described by the same poet as giving light to both gods and men. He rose in the east from the marshy borders of Oceanus, into whose dark abysses he also sank at evening. The later poets, however, gave him a splendid palace in the east, somewhere beyond Colchis, and described him as being conveyed, after the termination of the burning labors of the day, in a winged boat of gold, along the northern coasts of the sea back to Colchis. In the earlier poets Helios is a distinct personality, all-seeing, the possessor of herds on Trinaeria, a powerful deity. Later, much of his personality is obscured, and the real sun-god becomes Apollo, probably because the word Helios, denoting the actual sun, was not felt

so fully as a proper name. Euripides contributes much to this fusion. His worship was widely spread. He had temples in Corinth, Argos, Træzene, Elis, and many other cities; but his principal seat was Rhodes, where four white horses were annually sacrificed to him. A similar sacrifice was offered in his honor on the summit of Mount Taygetus in Laconia. In art, he was represented as a young man in the full vigor of his strength and beauty, with flowing hair, and a crown of rays. Often he was represented in his four-horse chariot, as in a celebrated group by Lysippus at Rhodes.

HE'LIOSTAT. An instrument used in astronomy, physics, and engineering to reflect the light from the sun or other luminous body in a certain desired direction. It consists of a mirror so mounted that it is capable of being moved by clockwork in such a direction and with such velocity that it will reflect the light of the sun to the same point independent of its motion. The first instrument of this kind is described by s'Gravesande (1688-1742) in his *Physices Elementa* (3d ed. 1742). The heliostat is used with the spectroscope (q.v.), where it is desired to keep the sun's rays on the slit or in connection with a permanently mounted telescope, such as that constructed for the Paris Exposition of 1900. So large a telescope (see TELESCOPE) it would have been next to impossible to mount equatorially, and it was necessary to reflect the light from the heavenly objects under observation into its object-glass. The heliostat has also been used for observing eclipses, especially where it is desired to photograph the eclipse or make extensive spectroscopic observations. The term heliostat is also used to name an instrument which is more usually known as the *heliotrope*, used by surveyors and engineers in making long-distance observations for distant stations. This consists of a mirror at the distant station which is so mounted and adjusted that it will reflect a beam of light to the observing station. (See ENGINEERING INSTRUMENTS.) The heliostat of Thomas Drummond was an instrument of this kind, and was employed in geodetic surveying in England with considerable success.

HE'LIOTAXIS (Neo-Lat., from Gk. ἥλιος, *hēlios*, sun + τάξις, *taxis*, arrangement). Same as phototaxis (q.v.). See, also, HELIOTROPISM.

HE'LIOTROPE. See ENGINEERING INSTRUMENTS.

HELIOTROPE (from Lat. *heliotropum*, Gk. ἡλιότροπον, *hēliotropion*, heliotrope, sun-dial, from ἥλιος, *hēlios*, sun + τροπή, *tropē*, a turning, from τρέπω, *trepein*, to turn), *Heliotropium*. A genus of plants of the natural order Boraginæ (q.v.). Many of the species have fragrant flowers which are used by perfumers. The Peruvian heliotrope (*Heliotropium Peruvianum*), a small shrub, seldom more than two feet high, with oblong-lanceolate wrinkled leaves and small lilac-blue flowers, is in almost universal cultivation for its fragrance, which resembles that of vanilla. The European or common heliotrope (*Heliotropium Europæum*), a native of the south and west of Europe, is an annual with small white, or rarely pale-red, flowers. A white flowered species (*Heliotropium curassavicum*) grows wild in the Southern United States. *Heliotropium co-*

rymbosum is a large trussed, large-flowered, narcissus-scented species. Many hybrid heliotropes are now to be seen in flower-gardens and green-houses, which exhibit great variety in the size

HELIOTROPE.

and color of their flowers. They delight in a light, rich soil. The shrubby kinds are generally propagated by cuttings.

HELIOTROPE, or **BLOODSTONE**. A variety of chalcedony that is of a green color, with small spots of red jasper. It is found in Siberia, in the Hebrides on the west coast of Scotland, and in the United States—in Chatham County, Ga., Orange County, N. Y., and at various localities in Oregon and Colorado. It was known to the ancients, who valued it for gem purposes. During the early ages of the Christian Church it was used for the engraving of sacred subjects, the figures being so arranged that the red spots were made to represent drops of blood. It is still frequently used as a seal.

HELIOTROPISM, or **PHOTOTROPISM** (from Gk. ἥλιος, *hēlios*, sun + τροπή, *tropē*, a turning). The sensitiveness of plant organs to the direction of light-rays incident upon them.

FIG. 1. POSITIVE HELIOTROPISM.

Seedlings of oats grown in darkness: *a*, two exposed to light from direction of arrow, but with sensitive tips capped with tin foil; *b*, four, whose tips were not shaded, sketched at intervals as the bending toward the light increased. Growth is accelerated on the side less illuminated.

The organ responds to lateral illumination by bending in such a way as to bring its axis into a certain fixed position with reference to the direction of the rays of light. The main shoots of most higher plants are positively heliotropic—

i.e. they bend so as to direct their axes toward the source of illumination (Fig. 1). Thus, whenever plants are grown in front of a window, the stems bend toward the light. Some organs are negatively heliotropic. This is seen best in the case of certain roots (especially those of plants belonging to the mustard family) when grown in water. If such roots are laterally illuminated after having been grown in the dark, they bend away from the light.

Another mode of response to the stimulus of one-sided illumination is known as 'diaheliotropism.' Most leaves are diaheliotropic; they bend so as to bring their blades into a plane at right angles to the direction of the incident rays, the normally upper side of the leaf always facing the light (Fig. 2). This reaction is well shown by many house plants, such as the geranium (*Pelargonium*), when subjected to one-sided lighting. The form of heliotropic response may be very different when the intensity of the illumination varies. Many leaves, when exposed to a light of medium intensity, are diaheliotropic; but when the intensity of the light increases beyond a certain limit, they bend so as to direct their tips either toward or away from the source of the stimulating rays. They thus present less surface for the light to fall upon. Oxalis leaves show this response on bright summer days. The leaflets fold along the midrib and drop downward as though wilted. Clover (*Trifolium*), the sensitive plant (*Mimosa*), cassia, the bean (*Phaseolus*), and many

FIG. 2. TRANSVERSE HELIOTROPISM OF LEAVES.

Diagrams showing the plane of the leaves of *tropæolum* with light successively from the direction of the arrows.

others exhibit this phenomenon also. The final position assumed by any plant organ is never due, in nature, to the heliotropic response alone, but results from the combined action of many factors, of which light and gravity are the most important. See **PHYSIOLOGY OF PLANTS**.

HELIOZOA (Neo-Lat. nom. pl., from Gk. ἥλιος, *hēlios*, sun + ζῷον, *zōon*, animal). An order of rhizopods, comprising forms naked, or clothed with a siliceous skeleton, and with fine, more or less stiff pseudopodia radiating from all sides. Contraction vacuoles are generally present. They are fresh-water forms, and are frequently called 'sun-animalcules.' They are sometimes supplied with a stalk, and occasionally form colonies, but many of them are free-swimming. They take their food into the body by means of the currents of protoplasm on the

pseudopodia. A widespread and familiar species is *Actinophrus sol.*

HELIUM (Neo-Lat., from Gk. ἥλιος, *hēlios*, sun). A gaseous element, first isolated by William Ramsay in 1895. Lockyer discovered it, spectroscopically, in the solar chromosphere as far back as 1868. Ramsay obtained it originally by heating the Norwegian mineral cleveite; but it has since been found in other uranium minerals, in mineral waters, in meteorites, and in small quantities in atmospheric air. Helium (symbol He, atomic weight 3.96) is a colorless gas scarcely twice as heavy as hydrogen. It was liquefied in 1898. Like argon, it shows a disinclination to enter into chemical union, and therefore its compounds have not been studied. Its molecules, like those of argon, are assumed to be made up of single atoms. Its spectrum has been examined by Sir William Crookes, who found the line D₃, which corresponds to the yellow double line observed in the spectrum of the solar chromosphere by Lockyer.

HELIX (Lat., from Gk. ἑλξ, spiral). (1) In architecture, a spiral form, as when a flight of steps winds round a cylindrical space or centre post. The name is also given to the little volutes under the flowers of the Corinthian capital. The *helical* line is the central line of such a helix or spiral, and corresponds to the *axis* of the usual rectangular constructions. (2) A genus of land-snails. Fossil forms are often found in great abundance in both the fresh-water and marine limestones and marls of Tertiary age in America, Europe, Asia, and Africa.

HELL (Icel. *hel*, AS. *hel*, *hell*, OHG. *hella*, Ger. *Hölle*; probably connected with AS., OHG. *helan*, Ger. *hehlen*, to cover, and ultimately with Lat. *celare*, Gk. *καλύπτειν*, *kalyptein*, to hide, OIr. *celim*, I hide; hence, the hidden, unseen place). In common use, the place or state of the wicked after death, or the abode of evil spirits. Among the early Teutons the term signified the place under the earth whither all men, good or bad, went after death, and consequently denoted a conception similar to the Semitic Sheol (q.v.). There is evidence, however, that already before contact with Christianity this nether world was divided into distinct parts. Thus in the realm over which the goddess Hel rules there is the blessed place where Balder and Nanna dwell, and also Lif and Lifthraser, who are to become parents of a new and better human race; and there is Nasstrand, where the monster Nidhögg feeds upon the bodies of murderers, perjurers, and adulterers. How strongly entrenched the original meaning was is evident from the fact that the early translators of the Bible did not hesitate to use the word as a rendering of Sheol, the pit, or the grave, even in passages where good men are said to descend into these places. Modern translators generally restrict the word to those cases where the original has Gehenna (q.v.) or Tartarus, in harmony with the significance that the term has gradually attained. The Greek conception of Hades, or the unseen world, as seen in the Homeric poems, is substantially the same as that of the early Teuton. To the animistic origin of the idea the Mycenaean tombs bear testimony. Whatever native tendencies there may have been in the direction of a moral distinction and a differing lot among the shades in Hades, they were greatly strengthened in the seventh and

sixth centuries B.C. by the establishment upon Grecian soil of the originally Thracian Orphic cult societies. Those initiated in the Orphic mysteries secured for themselves a blessed immortality, while the uninitiated were liable to severe punishment for their sins in Hades. In a society where the *lex talionis* prevailed, it is natural that the punishment conceived to be inflicted upon men in a future world should be related to the crimes committed, and Greek imagination nicely adjusted the penalty to the sin. Through Pythagoras of Samos in the sixth century B.C., the idea of a transmigration of souls and the necessity of expiating the sins of a past age grafted itself upon the Orphic conceptions. With the expansion of Greek civilization through the conquests of Alexander, Orphic and Pythagorean speculation spread in the East, modifying or transforming many native ideas. As in other Semitic nations, so in ancient Israel, the shadowy existence in Sheol was in marked contrast with existence in the land of the living and could not be called life at all. In Sheol there were no moral distinctions and no rewards for virtue or punishments for crimes. "The wicked ceased from troubling and the weary were at rest." This attitude toward the future was preserved throughout the Old Testament. There is not a single passage in which Sheol is represented as a place where the wicked are punished. When for the first time the idea of a resurrection is found in the Book of Daniel (written B.C. 165), the tyrants that are raised to obloquy and shame, as well as the martyrs that rise to life and glory, undoubtedly continue their existence on earth. In an addition to the last chapter of the Book of Isaiah, probably made in the second century B.C. (lxvi. 23, 24), it is predicted that the pious Jews who visit the temple in Jerusalem on Sabbaths and other holidays will go out to look with pleasure upon the carcasses of the enemies that are being consumed by fire and worms. Probably the Valley of Hinnom (q.v.) is meant. It is significant that this place of punishment has not yet been transferred to the unseen world. There was no allusion to this passage in the original text of Ecclesi. vii. 17, where the Hebrew has only "the hope of man is the worm." But substantially the same conception of the Valley of Hinnom is found in Enoch xvii. 2, 3, and xc. 24-26. While the growth of the doctrine of Gehenna can be explained from national premises (see HINNOM), the transformation of a Sheol without wide distinctions into a hell where the wicked are punished, seen for the first time in Enoch xxii., can scarcely be accounted for without resorting to Greek influence. In this place of punishment some sinners remain, according to the author, even after the general judgment, being neither slain nor raised. In the Slavonic Enoch, the prison of the apostate angels is in the second heaven (vii.), and the place of the damned in the northern part of the third heaven (x.); and in the Testaments of the Twelve Patriarchs, the spirits of the lawless are confined in the second heaven. In the Wisdom of Solomon, iii. 10, 14; iv. 10, 19, Hades is practically identical with Gehenna, since the author does not believe in a resurrection. The influence of Orphic-Pythagorean thought is particularly evident in the fullest description of hell preserved from the early Church, the Apocalypse of Peter, where the different punishments are carefully adjusted to

the different kinds of sin. Among early Christian writers, the word hell is variously employed, sometimes to signify a place of temporary purgation, in which sense it comprehends the Roman Catholic purgatory; sometimes the place (*limbus patrum*) in which the souls of the just of the old law awaited the coming of Christ, who was to complete their felicity; sometimes the place in which unbaptized children are believed to be detained, on account of the stain of unremitted original sin; and lastly, the prison of those who die stained with the personal guilt of grievous sin. As to the nature of the punishment to which they are subjected, whether it is confined to the 'pain of loss'—that is, to the remorseful consciousness of having forfeited the presence of God and the happiness of heaven—or whether and to what degree it further includes the 'pain of sense,' there is some difference between the Eastern and the Western churches, and it is sometimes alleged that the Eastern Church altogether rejects the idea of punishment of sense. This, however, is a mistake; both churches agree that the punishment of hell includes the 'pain of sense,' the controversy between them having regarded not the existence of the pain of sense, but certain questions as to its nature, and especially whether it consists of material fire, a point which, in the decree for the union of the Greek and Latin churches at the Council of Florence, was left undecided. The controversy on the subject of the eternity of the punishment of hell dates from an early period, Origen and his school having taught that the punishment was but purgatorial in its object; that its purifying effect having once been attained, the punishment would cease for all, even for the devils themselves; and that its duration in each case is proportioned to the guilt of the individual. This doctrine of the final restoration of all to the enjoyment of happiness was the well-known Origenistic theory of the *apocatastasis*, to which so many of the early writers refer. It was condemned by the second council of Constantinople, and a belief in the eternity of the punishments in hell became characteristic of both the Eastern and the Western churches, and from them passed into the creeds of the churches of the Reformation. The more radical thinkers of the Renaissance period rejected the doctrine of hell, and especially many Baptist and Anti-Trinitarian churches. In modern times the belief in physical punishment after death has been abandoned by certain Protestants, and the endless duration of this punishment is rejected by many, either on the ground of a future acceptance of Christ after a punishment commensurate with the offenses committed during a brief lifetime, or for reasons connected with their general interpretation of life. Consult: Söderblom, *La vie future* (Paris, 1901); Dieterich, *Nekyia* (Leipzig, 1893); Charles, *Eschatology* (London, 1899); Bantz, *Die Hölle* (Mayence, 1882); Passaglia, *De Æternitate pœnarum deque Igne Inferno* (Regensburg, 1854). See ESCHATOLOGY; HEAVEN; INTERMEDIATE STATE; JUDGMENT, FINAL.

HEL'LA. A town in Asiatic Turkey. See HILLAH.

HEL'LADOTHE'RIMUM (Neo-Lat., from Gk. Ἑλλάς, *Hellas*, Greece + θήριον, *thêrion*, diminutive of θήρ, *thêr*, wild beast). A fossil giraffe with hornless skull and legs of nearly equal

length, skeletons of which have been found in the Pliocene deposits of Europe, Persia, and India. See GIRAFFE.

HELLANICUS (Lat., from Gk. Ἑλληνικός, *Hellanikos*) (c.496-c.406 B.C.). A Greek logographer (q.v.) of the fifth century B.C., born at Miletus. Although a contemporary of Herodotus, Hellanicus's attitude was essentially that of the older Ionian logographers, rather than that of the historian. He traveled extensively, and the titles of his works show that he had an intimate knowledge of many parts of Greece. He wrote a chronicle based upon the records of the priestesses of Hera at Argos (*Ἱεραὶ αὶ ἐν Ἀργεὶ*), and another based on the lists of victors at the Carneian games (*Καρνεονικαί*). He also composed special histories of a number of districts in Greece, such as the *Ἀττικὴ* (history of Attica), *Φωρονίς* (history of Argos), *Ἀσωπίς* (history of Bœotia), *Arcadica*, *Æolica*, *Lesbica*, etc., as well as accounts of special events, such as the Trojan War (*Τρωϊκά*) and the Persian invasion (*Περσικά*). He is blamed by Thucydides and subsequent historians for inaccuracy in his chronological statements, but there can be no doubt that his work was employed by Herodotus and later historical writers. All that is preserved of his writings is given in Müller, *Fragmenta Historicorum Græcorum* (Paris, 1841-70). Consult Koehler, *Leipziger Studien zur klassischen Philologie*, xviii. (Leipzig, 1898).

HELLAS (Lat., from Gk. Ἑλλάς). In the Epos, a district of southern Thessaly, near Phthiotis, with which it is sometimes identified. As the name Hellenes (*Ἕλληνες*, or, at first, *Πανέλληνες*) came to be applied to the whole Greek race, so the name Hellas was applied to the lands where the Greeks were settled, and in a more restricted sense to the mainland of Greece, especially the district north of the Peloponnesus. The Hellenes, or Greeks, seem to have received this name as a collective title with the growth of the legend that Hellen (q.v.), son of Deucalion, was the father of the race. Originally it must have meant only the inhabitants of the little district of Hellas.

HELLBENDER. A large, ugly-looking, but harmless salamander (*Cryptobranchus Alleghaniensis*), which occurs in Ohio, Pennsylvania, Tennessee, and southward. It is also commonly known as 'alligator' and 'water-dog.' It is voracious, and feeds on crayfish, fish, and other water animals, and readily takes the bait from the fisherman's hook. It exudes much slime, and is consequently difficult to handle. It is tenacious of life, and can live for hours out of water. The spawn much resembles that of frogs, but is lighter in color. It may reach a length of about twenty inches. See Plate of SALAMANDERS.

HELLE, hē'lē (Lat., from Gk. Ἑλλη). In Greek mythology, a daughter of Athamas, King of Orchomenus in Bœotia, and the goddess Nephele ('a cloud'). When Athamas married Ino, daughter of Cadmus, Nephele punished the land by a drought. Ino plotted the sacrifice of Phrixus, brother of Helle, but Nephele rescued her children by giving them the ram with the golden fleece, on which they escaped over the sea to Colchis. While passing through the strait between Asia and Europe, Helle fell from the ram and was drowned. The strait was called Hellespont, or sea of Helle, in her honor.

HELLEBORE (Lat. *helleborus*, *elleborus*, from Gk. ἑλλέβορος, ἔλλέβορος). A name applied to a number of plants of different genera, but properly to the species of *Helleborus*, a genus which belongs to the order Ranunculaceæ, and which contains about a dozen species, most of which are natives of Europe. The species are perennial herbs, with short rootstocks and few stem-leaves; the leaves are deeply divided, and the flowers terminal. One of the best-known species is the black hellebore (*Helleborus niger*), which has evergreen leaves, and is so called from its black rootstock. Its flowers, which are white or tinged with red, appear very early in the season; in England, frequently during the winter, on which account it is called Christmas rose. The leaves and flower-stalks arise from the rootstock. In former times this plant was reputed as efficacious in the treatment of insanity, but it is little used at present. It has some medicinal properties, but in over-doses is an acrid poison. A second species, common in Europe, is the stinking hellebore (*Helleborus fœtidus*), which grows upon hills in England and elsewhere, has leafy stems, and greenish flowers tinged with purple. It is noted for its disagreeable smell. Green hellebore (*Helleborus viridis*), which has large, greenish-yellow flowers, is another common European species. It has escaped from cultivation in the eastern part of the United States. *Helleborus orientalis* is the species known to the ancients. To it was first attributed the virtue of a specific for insanity. It is particularly abundant in Greece and the Levant, and was formerly very plentiful about Anticyra, where the best was obtained. Of these different species there are many horticultural varieties, some of which are beautiful. On account of their early

HELLEBORUS NIGER.

flowering, they are planted usually in shrubberies and borders. Closely allied to the above, and often called winter hellebore, is *Eranthis hyemalis*, the winter aconite, a native of Central Europe introduced into England, and sparingly escaped in the United States. This plant is employed in horticulture in the same way as the species of *Helleborus*. It has a single large yellow flower surrounded by an involucre of a single leaf.

A third plant, to which the name white hellebore is given, is *Veratrum album*. This genus belongs to the order Liliaceæ, or, according to some authorities, to the Melanthaceæ. White hellebore has a leafy stem, 3 to 4 feet high, and a long compound panicle of yellowish-white flowers. It is a native of Central and Southern Europe, and abounds in mountainous regions. The root of this plant is an active, acrid poison, and is used in medicine. In a powdered state it is an important insecticide, and is especially valuable for dusting over currant-bushes as a protection against the currant-worm. The American hellebore (*Veratrum viride*) also known as swamp hellebore, Indian poke, and itch weed, is a common plant in wet grounds from Canada to Alabama. Its properties are similar to those of white hellebore. A species commonly known as *Veratrum Californicum* is found from the Rocky Mountains to the Pacific Coast. Its properties are doubtless similar to those of the other species, and it is reputed to be the cause of considerable loss to stockmen through its being eaten by stock. The active principle seems in all of the species to be the alkaloid veratrine, or a substance similar to it. Some pharmacologists restrict the production of veratrine to the related *Schœnocaulon officinale*, and call the corresponding alkaloid of *Veratrum viride* veratroidine.

HELLEBORE. The president of a medical school, in Foote's *Devil upon Two Sticks*. The part is one of the incarnations assumed by the Devil, and was generally taken by the author himself.

HELLEN (Lat., from Gk. Ἕλλην). In Greek tradition, the son of Deucalion and Pyrrha, and father of Dorus, Æolus, and Xuthus; from Æolus were descended the Æolians, from Dorus the Dorians, while from the two sons of Xuthus, Ion and Achæus, came the Ionians and Achæans. From Hellen came the collective name of the Greeks, Hellenes. The whole story is relatively late, being unknown to the Homeric poems, where the Hellenes are a tribe of the Phthiotis, and is probably a creation of the eighth century B.C. or later, when the feeling of national unity developed among the Greeks, and the name Hellenes received its later meaning. We are told that Hesiod and Archilochus were the first to call the body of Greeks Hellenes.

HELLENES, hël'lénz. The name applied by ethnologists to the earliest Greek-speaking Aryans, who on their arrival in the peninsula found the land already inhabited by the Pelasgians, the eastern division of Sergi's Mediterranean species. The Pelasgi, excepting a few scattered groups, became Hellenized, the heterogeneous elements being fused with a Hellenic nationality, built upon a Pelasgic substratum and possessed of Hellenic culture. See GREECE.

HELLENICA (Lat., from Gk. Ἑλληνικά, *Hellēnika*, neu. pl. of Ἑλληνικός, *Hellēnikos*, relating to Greece, from Ἑλλάς, *Hellas*, Greece). An historical work in seven books by Xenophon, taking up the history of Greece from the point at which the history by Thucydides ends, and covering the forty-eight years prior to the battle of Mantinea. The work is trustworthy and the most important authority for the period covered, but suffers from incompleteness, failure to men-

tion momentous events, and the prejudice of the author.

HELLENIC STUDIES, SOCIETY FOR THE PROMOTION OF. An English society, organized in 1879 for the advancement of the study of the Greek language, literature, and art, and for the perpetuation of the history of the Greek race in the ancient, the Byzantine, and the Neo-Hellenic periods. It has devoted itself to the collections of drawings, facsimiles, transcripts, plans, and photographs of Greek inscriptions, works of art, ancient sites and remains, and to organizing means for the pursuit of archaeological researches in countries which at any time have been the sites of Hellenic civilization. The society issues annually the *Journal of Hellenic Studies*, which contains the results of the researches prosecuted under its auspices. It has members in every quarter of the globe. Among those who were active in the work of organization were: J. S. Blackie, Sidney Colvin, J. P. Mahaffy, A. H. Sayce, Sir Richard Jebb, Sir John Lubbock, and Hon. A. J. Balfour. The society has about 880 members, including foreign members in every quarter of the globe. The annual meeting of the society takes place in June.

HELLENIST (Gk. Ἑλληνιστής, *Hellenistēs*, one who speaks Greek, from Ἑλληνίζω, *Hellenizein*, to speak or make Greek, from Ἑλλήν, *Hellēn*, Greek, from Ἑλλάς, *Hellas*, Greece). In biblical and Jewish history, a Jew distinguished by the adoption or affectation of Greek thought, manner, or language. The word is found in the Bible only in Acts vi. 1; ix. 29; xi. 20 (cf. the Revised Version, margin), and in the last two of these passages the Codex Alexandrinus reads not Hellenist, but Greek (*Hellēn*). The latter term occurs rather frequently in the Greek version, chiefly in the Books of the Maccabees, the writings of Paul, and the Acts. There is little reference to the Greeks in Jewish literature prior to the time of Alexander the Great and his successors. Indeed, apart from the Wisdom of Solomon and Fourth Maccabees in the Greek Old Testament, and in the Epistle to the Hebrews, the Fourth Gospel, Second Peter, and to a lesser degree in Paul, in the New Testament, Greek thought did not essentially affect Judaism or primitive Christianity. The tone of the Bible is overwhelmingly Jewish, not Greek. Hellenism, which before the Maccabean revolt (c.150 B.C.) had stood to the Jew for what is characteristic of Greek culture, stands after that time also for what is anti-Jewish, Gentile, heathen. As the Greeks had divided the world into Greeks and barbarians, so now the Jews divided the world into Jews and Greeks. The term Greek (*Hellēn*) came to be used by the Jew not only specifically of Greeks as opposed to other nations (II. Mac. xi. 2; Rom. i. 16), but also generally of 'foreigners' (II. Mac. xi. 24; Gal. ii. 3); while Hellenist (*Hellenistēs*) seems to refer now to Greek-speaking Jews (Acts vi. 1; ix. 29), now to Greeks as such in contrast with Jews (Acts xi. 19, 20, Codex Vaticanus). The reading of the Codex Alexandrinus in ix. 29 and xi. 20 is *Greeks*, not *Hellenists*—a reading which suggests that the terms are interchangeable, the context alone determining the nationality. Indeed, *Hellēn*, in the Fourth Gospel, may, like *Hellenist* in Acts vi. 1, ix. 29, re-

fer not to Greeks as such, but to Greek-speaking Jews. See *Jews*; and for the Hellenistic Greek dialect, see *BIBLE*.

HELLER, hē'l'ēr, KARL BARTHOLOMAUS (1824-80). An Austrian naturalist, born at Myslibořitz, Moravia, and long professor in the Theresianum at Vienna. He is best known for his attempt to classify the fauna of Central America in his *Reisen in Mexiko in den Jahren 1845-48* (1853).

HELLER, STEPHEN (1814-88). An Hungarian composer and pianist, born in Budapest. When only nine he performed so successfully in public that he was sent to Vienna to continue his studies. In 1827 he played in Vienna, and in 1829 began a concert tour through Europe with his father. At Augsburg the young pianist fell ill, and was adopted by a wealthy family, with whom he lived until 1838. He had meanwhile continued his musical studies, and upon going to Paris became an intimate friend of Chopin, Liszt, and Berlioz. As a pianist, Heller now became well known, but his compositions gained favor more slowly. They are characterized by a fresh, natural beauty, forceful treatment of themes, and exquisite melody. In the originality of his themes Heller far outranks Mendelssohn, with whom, however, he has much in common. His studies for the pianoforte are among the very best, and are in universal use. With the exception of two visits to London, Heller lived in Paris from the time of his first journey there in 1838 to his death. For his *Life*, consult Barbadette (Paris, 1876; Eng. trans. 1877).

HEL'LESPONT. See *DARDANELES*.

HELLEU, ā'l'ē', PAUL (1859—). A French dry-point artist, born at Vannes. He studied painting at the Ecole des Beaux-Arts, but became interested in dry point through James Tissot, who gave him his first instruction. He made this art his special study, and achieved a reputation for his poetical etchings, particularly his portraits of women and children. He works very quickly; often his plates have but a few lines, and there is an effect of improvisation about them that is characteristic and charming. Helleu is well known in the United States through special exhibitions.

HELLEVOETSLUIS, hē'l'le-vōōt-slois'. A fortified seaport of the Netherlands, situated on the southern coast of Voorne in the Province of South Holland (Map: Netherlands, C 3). It has a good harbor, an arsenal, shipyards, a naval school, and large artillery stores. Population, in 1900, 4299. Hellevoetsluis is noted as the place where William of Orange embarked for England in November, 1688.

HELL-FIRE CLUBS. The name given to certain associations in England, Ireland, and Scotland, formed of profligate persons of both sexes, which came into existence in the early part of the eighteenth century. Several were suppressed by royal proclamation in 1721.

HELL GATE. A passage, called by the Dutch settlers of New York Helle Gat, being that part of the East River between Long Island and Manhattan Island, also between Long Island and Ward's Island, and between Ward's Island and Manhattan Island. The reefs of rock in the main passage, some of which were islands at low

tide, caused with the rising and falling of the tide numerous whirlpools and eddies, which rendered navigation at times dangerous, always difficult, and for large ships impossible, although the depth in the tortuous channel might be sufficient. The East River receives the Sound tide from the east and the Sandy Hook tide from the south. The times as well as heights of these tides being different, additional force is imparted to these treacherous currents. It was claimed that one out of every fifty sailing vessels attempting to go through Hell Gate was more or less damaged by the rocks.

A survey was made in 1848 by Lieutenants Charles H. Davis and David Porter, of the United States Navy, and in their report they recommended the destruction by blasting of Pot Rock, Frying Pan, and Ways' Reef, which lie between Long Island and Ward's Island.

The first attempts at removing the obstructions in Hell Gate were made by M. Maillefert, with whom a contract was made by citizens of New York. He commenced work in August, 1851, and by surface blasting operated upon the most prominent surface of the rocks and reduced them to an average depth of about sixteen feet. Congress, in 1851, appropriated for the work \$20,000 and placed it under the direction of Major Fraser. The method was by surface blasting, as had been practiced by M. Maillefert. The reefs in this channel are largely composed of a stratified gneiss, and the layers, being tipped up nearly perpendicular, were unevenly affected by the action of the water, the softer parts being worn away and the harder parts left in vertical sheets or points. In 1866 Gen. John Newton, of the United States Engineer Corps, was ordered to make a survey, and proposed the construction of a drilling scow which should be securely moored at the site of operations. The machine was constructed, and put into operation on Diamond Reef, near the mouth of the East River, in May, 1871. Coenties Reef was also operated on with this scow in alternation with the work on Diamond Reef. These operations proving satisfactory, the machine was taken to Hell Gate, where it was in operation nearly three years, and effected a great improvement in the channel.

The first really important engineering accomplishment was the removal by tunneling and blasting of Hallet's Point Reef, which extended from the Astoria shore into the East River. By means of diverging tunnels and transverse galleries the reef was thoroughly undermined and nitroglycerin in cans was introduced into a large number of holes drilled in the pillars supporting the roof and in the roof itself. After water was let into the mine the nitrogen was exploded and the reef was destroyed, the debris being removed by grappling and dredging, so that there was a depth of 26 feet at low water over the site of the reef. The explosion at Hallet's Point took place September 24th, 1876, and was followed by energetic prosecution of work on Flood Rock or Middle Reef, where similar tunnels were constructed. After over 21,000 feet of tunneling had been constructed and holes aggregating 113,102 feet had been drilled, 300,000 pounds of explosives were put into the holes, and water was let into the tunnel. The result of the explosion and subsequent dredging that took place October 10, 1885, was to provide a

channel of uniform depth of 26 feet through Hell Gate.

HELLGRAMMITE FLY, or **HELLDEVIL**. See **CORYDALIS**.

HELLIN, à-lyèn'. A district town of the Province of Albacete, Spain, situated 69 miles by rail from Murcia (Map: Spain, E 3). In its vicinity are sulphur springs and mines. The sulphur-mines have been worked since Roman times, and their exploitation is still the principal industry of the town. It is a market for agricultural products, and produces woolen textiles. Population, in 1900, 12,787.

HELLMANN, GUSTAV JOHANN GEORG (1854—). A German meteorologist and geographer, born at Löwen, and educated at Göttingen. In 1879 he was made assistant, and in 1882 temporary head of the Meteorological Institute of Berlin. He was vice-president of the Berlin Geographical Society, and a director of the *Meteorologische Zeitschrift*. Besides his contributions to the latter, Hellmann's more important works are: *Repertorium der deutschen Meteorologie* (1883); *Meteorologische Volksbücher* (1891); *Das Klima von Berlin* (1891); *Schneekristalle* (1893); *Regenkarte der Provinz Schlesien* (1899); *Regenkarte der Provinzen Ostpreussen, Westpreussen und Posen* (1900); *Regenkarte der Provinz Brandenburg und Pommern* (1901); and the series *Meteorologische Neudrucke* (1893-1900).

HELLMESBERGER, hël'mës-bërk'ër. A family of Austrian musicians whose founder, GEORG (1800-73), was a celebrated violin-teacher in Vienna. In 1829 he became conductor of the Imperial Opera, and in 1833 a professor at the Vienna Conservatory. He made several successful tours and composed considerable music for the violin. His two sons, GEORG, Jr. (1830-52), and JOSEPH (1829-93), were talented violinists. The former produced two operas, *Die Bürgschaft* and *Die beiden Königinnen*, and made a tour through Germany and England. Joseph was first violin of the 'Hellmesberger Quartet' (1849-87); violin professor at the conservatory (1851-77), and director (1851-93); concertmeister at the Imperial Opera (1860); and soloist in the Court orchestra (1863). His son JOSEPH (1855—) is the most important member of the family. He was second violin in his father's quartet, and in 1887 succeeded him as leader. In 1878 he became a professor at the Vienna Conservatory, and after having been a violinist in both the Imperial and Opera orchestras, was made leader in 1884, and kapellmeister in 1887 of the Court Opera. His compositions are wholly dramatic, and include six operettas, produced at Munich, Vienna, and Hamburg; numerous ballets; and some incidental music.

HELLMUTH, hël'mū't, ISAAC (1820-1901). An English clergyman, born at Warsaw, Poland, of Jewish parentage. He was educated at Breslau, became converted to Christianity, and entered the Anglican ministry in Canada. He founded Huron College and other schools, and was Bishop of Huron from 1871 to 1883. He then went to England to become Assistant Bishop of Ripon. In 1885 he was made rector of Bridlington, and in 1891 chaplain at Holy Trinity, Pau. Among his published works are: *The Genuineness and Authenticity of the Pentateuch* (1867); and a *Biblical Thesaurus* (1884).

HELLQUIST, hël'kvist, CARL GUSTAF (1851-90). A Swedish historical painter, born in Kungsör. He was a pupil of the Stockholm Academy, and studied under Lefebvre in Paris. He became professor at the Berlin Academy in 1886, and afterwards lived in Munich. His mannered historical pictures are usually of scenes from Swedish history. They include: "Disgraceful Entry of Sumanväder into Stockholm, 1526" (1878); "Sack of Wisby by Waldemar IV., 1361" (1882), both in National Museum, Stockholm; "The Death of Sten Sture" (1879); "The Embarkment of the Body of Gustavus Adolphus" (1885); and "Huss Going to the Stake" (1887).

HELLRIEGEL, hël'rè-gel, HERMANN (1831-95). A noted German agricultural chemist, born at Mausitz, in Saxony. In 1857 he became director of the agricultural experiment station of Brandenburg and Niederlausitz at Dahme, from which he resigned in 1873, and in 1882 accepted a similar post at Bernberg, where he died. From 1873 to 1882 he was wanderlehrer at Bernberg. Among his many agricultural investigations with plants none rank in importance with his demonstration of the ability of leguminous plants to assimilate the free nitrogen of the air, and his discovery of the tubercles on the roots as the agency through which this takes place. The question of the ability of leguminous plants to use the nitrogen of the air had long been one of inquiry, and its settlement by him marked an epoch in the agricultural world. The important parts of these experiments he published in *Untersuchungen über die Stickstoffnahrung der Gramineen und Leguminosen* (Berlin, 1888), and *Ueber Stickstoffnahrung landwirtschaftlicher Kulturgewächse* (Vienna, 1890). See LEGUMINOSÆ. Consult Römer, *Hermann Hellriegel, Nachruf* (Leipzig, 1896).

HELLWALD, hël'vált, FERDINAND VON (1843-84). An Austrian historian of literature, born in Vienna. In 1862 he was employed in the Imperial Library there, studied the North Germanic dialects and literatures, and was sent to the Netherlands by the library. He published (1866) the *Voyage au Maroc 1610-41* by the painter Adrian Mathan, and (1873) the second part of *Spiegel historiel* by Jakob von Maerlant, which he discovered in the library at Vienna, and other valuable works. His own writings are: *Vlämisches Leben, Geschichten und Bilder* (1867); *Geschichte des holländischen Theaters* (1874); and *Geschichte der niederländischen Litteratur*, completed and edited by Schneider (1887).

HELLWALD, FRIEDRICH VON (1842-92). An Austrian writer on geography and the history of civilization; brother of Ferdinand von Hellwald, and born at Padua. He entered the Austrian Army in 1858, and was lieutenant of cavalry (1866) in the war with Prussia; from 1871 to 1873 at Augsburg, then till 1882 at Cannstatt, he was editor of *Das Ausland*. His many works, which are more popular than scientific, include: *Maximilian I., Kaiser von Mexiko* (1869); *Kulturgeschichte in ihrer natürlichen Entwicklung bis zur Gegenwart* (4th ed. 1896-98); *Die Erde und ihre Völker* (4th ed. 1897); *Naturgeschichte des Menschen* (1883-84); *Amerika in Wort und Bild* (1883-85); *Frankreich in Wort und Bild* (1884-87); *Die menschliche Familie nach ihrer Entstehung und natürlichen*

Entwicklung (1889); and the posthumous work, edited by Möller, *Kulturbilder* (1894).

HELM (AS. *helma*, Icel. *hjalma*, helm). The steering apparatus of a vessel. It consists of a rudder and tiller, and, in ships, of a steering wheel supplemented in large vessels by a steering engine. The rudder, which may be of either iron or wood, is the part of the apparatus which is in the water. Its shape is variable, but is usually nearly that of a rectangle, with rounded corners, and in old ships slopes upward at the top from the after edge toward the rudder-post, to which it is ordinarily pivoted along the forward edge. In many modern ships the rudder is more or less perfectly balanced as to pressure by having the rudder post or pivot nearly in the centre (but always somewhat nearer the forward edge); this reduces the power necessary to put it over and keep it there. The rudder is supported by *pintles* or arms bent at right angles and projecting from the rudder-post; by a skeg or shoe at the heel; and by a collar around the rudder-head. The tiller is the lever which works the rudder. It either passes through a slot in the rudder-head or fits over it, and consists of a straight bar of wood or steel; or in some ships it is replaced by a *quadrant*, which consists of a sector of a circle secured to its centre, which is the rudder post or head, and having chains attached to its corners and passing around its surface before leading to the wheel or engine. The *wheel* consists of one or more wheels, with eight to sixteen spokes projecting through the rims to form handles, and a barrel or axle around which the wheel-ropes are wound. One wheel-rope winds around its forward end in one direction and the other around the after end in the opposite direction; so that one unwinds as the other winds up, when the helm is put over to one side.

When steering engines are used, the rudder and tiller are large, or when it is desired to effect quick working of the rudder by affording extra power. The engines are operated by electric gear in the pilot-house or on the bridge, or by means of small wire ropes leading from the valve-gear of the engine to a wheel located in those places. In steering, the terms used to designate the position of the rudder, except in Germany, refer to the placing of the tiller. Thus, when the *helm* is *a-port* the tiller is pressed over toward the port side of the ship; similarly, we have the helm *amidships* and *a-starboard*; the helm is *a-lee* when the tiller is pressed over to the lee side, that is, the side away from the wind; the helm is *a-weather* when over toward the other side, and it is *hard a-port*, *hard a-starboard*, *hard a-lee*, etc., when it is pressed as far over as it will go in that direction. To *right* the helm is to put the tiller amidships; to *shift* it is to put it from one side to the other. To *ease* the helm is to let the tiller come more nearly amidships so as to ease the strain on the tiller. When a vessel is turning under control of the rudder, to *meet her* with the helm is to shift the helm and prevent her from turning any farther. *Nothing to starboard* (or port) is a direction to the helmsman cautioning him to steer as good a course as possible, but in any case not to run to starboard (or port) of the desired course.

HELMSMAN. In large ships without steering engines two or more men are necessarily stationed at the wheel; in sailing ships the man on the weather side is the helmsman, and the others

are assistants. In men-of-war a quartermaster is in charge of the steering; he keeps watch of the course, sees that the helmsman steers correctly, and tends to other matters, such as reading the barometer, thermometer, and hygrometer, and filling in the columns of the log every hour (if there is no junior officer).

HELM, hēlm, ISRAEL (c.1615-c.1695). A Swedish colonist in America. Probably a soldier in Sweden, he was one of the earliest settlers on the Delaware; lived at Passyunk (now Philadelphia), where he was collector of customs (1659); in 1668 became a member of Captain Carr's council, and was one of the number who received a grant of Calken Hook in the same year; and, about 1674, was justice 'for the river' and probably a member of the earlier Upland Court. Helm did much service as interpreter in conferences with the Indians, especially in 1675, in the meeting of the New Jersey Indians, Governor Andros, and the Swedish authorities at New Castle, Del. He is possibly to be identified with Israel Holms, an old Swede, on whose authority Rudman tells of the end of Peter Minuit.

HELMBOLD, hēlm'bōlt, LUDWIG (1532-98). A German theologian and hymnologist, born at Mühlhausen, Thuringia, and educated at Leipzig and Erfurt. At the latter university he taught (1554-86), but was finally forced out because of his bitter opposition to the Catholic members of the faculty. He went back to Mühlhausen, and became superintendent of the town. He was a skillful Latin versifier, and besides Latin hymns wrote spiritual songs in the vernacular, which won him the name 'the German Asaph'; among these mention should be made of: *Von Gott will ich nicht lassen Du Friedefürst, Herr Jesu Christ*; and *Es stehn vor Gottes Throne*. For his biography, consult Thilo (Berlin, 1851).

HELMER, NORA. The heroine of Ibsen's drama of modern life, *A Doll's House*. She is, at the opening of the play, a thoughtless superficial creature, who is alternately petted and scolded by her narrow-minded husband, and thus becomes wholly unfitted to face or even comprehend life's realities. She impulsively commits a heinous crime, and only then discovers her own and her husband's actual natures. She escapes paying the legal penalty, but leaves her home with the determination to learn the truth regarding life, humanity, and herself.

HELMERS, hēlm'ers, JAN FREDERIK (1767-1813). A Dutch poet, born at Amsterdam. His first work, a tragedy, was moderately successful, and he followed it by a poem, *Socrates* (1790). But his patriotic verses, published in 1810, and *The Dutch Nation* (1812), an heroic poem in six cantos, are what made his reputation. At a time when Holland was under French rule, these fiery patriotic poems revived the nation's enthusiasm. A posthumous volume of his poetry appeared in 1815.

HELMERSEN, GRÉGORIJ PETROVITCH (1803-85). A Russian geologist, born at Duekershof, in the Government of Livonia. He was educated at Dorpat and various German universities, from 1838 to 1863 was professor of geognosy and geology in the school of the mining engineer corps, and from 1865 to his retirement in 1872 director of the Mining Institute. He attained the military rank of lieutenant-general, and was a mem-

ber of the Saint Petersburg Academy of Sciences. In 1829 he accompanied Alexander von Humboldt in the exploration of the lower courses of the rivers Volga and Ural. His chief published writings were his contributions to the extensive scientific work on the Russian Empire and the adjacent Asian countries, published by the Saint Petersburg Academy of Sciences, under the editorship of himself and Von Baer (26 vols., 1839-71).

HELMERT, FRIEDRICH ROBERT (1843—). A German geodesist, born at Freiberg, Saxony. He was educated at the Polytechnic of Dresden and Leipzig University, in 1869-70 was observer in the Hamburg Observatory, and in 1870 became instructor in geodesy in the Technical College of Aix-la-Chapelle. In 1886 he was appointed director of the Royal Geodetic Institute of Prussia, and in 1887 professor of geodesy in Berlin University. In addition to numerous contributions to the *Astronomische Nachrichten*, the *Zeitschrift für Vermessungswesen*, and other technical periodicals, he published several volumes, including *Die Ausgleichungsrechnung nach der Methode der kleinsten Quadrate* (1872), and *Die mathematische und physikalische Theorien der höhern Geodäsie* (1880-84).

HELMET (diminutive of *helm*, Goth. *hilms*, OHG. *helm*, Ger. *Helms*, helmet; connected ultimately with Skt. *śarman*, protection, AS., OHG. *helan*, Ger. *hehlen*, Lat. *celare*, Gk. *καλύπτειν*, *kalyptein*, to hide, OIr. *celim*, I hide). A covering wholly, or in part, of metal, used in warfare to protect the head. Such protections have been used from the earliest times, and have been made in many different forms. The simplest form is in the shape of a close-fitting skull-cap. Such helmets are represented on the Assyrian monuments. They were of metal, and sometimes were provided with a defense for the neck. A tendency toward decoration is shown in some of the bas-reliefs, where warriors are represented with elevated helmets terminating in a point. The Greeks of the Homeric age are occasionally described as wearing very elaborate helmets. In the *Iliad*, Agamemnon places on his brow a lofty helm, four-crested, double-peaked, with horse-hair plumes. At a later period the Greeks used helmets of different shapes, usually with protections for the face and neck, and sometimes surmounted by figures of birds or animals. Many of these were richly decorated. The Etruscans wore bell-shaped helmets, which often had projecting pieces like wings, which gave them a very peculiar appearance. The Romans ordinarily used a plain, undecorated skull-cap, strengthened by cross-bands of iron, and with a neck-guard. On the march this helmet was removed and carried slung from the right shoulder. Under the later Empire the Greek fashion of helmet became common. The Anglo-Saxons appear to have used a skull-cap with a figure of a boar on top. The Franks, on the contrary, used no protection for the head. But under Charles the Great the Imperial household guards wore helmets of a triangular shape, surmounted by conventionalized scrollwork or foliage. In the Bayeux tapestry the warriors wear conical helmets, with a straight piece descending in front to protect the nose. The most characteristic helmet of the Middle Ages, which was in vogue from the twelfth to the fourteenth century, was cylindrical in form and covered the head and a part of the neck. There were round openings

through which the warrior could see and breathe. It was so heavy that it was put on only at the moment of combat, and only when the knight fought on horseback. It was a very effective defense against a cut from a mediæval weapon, but no protection against bruises. In great contrast with this was the headpiece worn by the Saracens, with whom the Crusaders came into contact. They used light globular helmets of iron, richly ornamented and adorned with plumes. In the fourteenth century the heavy helmet was to a great extent discarded by the Western knights for the lighter bascinet (q.v.); but it continued to be used in tournaments until the eighteenth century. As the employment of firearms became more general, helmets naturally lost their utility, especially as regards the face. Those still remaining are, in the equipment of troops, limited for the most part to heavy cavalry, afford no protection to the face, and must be considered as rather for ornament than use. Firemen wear a heavy headpiece of leather and brass to protect them as far as possible from falling brands and cinders at conflagrations. In India and other hot climates, helmets of white felt, with the additional screen of rolls of linen, are worn by the military as well as by members of the civil service to protect them from the hot rays of the sun.

In heraldry, the helmet, from the early simple form known as the Norman, came at a later period to vary in shape according to the degree of the person who bore it, and helmets were set over coats of arms to bear the crest and to indicate by their form the rank of the bearer. The following forms of helmet are in use in English heraldry: (1) The helmet assigned to the King and to the princes of the blood royal; it is full-faced, composed of gold, and has the visor divided by six projecting bars. (2) The helmet of a duke or marquis is of steel, with five bars of gold. (3) The helmet of earls, viscounts, and barons is of silver, adorned with gold, has five bars, and is set in profile. (4) The helmet of knights and baronets is of steel, full-faced, with the visor thrown back and without bars. (5) The helmet of esquires is always presented in profile, and is of steel with the visor closed. These distinctions are of comparatively recent date. A much greater variety of helmets is in use in Continental heraldry. A helmet is never placed over the arms of any woman except the sovereign. See HERALDRY.

HELMET-BIRD. One of the names given to the turacos (q.v.), on account of their high, brilliantly colored crests. An Australian cockatoo, the ganga (q.v.), is called 'helmet-cockatoo,' and a genus of African shrikes (Prionops) are called 'helmet-shrikes' for a similar reason.

HELMET-CRAB. See KING-CRAB.

HELMET-CREST. A South-American humming-bird of the genus *Oxygogon* (in which there are three species) which has a tall, pointed, erectile crest suggesting a helmet-plume, and also chin-feathers resembling a long beard. See Plate of HUMMING-BIRDS.

HELMET-HORNBILL. See HORNBILL.

HELMET-QUAIL. A California crested quail (q.v.).

HELMET-SHELL (so called from the resemblance of the shell to a helmet). One of a genus

(*Cassis*) of large, active gastropods, allied to the strombs, and typical of the family *Cassidæ*. They have thick, heavy shells, boldly ridged, and often handsomely colored, and some species, as the black helmet-shell of the West Indies (erroneously named *Cassis Madagascarensis*) and *Cassis glauca* of the East Indies, are extensively used for making cameos (q.v.), because the shell is in layers of different colors. About fifty species are known, mostly Oriental; but some inhabit the Mediterranean and West Indian waters, and all are carnivorous, preying mostly on bivalve mollusks.

HELMHOLTZ, hĕlm'hólts, HERMANN VON (1821-94). A German physicist, one of the most distinguished scientific men of the nineteenth century, and an authority in several departments of science. He was born at Potsdam, and studied medicine in Berlin, subsequently serving as a surgeon in the army (1843-47). He then became assistant in the Berlin Anatomical Museum, and a professor of physiology, occupying chairs at Königsberg (1849-58), at Bonn (1855-58), and at Heidelberg (1858-71). In 1871 he became professor of physics at the University of Berlin. For several years prior to his death Helmholtz was president of the Physikalisch Technische Reichsanstalt at Charlottenburg, and supervised the researches of this important institution. He was equally distinguished in physiology and in experimental and mathematical physics. He was selected as honorary president of the International Congress of Electricians held at Chicago in 1893, and it was said then of him that he might have been easily first in several other departments of human knowledge quite distinct and apart from that of electricity. His physiological works are principally connected with the eye and the nervous system. As a physicist Helmholtz first attracted attention from the scientific world by a paper which he presented to the Physical Society of Berlin in 1847 on the "Conservation of Force." This paper, regarded by many as a fantastic speculation, provoked considerable discussion and established Helmholtz's reputation. His invention of the ophthalmoscope (q.v.), an instrument which enables an observer to examine the interior of the eye, gave to the oculist a most useful device now in universal use. His wonderful monograph on *Sensations of Tone* was first published in 1863, and is the most important work on acoustics of the nineteenth century. To Helmholtz is due the generally accepted theory of color, which is that of Young (q.v.) in a modified form, wherein the perception of color depends upon the three fundamental sensations of red, green, and violet or blue. He also developed the electro-magnetic theory of light in a manner which indicated its general possibilities. Another important research was on the theory of vortex motion, and not only did he discover the fundamental properties of such motion, but he so stated his conclusions that they have been used to explain various physical phenomena and in hypotheses concerning the constitution of matter and the luminiferous ether. He was the inventor of many ingenious methods in practical physics, as well as new apparatus. In 1883 the German Emperor conferred upon him a title of nobility. He visited the United States in 1893, and died in Berlin, September 8, 1894. The first edition of *Die Lehre von den Tonempfindungen, als Physiologische Grundlage*

für die Theorie der Musik, appeared in 1863, and several other editions and translations have since been published. The *Handbuch der physiologischen Optik* was published in 1867, and Helmholtz's *Gesammelte wissenschaftliche Abhandlungen* in 1882-83. Helmholtz was a contributor to the leading scientific journals of the world, and was the recipient of many honors. An interesting biographical sketch, by Prof. A. W. Rücker, F.R.S., was published in the *Fortnightly Review* for November, 1894, and reprinted in the *Smithsonian Report* of the same year.

HELMOLD, hēl'mōlt. A twelfth-century German historian of the Slavs. He was born in Holstein, and was a priest at Bosau. He was intimate with Gerold, the Bishop of Lübeck, who had done missionary work among the Slavs, and who urged him to write a history of the wars with them and the missions among them. This history, *Chronica Slavorum*, covered the period from Charlemagne to Helmholtz's own time and the days of Henry the Lion (1772), and was continued to 1209 by Arnold of Lübeck (q.v.). It is best edited by Lappenberg (1868), separately, and in vol. xxi. of *Monumenta Germanicæ*.

HELMOLT, hēl'mōlt, HANS F. (1865—). A German editor and historian, born at Dresden. He obtained a university education, and was appointed to an editorial post in the Bibliographic Institute at Leipzig. His publications include historical studies, such as *König Ruprechts Zug nach Italien* (1892), and *Fabrieus und Siber* (1895), and the compendious *Weltgeschichte* (1899-1901), a work based on an ethnographic method, in the preparation of which he was assisted by German and other specialists.

HELMOND, hēl'mōnt, *Fr. pron.* ēl'mōn'. A town in the Province of North Brabant, Holland, situated on the Zuid Willems Canal, 23 miles by rail northwest of Venlo (Map: Netherlands, D 3). There are a number of extensive textile mills, dyeing establishments, cigar-factories, and various other manufacturing establishments. Population, in 1890, 9029; in 1900, 11,436.

HELMONT, hēl'mōnt, JAN BAPTISTA VAN (1577-1644). A Belgian physician and chemist, born at Brussels. He studied at Louvain, and on the completion of his education accepted the chair of surgery in that university, the duties of which he discharged for two years. The study of the work of Paracelsus seems to have turned his attention to chemistry and natural philosophy, and in the pursuit of these sciences he spent several years in different universities of Italy and France; after which he returned home, married Margaret van Ranst, a noble lady of Brabant, and settled down at his estate near Vilvorde, where he spent the remainder of his life in investigations of various kinds. Writers of the history of chemistry regarded him as one of the greatest chemists who preceded Lavoisier. He paid much attention to the study of gases, and is supposed to have been the first to use the word *gas* as a generic name for all elastic æriform fluids. Of these gases he distinguished several kinds. He was also the first to take the melting-point of ice and the boiling-point of water as standards of the measurement of temperature. In his works the term 'saturation' was first employed to signify the combination of an acid with a base, and he was an early investigator of the

chemistry of the fluids of the human body. Along with other physiologists of his day, he speculated much on the seat of the soul, which he placed in the stomach. His reasons are chiefly these two: (1) It cannot exist in the brain, because, as he thought, that organ contains no blood; (2) it does exist in the stomach, because, when we hear bad news, we lose our appetite.

The most important of his works is his *Ortus Medicinæ*, which was published by his son, four years after his death; it passed through a very large number of editions, and was translated into Dutch, French, German, and English. A curious volume, containing translations of some of his works, was also published by W. Charlton, in 1650, under the title of *The Ternary of Paradoxes; the Magnetic Cure of Wounds; the Nativity of Tartar in Wine; and the Image of God in Man*. See CHEMISTRY.

HELMSTEDT, hēlm'stēt. A town in the Duchy of Brunswick, Germany, situated 25 miles by rail from the city of Brunswick (Map: Germany, D 2). It was formerly famous for its university, founded here in 1575, and suppressed in 1809. The university buildings now contain the remnants of the university library. Helmholtz manufactures agricultural machinery, pottery, woollens, soap, etc. About two miles from the town are the Helmholtz springs, whose waters, containing iron salts, are much used. Population, in 1890, 10,955; in 1900, 14,259.

HELMUND, or **HILMEND**. The largest river of Afghanistan. It rises in the Koh-i-Baba chain, and flows southwest, receiving numerous tributaries by which it drains the southern part of the country (Map: Asia, Central, H 5). It discharges into the lake, or rather swamp, of Savaran, near the Persian frontier. Its total length is estimated at over 600 miles. The channel of its lower course is very wide and deep, but is filled only during the summer. The region traversed by the lower course of the Helmholtz is well populated, and the water-power of the river is used by numerous mills.

HELMUTH, WILLIAM TOD (1833-1902). An American homeopathic physician. He was born in Philadelphia, and studied medicine there and in San Francisco. In 1888 he received the degree of LL.D. from Yale. He was dean and professor of surgery in the New York Homeopathic Medical College, had several hospital positions, and published numerous essays, both literary and medical, such as: *Scratches of a Surgeon* (1879); *A Steamer Book* (1880); *Diphtheria; Medical Pomposity; System of Surgery; Suprapubic Lithotomy*; and some verses, *With the Pousse-Café*.

HELODERMA (Neo-Lat., from Gk. ἧλος, hēlos, nail, wart + δέρμα, derma, skin). A genus of North American lizards, with two species, of which one is the poisonous Gila monster. It represents, according to Cope, a family (Helodermatidæ) and superfamily (Helodermatoidea), characterized prominently by the fact that the eight to ten acrodont teeth in each jaw are anchored by oblique bases, and each is fang-like and grooved both before and behind, as if designed for conducting fluid poison. For full structural details, consult Cope, *Crocodylians, Lizards, and Snakes* (Smithsonian Institution, Washington,

D. C., 1900); for external appearance and habits, see GILA MONSTER.

HELOÏSE, ἡ'λό'εζ'. See ABÉLARD.

HÉLOS (Lat., from Gk. Ἑλος, from ἕλος, *helos*, march). A town of Laconia, near the coast and a short distance east of the mouth of the Eurotas, said to have been founded by Heleus, son of Perseus. When the Dorians invaded the Peloponnesus, Helos defended itself with great stubbornness; it was finally taken and the inhabitants were made slaves. In Strabo's time it had become a village, and when Pausanias visited it it was already in ruins. The Helots were supposed to have received their name from this town; but the most probable view is that the ethnic term is related to the root ἔλ-, *take*. The plain of the lower Eurotas is still called *Helos*. There were several other towns of this name in ancient Greece—one mentioned in the *Iliad*, and one situated in Argolis.

HELOTS, *hē'lots* or *hē'lots* (Lat. *Helotæ*, from Gk. Ἑλωτες, *Heilōtes*, or Ἑλωται, *Heilōtai*; probably connected with ἔλεῖν, *helein*, to seize, less plausibly with Ἑλος, *Helos*, a town of Laconia, whence the first Helots were said to have been enslaved). The lowest of the three classes into which the population of ancient Laconia was divided. The Helots were serfs of the soil, the property of the State, by whom alone they could be freed, but assigned to individual Spartans for the cultivation of their allotments of land. If the Helots were originally the descendants of the pre-Dorian population, the distinction of dialect and descent was early lost, for there is no indication of any social or linguistic difference between them and the ruling Spartans. The Helots paid the Spartan proprietors a fixed amount of produce, but could keep the remainder, and were thus enabled to acquire property. In fact, in general appearance and intelligence they seem to have been much like the free village population in other parts of Greece. In war they served as light-armed troops or on shipboard, and after the Peloponnesian War were sometimes employed in the heavy infantry, especially in Asia Minor. They were subject to harsh treatment, and were in the absolute power of the Ephors, though many of the ancient stories are scarcely trustworthy. Their great superiority in numbers and their known discontent rendered them objects of suspicion; and during the Peloponnesian War 2000 of them, who claimed to have rendered distinguished services, were freed and then secretly murdered (see Thucyd. iv. 20). The Spartan secret service (*κρυπτελα*), in which the young men were sent singly through the land to endure hardships and watch symptoms of discontent, kept the Helots under close observation, and any who showed special strength or intelligence are said to have been secretly assassinated. The statement that the Ephors annually declared formal war upon the Helots is doubtless an error.

HEL'OTISM (from Lat. *Helota*, Gk. Ἑλωτης, *Heilōtēs*, or Ἑλωτος, *Heilōs*, Helot). A symbiotic relation in which one subject (see SYMBIOSIS) is regarded (perhaps somewhat fancifully) as enslaved by another. This relation differs from parasitism in that the enslaved form is not necessarily harmed; it may even be benefited. Lichens (q.v.) have been given as the type of helotism, the alga being regarded as enslaved by the fungus.

HELP. The character in Bunyan's *Pilgrim's Progress* by whom Christian is rescued from the Slough of Despond.

HELPER, HINTON ROWAN (1829—). An American author and railway projector. He was born near Mocksville, N. C.; graduated at Mocksville Academy in 1848, and from 1851 to 1854 lived in California. In 1857 he published a book entitled *The Impending Crisis in the South, and How to Meet It*, which perhaps did more to arouse a widespread opposition in the North to the institution of slavery than any other book except *Uncle Tom's Cabin*. This book was dedicated to the 'non-slaveholding whites' of the South, and was written to prove that, wholly aside from its immorality, slavery was an economic curse. Between 1857 and 1861 nearly 150,000 copies of the book were circulated, and in 1860 the Republican Party distributed it as a campaign document. From 1861 to 1866 Helper was United States Consul at Buenos Ayres, Argentine Republic, and afterwards devoted his attention chiefly to the promotion of his projected intercontinental railway, or 'Three Americas Railway,' to extend eventually from Bering Sea to the Strait of Magellan. In addition to *The Impending Crisis*, his publications include: *The Land of Gold* (1865); *Nojoque: A Question of a Continent* (1867); *The Negroes in Negroland, the Negroes in America, and the Negroes Generally* (1868); *Oddments of Andean Diplomacy* (1879); and *The Three Americas Railway* (1881).

HELPS, Sir ARTHUR (1813-75). An English essayist, born at Streatham, Surrey. He was educated at Eton, and at Trinity College, Cambridge, where he graduated B.A. in 1835 and M.A. in 1839. He obtained a post in the civil service, but resigned in 1841 and retired to the country, where he cultivated his taste for literature. In 1860 he was appointed clerk of the Privy Council, a post which he held until his death. For Queen Victoria he edited the speeches of the Prince Consort (1862), and prepared for the press her own Highland journals (1868-69). After beginning his literary career in 1835 with a series of aphorisms entitled *Thoughts in the Cloister and the Crowd*, Helps attempted the essay, the novel, the drama, and history. With the drama and the novel he failed utterly; with history he succeeded moderately. In this field his best work is represented by *Las Casas* (1868), *Columbus* (1869), *Pizarro* (1869), and *Cortez* (1871)—biographies which grew out of his *Conquerors of the New World and Their Bondsmen* (1848-52), and *The Spanish Conquest in America* (4 vols., 1855-61). By his essays he won his contemporary fame, especially by *Friends in Council* (1st series 1847; 2d series 1859). It consists of conversations on social and intellectual questions. Helps exhibits throughout these dialogues acuteness, humor, a satire which gives no pain, and a quiet depth of moral feeling and sense of man's social responsibilities.

HELSINGBORG, *hēl'sing-bōr-y'*. A fortified seaport of Sweden, situated at the narrowest point of the sound, opposite the Danish town of Elsinore, with which it is connected by ferry (Map: Sweden, E 8). Several railroad lines run into the town, and it carries on a flourishing trade with Denmark. It exports iron ore, bricks, earthenware, grain, and fish; imports coal, min-

erals, gun-metal, and fertilizers. It has considerable manufactures of sugar, chemicals, and machinery, and has a slaughter-house and ship-building yards. Population, in 1901, 24,670. Helsingborg has played a prominent part in the Scandinavian wars. It was almost destroyed in the war between Sweden and Denmark during the reign of Charles XI., and was the scene of a Danish defeat at the hands of Swedish peasants in 1710.

HELSINGFORS, hēl'sing-fōrs. The capital of the Grand Duchy of Finland, as well as of the Government of Nyland (Map: Russia, B 2). It is beautifully situated on a peninsula on the Gulf of Finland, 191 miles west of Saint Petersburg by sea. The entrance to the harbor is protected by a series of formidable batteries, called the fortifications of Sveaborg, and consisting of seven strongly fortified islands and numerous islets, while the harbor itself is further defended by two forts. Helsingfors is next in importance to Cronstadt as a naval station on the Baltic, and the largest and handsomest town of Finland. Its streets are broad and regular, and there are a number of handsome squares. Of the public buildings, the most prominent are the residence of the Governor, the Senate House, the university buildings, the Lutheran Church of Saint Nicholas, the Russian Church (completed in 1868), the Athenæum (built in 1887), with a picture gallery, and the new theatre. The university, originally founded at Åbo in 1640, and removed to Helsingfors in 1829, comprises four faculties, with over 2500 students, a library of 190,000 volumes, a hospital, a zoölogical and botanical museum, a botanic garden, and a valuable observatory. Another prominent educational institution is the Polytechnical Institute. Helsingfors is the seat of many learned societies. Since 1840 Helsingfors has been a favorite bathing-place, and attracts many visitors from Saint Petersburg during summer. The town carries on a considerable trade in agricultural and dairy products with Saint Petersburg, England, and Swedish and German ports. It has manufactures of beer, sugar, tobacco, liquors, carpets, linen, etc. Helsingfors is the seat of the Governor-General of Finland, the Finnish Diet, and numerous consular representatives, including one from the United States. Population, in 1900, 93,217, of whom over 50 per cent. are Swedes, nearly 43 per cent. Finns, and the rest Russians and Germans.

Helsingfors was founded by Gustavus I. of Sweden in the middle of the sixteenth century, a short distance inland; it was removed to its present site in 1642. It was fortified in 1729, and came into the possession of Russia in 1809. In 1812 it became the capital of Finland. During the Crimean War it was bombarded for two days and nights by the allied fleet without any appreciable injury to its fortifications.

HELSINGÖR, hēl'sing-ēr. A seaport of Zealand, Denmark. See ELSINORE.

HELST, hēlst, BARTHOLOMÆUS van der (c.1611-70). A Dutch portrait painter. His birthplace is uncertain, being assigned to Haarlem and to Dordrecht, and the year of his birth falls between 1611 and 1614. He is reputed to have been a pupil of Frans Hals (q.v.) at Haarlem, and a few of his works, indeed, show this influence. But his art on the whole was directly the opposite of Hals's, and he was more influenced

by his other master, Nicolaes Elias of Amsterdam. The researches of Scheltema show that he was living in Amsterdam in 1636, and probably much earlier. There he married the attractive Constantia Reinst, and in 1654, in conjunction with Nicolaes de Helt Stokade, he founded the Painters' Guild of Saint Luke. He died at Amsterdam, December 16, 1670.

His best-known work is the "Banquet of the Civic Guard," now in the Museum of Amsterdam, which was painted to represent the celebration of the Peace of Westphalia in 1648. It contains twenty-four full-length portraits, characteristic, well modeled, and rich in color. In the same museum are the "Syndics of the Brotherhood of Saint Sebastian" (1663), of which there is a replica in the Louvre; the four "Syndics of the Marksmen;" the "Company of Captain Rogloff Bicker" (1639), thirty-two figures in all; the portraits of the Princess Maria Henrietta Stuart, Burgomaster Andries Bicker, Admirals Kortenaar, Van Ness, and others. Among his other portraits are those of a "Protestant Dame" (1638), and of Paul Potter, at The Hague; a "Lady in Blue," in the National Gallery of London; Admiral Van Tromp, at Munich; and the portrait of the artist in the Uffizi, Florence. In America there are portraits of an "Unknown Lady," in the New York Historical Society, and of a "Dutch Burgomaster," in the Metropolitan Museum, New York. The heads of Helst's portraits are well characterized, and all the details, especially the hands, are carefully carried out, though without sacrifice of breadth. His color is clear and powerful.

HELSTON, DOCTOR MATTHEWSON. The rector of Briarfield, in Charlotte Brontë's novel *Shirley*, the uncle of Caroline, and a man of imperious temper though upright principles. The character was suggested in part by Patrick Brontë, the author's father, and in part by a friend of his, Mr. Roberson, Vicar of Heckmondwike.

HELVE'DIUS. The nom-de-plume signed by James Madison to his five essays, published in various public journals (1793-96), criticising the foreign policy of the Administration, and replying to the letters of Hamilton, signed 'Pacificus.'

HELVELLYN, hēl-vēl'īn. One of the highest mountains in England, 3118 feet high, in the Lake District, Cumberland, between Keswick and Ambleside (Map: England, C 2).

HELVE'TIC CONFESSIONS. See CREEDS AND CONFESSIONS.

HELVE'TIC REPUBLIC. See SWITZERLAND.

HELVE'TII (Celtic, possibly connected with Welsh *clw*, gain). A Celtic people inhabiting, according to Caesar, the region between the Jura Mountains on the west, the Rhône on the south, and the Rhine on the east and north, the region corresponding closely with the western part of modern Switzerland. They are first mentioned as defeating a Roman army in n.c. 107, and in 101 they accompanied the Cimbri on their invasion of North Italy. The great event in their history is their attempted irruption into Gaul, in which they were repulsed by Caesar. They collected three months' provisions, burned 12 cities, 400 villages, and all isolated dwellings, and made a general rendezvous by Lake Lemán,

in the spring of B.C. 58. Cæsar hastened to Geneva, destroyed the bridge there, raised two legions in Cisalpine Gaul, and when the Helvetians sent delegates to demand a passage delayed them until he had built a wall along the Rhône 19 Roman miles in length, flanked with redoubts. Having vainly attempted to pass this barrier, the Helvetii took another route, but were followed and defeated with a terrible slaughter at Bibracte (modern Mont-Beuvray, in Burgundy), and the remnant were obliged to return to their own country, where they became subject to the Romans. Of 368,000 who left their homes, according to Cæsar, including 92,000 fighting men, only 110,000 returned. In the commotions which followed the death of Nero, the Helvetians met with another catastrophe. Remaining faithful to Galba, they were attacked by Cæcina, a general of Vitellius, who gave them over to the rapacity of his legions. From this time they scarcely appear as a distinct people.

HELŦÉTIUS, hêl-vê'shî-ûs, *Fr. pron.* êl'vá-sê'us', CLAUDE ADRIEN (1715-71). A noted French encyclopædist. He was born in Paris in 1715, educated at the Collège Louis-le-Grand, and after some practical training at Caen appointed at the age of twenty-three to the lucrative office of farmer-general; but as he was of a very humane and gentle disposition, the cruel and odious duties connected with the post decided him to resign it subsequently for the situation of chamberlain to the Queen's household. He wearied of the idle and dissipated life of the Court, and marrying in 1751 the daughter of the Comte de Ligneville, he withdrew to a small estate at Voré, where he spent the most of his life in the education of his family, the improvement of his peasantry, and literary labors. In 1758 appeared his celebrated work, *De l'esprit*, in which he endeavored to prove that sensation (*sensibilité*) is the source of all intellectual activity, and that the grand lever of all human conduct is self-satisfaction. But he admits, at the same time, that self-satisfaction assumes different forms; e.g. the self-satisfaction of a good man consists in the subordination of private to more general interests—first to the circle among which he lives, then to the community, and finally to the world at large. The book was denounced by the doctors of the Sorbonne, and condemned by the Parliament of Paris to be publicly burned. He then went to England and to Germany, where Frederick II. received him with distinction. He died in Paris, December 26, 1771, leaving behind him, besides some other writings, a work called *De l'homme, de ses facultés intellectuelles, et de son éducation* (published 1772). His collected works were published in Paris in 1791, in 14 volumes. Consult: Morley, *Diderot and the Encyclopædists* (London, 1878); Avezac-Lavigne, *Diderot et la société du Baron d'Holbach* (Paris, 1875).

HELŦIG, hêl'vîk, AMALIE VON (1776-1831). A German poet, born Amalie von Imhoff, at Weimar. She received a careful education, and traveled much. In 1803 she married a Swedish officer, Karl Gottfried von Helvig, who entered the Prussian service in 1815. Several of her poems were first published by Schiller in the *Musen Almanach*, and her "Abdallah und Balsora" appeared in the *Horen*. She read Greek, and Goethe taught her to use the hexameter, in

which she composed the epic *Die Schwestern von Lesbos* (1800). Her other works include a translation of the *Fridthofssaga* (last ed. 1879); the collection *Taschenbuch der Sagen und Legenden* (1812-13); and the poems *Die Schwestern auf Corcyra* (1812), *Die Tageszeiten* (1812), *Die Sage vom Wolfsbrunnen* (1821), and *Helene von Tournon*. For her biography, consult Bisping (Berlin, 1889).

HELŦIUS CINNA, GAIUS. An eminent Roman poet, who lived about B.C. 50. He was a friend of Catullus, and was considered by Vergil a poet superior to himself. On the day of the funeral of Julius Cæsar, he was killed by the infuriated rabble, which, defeated in its attempt to fire the houses of Brutus and Cassius, encountered him, and mistook his name for that of Cornelius Cinna, the prætor of the year, and one of the conspirators against Cæsar. By the ancient historians who narrate this, he is called a tribune of the plebeians. The story of his dream as given by Plutarch (*Cæs.* 68) has been introduced by Shakespeare into the drama of *Julius Cæsar* (act iii., scene 3). His most highly esteemed work was the *Smyrna*, whose subject is unknown, but whose style is shown by two extant fragments to have been epic. He wrote also a poem entitled "Prøpempticon Pollionis," in respect to which the few lines preserved afford no information. Prior to the publication of the *Æneid*, the *Smyrna* was regarded as the most complete thesaurus of Roman mythology. Consult: Weichert, *Commentationes II. de Caio Helvio Cinna, Poeta* (1822-23); and Kressling, "De C. Helvetio Cinna Poetice," in *Commentationes Mommsenianæ* (Berlin, 1877).

HELŦY-HUTCHINSON, JOHN, BARON HUTCHINSON (1757-1832). An English general, son of John Hely-Hutchinson (1724-94). He was educated at Eton and at Trinity College, Dublin, and in 1798 was in command at Castlebar when the French landed in Killalla Bay, but General Lake succeeded him previous to the flight of the raw Irish troops. Two years after he was appointed a chief of division in Abercromby's army in Egypt, and assumed command in the battle of Alexandria when that general was mortally wounded. He succeeded, in spite of disaffection among his officers, in separating the two superior French forces; then forced the surrender of Cairo (June, 1801), and two months later of Alexandria.

HELŦY-HUTCHINSON, SIR WALTER FRANCIS (1849—). An English colonial administrator, born in Dublin, and educated at Harrow and at Trinity College, Cambridge. He was attaché to Sir Hercules Robinson in Fiji (1874), and, after serving as private secretary for Fiji Affairs and for New South Wales Affairs, became Colonial Secretary of the Barbadoes (1877), and chief secretary to the Governor of Malta (1883), where he was Lieutenant-Governor for five years (1884-89). He was then appointed Governor of the Windward Islands (1889), and four years later of Natal, where he introduced 'responsible government,' and of Zululand, to which he annexed the territories across the Pongola (1895). In 1895 he was made Special Commissioner for Tongaland, and in 1901 was transferred to the Cape of Good Hope as Governor of the Colony.

HÊLYOT, â'lyô', PIERRE (1660-1716). A French Franciscan scholar. He was born and died

in Paris; entered the Franciscan convent of the strict observance, 1683; devoted himself to the exhaustive study of the monastic Orders and congregations, and produced the masterpiece, which has been the source whence innumerable writers have drawn, *Histoire des ordres monastiques religieux et militaires et des congrégations séculières de l'un et l'autre sexe, qui ont été établies jusqu'à présent* (8 vols., 1714-19); an enlarged edition in four volumes by Migne, *Encyclopédie théologique*, appeared in Paris, 1858-59.

HEM'ANS, FELICIA DOROTHEA (BROWNE) (1793-1835). An English poet, born in Liverpool. Her early taste for poetry was so far encouraged that she was permitted to publish a volume of juvenile verse in 1808. This was followed with another volume in 1812, in which year she married Captain Hemans, an Irish gentleman, who had served in Spain. In 1818, after the birth of five sons, she separated from him. She spent the rest of her life in North Wales, in Lancashire, and in Dublin, where she died. Among her works are: *The Forest Sanctuary* (1825), in the second edition of which, published in 1829, first appeared "Casabianca;" *Records of Women* (1828); *Songs of the Affections* (1830); *Hymns for Childhood*; *National Lyrics and Songs for Music*; and *Scenes and Hymns of Life* (1834). She also wrote three dull plays, and contributed to the magazines. A volume of *Poetical Remains* appeared after her death, and a complete edition of her works, with a memoir by her sister, in seven volumes, in 1839. Mrs. Hemans, without great daring or force, is sweet, natural, and pleasing; but too fluent, she wrote too much and too hastily. Her lyrics are her best productions, her more ambitious poems being very insipid. Still, she was a woman of talent, and some of her little pieces, such as "The Graves of a Household," "The Treasures of the Deep," and "The Homes of England," are admirable in pathos and sentiment. Consult: Chorley, *Memorials of Felicia D. Hemans* (London, 1836); *Poetical Works*, with memoir, ed. by W. M. Rossetti (ib., 1873); and Espinasse, *Lancashire Worthies* (ib., 1874).

HEM'ATITE (Lat. *hamatites*, from Gk. *αματῖτης*, *haimatites*, blood-like, from *αἷμα*, *haima*, blood), or **SPECULAR IRON**. An iron sesquioxide that crystallizes in the hexagonal system. The spectacular varieties are crystallized and have a metallic lustre, whence their name. Hematite also occurs in fibrous varieties, which have a sub-metallic or metallic lustre, and are brownish-red to black in color; while the earthy varieties, known as *red ochre* and *argillaceous hematite*, are red to brownish-black in color. It is a valuable ore of iron, containing when pure 70 per cent. of that metal, and is widely distributed throughout the world. In North America, deposits of great thickness are found in the Lake Superior region, which includes the famous deposits of the Gogebic, Marquette, Menominee, Mesabi, and Vermilion ranges, where the output in 1899 reached a total of 17,802,955 long tons. Deposits at Pilot Knob and Iron Mountain in Missouri were formerly famous, but have not been extensively worked in recent years. See **IRON**.

HEM'EL HEMP'STEAD. A market-town and municipal borough in Hertfordshire, England, 23 miles northwest of London (Map: Eng-

land, F 5). Its industries comprise boat-making, paper-making, straw-plaiting, iron-foundries, tanneries, and breweries. Its incorporation dates from 1898, and much activity is being shown in public works and improvements. The town owns fine town hall buildings and a corn exchange and markets. Population, in 1891, 9700; in 1901, 11,300.

HEM'ERALOPIA. A disorder of vision in consequence of which objects cannot be seen well in ordinary daylight. Distant vision is only possible by strong artificial light or in twilight. See **EYE**, **DISEASES OF THE**; **SIGHT**, **DEFECTS OF**.

HEM'EROBAP'TISTS (from Gk. *ἡμεροβαπτιστής*, *hēmerobaptistēs*, from *ἡμέρα*, *hēmera*, day + *βαπτιστής*, *baptistēs*, baptist, from *βαπτίζω*, *baptizein*, to baptize). A sect of Jews mentioned by Eusebius (*Hist. Ecl.* iv. 22) on the authority of Hegesippus, by Epiphanius (*Haer.* 17), and Justin Martyr in the *Dialogue with Tryphon*. Their distinguishing feature seems to have been the daily ablution. Nothing further is known of them except that the Clementine Homilies speak of John the Baptist as a member of the sect. Some have thought that the term was not properly the name of a sect, but a derisive epithet applied to certain of the Pharisees and others who were particularly scrupulous about the ritual washings. The name is also applied to the Mandæans or Christians of Saint John. See **MANDÆANS**.

HEM'EROCAL'LIS. See **DAY-LILY**.

HEM'ESSEN, **HEMISHEM**, or **HEM'SEN**, JAN VAN (c.1500-1566). A Dutch painter, born at Hemixhem, near Antwerp. His real name was Jan Sanders. He was a pupil of Hendrik van Cleve, became dean of the Antwerp Guild (1548), and in 1551 went to Haarlem, where probably he lived for the remainder of his life. He was an imitator of Quentin Massys, and is noticeable for having remained steadfast to the Dutch traditions when the influence of Italian art was dominant. His works include some portraits. His daughter, CATHARINA, married a Dutch musician, and entered the service of the Queen of Hungary, with whom she went to Spain. There is a picture by her, dated 1552, in the National Gallery, London.

HEM'IANOP'SIA. See **HEMIOPIA**.

HEMICHORDA, hēm't-kōr'dā. Same as **Adelochorda** (q.v.). See **BALANOGLOSSUS**.

HEM'ICRA'NIA (Lat., from Gk. *ἡμικρανία*, *hēmikrania*, pain on one side of the head, from *ἡμι-*, *hēmi-*, half + *κρανίον*, *kranion*, skull). A headache affecting one side of the head. See **HEADACHE**, **MIGRAINE**.

HEM'ICYCLE, THE. A painting by Paul Delaroche (1835) on the wall of the amphitheatre at the Ecole des Beaux-Arts, Paris. Seventy-five figures, 23 feet in height, represent the artists, and symbolize the art of all periods. Phidias, Ictinus, and Apelles are in the centre of the group.

HEMIGALE, hē-mīg'a-lē (Neo-Lat., from Gk. *ἡμι-*, *hēmi-*, half + *γαλή*, *galē*, weasel). An East Indian weasel-like civet (*Hemigalea Hardwickii*), about the size of an ichneumon, and grayish-brown, with six or seven dark wide stripes across the back. It feeds on eggs and small animals.

HEMIMETABOLIC INSECTS (from Gk. ἥμι, *hēmi*, half + μεταβολή, *metabolē*, transformation, from μεταβάλλειν, *metaballein*, to transform, from μετά, *meta*, after + βάλλειν, *ballein*, to throw). Insects that have a partial or incomplete metamorphosis. There are often very great differences between the habits and the structure of the young and the adults. For example, in the case of the cicadas, the larvæ live in the ground and have fore legs fitted for burrowing, while the adults, which appear only after a period of pupation, fly about and rest in herbage. In other forms, such as dragon-flies, the larvæ are aquatic and have tracheal gills, while the adults are winged and have open trachea. The orders of the hemimetabolic insects are Plecoptera, or stone-flies; Isoptera, white ants or termites; Corrodentia, psocids and book-lice; Mallophaga, bird-lice; Euplexoptera, ear-wigs; Hemiptera, cicadas, chinch-bugs, squash-bugs, bedbugs, plant-lice, etc.; and Orthoptera, grasshoppers, crickets, and walking-sticks. Fossil insects belonging to this group have been found in the coal basins of Illinois, Pennsylvania, and Colorado. See METAMORPHOSIS.

HEMI'NA, LUCIUS CASSIUS. A Roman annalist who lived about 145 B.C., and wrote a history of Rome from the founding of the city to the end of the Third Punic War (Pliny xiii. 84; xxix. 6). Though the work is frequently cited by Pliny, Nonius, and Aulus Gellius, only a few fragments are preserved. These are given in Peters, *Fragmenta Historicorum Romanorum* (Leipzig, 1883).

HEMING, JOHN. coeditor with Condell of the first folio of Shakespeare. See CONDELL, HENRY.

HEM'IOPIA, **HEM'IANOPIA**, or **HEM'IANOP'SIA** (Neo-Lat., from Gk. ἥμι-, *hēmi*-, half + ὄψ, *ōps*, eye). A disorder of sight, consisting in loss of vision for corresponding halves or sections of the visual field. It depends upon the arrangement of the nerve-fibres running from the brain through the optic nerves to the eyes. The fibres coming from each half of the brain, through the optic tracts, meet at a point called the optic chiasm, where some fibres cross over to the optic nerve of the opposite side and some go to the eye of the same side. From the way in which this crossing and subsequent arrangement of the fibres takes place, the right halves of both retinae, and so the left halves of both visual fields, are supplied from the right half of the brain through the right optic tract. An affection of one optic tract will, therefore, cause loss of vision in the corresponding half of each retina, and so loss of the field of vision of the opposite side. This is homonymous or lateral hemiopia. A lesion in the chiasm destroying all the crossing fibres causes loss of vision in the outer half of the field of both eyes, bitemporal hemiopia, known, together with a possible loss of the inner field of both eyes, as crossed hemiopia.

HEM'IPLE'GIA (Neo-Lat., from Gk. ἡμιπλήξ, *hēmiplēx*, smitten on one side, from ἥμι-, *hēmi*-, half + πλήσσειν, *plēssein*, to strike). Paralysis (q.v.) limited to one side of the body. In some cases part of the face is also involved, if the cause of the paralysis affects the origin or the course of the facial nerve. The cause is usually a hemorrhage within the brain-cavity, that is, apoplexy (q.v.); or a collection of fluid; or a

tumor. Because of the fact that about 90 per cent. of the fibres in the pyramids of the brain pass to the opposite side of the body (see NERVOUS SYSTEM), the paralysis occurs on the opposite side of the body from the site of the lesion in the brain, unless the lesion is situated below the decussation of the fibres. While the motor nerves are principally affected, the nerves of sensation are also more or less involved. Besides the causes named, epilepsy, hysteria, and chorea may also operate to cause hemiplegia, which in these cases is temporary. The treatment varies with the cause, and must always be under a physician's direction. Stimulants should never be administered to a paralyzed patient unless ordered by a physician. The prognosis varies according to the cause. If hemiplegia is due, as it very frequently is, to apoplexy, the first attack may terminate in more or less complete recovery; but even then subsequent attacks are likely to occur.

HEM'IPODE (Gk. ἡμίπους, *hēmiπους*, half-footed, from ἥμι-, *hēmi*-, half + πούς, *pous*, foot). A book name for certain gallinaceous birds, usually regarded as a family (Turnicidæ), distinguished by a slender beak, and by the want of a hind toe. They are especially notable because all of the vertebrae remain distinct instead of being extensively ankylosed, as is usual in birds. The palate is like that of the Passeres, and Huxley and some other systematists have placed them in a separate order, the Hemipodii or Turnicomorphæ. They are the smallest of gallinaceous birds, and inhabit cultivated grounds and sterile sandy plains in warm countries. There are rather more than twenty species, in three genera. See BUTTON-QUAIL; ORTYGAN.

HEMIPTERA (Neo-Lat. nom. pl., from Gk. ἥμι-, *hēmi*-, half + πτερόν, *pteron*, wing). An order of insects commonly known as bugs, and divided into the suborders Homoptera and Heteroptera. The name 'Hemiptera' was suggested by the appearance of the first pair of wings, the proximal half of which in many of the species (suborder Heteroptera) is thickened much like that of beetles. The wings of the suborder Homoptera, when present, are of equal thickness throughout. The mouth-parts of the Hemiptera are fitted for sucking, and the young undergo incomplete metamorphosis. The order is one of the most destructive to agriculture of all the insects. A few of the forms are useful in the economy of plants and man, for certain species prey upon injurious insects, while the species producing cochineal and wax furnish materials of commercial value. The injurious species include the loathsome lice and bedbugs, redbugs which do much damage to the cotton and orange crops, the vastly destructive chinch-bug, squash-bug, plant-lice, and scale-insects (qq.v.).

Fossil Hemiptera. The oldest known fossil insect, represented by a fragmentary wing of hemipteran relations, was found in the Upper Ordovician shales of Sweden. The earliest fossil bugs that have the mouth-parts preserved have been obtained from Carboniferous rocks and show these parts to have been, at that early period, of the highly specialized lancet form characteristic of the order, an indication of the very early evolution of the type. The scale-insects and mealy-bugs (Coccidæ), the harvest-flies (Cicadidæ), lantern-flies (Fulgoridæ), and tree-

HEMLOCK

2. SPRAY SHOWING CONES

hoppers (Membracidae) have their fossil ancestors in the Tertiary rocks. Some of the Heteroptera, such as the water-bugs, appear in the Jurassic. Chinch-bugs, squash-bugs, and bedbugs appear in the Liassic and Tertiary.

BIBLIOGRAPHY. Osborn, "Classification of Hemiptera," in *Entomologica Americana*, vol. i. (Brooklyn, 1885); Sharp, "Insects," in *Cambridge Natural History*, vols. v., vi. (London and New York, 1900); Comstock, *Manual for the Study of Insects* (Ithaca, 1895); Howard, *The Insect Book* (New York, 1901).

HEMTRAMPH (from Gk. ἤμι-, *hēmi-*, half + ῥάμφος, *rhamphos*, snout). A fish of the family Hemiramphidae. See HALFBEAK.

HEM'ISHEN. See HEMESSEN.

HEM'LING, HANS. A Flemish painter, more correctly MEMLING (q.v.).

HEMLOCK (AS. *hemlic*, *hymblicæ*, hemlock), *Conium*. A genus of plants of the natural order Umbelliferae, the members of which have compound umbels of small white flowers, small involucre and involucels, the former consisting of several small leaflets, the latter of three leaflets all on one side; the limb of the calyx merely rudimentary, and a compressed ovate fruit with five prominent wavy ridges and no vittæ. The best known and only important species is the common or poison hemlock (*Conium maculatum*), which grows by waysides on heaps of rubbish, and in other similar situations throughout Europe, in some parts of Asia, and naturalized in North America and Chile. It has a root somewhat resembling a small parsnip; a round, branched, hollow, bright-green stem, two to seven feet high, generally spotted with dark purple; large tripinnate, dark shining green leaves with lanceolate pinnatifid leaflets. All parts of the plant are destitute of hairs. The whole plant has a nauseous smell, particularly if rubbed or bruised. The leaves and fruits are employed in medicine. The leaves should be gathered just before the time or at the commencement of flowering, and after the removal of the larger stalks they should be quickly dried by a heat not exceeding 120°. As, however, they sometimes yield little or none of the active principles in the plant, the fresh leaves are preferred. The whole plant contains the active principles, and many fatal cases of poisoning have been attributed to eating the roots under the mistaken idea that they were parsnips.

The uses of hemlock in medicine are few and unimportant and depend chiefly upon its action upon the motor nerves, beginning with their end-organs. Although large doses cause complete paralysis by their action upon the peripheral nerves, sensation and consciousness are not affected; death finally occurs by extension of the paralysis to the muscles of respiration. In large or poisonous doses it sometimes gives rise to coma, and sometimes to convulsions or violent delirium. Among the ancient Greeks poisoning by hemlock was a common mode of death for condemned criminals, but whether it was the juice of the common hemlock or the water-hemlock that was used is unknown. The strength of its preparations is very variable, as its active principles are volatile. Practically the only use of the drug is in tetanus, hydrophobia, strychnine poisoning, and other convulsive disorders. Even in these it is rarely used, and

only to prevent exhaustion by lessening muscular contractions. Water-hemlock, or cowbane (*Cicuta virosa*), is also an umbelliferous plant, of a genus having vaulted umbels, a five-toothed calyx, and almost globose fruit, each carpel with five broad flattened ribs and evident single vittæ. Water-hemlock grows in ditches, the margins of ponds, and wet grounds in Europe and the north of Asia. It has a large fleshy white root, covered externally with fibres; an erect much-branched stem, two to five feet high; tripinnate leaves, with linear-lanceolate regularly and sharply serrated leaflets, one general involucre or only a single small leaflet, partial involucre of many short narrow leaflets, and white flowers. It is a virulent narcotic acrid poison. Another species, *Cicuta maculata*, is common in North America, growing in many places. It has a spotted stem, like that of true hemlock, the name of which it very generally receives in North America. The leaves are triternate, the leaflets ternate. It is a very poisonous plant, and is the cause of many deaths. *Cicuta*, in Latin, seems to have been the name of the same plant called *coneion* by the Greeks, but it is not known whether this or the previous plant was so denominated. See CONIINE.

HEMLOCK-TREE, or HEMLOCK SPRUCE. A name applied to the coniferous trees which belong to the genus *Tsuga*, especially to *Tsuga Canadensis*. This is a large, graceful tree with much the habit and appearance of some spruces. It is found from Nova Scotia to Alabama and Georgia, and west to Wisconsin and Minnesota. The leaves are one-half inch long, bright green above and silvery beneath. The cones, which have few thin bracts, are scarcely longer than the leaves. The wood, light, soft, brittle, and light-red in color, is extensively used in building. It warps badly when exposed. The bark is largely employed in tanning leather, for which purpose it is preferred and more extensively used than any other American product. Hemlock oil is distilled from the branches and leaves, and pitch is obtained from the trees. There are numerous cultivated varieties which are very ornamental, especially while the trees are young. *Tsuga Caroliniana* is a second species, which occurs locally in Virginia, North Carolina, and Georgia. Other species are found in Asia. See SPRUCE.

HEMP (AS. *henep*, OHG. *hanaf*, *hanof*, Ger. *Hanf*; connected with Lat. *cannabis*, Gk. *κάνναβις*, *kannabis*, OChurch Slav. *konoplya*, Lith. *kanapcs*, *hemp*, and probably with Skt. *śana*, *hemp*), *Cannabis sativa*. A fibre plant of the natural order Urticaceæ (q.v.), which has the male and female flowers on different plants. There is only one known species of the genus, which varies considerably, however, in different soil, climate, and cultivation. It is an annual, a native of the warmer parts of Asia, but has been cultivated in Europe from the earliest historic times, and is now naturalized in many parts of Europe and America. Like flax, it adapts itself to diversities of climate, and is cultivated equally well under the burning sun of the tropics, and in the northern parts of Russia. It is, however, readily injured by frost, particularly when young; and in many countries where it is cultivated, it succeeds only because the summer is sufficiently long for its whole life. Hemp varies very much in height, according to the soil and climate; some-

times it is only three or four feet, sometimes fifteen or twenty feet. Notwithstanding the nettle-like coarseness of its leaves, it is an elegant plant, and is sometimes utilized in shrubberies and large flower borders. The stem is erect, more or less branched; the leaves are five to nine-fingered, the flowers yellowish-green, small, and numerous. It is hollow or filled with only a soft pith, surrounded by a tender brittle substance, consisting chiefly of cellular tissue, with some woody fibre, which is called the 'reed,' 'boon,' or 'shive' of hemp. Over this is the thin bark, composed chiefly of fibres extending parallel with the stalk, with an outer membrane or cuticle. The female plants are taller and stronger than the male.

Hemp is cultivated for its fibre in almost all countries in Europe; most extensively in the centre and south of European Russia, which is the chief hemp-exporting district. French hemp is much esteemed in the market, as is also that of England and Ireland, of which, however, the quantity is comparatively inconsiderable. Hemp is cultivated to some extent in the United States; especially Kentucky, Missouri, and Illinois. The production has been greatly reduced in the last quarter century, owing to the introduction of Manila hemp and jute. Limestone soils and alluvial soils are best adapted to this plant. It is very necessary to have the soil so rich, and to sow the seed at such a season, that the plants shall grow rapidly at first, as they thus form long fibres. Hemp sown thinly produces a coarser fibre than that sown thickly. It is not considered an exhaustive crop when the leaves of the plant and the shive or boon are returned to the land. As with flax, a thorough preparation of the soil is necessary. With the ground well prepared there is little trouble with weeds, as hemp occupies the entire ground. The crop is ready to cut when the first seeds are ripe, or about 100 days from planting. Cutting is done by a knife or by a heavy mower. The treatment of hemp by 'retting,' etc., is similar to that of flax (q.v.). It is usually dew-retted by spreading evenly over the ground to rot out the gums that hold the filaments together. The hemp-stalks are afterwards decorticated by hand beating or machinery and cleaned from the fibre by 'hackling.' The fibre is tied up into 'hands' and baled. The average yield of hemp-fibre is about 1000 pounds per acre. The fibre of hemp is generally used for coarser purposes than that of flax, particularly for sail-cloth, pack-sheet, ropes, and the calking of ships.

The seed of hemp is produced in great abundance. It is commonly sold as food for cage-birds; and birds are so fond of it that not only the ripening fields, but the newly sown ground, must be carefully guarded against their depredations. Hemp is cultivated in warm countries for a resinous secretion which has narcotic or intoxicating qualities. In India the resin is commonly known as churrus or charras. See HASHISH.

While strictly speaking the name hemp belongs to the plant *Cannabis sativa*, by common usage it is now applied to other fibre-plants that in a great measure supply the uses once filled by common hemp alone. These are designated as bowstring, Manila, Sisal, and Sunn hemp (see below). Many lesser known fibre-plants pass under the general name of hemp, though they

vary widely in their botanical aspects and relations.

HEMP, BOWSTRING. The fibre produced by *Sansevieria* spp., a genus of Liliaceæ with representatives in tropical regions of both hemispheres. The employment of the fibre for making bowstrings led to this name. The plants are stemless perennials which grow wild in the jungles and increase by runners. The leaves, which yield readily to treatment in the fresh state, are thick and fleshy, sword or lance-shaped, and rich in fine lustrous fibre which ranges from two and one-half to seven feet in length, does not rot readily in water, and by experiment has been found to be the strongest and best-fitted fibre for deep-sea sounding. The plant, which is propagated readily from cuttings, requires a good rich soil in which, under favorable conditions, it will reach its full growth in one year. Ordinarily, however, it does not acquire its full size until the second season, and some species do not yield a crop until the third year. When once the land is stocked with it a full crop may be expected from the roots within twelve months after cutting. It does not appear to exhaust the soil materially, and will continue to make vigorous growth for a number of years in the same place. The yield is about 50 pounds of fibre per ton of green leaves. The total yield per acre has been reported by experiments to be nearly two and a-half tons of fibre annually.

HEMP, INDIAN. See HASHISH.

HEMP, MANILA, OR ABACA. The fibre of a species of plantain or banana (*Musa textilis*), a native of the Philippine Islands, where it is extensively cultivated. It is most widely grown in the southern part of Luzon, and less extensively on the islands of Samar, Leyte, Cebu, and Mindanao. The fibre is white, easily separated, and very tenacious. The harder and stronger outer fibre is used for cordage, the finer inner fibres for weaving delicate fabrics, and the intermediate layers for manufacture of web-cloths and gauzes. From the finer sorts of the fibre, veils, crapes, robes, and women's hats of great beauty are made; also various articles of men's wear, as shirts and suitings of remarkable durability. Manila hemp is largely used in the United States for making binding twine and cordage. Manila cordage is now used for every purpose for which rope is employed. The best conditions for the growth of abaca are shade and abundant moisture, with good drainage. The finest growth is obtained on the slopes of the volcanic mountains. A new plantation is generally made of young shoots, which very quickly throw out suckers. Occasionally the plants are raised from seed. The cultivation of the plant is simple. Weeds and undergrowth must be kept down during the first season, but after that the plants will exterminate other growths. Plants raised from year-old seedlings need at least two years, while those raised from suckers require four years before they will produce fibre of value.

The abaca is cut just before flowering, near the roots, split open longitudinally, and the central peduncle separated from the sheathing layers of fibre. The fibrous coats are dried two or three days in the shade, and are then scraped until only the fibres remain. Two men will cut and scrape about twenty-five pounds of the fibre in a day. It takes about 3200 plants to produce a

ton of 2240 pounds of fibre. The yield is about one and one-third tons of fibre per acre annually. The output of abaca is fairly uniform under natural conditions. The exports for several years preceding the cession of the islands by Spain averaged about 100,000 tons annually.

HEMP, SISAL. The fibre of *Agave rigida sisalana*, order Amaryllidæ, native of Yucatan, Mexico, Central America, and West Indies, and closely related to the century plant. It has been introduced into the Bahamas and Florida. As a cordage fibre it is second only to Manila hemp in strength. Its straight smooth strands of fibre become white upon drying without washing. The plants yield best on a gravelly, rocky soil in comparatively arid districts only a few feet above the level of the sea. It thrives upon the Florida Keys, upon the almost naked coral rock, but will not thrive when even slightly shaded. Plants set out at 18 inches high from the nursery will produce leaves fit for cutting in three years. The life of a plant when undisturbed is six or seven years, after which it sends up its blossom-stalk and then dies. Cutting, however, extends its life fifteen to twenty years. No special cultivation is needed except that the land be kept clean and the suckers kept down. The cutting of the leaves is done in Yucatan by Indians, who use a heavy-bladed, sabre-like knife called a machete. The spine at the leaf-end is cut off and the leaves bundled for removal to the machines. On large plantations they are transported by steam-power over tramways which reach different parts of the estate. The fibre is separated from the fresh leaf by a specially constructed machine called a raspador. The annual yield of fibre is from 1000 to 1470 pounds per acre, 50 to 70 pounds of fibre being derived from 1000 leaves.

HEMP, SUNN. The fibre derived from the bark of *Crotalaria juncea*, order Leguminosæ, a native of India. The plant has been in cultivation from time immemorial upon the high, sandy lands less suited for the more exacting crops. Seed is generally sown in April or May, and in August the plant, if grown for its fibre, is pulled or cut close to the ground, laid in long rows till the leaves begin to rot and separate from the stalks, which are then steeped in water for a few days, till the bark separates freely. The average yield is about 640 pounds of fibre per acre. The fibre is not so strong as hemp, but good cables, canvas, and cloth are made of it. It is now exported in considerable quantity, and is known by various names, as brown hemp, Bengal hemp, etc. Jubbulpore hemp (*Crotalaria tenuifolia*) is considered by some authorities to be a variety of *Crotalaria juncea*. See CROTALARIA.

HEMP-AGRIMONY. A European medicinal plant. See EUPATORIUM.

HEMPEL, CHARLES JULIUS (1811-79). An American homeopathist. He was born at Solingen, in Prussia, and was educated there, at the University of Paris, and, after coming to the United States (1835), at New York University. In 1857 he became professor of materia medica at the Hahnemann Medical College in Philadelphia, and later practiced at Grand Rapids, Mich., where he died. A man of considerable literary ability, Hempel, who when a student in Paris had assisted in the preparation of Michelet's *Histoire de la France*, published translations of *Hahnemann's Chronic Diseases* (1846), and of

Jahr's *Mental Diseases* (1853), as well as other homeopathic manuals. His most important works, however, were: *A System of Materia Medica and Therapeutics* (1859); *The Science of Homœopathy* (1874); and among several miscellaneous studies, *Christendom and Civilization* (1840).

HEMP-PALM (*Trachycarpus excelsus*). A palm of China and Japan, the fibre of the leaves of which is much employed in those countries for making cordage. Hats are also made of its leaves, and even cloaks and other garments for wet weather. See CHAMÆROPS.

HEMP-SEED OIL (*oleum cannabis*). An oil obtained from the seeds of the *Cannabis sativa*, or common hemp (q.v.). It has a mild odor, nauseating taste, and a greenish-yellow color which turns to brown with age. Its specific gravity at 15° C. is .9276. It is freely soluble in boiling alcohol. It has weaker drying properties than linseed, for which it is sometimes used as a substitute in making paints and varnishes. It is also used in soap manufacture. The seeds contain about 30 per cent. of oil. Consult Sadtler, *Industrial and Organic Chemistry* (Philadelphia, 1900). See OIL.

HEMPSTEAD. A village in Nassau County, N. Y., about 20 miles east of New York City; on the Long Island Railroad (Map: New York, G 5). Its principal interests are in farming and market gardening, though there are some manufacturing establishments. The village is a popular suburb of New York, and has the Hempstead Institute. Camp Black was established here during the war with Spain, as an encampment for State troops. The water-works are owned by the municipality. Hempstead was settled by New Englanders in 1643. The Presbyterian Church, organized the following year, claims to be the oldest Presbyterian society in the country. Population, in 1900, 3532. Consult Onderdonk, *The Annals of Hempstead, 1643-1832* (Hempstead, 1878).

HEMPSTEAD. The county-seat of Waller County, Tex., 50 miles northwest of Houston; on the Houston and Texas Central Railroad (Map: Texas, G 4). It is an important shipping point, especially for garden truck, being situated in a farming and cotton-growing region, and has cotton-gins, cottonseed-oil mills, etc. Population, about 2000.

HEMS. A city in Asiatic Turkey. See HOMS.

HEMSEN. See HEMESSEN.

HEMSTERHUIS, hēm'stēr-hois, FRANS (c.1721-90). A Dutch writer on moral philosophy and æsthetics. He was born at Groningen, the son of Tiberius Hemsterhuis; studied at the University of Leyden, and held a subordinate place in the Council of State of the United Provinces. He also devoted himself to literature and art, and especially to philosophy, and is classed with the sentimentalists of the eighteenth century. His chief works are: *Lettre sur la sculpture* (1769); *Lettre sur l'homme et ses rapports* (1772); *Aristée, ou de la divinité* (1778); and *Des facultés de l'âme* (1791).

HEMSTERHUIS, TIBERIUS (1685-1766). A celebrated Dutch philologist. He was born at Groningen, studied at the university there, and in 1704 was appointed professor of mathematics and philosophy at Amsterdam. In 1717 he was

made professor of Greek at Franeker, although he did not take up his residence there until three years later. In 1740 he received a call to the University of Leyden, where he remained until his death. One of the greatest Greek scholars of his time, he may be said to have created a new school of Greek philology, to which belong his distinguished pupils Ruhnken and Valckenaer. His editions of the *Onomasticon* of Pollux (2 vols., 1706), of the *Colloquia* of Lucian (1708 and 1732), and of the *Plutus* of Aristophanes (1744) are his principal literary works. From Hemsterhuis's manuscripts, *Anecdota Hemsterhusiana* (1825) have been edited by Geel, and *Orationes et Epistolæ* (1839) by Friedmann. Consult: Ruhnken, *Elogium Hemsterhusii* (Leyden, 1768; reprinted in the *Bibliotheca Teubneriana*); Lindemann, *Vitæ Duumvirorum T. Hemsterhusii et D. Ruhnkenii* (Leipzig, 1882), and Müller, *Geschichte der klassischen Philologie in den Niederlanden* (Leipzig, 1869).

HEN. See FOWL.

HÉNAULT, à'nò', CHARLES JEAN FRANÇOIS (1685-1770). A French historian. He became president of the *cour d'équêtes* in 1710, and member of the French Academy in 1723. Later he was the head of the household of Maria Leszczyńska, wife of Louis XV. He wrote much light and graceful verse, and some mediocre plays; but is best known for his excellent *Abrégé chronologique* (1744), the first successful attempt at a general history of France. His *Mémoires* (1854) are of value mainly because they contain interesting anecdotes of men of note in his day.

HENBANE (*Hyoscyamus*). A genus of plants of the natural order Solanaceæ, the members of which have a five-toothed calyx, an irregular funnel-shaped corolla, and a capsule which opens by a lid and is inclosed in the hardened calyx. The species are mostly annual and biennial herbs, natives of the Mediterranean region. The common henbane (*Hyoscyamus niger*) is not uncommon in waste places in the neighborhood of towns and villages in Europe, Northern Africa, Asia, and as an escape in the Eastern United States. It is also cultivated to some extent. It is an annual or biennial, somewhat bushy, one to four feet high, with large sinuated or sharply lobed leaves without leafstalks, and large, dingy yellow flowers, with brownish-red or purple veins. The whole plant is covered with clammy hairs, and has a nauseous smell, which gives warning of its strong narcotic, poisonous quality. Cases of poisoning by henbane are not rare, since its root somewhat resembles small parsnips. The seeds contain in largest quantity the peculiar alkaloid hyoscyamine, on which the properties of the plant chiefly depend. The symptoms of poisoning by henbane are similar to those produced by other narcotic poisons, and the proper treatment is the same as in cases of poisoning by opium. In medicine the leaves are commonly used internally. They are gathered and quickly dried when the plant is in full flower. Fomentations of henbane are applied to painful glandular swellings, parts affected with neuralgia, etc., and are often found to afford relief. Their action is almost the same as that of belladonna, and tincture and extract of henbane are often administered in cases of annoying cough, spasmodic asthma, and other diseases that seem to demand sedatives and anti-spasmodics. Henbane is also

employed to calm mental irritation and to induce sleep. For many cases it has one great advantage over laudanum in not producing constipation. The other species of henbane possess similar properties. In Greece the dried stalks of *Hyoscyamus albus* are smoked to allay toothache.

HENCKE, hēnk'e, KARL LUDWIG (1793-1866). A German astronomer, born at Driesen, where he was long postmaster. He discovered the planetoids Astræa (1845) and Hebe (1847), and contributed some additions to previous lists of stellar magnitudes to Peter's *Zeitschrift für Astronomie* (1860) and the *Monthly Notes* of the Astronomical Society (1859).

HENDERSON. A city and the county-seat of Henderson County, Ky., 10 miles below Evansville, Ind., on the Ohio River, and on the Louisville and Nashville, the Illinois Central, and other railroads (Map: Kentucky, D 3). A magnificent bridge crosses the Ohio at this point. Among the attractions of the place are Atkinson Park, containing 100 acres, and the county fair grounds. The city has fine public school buildings, and owns a well-equipped sanatorium. Henderson controls an important trade in tobacco, corn, and wheat; and among its industrial establishments are cotton and woolen mills, grain-elevators, tobacco-stemmeries, hominy-mills, saw and planing mills, a furniture-factory, wagon-works, coal-mines, etc. First incorporated in 1797, the city is now governed under a charter of 1893, by a mayor, elected for four years and ineligible for a second term, and a common council, chosen by popular vote. The water-works, gas plant, and electric-light plant are owned and operated by the municipality. Population, in 1890, 8835; in 1900, 10,272.

HENDERSON. A town and the county-seat of Vance County, N. C., 44 miles north of Raleigh, on the Seaboard Air Line and the Southern railroads (Map: North Carolina, D 1). It carries on an important trade in tobacco and cotton, and has several extensive tobacco-warehouses, cotton-mills, knitting-mills, cottonseed-oil mills, buggy and wagon factories, etc. Settled in 1820, Henderson was first incorporated in 1842. Under a charter last revised in 1893, the government is vested in a mayor, biennially elected, and a municipal council. Population, in 1890, 4191; in 1900, 3746.

HENDERSON. The county-seat of Chester County, Tenn., 180 miles west southwest of Nashville; on the Mobile and Ohio Railroad (Map: Tennessee, C 5). It is the seat of the Georgia Robertson Christian College, and of the Vanderbilt Training School. Henderson is the centre of an agricultural region, and has some manufactures, and considerable cotton trade. Population, about 2000.

HENDERSON. The county-seat of Rusk County, Tex., 160 miles north by east of Houston; on a branch of the International and Great Northern Railroad (Map: Texas, G 3). It has a normal college. There are cotton-gins, a pottery, and other industries, and a trade in cotton, live stock, etc. Population, about 2000.

HENDERSON, ALEXANDER (c.1583-1646). One of the greatest men in Scottish history, and, next to Knox, the most renowned ecclesiastic of Scotland. He was born in the Parish of Criech, Pifeshire, about 1583, and educated at Saint Andrews (M.A. 1603). He was presented to the

living of Leuchars (1614) by Archbishop Gladstones, where he was for a time unpopular; but as he changed his views he became one of the most influential ministers of Scotland. In 1639 he was transferred to Edinburgh. He took an active part against Episcopal innovations, and was mainly responsible for the 'National Covenant,' which was publicly signed in Greyfriar's Church, Edinburgh, 1638. During the troubled times of Charles I.'s reign Henderson's influence was felt in the negotiations for peace between the Scottish ecclesiastics and the Court, and when Charles visited Scotland in state (1641) Henderson attended him as chaplain, and later on went to Oxford to mediate between the King and Parliament. In 1643 Henderson was elected moderator for the third time in the General Assembly at Edinburgh, and in that capacity presented a draught of the famous 'Solemn League and Covenant,' an instrument against prelacy which was generally accepted by the Puritans. With Baillie, Rutherford, and others, Henderson represented Scotland in the Westminster Assembly, when the 'Solemn League,' with slight modifications, passed both Houses and became law for the two kingdoms. When in 1646 the King joined the Scottish army and retired with it to Newcastle, he sent for Henderson, and discussed the systems of Church government in a number of papers. Henderson died at Edinburgh, August 19, 1646, and his death was the occasion of a national mourning in Scotland. For his life, consult Aiton (Edinburgh, 1836).

HENDERSON, ANDREW (c.1705-75). A Scottish maker and seller of books. He was born in Roxburghshire, and was educated at Aberdeen and in Edinburgh, where he afterwards was a high-school teacher, as well as a tutor in private noble families. He was in London when his first book was published, a translation of Voltaire's *Charles XII. of Sweden* (1734), but was back in his native land in time to witness the Jacobite uprising, and to describe it in *A History of the Rebellion, 1745 and 1746* (1748). He began his bookselling at Longacre, London, but continued to produce such histories as: *Frederick, King of Sweden* (1752); *William the Conqueror* (1764); memoirs: *Dr. Archibald Cameron* (1753); *Field-Marshal Leopold, Count Daun* (a French translation, 1757); and *Field-Marshal James Keith* (1758); as well as certain disputatious writing directed against the Bishop of Chester and Dr. Samuel Johnson, with a side thrust at Smollett. But his best book is said to be *The Life of William Augustus, Duke of Cumberland* (1766).

HENDERSON, CHARLES HANFORD (1861—). An American educator, born in Philadelphia, and educated at the University of Pennsylvania and in Zürich. For two years (1883-85) he was lecturer at the Franklin Institute in Philadelphia, and then, after two years of editorial work, was appointed principal of the Philadelphia Manual Training High School (1892-96). In 1898 and 1899 he directed the Pratt Institute High School in Brooklyn. His publications include *The Elements of Physics* (1900), and many essays upon educational and social subjects.

HENDERSON, CHARLES RICHMOND (1848—). An American sociologist, born in Covington, Ind. He graduated at the University of Chicago in 1870, and received the degree of S.T.B. at Union

Theological Seminary in 1873. From 1873 to 1883 he was pastor at Terre Haute, and from 1883 to 1892 at Detroit. In 1892 he was elected assistant professor of sociology at Chicago University, and afterwards was advanced to the full professorship. His principal works are: *An Introduction to the Study of the Dependent, Defective, and Delinquent Classes* (1898); *Social Elements* (1898); *Social Settlements* (1899). His discussions are practical rather than theoretical; and his works are characterized by a tone of healthy optimism.

HENDERSON, DAVID BREMNER (1840—). An American statesman, born at Old Deer, Aberdeenshire, Scotland. He went to Illinois in 1846, to Iowa in 1849, graduated at Upper Iowa University (Fayette, Iowa), studied law in an office at Dubuque, and was admitted to the bar in 1865. In 1861 he enlisted as a private in the Twelfth Regiment Iowa Volunteer Infantry, was elected and commissioned first lieutenant of Company C, and served until discharged, February 26, 1863, owing to the loss of a leg at the battle of Corinth. From May, 1863, to June, 1864, he was commissioner of the board of enrollment of the Third Iowa District, and then reentered the army as colonel of the Forty-sixth Iowa Volunteer Infantry, in which rank he served to the close of the war. From 1865 until his resignation in 1869 he was collector of internal revenue for the Third Iowa District, in 1869 began to practice law as member of a Dubuque firm, and in 1869-71 was Assistant United States District Attorney for the Northern Division of the District of Iowa. He was elected to the Federal House of Representatives in 1882, as a Republican from the Third Iowa District, was chairman of the Committee on Judiciary, and a member of the Committee on Rules in the Fifty-fourth and Fifty-fifth Congresses, and in 1899, at the organization of the Fifty-sixth Congress, was elected to succeed T. B. Reed, resigned, as Speaker of the House. He was also chairman of the Iowa delegation at three national Republican conventions. In Congress he acquired reputation for his skill in debate, and the wise conduct of his important legislative office.

HENDERSON, EBENEZER (1784-1858). A Scotch missionary and linguist. He was born of poor and humble parents in Fifeshire, November 17, 1784. He worked as a clockmaker and shoemaker, but in 1803 entered Robert Haldane's seminary in Edinburgh and studied theology. He planned in 1805 to accompany the Rev. John Paterson to India; but as this did not prove practicable, he located at Elsinore, Denmark, and devoted himself to the distribution of Bibles in the Scandinavian countries. In the course of his labors he visited Sweden and Lapland, Iceland, Denmark, and Germany. In 1818 he accompanied Dr. Paterson through Russia as far as Tiflis, and until 1825, when the Russo-Greek Church induced the Czar to interdict the Bible Society, he resided at Saint Petersburg. Returning home, he was appointed tutor of the Mission College, Gosport, and from 1830 till 1850 was professor of Oriental languages in Highbury Congregational College. He died at Mortlake, May 16, 1858. His linguistic attainments were very great; he made himself acquainted not only with the ordinary languages of scholarship, but also with Hebrew, Syriac, Ethiopian, Russian, Arabic,

Tatar, Persian, Turkish, Armenian, Manchu, Mongolian, and Coptic. The first Bible society in Denmark was organized by him (1814); he was associated with the London Religious Tract Society and the Society for the Propagation of the Gospel Among the Jews. He published an account of his travels in Iceland (1818); Russia (1826); *The Vaudois: A Tour to the Valleys of Piedmont* (1845); several volumes of Bible annotations; enlarged Charles Buck's *Theological Dictionary* (1833); and edited numerous volumes of other writers. For his life, consult Henderson (London, 1859).

HENDERSON, JAMES PINCKNEY (1808-58). An American soldier and political leader. He was born in Lincoln County, N. C.; practiced law in Mississippi, went to Texas in 1836, and served as brigadier-general during the revolution of that year. He was Secretary of State of the Texan Republic in 1837-39, was a minister to England and France to secure the recognition of Texan independence, and went to Washington in 1844 to secure annexation. He was a member of the Texas Constitutional Convention in 1845, and in the following year was elected first Governor of the State after annexation. He served in the Mexican War, and was presented with a sword by Congress. In 1857 he was appointed Senator from Texas as a State-Rights Democrat.

HENDERSON, JOHN (1747-85). An English actor of Scotch descent, native of Cheapside, London. In Bath (1772) he made his debut as Hamlet, was fairly successful in other Shakespearean rôles, and came to be known as 'Bath Roscius.' In 1777 he was acting at the Haymarket, London, and for the two following years was with Sheridan at Drury Lane, making himself famous as Shylock and Falstaff, besides creating characters in plays of Shirley, Cumberland, Jephson, and Mackenzie. He was engaged at Covent Garden from 1779 until his death, and was ever remembered gratefully by Mrs. Siddons, whom he had encouraged, and by many others of the profession, though Garrick was jealous of him, and he had earned the ill will of another actor-manager by his powers of mimicry. The deficiencies of Henderson's voice and person were overbalanced by the superior qualities of his mind, and he achieved special renown as a reader and a reciter of dramatic monologues. Gainsborough, his intimate friend, painted his picture, and there are portraits of him also by Stewart and Romney. He was buried in Westminster Abbey.

HENDERSON, PETER (1822-90). A Scotch-American horticulturist, born at Pathhead, Scotland. He came to America in 1843, and engaged in horticultural pursuits. In 1862 he opened a seed store in New York City, and in 1871 undertook the seed business on a large scale under the firm name of Peter Henderson & Co. He was not only very successful as a seed-merchant, but also did much to develop improved varieties of horticultural plants. He has been deservedly called 'the father of horticulture and ornamental gardening' in the United States. He wrote much for horticultural journals, and was the author of the epoch-making book entitled *Practical Floriculture* (1867), which has passed through many editions. Some of his other works are: *Gardening for Profit* (1866); *Gardening for Pleasure* (1875); and *Garden and Farm Topics* (1884).

HENDERSON, RICHARD (1734-85). An American pioneer, born in Hanover County, Va. He removed to Granville County, N. C., in 1762; studied law, was admitted to the bar, and in 1769 was appointed Associate Justice of the Superior Court. After the Declaration of Independence and the organization of the State Government in North Carolina, he was reelected judge, but was prevented from accepting that position by his participation in a scheme organized under the name of the Transylvania Land Company, by which in 1775 the Cherokee Indians were induced to transfer to the company all the land lying between the Cumberland River, the Cumberland Mountains, and the Kentucky River, and situated south of the Ohio. This territory, half as large as the present State of Kentucky, was organized by Henderson and his associates into a political community, with president, legislature, and judges; but the State of Virginia annulled the purchase from the Indians, whose chiefs had signed the Treaty of Watoga for the purposes of the transfer. Nevertheless the enterprise and success of Henderson and his friends in colonization and settlement were rewarded by the Virginia Legislature with the grant of a tract of land twelve miles square on the Ohio River, below the mouth of Greene River. After a short residence in Nashville, Tenn., where he practiced law, he returned to North Carolina, and engaged in farming on a large scale.

HENDERSON, THOMAS (1798-1844). A Scotch astronomer, born at Dundee, and educated at the academy of that city. He had to go to work at fifteen, but all his spare time was spent on astronomy. From 1819 to 1831 he was secretary to the Earl of Lauderdale and to Lord Jeffrey, and during this period became known to astronomers in Edinburgh and to the Royal Society of London. In 1831 he was made royal astronomer at the Cape of Good Hope, succeeding Fellows, but resigned two years later; was appointed astronomer royal for Scotland, professor of practical astronomy at Edinburgh, and director of the Calton Hill Observatory. He died at Edinburgh. Henderson wrote contributions, on the orbits of several comets, to the *Astronomische Nachrichten*; and published five volumes of his observations (1838-43; continued by Smyth, 1843-52). He is best known for his new method of calculating occultations (1824) and for his remarkable ability in astronomical computation.

HENDERSON, WILLIAM JAMES (1855-). An American musical critic and scholar, born at Newark, N. J. He is regarded as one of the most accomplished scholars in music in America, and is a frequent contributor to the leading magazines and reviews. He graduated from Princeton in 1876, and immediately began work as a journalist, serving in 1883 as a reporter, four years later as the musical critic of the *New York Times*, and in 1902 of the *New York Sun*. Later he received the appointment of lecturer on musical history in the New York College of Music. Besides writing the librettos to a number of light operas, he published: *What is Good Music?* (1898) and *How Music Developed* (1899), both of which are regarded as authorities. He also published *Preludes and Studies*, a story of music, *The Orchestra and*

Orchestral Music (1902), and numerous other tales and stories.

HEN'DERSONVILLE. A town and the county-seat of Henderson County, N. C., 21 miles south of Asheville; on the Southern Railway (Map: North Carolina, B 4). It has a tannery, a furniture-factory, a lumber-yard, etc., and considerable trade in agricultural products, particularly potatoes, cabbages, and apples. The town enjoys considerable popularity as a summer resort. Population, in 1890, 1216; in 1900, 1917.

HEN'DON. A town in Middlesex, England, situated on the picturesque coach route from London to Saint Alban's, six miles northwest of Saint Pancras Station, London (Map: London, C 6). Population, in 1891, 15,800; in 1901, 22,450.

HEN'DRICKS, THOMAS ANDREWS (1819-85). An American politician. He was born near Zanesville, Ohio; was early taken by his parents to Indiana; graduated at South Hanover College in 1841, and two years later was admitted to the bar. He practiced his profession with success in Indiana; was a member of the Legislature and the State Constitutional Convention of 1851; and was a member of Congress from 1851 to 1855. He was United States Senator from 1863 to 1869, and in 1868 was a candidate for the Democratic nomination for President. In the next Presidential election, the Democratic candidate, Horace Greeley, having died before the casting of the electoral votes, they were given to Hendricks. He was Governor of Indiana from 1873 to 1877. He ran for Vice-President of the United States on the ticket with Samuel J. Tilden in 1876, and was elected Vice-President in 1884 on the ticket with Grover Cleveland, but died on November 25th of the following year.

HEN'DRICKSON, GEORGE LINCOLN (1865—). An American Latinist, born at Winchester, Ill. He was educated at Beloit College, the Johns Hopkins University, and the universities of Bonn and Berlin. From 1891 to 1896 he was professor of Latin at the University of Wisconsin, and in 1897 was appointed to a similar chair at the University of Chicago. His writings include frequent contributions to the *American Journal of Philology* on subjects relating to the history of Latin literature.

HENGEST, hēng'gēst, or **HENGIST AND HOR'SA**. The legendary leaders of the first Germanic invaders of Britain. About 449 A.D. a band of Jutes landed at Ebbsfleet on the island of Thanet. They came from the peninsula now called Jutland, and, according to tradition, were in three vessels. Tradition has assigned to their leaders the names of Hengest and Horsa, one meaning the horse and the other the mare. It is now generally held that these names are mythical. This point of view is confirmed by the fact that Hengest is the name assigned to the hero of many different traditions. The cromlech called 'Wayland Smithy' has sometimes been designated as a monument to Hengest and Horsa. Consult Elton, *Origins of English History* (London, 1882). See **ANGLO-SAXONS**.

HENGSTENBERG, hēng'sten-bērk. **ERNST WILHELM** (1802-69). The leader of the Conservative School of theologians in Germany during the first half of the nineteenth century. He was born in Westphalia, October 20, 1802, the son of a clergyman. He studied at Bonn and became

tutor in Basel (1823-24). Going to Berlin in 1824 as privat-docent, he put himself at the head of a rising orthodox school, and, with most conscientious devotedness, made the scientific defense of their principles the aim of his labors in the university and through the press. He was made professor extraordinary in 1826, and full professor in 1828. As editor of the *Evangelische Kirchenzeitung*, begun in 1827, he combated rationalism even in its mildest forms, seeking to restore the orthodoxy and Church discipline of the sixteenth and seventeenth centuries. With the same view were written all his principal works: *Christologie des alten Testaments* (1829-35; 2d ed. 1854-57); *Beiträge zur Einleitung ins alte Testament* (1831-39); *Kommentar über die Psalmen* (1842-45; 2d ed. 1850); *Das Hohelied Salomons ausgelegt* (1853); and others devoted to the defense of the old interpretation and criticism of the Scriptures against the results of modern biblical science. Hengstenberg's influence in ecclesiastical matters also was employed in carrying out the high Lutheran dogmas of the Church, of Church offices, and of the sacraments, by persecution of sectaries, by opposition to the union of Lutherans and Reformed, and by attempts to depose from their chairs Gesenius, Wegscheider, De Wette, and other rationalistic teachers in the universities. He died in Berlin, May 28, 1869. Among his later works were: *Die Weissagungen des Propheten Ezekeil* (1867-68); *Geschichte des Reiches Gottes unter dem alten Bunde* (1869-71); *Das Buch Hiob erläutert* (1870-75). Most of his exegetical and critical works have been translated. For his life, consult Bachmann and Schmalenbach (Gütersloh, 1876-92).

HEN-HARRIER. See **MARSH-HAWK**.

HEN-HAWK, HEN-HARRIER, or CHICKEN-HAWK. A hawk which attacks poultry. This definition includes an extensive list and variety of birds of prey, if the entire English-speaking world is considered, and the accusation is not always a fair one, as the offense is occasional rather than habitual with many of the birds against which it is charged. The term 'hen-harrier' is British, and belongs to the subfamily *Circinae*, represented in the United States by the innocent marsh-hawk (q.v.). Many of the eagles and larger falcons, as well as some of the smaller ones, do now and then swoop upon domestic fowls; yet these robberies constitute only a small proportion of their food, which mainly consists of small mammals, frogs, grasshoppers, and other insects. In certain places, the smaller falcons may become a serious local nuisance to the poultry-keeper, especially in winter; but in general the harm they do is far more than compensated for by their service to agriculturists in destroying injurious rodents and insects. The miscellaneous destruction of hawks and owls is therefore unwise. The species commonly called hen-hawks include two birds, the red-tailed and the red-shouldered hawk. See **BUZZARD**.

RED-TAILED HAWK. The redtail (*Buteo borealis*) is one of the largest, most numerous, and most widely distributed of North American buzzard-hawks. It is from 19 to 25 inches long, and its spread of wings is from 49 to 58 inches. In maturity the upper surface is blackish-brown, variegated with whitish and dull rust-color, the last tint growing brighter on the upper surface

of the tail, which has a blackish cross-band near the end. The under surface of the body is buffy white, the belly marked with dark streaks. Young specimens show a dark zone across the lower part of the breast, and from six to ten regular dark bands across the gray tail. Western specimens vary a good deal, and were described as separate species by early writers. The majority of them leave the Northern States in winter, and migrate in large flocks. They build their nests in tall trees. Their food includes all the mammals from the size of a squirrel downward, and all sorts of birds from grouse and rails to sparrows; but this larger game is far outnumbered by the smaller gophers, mice, frogs, insects, and carrion upon which they principally subsist. Fisher declares that it has been demonstrated by careful examination of stomachs that poultry and game birds do not constitute more than 10 per cent. of the food of this bird.

RED-SHOULDERED HAWK. This species (*Buteo lineatus*) is rather less in size than the redtail, and generally more reddish in plumage, especially bright on the shoulders, while the lower parts (whitish in the young) are everywhere rusty in color, transversely barred with a darker tint. The tail is black, covered by about six bands of white. It is a rather heavy, sluggish bird, and lives throughout the year south of the Great Lakes, frequenting lowlands and marshes, except in the spring, when it retires to the woods for breeding purposes. The great tree-built nest is often begun before the end of February. This hawk's diet is exceedingly varied, and includes a larger proportion of frogs and snakes than the redtail's. It preys principally on mice, however, and almost never attacks poultry, so that its reputation as a hen-hawk is undeserved. On the contrary, its work is of the highest benefit to farmers, who should carefully preserve it. A similar species, Swainson's hawk, of the Western interior, is equally beneficial and worthy of protection because of the great numbers of gophers, locusts, and the like it kills at all seasons.

CHICKEN-HAWKS. Under this head may be mentioned a few of the smaller destructive falcons. The goshawk and gyrfalcon (qq.v.) are so rare that the harm resulting from them is small. The sharp-shinned hawk (*Accipiter velox*) is a true falcon, and inhabits all of North America, migrating annually from the northern districts to the warmer parts. It is about a foot long. Its pointed wings stretch about two feet, and they enable it to fly with extreme swiftness and power. In color it is uniformly grayish above, darker on the crown, and the tail is crossed by several blackish bands; below, the surface is white, with breast and sides barred dusky or rufous. It takes its name from the sharp front of the tarsi. Its courage and boldness are admirable, but they are unfortunately directed mainly against birds, which constitute almost all of its food. Where it settles on a farm it lives upon young chickens, since these are more easily caught than wild birds; and it stays in the neighborhood until it is killed or the supply of poultry is exhausted. It is to be noted in its favor, however, that it preys persistently upon the English sparrows. Cooper's hawk (*Accipiter Cooperi*) is nearly twice as large as the sharpshin, but closely resembles it in color. It is not found much north of the Saint Lawrence and Saskatchewan valleys, and in winter retreats south of the middle part of the United States.

Like the sharpshin, it feeds mainly upon birds, and is destructive to English sparrows and poultry, with a special fondness for domestic pigeons. These two smaller falcons, and certain owls, are responsible for most of the evil reputation attaching to the hawk tribe in the minds of indiscriminating poultry-keepers.

BIBLIOGRAPHY. Fisher, *Hawks and Owls of the United States* (Washington, 1893).

HENKE, hĕnk'ĕ, **HEINRICH PHILIPP KONRAD** (1752-1809). A German Protestant ecclesiastical historian, born at Hehlen. He was educated at Brunswick and at Helmstedt, where in 1778 he became professor of theology. He is best known as author of a valuable *Allgemeine Geschichte der christlichen Kirche* (1795-1806). Consult the biography by Wolff and Bollmann (Helmstedt, 1816).—His youngest son, **ERNST LUDWIG THEODOR HENKE** (1804-72), born at Helmstedt, was also a Church historian. In 1833 he became professor at Jena, and in 1843 at Marburg, where six years afterwards he was appointed supervisor of the Theological Seminary. His works include: *Georg Calixtus und seine Zeit* (1853-60); *Papst Pius VII.* (1860); and *Konrad von Marburg* (1861). For his biography, consult Mangold (Marburg, 1879).

HENLE, hĕn'le, **FRIEDRICH GUSTAV JAKOB** (1809-85). A German physiologist and anatomist, born at Fürth. He studied at Bonn and Heidelberg (1827-32), and then became assistant to Rudolphi in the anatomical museum at Berlin, and in 1834 demonstrator of anatomy under Johann Müller. Three years later he became privat-docent in Berlin, and made a specialty of microscopic anatomy and pathology. From 1840 to 1844 he was professor of anatomy and physiology at Zurich, and in the latter year went to Heidelberg as professor of anatomy. At this time he wrote *Handbuch der rationellen Pathologie* (3d ed. 1855), which put him in the first rank of the members of the rational-physiological school. His most important work was *Handbuch der systematischen Anatomie des Menschen* (3d ed. 1876-79), in connection with which he issued *Anatomischer Handatlas zum Gebrauch im Seciersaal* (3d ed. 1895-96). Henle's other works include: *Pathologische Untersuchungen* (1840); *Handbuch der allgemeinen Anatomie* (1841); *Grundriss der Anatomie des Menschen, mit Atlas* (4th ed. 1901). He also wrote yearly reviews on pathology and anatomy for Müller's *Archiv* (1838-42), and on anatomy in general in Cannstatt's *Jahresbericht* (1844-55). In 1841 he founded with Pfeufer the *Zeitschrift für rationelle Medizin*. For his life, consult Merkel (Brunswick, 1891).

HENLEY, JOHN (1692-1756), commonly known as **ORATOR HENLEY**. An eccentric English clergyman, son of Rev. Simon Henley. He was born at Melton Mowbray, Leicestershire, and educated at Saint John's College, Cambridge. While an undergraduate, he sent a witty letter to the *Spectator* (1712). After leaving the university, he became headmaster of the grammar school of his native town. He was also ordained, and held for some time a curacy there. In 1714 he published a rhetorical poem entitled *Esther, Queen of Persia*. He also compiled at this period a grammar of seven languages called *The Complete Linguist* (1719-21). Removing to London, he was appointed reader at the Church of Saint Joseph the Martyr. He found it agreeable to re-

tire, in 1724, to the rectory of Chelmondiston, in Suffolk. Again, his talents not being appreciated, he left the Church, and returned to London, where he opened, in 1726, his famous oratory in Newport Market, above the market-house. He preached on Sundays and lectured on Wednesdays. His pompous elocution and his strange service drew for a time large congregations. He struck medals of admission to his hall, bearing the device of a star rising to the meridian with the motto, *Ad summa*, and below, *Inveniam viam aut Faciam*. His pulpit was covered with velvet and adorned with gold, and over his altar was raised the inscription, 'The Primitive Eucharist.' In 1730 he became a pensioner of Walpole, editing for him the rather disreputable periodical called the *Hyp Doctor*. He was ridiculed by Pope, and he furnished the subject for two plates by Hogarth. Fifty manuscript volumes of his lectures were deposited in the British Museum.

HENLEY, ROBERT, Earl of Northington. See **NORTHINGTON**.

HENLEY, WALTER DE. An English friar and author of the thirteenth century. He wrote in French a work called *Hosebandri*, which for two centuries was the best treatise on the subject. The book was several times translated into Latin and English, and once into Welsh. A unique copy of an English version is in the possession of the Cambridge University Library.

HENLEY, WILLIAM ERNEST (1849—). An English author and editor, born at Gloucester. He was educated at the Crypt Grammar School at Gloucester. While ill at a hospital in Edinburgh in 1874—which experience he afterwards embodied in *Hospital Rhymes*—he met Robert Louis Stevenson, and the two men, in many ways alike, were intimate friends for thirteen years. Together they wrote the plays, *Deacon Brodie* (1879); *Beau Austin*, an admirable comedy; *Admiral Guineá*; and *Robert Macaire*; and Stevenson contributed to several of Henley's publications. Henley edited *London* (1877-78); the *Magazine of Art* (1882-86); the *Scots Observer*, which was transferred to London as the *National Observer* (1888-93); and the *New Review* (1893-98). There has been adverse criticism of Henley for his arraignment of Balfour's *Life of Stevenson*, which he claimed did not give a true idea of his friend's character. He has also been criticised for his point of view in the essay on Burns, *The Centenary Burns* (1897), with T. F. Henderson (terminal essay by W. E. H., reprinted as *The Life, Genius, and Achievement of Robert Burns* in 1898). He is strong in his likes and dislikes, and arrogant, even aggressive, in his statement of them. But the brilliant style, the acute insight, the technique, the pungent felicitous wit, make the work a *tour de force* of criticism. His *Views and Reviews, Literature* (1900), and *Views and Reviews, Painting and Sculpture* (1901), are collected from previous publications. They show primarily his own personality, but they are never commonplace and never dull. His learning is solid, whether he touches on literature or art; and he is always suggestive. As a poet, Henley belongs to the 'fleshy school.' In subject and treatment he is essentially modern and original. Perhaps his most characteristic work is *London Voluntaries* (in *Song of the Sword*, 1898). His poetry, like his prose, is egotistical.

Sometimes his imagery is grotesque, and his humor of the grimmest, but he has the gift of original and powerful expression. He edited *Lyra Heroica* (1892); *A London Garland* (1895); *English Lyrics* (1897); *The Works of Lord Byron* (1897); *The Poetry of Wilfrid Blunt* (1898, with George Wyndham); and wrote *London Types* (1898, with W. Nicholson); *A Book of Verses* (1888); *Poems* (1898); *For England's Sake* (1900); *Hawthorn and Lavender, and Other Verses* (1901); and *Shakespeare, the Edinburgh Folio* (1901).

HENLEY-ON-THAMES. A town in Oxfordshire, England, on the left bank of the Thames; 35 miles west of London. It is a favorite boating and angling resort, famous for the annual regatta held here since 1839, in which crews from the universities participate (Map: England, E 5). American colleges are frequently represented. An elegant stone bridge which spans the Thames, the old parish church, grammar school, town hall, library and reading-rooms, are prominent features. Henley dates from the Roman occupation and received a charter of incorporation from Elizabeth. Population, in 1891, 4900; in 1901, 5984. Consult Burn, *History of Henley-on-Thames* (London, 1861).

HENLEY REGATTA. The most famous open rowing contest in the world, held annually at Henley-on-Thames, during the month of July. It lasts for three days, during which the gathering of a brilliant assemblage makes the river and its banks a scene of the utmost picturesqueness. In 1829 this course was chosen for rowing contests between Oxford and Cambridge; and in June, 1839, the first regatta was held. The course is one mile 550 yards in length; owing to the narrowness of the river, all races are rowed in heats of only two boats at a time. The events, which are open to all amateurs, English and foreign, are the Grand Challenge Cup, Ladies' Plate, Thames Challenge Cup for eight-oars; Stewards', Visitors', and Wyfold Challenge Cups for four-oars; Silver Goblets (Nickalls Challenge Cup) for pairs; and the Diamond Sculls for single scullers. Toward the close of the nineteenth century the purely amateur character of the regatta was threatened by the increasing participation of crews trained by professional coaches, and competing with all the advantages of professionalism. This gave rise to considerable agitation, and a strong demand on the part of some of the English rowing clubs for the exclusion of foreign crews. The culmination of the agitation occurred in 1902, when a regulation was enacted which prohibited all competing crews and individuals from the enjoyment of a professional coach for a period of thirty days immediately preceding the race or regatta.

HENLO'PEN, CAPE. See **CAPE HENLOPEN**.

HENNA, or HINNA (Ar. *hinnā'*, from *ḥana'a*, to be green). A name given to *Lawsonia alba*, a shrub of the natural order Lythraceæ. The species was formerly divided into *Lawsonia inermis* and *Lawsonia spinosa*, but both are now grouped under *Lawsonia alba*, the only species. They differed in little but that the one is unarmed and the other thorny, the latter being also the larger plant. Henna grows in moist situations throughout the north of Africa, Arabia, Persia, and the East Indies. It is cultivated in many places for the sake of its flowers, which

are much prized for their fragrance, particularly by the Egyptian ladies; but still more for the sake of the leaves, which abound in coloring matter, and which, being dried, powdered, and made into a paste with hot water and catechu, are very generally employed by women throughout the East to stain the nails and tips of the fingers of an orange color; also by men to dye their beards, the orange color being converted into a deep black by indigo; and for dyeing the manes and hoofs of horses, and to dye skins and leather reddish-yellow. Powdered henna-leaves form a large article of export from Egypt to Persia, and to various parts of Turkey, from which they find their way to more northern countries, and even to Germany, to be employed in dyeing furs and some kinds of leather. The use of henna for staining the nails appears to have prevailed from very ancient times. See ALKANET.

HENNE-AM-RHYN, hën'ne âm rën, OTTO (1828—). A Swiss-German historian of civilization. He was born at Saint Gall in Switzerland, and was the son of Anton Henne, a Swiss historian and poet. He studied at Bern, and after holding several positions as teacher and archivist in Switzerland, went in 1872 to Leipzig, where he was editor of the *Freimaurerzeitung*. From 1882 to 1885 he lectured in the University of Zurich, and since 1885 he has been State archivist at Saint Gall. He wrote: *Geschichte des Schweizervolks und seiner Kultur* (last ed. 1879); *Kulturgeschichte der neuern Zeit*. (1870-72); *Die deutsche Volkssage* (1879); *Allgemeine Kulturgeschichte von der Urzeit bis zur Gegenwart* (1877-97); *Kulturgeschichte des Judentums* (2d ed. under the title *Kulturgeschichte des jüdischen Volks*, 1892); *Das Jenseits* (1881); *Die Kreuzzüge und die Kultur ihrer Zeit* (1883-84); *Kulturgeschichte des deutschen Volks* (last ed. 1898); *Die Kultur der Vergangenheit, Gegenwart und Zukunft* (last ed. 1892); *Die nationale Einigung der Deutschen* (1891); *Das Christentum und der Fortschritt* (1892); *Die Frau in der Kulturgeschichte* (1892); *Die Gebrechen und Sünden der Sittenpolizei* (last ed. 1897); *Geschichte des Rittertums* (1893); *Die Freimaurer* (1894); *Die Jesuiten* (3d ed. 1894); *Aria, das Reich des ewigen Friedens im 20. Jahrh. Ein Zukunftsbild* (1895); *Handbuch der Kulturgeschichte* (1900-01). His autobiography appeared in *Deutsche Denker*, vol. viii. (Danzig, 1890).

HENNEBERG, hën'ne-bërk, WILHELM (1825-90). A German agricultural chemist, born at Wasserleben. He was educated at Brunswick, Jena, Giessen, the agricultural college at Badersleben, and in England. In 1853 he founded at Celle the *Journal für Landwirtschaft*; four years later he was appointed director of the new experimental station near Göttingen, and in 1865 professor in the university. The founder of a new school of agricultural chemistry, especially in the matter of pasturage, he wrote, with Stohmann, *Beiträge zur Begründung einer rationellen Fütterung der Wiederkäuer* (1860-64), and *Neue Beiträge* (1870-71).

HENNEGAU, hën'ne-gou. See HAINAULT.

HENNEPIN, ën'pä'n', LOUIS (c.1640-c.1706). A Belgian missionary and explorer in America. He was born at Ath, in Hainault, and at an early age joined the Recollet branch of the Franciscan

Order, becoming a successful preacher in Belgium and Northern France. In 1675 he embarked for Canada in the same ship with La Salle, the explorer, and Bishop Laval, of Quebec. The next year he was in the Indian mission of Fort Frontenac, and visited the Mohawk country. In 1678 he accompanied La Salle's expedition to Niagara and the upper lakes, and constructed a vessel in which they proceeded by the Erie, Huron, and Michigan lakes to Saint Joseph's River, which they navigated in canoes. Reaching the Illinois, they built Fort Crèvecoeur. Here La Salle left them, and Hennepin and his party proceeded down the Illinois to the Mississippi. They were captured by the Sioux and carried up the Mississippi, but were soon released, and Hennepin returned to Quebec. During this journey Hennepin discovered the Falls of Saint Anthony, July 3, 1680, and one of his party penetrated as far as Lake Superior. Hennepin soon after sailed for France, where he published his *Description de la Louisiane* (1683-84), containing an account of La Salle's expedition and of the missionary's own discoveries. Hennepin refused to return to America, though ordered to do so by his superiors of the Church, and took refuge in Holland. After La Salle's death Hennepin published his *Nouvelle découverte d'un très grand pays situé dans l'Amérique*. In this he claimed to have been the first man to descend to the mouth of the Mississippi—a statement which was easily proved to be false. His works won great popularity and were translated into several languages. Hennepin died at Utrecht about the year 1706. For his life and discoveries, consult: Saint-Genois, *Les voyageurs belges du XIII. au XIX. siècle* (Brussels, 1867); Van Hulet, *Notice sur le père Louis Hennepin* (Liège, 1845); Shea, *Discovery of the Mississippi* (New York, 1852); Parkman, *La Salle and the Discovery of the Great West* (12th ed., Boston, 1887); Winsor, *Narrative and Critical History of America*, vol. iv. (Boston, 1884), contains a full account of Hennepin.

HENNEQUIN, ën'kän', ALFRED (1842-87). A French dramatist, born at Liège, Belgium. He was a pupil at the school of mines in his native town, and practiced engineering, but after 1875 confined himself to play-writing. His early works include: *J'attends mon oncle* (1869), and *Les trois chapeaux* (1870). His first Parisian success was *Le procès Vauradieux* (1875). This was followed by *Les dominos roses* (with Delacour, 1876); *Bébé* (with Najac, 1877); and *Nounou* (1879); *Niche* (1878); *Lili* (1880); *La femme à papa* (1885), the last three in collaboration with Albert Millaud, and many other gay, daring comedies.

HENNET, ë'nä', CHEVALIER ALBERT JOSEPH ULIPIEN (1758-1828). A French economist, born at Maubeuge. When he was nineteen he became supernumerary in the Ministry of Finance under Necker, and, although a royalist at heart, acted with such prudence through both Republic and Empire that he became chief commissioner of finance, and held that post from 1813 to 1816. He is well known for his work on finance, including *Théorie du crédit public* (1816), and *Essai d'un plan des finances* (1816), which, however, are largely colored by his partisan views, and also wrote a *Cours d'astronomie* (1820), and some critical work, of which *La poétique anglaise* (1806) may be mentioned.

HENNIGES VON TREFFENFELD, héné-gés fón tréff'en-félt, JOACHIM (c.1625-88). A Brandenburg general. He especially distinguished himself in Alsace (1674); was the first to be ennobled by the Elector of Brandenburg; and in 1679 was promoted to the rank of general for his defeat of the Swedish Army near Tilsit. For his biography, consult: Kessel (Stendal, 1863), and Bussler (Gotha, 1897).

HENNINGSEN, CHARLES FREDERICK (1815-77). An English soldier of fortune and man of letters. In 1834 he took service in the Russian Army. He joined Kossuth in the Hungarian revolt, came to the United States, and fought with Walker in Nicaragua. At the outbreak of the Civil War he entered the Confederate Army as a colonel. He was promoted to be brigadier-general, and directed the manufacture of the first Minié rifles made in this country. He was the author of *Revelations of Russia* (1845); *The Past and Future of Hungary* (1852); and several other works, published chiefly in England.

HENOCH, há'nóg, EDUARD HEINRICH (1820—). A German physician, born and educated at Berlin, where he became privat-docent in 1850 and professor eight years later. Associated with Romberg at the Polyclinic, he edited that physician's *Klinische Ergebnisse* (1846). In 1872 he became director of the clinic for children's diseases in the Royal Charité, and retired in 1893. He wrote: *Klinik der Unterleibskrankheiten* (3d ed. 1863); *Beiträge zur Kinderheilkunde* (1861-68); and the well-known *Vorlesungen über Kinderkrankheiten* (10th ed. 1899).

HENOTHEISM (from Gk. *ἑῖς*, *heis*, one + *θεός*, *theos*, god). A term used to denote a tendency of the Vedic poets to attribute to a deity especially lauded at a given time the attributes of any other god or of the whole body of gods. This tendency is doubtless more apparent than real. It was but natural that in a hymn to Indra or to Agni the thought of the bard should be focused on the deity in question so that special honors and powers should be assigned him, whichever god he might be. Again, as the religion of the Vedic period was preëminently a nature-worship, it is probable that the changes of the seasons led to the apparent exaltation of certain divinities at one time of the year, and to their apparent dethronement at another time. In this way the so-called henotheism with regard to the various aspects of the sun-god (Sūrya) and of the storm-god (Indra) receives at least a partial solution. There was consequently no constant lord of the Vedic pantheon until the rise of the philosophical speculations which characterized the close of the Vedic age. It must also be borne in mind that expressions of laudation, which, taken by themselves, seem exaggerated, are almost invariably checked by the context in the Veda. The origin of henotheism is based on the syncretistic trend of the Hindu mind. It is noteworthy that it is the later deities especially who are treated henotheistically, and herein lies the key to the problem. The Vedic poets, long before the Rig Veda had been completed, rising in their religious concepts from a low stage of nature-worship and crematheism, or worship of material objects, especially useful ones, identified each and every god, and at a later age all living creatures and all things, with the All-Soul (called Atman, Brahma, etc.). Each god being therefore

a phase of the supreme deity, and not a distinct divinity, might receive as the temporary representative of the All-Soul precisely the same attributes as any other god, controlled, however, by the traditional views held by the priests or the people concerning him.

The same religious phenomenon occurs elsewhere, as in the philosophical aspects of Greek religion. The term is sometimes used to denote the conception of a special god for each nation or tribe. Nowhere else, however, does henotheism become a distinctive trait of the faith as it did in India. After the close of the Rig-Vedic period it practically vanishes, since by that time the esoteric unitarianism on which it was based had permeated the entire body of the religious and philosophical thought of India. As a term henotheism is scarcely a fortunate one, and many scholars prefer to call the religious impulse syncretism instead. Consult Hopkins, "Henotheism in the Rig-Veda," in *Classical Studies in Honor of Henry Drisler* (New York, 1894).

HENRI, ROBERT (1865—). An American landscape and portrait painter, born in Philadelphia, Pa. He studied in his native city, and for several years was a teacher in the Philadelphia School of Design. His pictures have been received at both Salons, and his "Snow" (1899) is in the Luxembourg. While in Paris he established a studio at which several of the 'Glasgow School' received valuable instruction. His landscapes are broadly painted and vigorous. Especially noticeable are the cloud effects in such pictures as "A Sudden Shower," and "Cumulus Clouds, East River." His "Figure of a Girl" (1902) is a strong and individual example of his skill as a portraitist.

HENRI III. ET SA COUR, än're' trvä á sá köör (Fr., Henry III. and his Court). A prose drama by the elder Dumas, produced February 11, 1829. With it he was supposed to found the Romantic School of the drama; but he denies this in the preface of the play, giving that honor to Hugo, Mérimée, Vitet, and others.

HENRIADE, än'rê-ád', LA. An epic poem of ten cantos in Alexandrine couplets, by Voltaire, begun during his confinement in the Bastille in 1717, and first printed at Rouen in the winter of 1722-23 under the title *Poème de la Ligue*. During the author's English exile (1726-29) he published the *Henriade* by subscription (1728) with a dedication to Queen Caroline, "not only as the protectress of arts and sciences, but as the best judge of them." A number of editions followed in England, Holland, and France, where the work, in spite of its political theories and attacks on religion, was generally admired. The poem, by picturing religious wars, sought to inspire a hatred of fanaticism and intolerance. It lacks sentiment and poetic imagination, but is important on historical and philosophical grounds.

HENRICI, hén-ré'tsê, CHRISTIAN FRIEDRICH (1700-64). A German poet (also called 'Picander'), born at Stolpen, near Dresden, and educated at Wittenberg and Leipzig. His ability as a poet, it seems, won him first a place in the Postal Department, and then an office as an excise and tax collector. His poetry includes the *Ernstscherzhaft und satyrische Gedichte* (1727-37); the *Sammlung vermischter Gedichte* (1768); and the *Teutsche Schauspiele* (1726), which are

very obscene, but none the less valuable as a picture of contemporary life, especially at the universities. His devotional poetry includes many verses for the compositions of Johann Sebastian Bach, especially his passion music; and, among other hymns, *Wer weiss, wie nahe mir mein Ende*. Consult Flossman, *Picander* (Leipzig, 1899).

HENRICIANS, hën-rish'an-z, or **HENRICANS**. The followers of Henry of Lausanne in the twelfth century. Grieved at the corruption of the times, Henry left the Benedictine monastery of Clugny, to which he belonged, in Southern France. His consistent life and the eloquence of his discourses deeply moved the people. At first Hildebert, his bishop, favored him, but afterwards drove him from Le Mans. Joining the disciples of Peter of Bruys (see BRUYS, PIERRE DE) in Provence, he was arrested by the Archbishop of Arles, and at the second Council of Pisa (1135) was declared a heretic and placed in a cell. Subsequently released, he again went to the south of France, where he had a great influence over the lower classes. He was arrested by Pope Eugenius III., and at the Council of Rheims (1148) condemned to perpetual imprisonment. He died in prison in 1149.

HENRIETTA. A town and the county-seat of Clay County, Tex., 96 miles northwest of Fort Worth; on the Little Wichita River, and on the Fort Worth and Denver City and the Missouri, Kansas and Texas railroads (Map: Texas, E 3). As the centre of an agricultural and stock-raising country, Henrietta has a considerable trade in grain and live stock; and among its industrial establishments are grain-elevators, flour-mills, cotton-gins, lumber-yards, etc. Building-stone is quarried in the vicinity. Population, in 1890, 2100; in 1900, 1614.

HENRIETTE, ä'n-rë'tët'. The simple, unaffected *ingénue* in Molière's *Femmes Savantes*, whose pedantic mother and sister give the title to the play. She marries Clitandre in spite of all Armande's machination; and is considered the truest type of womanliness on the French stage.

HENRIOT, ä'n-rë'öt', FRANÇOIS (1761-94). A French politician, born at Nanterre. He was educated as a choir-boy, and little is known of him until 1789, when he left his post in the city employ and joined the *sans-culottes*, who made him one of their commanders. He was a leader in the massacres of the Carmes and Saint Firmin (1792), and in the following year was appointed by the Commune provisional general of the army in Paris. A year later he resigned from this post, and was elected general of the National Guard three weeks afterwards, but refused to 'command the army against the people.' In 1794 his arrest was ordered on the suggestion of Tallien and Delmas; he made a bold attempt to rouse the mob in his behalf, but was taken and guillotined with Robespierre.

HENRIQUEL-DUPONT, ä'n-rë'kël' dü'pôn', LOUIS PIERRE (1797-1892). A French designer and engraver. He was born in Paris, June 13, 1797. After studying in the Ecole des Beaux-Arts he entered the studio of Pierre Guérin (q.v.), and after remaining there three years turned his attention to engraving under Bervic. His first production, the "Portrait of a Young Woman with Her Infant," gained the second

medal at the exhibition of 1822. He produced in succession a "Portrait of M. de Pastoret;" "Strafford;" "The Interment of Christ," after Paul Delaroche; "The Abdication of Gustavus Vasa," after Hersent; "The Disciples at Emmaus," after Paul Veronese; "The Marriage of Saint Catharine," after Correggio; and other works. Ten years of his life were employed in reproducing the "Hemicycle" of Paul Delaroche (q.v.). He was considered the most eminent French engraver of the day; his work is characterized by accuracy of design and purity of style. He became member of the Academy in 1849, and professor at the Ecole des Beaux-Arts in 1853, and was elected an honorary member of the Royal Academy of London in 1869. He died in Paris, January 20, 1892.

HENRIQUEZ, ën-rë'kâth, FRANCISCO FERNANDEZ DE LA CUEVA. See FERNANDEZ DE LA CUEVA, HENRIQUEZ FRANCISCO.

HENRY (named in honor of Joseph Henry). The practical unit of induction in the measurement of self and mutual induction. (See ELECTRICITY and ELECTRICAL UNITS.) It is the induction in a circuit if the induced electro-motive force in it is one volt when produced by the variation of a current at the rate of one ampere per second. The henry is, therefore, substantially 10⁹ times the C. G. S. electromagnetic unit of induction.

HENRY I. (876-936). King of Germany from 919 to 936, surnamed the Fowler. He was the son of Otho, Duke of Saxony, and was distinguished in early youth for the courage and energy with which he warred against the Slav tribes to the east of his native duchy. Otho, who died in 912, appointed Henry his successor, not only as Duke of Saxony, but as Lord of Thuringia and part of Franconia. The German King Conrad I., instigated by certain ecclesiastical advisers whom Henry's independent bearings toward the Church had deeply offended, resisted the claims of the young Duke; but the latter was ultimately left in possession of all the lands over which his father had ruled. After Conrad's death, Henry, to whom Conrad had sent the royal insignia, was chosen King by the Franconian and Saxon nobles (919), and he had little difficulty in securing the acquiescence of the rest of Germany. For some years Lotharingia or Lorraine had held an uncertain position between the kingdoms of the East and the West Franks, as Germany and France were then called; but in 925 Duke Giselbert transferred his allegiance from the French to the German King. From the time of Louis the Child, Germany had been exposed to the inroads of the Hungarians. In 924 Henry had to purchase a truce of nine years by agreeing to pay an annual tribute to the Hungarians. The King made use of this respite by preparing his subjects for a final struggle with the barbarous invaders. In the northern districts the Germans had hitherto lived for the most part in small villages or on separate settlements. Henry began building fortified cities throughout Saxony and Thuringia, and in the remaining duchies his example was followed. He also trained his vassals to meet the enemy on horseback, thus giving a strong impetus to the movement which resulted in the institution of chivalry. When his arrangements were complete he tried his new force in a contest

with the Danes and with some Slav tribes, whom he utterly defeated. In 933 the Hungarians demanded as usual the tribute which had till then been punctually paid, and when it was refused invaded Thuringia with a great army. Henry defeated them so decisively that they did not again enter Germany for some years, and were never again seen in the northern duchies. In 934 Henry fought against the Danes and compelled their King to pay tribute. In the internal affairs of the realm he acted with great precaution and judgment. The dukes by this time had become so powerful that there was some danger of their altogether overshadowing the throne. Instead of directly forcing them to submission, as was afterwards done by his son Otho, he attached them to his interests by confirming them in many of their rights, and by acting as a mediator in their disputes. Toward the close of his life his position was so secure that he resolved to go to Rome either on a pilgrimage or to claim the Imperial crown; but he died of apoplexy, July 2, 936. Consult Waitz, *Jahrbücher des deutschen Reichs unter Heinrich I.* (3d ed., Leipzig, 1885).

HENRY II. (c.973-1024). Holy Roman Emperor from 1002 to 1024. He was the son of Henry the Quarrelsome, Duke of Bavaria, and a grandson of Henry I. (q.v.). He was in Italy with Otho III. in 1001, and upon the latter's death, in January, 1002, hastened to secure possession of the Imperial power, with the aid of the Archbishop of Mainz. He was crowned at Mainz, June 3, 1002. His most determined enemy during the greater part of his reign was Boleslas Chrobry (the Brave) of Poland, who annexed Bohemia, and during the King's absence in Italy, in 1004, invaded Lusatia and Meissen. Henry hurried back, defeated Boleslas in 1005, and granted Bohemia as a fief to Jaromir, of the native House of the Premyslides. Boleslas, however, continued the war, which was not ended until 1018, when Henry was obliged to conclude peace on terms favorable to the Polish King. In the midst of this struggle he had to make war on Adalboro, his wife's brother, who had seized the Archbishopric of Treves, and was protected in his claim by another brother of the Empress, the Duke of Bavaria. Both were overcome and deprived of their dignities, although Bavaria was ultimately restored to the elder of the two brothers. Henry also put down rebellions in Flanders and Meissen, and concluded, in 1007, a treaty with Rudolph III. of Burgundy, whereby, after Rudolph's death, his territories were to be united to Germany. In 1013 Henry went for the second time to Italy, where Arduin had raised himself to the throne. The usurper was displaced, and in 1014 Henry was crowned Emperor at Rome by Benedict VIII., whom he had confirmed in the Papal See in opposition to the Antipope Gregory. At the request of Benedict the Emperor returned to Italy in 1022, in order to drive back the Greeks, who were steadily pressing northward. Henry died July 13, 1024, and was canonized by Pope Eugenius III. in 1146. His wife, Kunigunde, was also ranked among the saints. Henry founded the Bishopric of Bamberg, which was given very great privileges, and which the Pope took under his immediate protection. Consult Hirsch and Bresslau, *Jahrbücher*

des deutschen Reichs unter Heinrich II. (Leipzig, 1862-75).

HENRY III. (1017-56). Holy Roman Emperor from 1039 to 1056. He belonged to the Franconian or Salic line, and was the son of Conrad II. He was crowned Duke of Bavaria in 1027, King of the Germans as successor presumptive to his father, 1028, Duke of Swabia and King of Burgundy in 1038, and became King of Germany at his father's death, in 1039. Henry possessed great natural abilities, had been educated with the utmost care, and succeeded to an exceptionally strong dominion. The four duchies of Franconia, Swabia, Bavaria, and Carinthia were at first in his own hands, and two only, Saxony and Lorraine, had semi-independent dukes. Under him the German Empire attained to very great power. Poland was a subject principality, the Bohemian Duke was compelled to become Henry's vassal in 1041, and for a time the King of Hungary acknowledged his overlordship. In Italy Drogo, the Norman, became his vassal for Apulia. In 1046 Henry made his first expedition to Italy, summoned to end the troubles caused by the three rival popes, Benedict IX., Gregory VI., and Sylvester III. All three were deposed. Henry was asked to appoint a new Pope, and during the remainder of his reign the occupants of the Papal chair were nominated by him. He was crowned Emperor at Christmas, 1046. From this time on, however, Henry was compelled constantly to face revolts in different parts of his dominions. The revolt of Godfrey in Lorraine proved exceedingly formidable, but Henry ultimately triumphed. He died on October 5, 1056. Henry was deeply devoted to the Church, and earnestly endeavored to reform the clergy. He aided the Papacy in securing the power which was to be so dangerous to his son; but during his life the popes and the Emperor worked in harmony to check the abuses in the Church. Consult: Steindorff, *Jahrbücher des deutschen Reichs unter Heinrich III.* (Leipzig, 1874-81); Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. ii. (5th ed., Leipzig, 1885).

HENRY IV. (1050-1106). Holy Roman Emperor from 1056 to 1106. He was the son of Henry III., and was born November 11, 1050. He had been crowned in 1054, and although only six years old at his father's death, was recognized at once as King of Germany, Italy, and Burgundy, his mother, Agnes of Poitou, ruling in his name. Henry III. had exercised great power over the Church and had greatly strengthened the Papacy; in Germany he had held the nobles in subjugation against their will. Now both the Church and the nobles seized the opportunity to achieve their independence. The brother of Godfrey of Lorraine (see HENRY III.) was elected Pope as Stephen IX., and Godfrey was made Imperial vicar in Italy. Agnes was not strong enough to rule effectively. She was forced to cede Lorraine to Godfrey, and to bestow upon the most powerful of the nobles the three great southern duchies of Swabia, Bavaria, and Carinthia, thus undoing the work of Conrad II. (q.v.). Her authority was not recognized in Italy. Even the bishops in Germany, who had been the chief instruments of her husband, deserted her. In 1062 Anno, Archbishop of Cologne, seized Henry by treachery and governed in his

name. Under Anno's regency the German authority was reestablished over Hungary. The Archbishop, however, was greatly disliked by Henry, and was forced to make way for the Archbishop Adalbert of Bremen, who became the young King's tutor, and in 1065 caused him to be declared of age. Henry had been brought up very badly. He had ability, but an ungovernable temper; he was brave, but a poor general; he was surrounded by flatterers, and at first gave himself up almost entirely to pleasure. Germany soon sank into a state of feudal anarchy. The Slavs revolted and devastated the northeastern parts of the Empire, while the Danes held the Baltic coast. Henry attempted to reestablish his authority by degrading the independent dukes in the south, by imprisoning the Duke of Saxony, and by erecting many fortresses in his duchy. The Saxons revolted in 1073, instigated in large measure by their bishops, and Henry barely escaped from their hands. The nobles in the north aided him against Saxony, and in June, 1075, he won a great victory on the Unstrut which temporarily crushed the rebellion; for the first time he seemed to be really powerful.

But the greatest danger came to a head just at this time. After the death of Henry III. the Papacy had gradually freed itself from Imperial control. In 1059 a decree had been enacted which gave the election of the Pope to the college of cardinals, and during the period of disorder in Germany the Church, under the guidance of Hildebrand, had gained steadily in power. In 1073 Hildebrand was elected Pope as Gregory VII. (q.v.), and proceeded with greater energy to carry out the policy of ecclesiastical and Papal supremacy with which he had been identified so closely under the two preceding popes. In 1075 a synod at Rome passed a decree against lay investiture, threatening secular princes who should presume to confer abbacies or bishoprics on priests with excommunication. The bishops and abbots in the Empire held great possessions and were great territorial lords. If Henry could not control their appointment, a large part of his resources and power would be taken from him and a large section of the Empire would become independent. As long as the bishops and abbots continued to hold their temporal possessions as feudal lords, it was absolutely necessary to the King to have them under his control. On the other hand, the Church was determined to appoint its own officials. When Henry therefore appointed an archbishop for Milan, Gregory sent legates to demand that he should obey the decree against lay investiture, charging him at the same time with simony and oppression of the clergy. Henry, however, was elated by his great victory over the Saxons, and in no mood to temporize, as he had done previously. He retorted by convoking a German council at Worms, January 24, 1076, which deposed the Pope. The Pope in return excommunicated Henry, decreed his deposition, and released his subjects from their oath of allegiance. All of Henry's enemies seized this opportunity to revolt, and proposed to elect a new king, and the most that Henry could obtain was a respite. He was deprived of all authority, and if not absolved within a year was to be deposed.

The Pope seemed to be entirely triumphant, and Henry doomed to degradation; but there was one weak point in Gregory's position which afforded Henry a chance of redeeming his fortunes.

As a Christian priest the Pope was bound to pardon a penitent who sought absolution; when, therefore, Gregory, who had promised to take no action without the consent of the German nobles, with whom he was to hold a council, set out for Germany, Henry hurried to Italy to meet him. The Lombards, who were hostile to the Pope, welcomed the Emperor eagerly, and he soon had an army at his command. Gregory took refuge in the strong castle of Canossa, belonging to Countess Matilda of Tuscany. Henry, however, had not come to fight, but to seek absolution. For three days (January 25-27, 1077) he begged admission to Canossa as a penitent, waiting barefooted at the gate of the courtyard of the castle; and finally Gregory had to yield and to grant the desired absolution. Canossa was the deepest possible humiliation for Henry, but his act had won for him a diplomatic victory. He had prevented the meeting between Gregory and the nobles, and had placed the latter in the position of rebels, if they persisted in their hostility.

Many of them did persist, and elected an anti-king in the person of Rudolph, Duke of Swabia; but Henry now had many partisans. Civil war raged throughout Germany, and every part of the country except Saxony was divided into two parties. Gregory VII. hesitated, but finally in 1080 recognized the anti-king, and excommunicated Henry once more. Rudolph, however, was killed soon after, and his death was accepted as a judgment of God. An antipope, Clement III., was elected by the Imperial Party, and in 1084 Henry captured the city of Rome and installed the antipope, who gave him the Imperial crown; but in the same year the Emperor, who had been besieging Gregory VII. in Sant' Angelo, was driven from Rome by Robert Guiscard (q.v.). Gregory VII. died soon after in exile. The strife went on in Germany, where Henry had to contend against two other anti-kings—Hermann of Luxemburg, who died in 1087, and the Margrave of Meissen, whose death occurred in 1089. Supported by Godfrey of Bouillon (q.v.) and Frederick of Swabia, the ancestor of the Hohenstaufen, Henry was on the whole successfully asserting himself, when his eldest son, Conrad, joined the Emperor's enemies. For a time this weakened the Emperor, but he gradually won the support of the great nobles, all of whom were weary of the strife. Conrad was deposed from his position as heir to the throne, and died in 1101, and Henry, the second son of the Emperor, was declared heir. Henry's difficulties, however, were not over. The Pope, Paschal II., renewed the excommunication against Henry. His second son was induced to rebel, and the Emperor was made prisoner December, 1105, and forced to abdicate. He died soon after, August 7, 1106, while preparing to make war upon his son. As he died excommunicated, his body remained unburied for five years. During the latter part of his life especially, he was very popular with the people, who mourned his loss. Consult: Meyer von Knonau, *Jahrbücher des deutschen Reiches unter Heinrich IV. und Heinrich V.* (Leipzig, 1890-94); Floto, *Heinrich IV. und sein Zeitalter* (Stuttgart, 1855-57); Giesbrecht, *Geschichte der deutschen Kaiserzeit*, vol. iii. (5th ed., Leipzig, 1890); also the authorities referred to under GREGORY VII. See INVESTITURE.

HENRY V. (1081-1125). Holy Roman Emperor from 1106 to 1125. He was the second son of Henry IV., and was appointed his father's successor in 1098 after his elder brother, Conrad, had forfeited his right to the throne by rebellion. Six years afterwards he himself rebelled against the Emperor. The Papal party, with which he allied himself, took for granted that when he mounted the throne Church and State would instantly be reconciled; but their hopes were disappointed. The main point for which Henry IV. had contended was the right of investing the bishops with ring and staff. When Henry V. succeeded him in 1106, Pope Paschal II. demanded that this right should be given up, but Henry replied that he could not resign powers that had been exercised by his predecessors, and the loss of which would imply that the ecclesiastical lands of Germany would be removed from secular control. In 1110 he entered Italy at the head of 30,000 men. Paschal proposed that the Church should give up its property and feudal privileges if Henry would renounce the right of investiture. To this the latter agreed, and a day was appointed for the coronation of Henry as Emperor. The opposition of the Roman prelates made it impossible for the Pope to proceed with the ceremony, whereupon he and his cardinals were made prisoners. Paschal then formally recognized the right of investiture, and Henry received the Imperial crown. When the Germans had recrossed the Alps, Paschal renounced the treaty he had concluded, and the Emperor was excommunicated. As many of the princes were pleased to avail themselves of this opportunity for rebelling, Germany again became the scene of confused contests like those which had plunged the country into misery during Henry IV.'s long reign. In 1116 the Emperor went a second time to Italy and drove Paschal from Rome, and after Paschal's death he caused Gregory VIII. to be elected Pope. The Papal party, however, selected Gelasius II., who renewed the sentence of excommunication against Henry. The latter returned to Germany in 1119, and at the Diet of Tribur succeeded in allaying the hostility of the more important among his enemies. Pope Calixtus II., who succeeded Gelasius in 1119, now found it necessary to offer a compromise; and the controversy between the Empire and the Papacy was for the time closed by the Concordat of Worms (1122), in which it was agreed that at every election of a prelate in Germany the Emperor should have the right of being present in person or through a representative, and that the chosen bishop or abbot, before being consecrated, should receive his lands and secular authority in fief of the Crown. In the other parts of the Empire the election was to be free and canonical, and the Emperor to confer the secular authority after the consecration. Henry died at Nimeguen, May 23, 1125. Consult: Giesebrecht, *Geschichte der deutschen Kaiserzeit*, vol. iii. (5th ed., Leipzig, 1890). See INVESTITURE; WORMS, CONCORDAT OF.

HENRY VI. (1165-97). Holy Roman Emperor from 1190 to 1197. He was the son of Frederick Barbarossa, and was crowned King in 1169. He assumed control of the government on his father's departure for the Holy Land in 1189, and on the latter's death, in the following year, succeeded to the throne. He shared the intellectual culture of his time, and was distinguished

for the splendor of his political schemes; but he was of a stern disposition, and in order to attain his ends was guilty of cruelty. Henry the Lion (q.v.), who had been banished to England by Frederick I., had returned to Germany in 1189, and again disturbed the country with his wars. King Henry, after restoring peace, hastened to Rome, where he was crowned Emperor in 1191. Through his wife, Constance, he had a claim to the throne of Sicily; but the Sicilian nobles made Count Tancred, an illegitimate son of Constance's brother, King. After receiving the Imperial crown, Henry advanced against Tancred. He was successful in Sicily, but before Naples his army was struck by pestilence, and he was forced to return to Germany. There he suppressed various private wars, and compelled Henry the Lion to acknowledge his supremacy. The great ransom which he received from Richard I. of England (q.v.) enabled him to fit out a large army, and with this he descended upon Italy in 1194, and without much difficulty conquered the Sicilian kingdom. Tancred was dead, but he had left a number of relatives, who were so barbarously treated that the people were seized with terror. On his return to Germany it was easy for Henry, with the prestige which he had now acquired, to enforce submission; and so great was his authority that, in 1196, he endeavored to secure the declaration that the crown be made hereditary in his family. Had he lived some years longer he would probably have succeeded, but he died suddenly at Messina, September 28, 1197. His power was greater than that wielded by any other German Emperor. Aside from his firm control over the Imperial lands, Sicily had been subdued, and Richard of England, the King of Cyprus, and Bohemond of Antioch had become his vassals. Consult Toeche, *Jahrbücher des deutschen Reichs unter Heinrich VI.* (Leipzig, 1867).

HENRY VII. (?-1313). Holy Roman Emperor from 1308 to 1313, the first of the line of Luxemburg. He was the son of Duke Henry III. of Luxemburg, and succeeded Albert I. as German King in 1308, being crowned at Aix-la-Chapelle in the following year. When he came to the throne Bohemia was subject to Henry of Carinthia, who was greatly disliked by his subjects. The King displaced him in 1310, and enriched his own family by granting Bohemia, at the request of the Bohemians themselves, to his son John, whose claims were rendered secure by his marriage with Elizabeth, the daughter of Wenceslas II. For some time no German King had sought the Imperial crown; but Henry resolved to revive the traditions which were dying out, and with a view to this result did what he could to compose the differences between the nobles and to gain their allegiance. He was welcomed in Italy with eagerness by the Ghibellines, whose great poet, Dante, saw in Henry VII. the savior that was to rescue Italy from anarchy and to bring it peace and honor. The *De Monarchia* of Dante was probably written at this time. In 1312 Henry was crowned Emperor of Rome, having previously received the iron crown of Lombardy in Milan. He was preparing to undertake an expedition for the conquest of Naples, when he died suddenly, near Siena, August 24, 1313. It was generally believed at the time that he had been poisoned by a Dominican monk, but this was not proved. Consult: Dönniges, *Acta Henrici VII.* (Berlin,

1840-41); Barthold, *Der Römerzug König Heinrichs von Lützelburg* (Königsberg, 1830-31); Pöhlmann, *Der Römerzug Kaiser Heinrichs VII.* (Nuremberg, 1875).

HENRY I. (1068-1135). King of England from 1100 to 1135. He was the fourth son of William the Conqueror, and was born, according to tradition, at Selby, in Yorkshire. Unlike his elder brothers, Robert and William Rufus, he was of a studious disposition, and received what was for the times an excellent education, being known later in history as Beauclerc. At his father's death he received £5000, but no lands. With £3000 he bought from his brother Robert, Duke of Normandy, the Avranchin and the Côtentin, and displayed great ability in the government of his territories. In 1091 William Rufus and Robert wrested his possessions from him, after besieging him for a long time in Mont Saint-Michel. For a time he wandered about, a landless man, until the men of the town of Domfront, on the river Varenne, invited him to become their lord. Henry thus obtained possession of a powerful stronghold, which he used as a base of operations in numerous raids against his brother, the Duke of Normandy, and Robert of Belleme. After 1094 he and William were allies, and in 1096 he received from the latter the counties of Coutances and Bayeux. When William Rufus was found dead in the New Forest, where the two brothers had been hunting, August 2, 1100, Henry at once rode to Winchester and seized the royal treasury, and two days later was crowned at Westminster, publishing a charter of rights which was subsequently taken as the basis of Magna Charta. To strengthen his hold on the crown, he recalled Anselm, the exiled Archbishop of Canterbury, thus gaining the support of the clergy, and by his marriage to Eadgyth, or Matilda, daughter of Malcolm Canmore, King of Scotland, and great-granddaughter of Edmund Ironside, he won the affections of his Saxon subjects. Henry successfully defended the throne against his brother Robert. In July, 1101, the Norman Duke invaded England, and Henry was forced by a conspiracy among his nobles to come to terms with his brother, ceding to Robert all his possessions in Normandy excepting Domfront, and granting him a pension. War with Robert broke out again in 1105, and on September 28, 1106, Henry defeated the Duke in a bloody battle before the walls of Tinchebray, and took him prisoner. Robert was confined in Cardiff Castle till his death, in 1134. The acquisition of Normandy added greatly to Henry's strength; but he had some trouble in keeping the duchy, as the French King, Louis VI., and the Count of Anjou took part with William, Robert's youthful son. A desultory warfare was carried on from 1109 to 1120, during which a large part of Normandy was devastated and great atrocities were committed on both sides. The death in 1120 of his son William, whom the King greatly loved, was a severe blow to Henry. To prevent the crown from falling into the possession of his nephew William, he caused his barons in 1126 to accept as his successor in England and Normandy his daughter Matilda, who in 1128 became the wife of Geoffrey Plantagenet, Count of Anjou. Henry died on December 1, 1135, near Rouen.

The reign of Henry I. was important for the

progress that was made toward the amalgamation of the Saxons and the Normans in England. The feeling of English nationality was greatly stimulated by the wars carried on against the French and the rebellious nobles in Normandy. The King continued the policy of the Conqueror in relentlessly crushing down the opposition of the great nobles, and in making himself the champion of the common people against their territorial lords. In carrying out this policy the functions of the *curia regis*, or King's Court, were greatly increased, and for the first time justices as guardians of the King's peace were sent through the country. The great offices of State were conferred by preference on the members of the clergy. Yet in his struggle with Anselm and other prelates over the rights of nomination and consecration of bishops, the King knew how to keep the virtual power in his own hands without arousing the open hostility of the Church. Henry had great natural ability, especially in the line of State intrigue. He was, however, dissolute, cruel, avaricious, and given to acts of meanness. His influence on English history, nevertheless, was lasting. Consult: Freeman, *The Norman Conquest*, vols. iv. and v. (Oxford, 1867-79); id., *William Rufus* (Oxford, 1882); Norgate, *England Under the Angevin Kings* (London, 1887); Stubbs, *Constitutional History of England*, vol. i. (Oxford, 1891).

HENRY II. (1133-89). King of England from 1154 to 1189. He was the grandson of Henry I. by his daughter Matilda and her second husband, Geoffrey Plantagenet, and was born March 5, 1133, at Le Mans, in Maine. From his birth he was regarded as the successor of Henry I.; but on the death of the latter, in 1135, the English crown was seized by Stephen of Blois, and a civil war followed, in which the country was devastated and reduced to anarchy. During his minority Henry's affairs were under the care of his mother, Matilda, and her half-brother, Robert, Earl of Gloucester. In 1151 Henry received Normandy from the French King; the death of his father soon after left him master of Anjou, Maine, and Touraine; and by his marriage, in May, 1152, to Eleanor, the divorced wife of Louis VII. of France, he added to his possessions the immense territories of Guienne (Aquitaine) and Poitou, so that he was the ruler of more extensive domains in France than the French King himself. In 1153 Henry made an attempt to conquer England. After nine months of fighting it was agreed, by the Treaty of Wallingford, November, 1153, that Stephen should reign during his lifetime, and that Henry should succeed him. Stephen's death occurred the following year, and Henry was crowned December 19, 1154, together with his Queen, Eleanor. The early years of his reign were devoted to the restoration of peace, and the reduction of the powerful nobles who had taken advantage of the civil war to make themselves virtually independent of the royal authority. The judicial and financial systems were reorganized, and the Crown was freed in great measure from its dependence on the great feudatories by the institution of 'scutage' or shield money as a substitute for personal military service, due from the vassal, thus enabling the King to maintain a standing force subject to his will alone. The chief obstacle in the way of Henry's schemes for the aggrandizement of the royal power was the

clergy, whose immunity from the jurisdiction of the secular courts made them a disturbing factor in the judicial administration of the country. To aid him in reducing the Church to submission to the civil power, Henry appointed his trusted Chancellor, Thomas a Becket (q.v.) to the See of Canterbury, in June, 1162. Becket, however, to the surprise and indignation of the King, became the most fervent champion of ecclesiastical privilege and repeatedly thwarted the royal measures aimed against the Church. Henry succeeded, nevertheless, in wringing from the bishops a ratification of the ancient customs of the land as re-enacted in the Constitutions of Clarendon in 1164. (See CLARENDON, CONSTITUTIONS OF.) The long struggle with Becket was terminated only by the latter's murder, in 1170. Henry did penance at his grave, allowing himself to be scourged by the monks; but though the Constitutions of Clarendon were formally repealed, the King was ultimately successful in reducing the Church to subordination in civil matters. The administration of justice in the criminal courts was regulated in 1166 by the Assize of Clarendon. See CLARENDON, ASSIZE OF.

During Henry's reign occurred the conquest of Ireland. That country was then the home of a number of tribes or clans, and Pope Adrian IV. in 1155, by a bull, is said to have given Henry the authority over the entire island, and ordered the inhabitants to obey him. In 1166 the intervention of the English was solicited by one of the Irish petty kings, Diarmait of Leinster (see MACMURROUGH), and Henry gave leave to any of his subjects to aid him. Robert Fitzstephens, Constable of Albertivi, Maurice Fitzgerald, and Richard de Clare, surnamed Strongbow, Earl of Strigul, went over with a few hundred men-at-arms, and in four years conquered the coast region from the Nore to the Liffey. Their success was so rapid that Henry became jealous, and in 1171 went over himself with an army of four thousand men to complete the conquest of the country. All Ireland except Connaught submitted for the time, but the majority of Irish tribes and chieftains continued to be independent for centuries. During this reign, also, the first ascendancy of England over Scotland was gained. Henry's sons, incited by their mother, rebelled against him (1173), and their cause was espoused by the Kings of France and Scotland. The latter, William the Lion, was ravaging the north of England with an army, when he was surprised at Alnwick and taken prisoner, July 13, 1174. To obtain his liberty, he stipulated to do homage to Henry for Scotland, and to cede to him five of his strongest fortresses. In Normandy, Anjou, and Aquitaine, Henry was equally successful in suppressing the rebellion. In the course of a second rebellion of his sons (1183) Henry, the eldest son, died; Geoffrey, the second son, died three years later. Richard Cœur-de-Lion still remained hostile to his father, and with the aid of King Philip Augustus of France drove Henry from Maine and Anjou. Deserted by all his troops, Henry was compelled to come to terms with Richard. On July 4, 1189, peace was concluded at Colombières. One of the stipulations was for an indemnity for all the followers of Richard. The sight of the name of his favorite son John in the list, acting upon a constitution weakened by many cares, threw the King into a fever, of which he died, July 6, 1189, at Chinon.

Henry was a man of restless energy, subject to sudden outbursts of a mad temper, but a born ruler, nevertheless, who gave to his subjects justice and peace. During his reign the barons were overawed, and hundreds of their castles were destroyed. Law made very great progress; circuit courts were established, and Henry facilitated the making of appeals to his own courts, in order to bring the people into direct dependence upon the King. The earliest writer on English law, Ranulf de Glanville, was Henry's chief judiciary. In intellect and character he resembled his grandfather, Henry I. He had three illegitimate children; his mistress, the Fair Rosamond (q.v.), may have been the mother of the first of the two that are remembered: William Longsword, Earl of Salisbury, and Geoffrey, who became Archbishop of York, and who was faithful to him when his four legitimate sons took up arms against him. Henry was a great builder of palaces and roads; of the latter, the great embankment, 30 miles in length, erected to prevent floods from the river Loire, still remains in use. He was a lover of learning and an assiduous reader. His great work for England consisted in uniting the conquerors and conquered into one race, and in laying the foundation for the present Greater Britain by the conquest of Ireland. Consult: Norgate, *England Under the Angevin Kings* (London, 1887); Stubbs, *Constitutional History of England* (Oxford, 1891); id., *The Early Plantagenets* (London, 1876); Green, *History of the English People* (London, 1874); Mrs. J. R. Green, *Henry the Second* (London, 1888).

HENRY III. (1207-72). King of England from 1216 to 1272. He was the eldest son of King John and of Isabella of Angoulême, and was born at Winchester, October 1, 1207. He succeeded his father in 1216, under the regency of William Marshall, Earl of Pembroke. The French Dauphin, who had invaded England during the lifetime of King John, in response to an invitation by a party among the nobles, was defeated in 1217, and the confirmation of Magna Charta in the same year established Henry securely on the throne. The Regent died in 1219, and the chief powers of government were exercised by Stephen Langton, Archbishop of Canterbury, and the Justiciar Hubert de Burgh. The dismissal of Hubert in 1232 was followed by the rule of foreign favorites, which stirred up great dissatisfaction in the nation. Henry was constantly beset with hosts of his Poitevin relations and men from the country of his Queen, Eleanor of Provence, whom he married on January 14, 1236. His weakness was shown also in his failure to make a stand against the exorbitant exactions of the clergy and the Pope. Schemes for foreign conquest loaded the nation with a heavy debt and increased the general discontent. In 1258 the barons in Parliament, headed by his brother-in-law, Simon de Montfort, Earl of Leicester, rose against him, and forced him to transfer his power temporarily to a commission of barons and to enact a number of reforms. He agreed to these demands by the Provisions of Oxford (q.v.). The barons, however, failed to make any use of that power in reforming the State, and the King utilized the opportunity to regain the power which he alleged, with truth, had been taken from him by compulsion, though his action had worn the appear-

ance of free will. The question of the validity of these provisions was submitted by both parties to Saint Louis of France, who in the *Mise of Amiens* (q.v.) annulled the provisions (1264). Leicester and his party refused to be bound by the decision, and took up arms against the King. They defeated him and took him prisoner in the battle of Lewes, on May 14, 1264. The battle was followed by an agreement known as the 'Mise of Lewes' (q.v.), more humiliating to the King than the Provisions of Oxford. Leicester, being virtual ruler of the country, summoned a Parliament in 1265, to which, for the first time in English history, representatives from both boroughs and shires were called. Knights of the shire had been summoned to Parliament as early as 1254. Leicester's supremacy did not last long. Within a year the powerful Earl of Gloucester deserted his party, and with Prince Edward, the gifted son of the King, who had been taken prisoner at Lewes and succeeded in making his escape, led an overwhelming army against Leicester, who was defeated and slain at Evesham, on August 4, 1265. During the remainder of Henry's reign affairs were under the control of Prince Edward. The King died on November 16, 1272, and was succeeded by his son. The weakness of Henry and his father had allowed the development of the power of the barons, and in the struggle between the two the modern system of Parliamentary Government arose, marked by the concession of representation to the shires and the boroughs. Statute law dates from the time of Henry III., the Provisions of Merton, passed in the twentieth year of Henry's reign, being the first enactment on the English statute book. Consult: Stubbs, *Constitutional History of England* (Oxford, 1891); Prothero, *Simon de Montfort* (London, 1877); Pauli, *Simon de Montfort* (Tübingen, 1867); Green, *History of the English People* (London, 1874).

HENRY IV. (1367-1413). King of England from 1399 to 1413. He was the eldest son of John of Gaunt, fourth son of Edward III., and Blanche, the daughter of Henry, Duke of Lancaster, and was born April 3, 1367, at his father's castle of Bolingbroke in Lincolnshire. He is frequently called Henry of Bolingbroke from the name of his birthplace, but to his contemporaries he was more generally known as Henry of Lancaster. About 1380 he married Mary Bohun, one of the heiresses of the Earl of Hereford. He was distinguished for his martial attainments, and became a great favorite with the people of London. From 1387 to 1390 he was one of the leaders of the party opposed to Richard II. (q.v.), being one of the five lords appellants who in 1387 led an army against London and forced Richard to dismiss his unpopular favorites. In 1390-91 he was engaged on a crusading expedition in Lithuania with the Teutonic Knights. In 1392 he started on a second expedition to Lithuania, but soon changed his purpose and made a pilgrimage to Jerusalem. After his return he joined the King's Party, and was made Duke of Hereford in 1397. In 1398, as a result of the hostility between Henry and the Duke of Norfolk, the former was banished from England for six years, while his rival was exiled for life. Henry's banishment served to increase his popularity with the people of London, who chose to regard him as a martyr. In 1399 his father died, and Richard, in spite of his promise, confiscated

the estates which should have descended to Henry. The latter, profiting by the King's absence in Ireland, landed in England in July, 1399. He was eagerly welcomed by all the discontented, and met with no effectual opposition. Richard on his return from Ireland was deserted by his followers, and soon fell into Henry's hands. The King agreed to abdicate, his resignation was accepted by Parliament on September 30, 1399, and Henry was chosen King, inaugurating the line of Lancaster. As he was not the nearest heir in line of descent, and as he did not claim England by right of conquest, he owed his title to Parliament, and he is sometimes called the first constitutional monarch. The first half of his reign was filled with wars. At his accession he showed himself lenient to all his former enemies, merely taking from them the dignities which they had won at his expense. An attempt at rebellion in January, 1400, by the lords whom he had degraded was easily put down. Most of the rebels were put to death, and Richard II. died soon after, possibly murdered. In the same year the Welsh revolted under Owen Glendower (q.v.). The Scots, who also began war, were defeated at Homildon Hill (q.v.) in 1402. The French gave aid both to the Scotch and Welsh and harried the English coast, but accomplished little, on account of their internal dissensions. In 1403 the Percy family, dissatisfied with the rewards bestowed upon them by the new King, rose in rebellion, but were overthrown in the battle of Shrewsbury, in which Harry Percy, the famous Hotspur, fell. In 1405 James I., heir to the Scotch throne, was captured while on his way to France, and this brought peace with Scotland. After this date the wars were less dangerous, but Henry suffered from an illness which gradually sapped his strength. Another rebellion was put down in 1408, and at the same time a number of successes were gained over the Welsh. Henry died March 20, 1413. He was brave, naturally merciful, devout, and able, but subject to fits of passion. He recognized the authority of Parliament and acted as a constitutional monarch. His reign was stained by enactments against the Lollards, and by persecutions. He was a patron of Gower, Chaucer, and Christine de Pisan. He had four sons and two daughters by his first wife. In 1403 he married Joan of Brittany as a matter of diplomacy, but he gained nothing by this marriage. For the best modern authorities on his reign, consult: Stubbs, *Constitutional History of England* (Oxford, 1891); Pauli, *Geschichte von England* (Leipzig, 1864-75); Wylie, *History of Henry IV.* (4 vols., London, 1884-98).

HENRY V. (1387-1422). King of England from 1413 to 1422. He was the eldest son of Henry IV. and of Mary Bohun, and was born August 9, 1387, at Monmouth. In 1399, on the accession of his father to the throne, he became Earl of Chester, Duke of Cornwall, Prince of Wales, Duke of Aquitaine, and Duke of Lancaster. In his youth he had acquired great military distinction in operations against Hotspur and Glendower (q.v.), and in 1410 and 1411 he governed in the name of his father, who was ill. In 1412 he fell into disfavor with his father, and was deprived of his power. At his father's death, March 20, 1413, he became King. He liberated the young Earl of March from the confinement in which Henry IV. had placed him,

and restored the son of Hotspur to the lands and honors which his father had lost by rebellion. He followed in the footsteps of his father in persecuting the Lollards with fire and halter, the celebrated leader of the Lollards, Sir John Oldcastle (q.v.), being put to death in 1417. The great event of his reign was the attempted conquest of France, in which he virtually succeeded. In his first campaign he besieged and took the town of Harfleur, and gained the battle of Agincourt (q.v.), October 25, 1415, against enormous odds. Two years after he again invaded France, and made Normandy once more subject to the English Crown. Rouen was captured in January, 1419, after a long siege, an incapable King and civil discord in France aiding him greatly. On May 21, 1420, a treaty was concluded at Troyes between Henry and the French King, Charles VI., by which Henry obtained the regency of France, the eldest daughter of the French King for his wife, and the succession to the French crown on the death of the King. He was married to Catharine of France on June 2, 1420. He had hardly returned to England when the defeat at Beaugés of his brother, the Duke of Clarence, whom he had left as Governor of Normandy, rekindled the hopes of the French, who supported the Dauphin Charles in his repudiation of the Treaty of Troyes, to which he had not agreed. Henry returned to France for a third campaign, and his wonted success in arms was following him when he was seized with illness, and died on August 31, 1422, at Vincennes, at the age of thirty-five years, leaving an infant son, Henry VI., to succeed him. His private life was exemplary; as a King he was noted for his strict justice; in war he was one of the ablest generals of his time. Consult: Pauli, *Geschichte von England* (Leipzig, 1864-75); Stubbs, *Constitutional History of England* (Oxford, 1891); Wylie, *History of Henry IV.* (London, 1884-98); Church, *Henry V.* (London and New York, 1889).

HENRY VI. (1421-71). King of England from 1422 to 1461. He was the only child of Henry V. and Catharine of France, and was born at Windsor, December 6, 1421. He was not quite nine months old at his father's death, when he became King of England, and a few weeks later, on the death of Charles VI. of France, he was also proclaimed King of that country. His claim to France was disputed by Charles VII.; but the latter was too indolent to make any serious attempt to conquer the kingdom. The Duke of Bedford, brother of Henry V., who was Regent of France, was successful in holding the country for Henry VI. until 1429. Then Joan of Arc (q.v.), by her heroism, aroused the valor of the French nation, defeated the English at Orléans, and led Charles VII. to Rheims to be crowned. The Maid of Orléans fell into the hands of the English the following year and was burned in 1431, and a few months later Bedford was able to have Henry crowned at Paris. He had already received the English Crown at Westminster, on November 6, 1429. But France gradually passed out of the control of the English, as the French united against foreign rule. On Bedford's death, in 1435, the Duke of Burgundy broke off his alliance with the English and joined Charles VII. From this time the English lost ground steadily, and by the end of 1451 Calais

was the only English possession in France. During Henry's minority there was no opposition to the King in England; but his marriage with Margaret of Anjou, in 1445, was unpopular, as the bride brought no dowry and one of the conditions of the marriage was the surrender of some English territory in France. Henry's own weakness, the lack of success in France, and economic troubles at home aroused bitter opposition, for Henry was virtuous and amiable, but unequal to the task of ruling. When he was thirty-two years old his weak intellect gave way, and he became insane. At times he recovered his reason, but was always subject to a relapse into insanity.

As the wars ceased in France, disorderly bands of soldiers returned home and sought service with the powerful nobles, who maintained great armies of followers, in defiance of the law. The King was too weak to enforce order in his kingdom, and many illegal usurpations of property by the great nobles went unpunished. The system of inclosing lands for pasturage threw many agricultural laborers out of employment. The result was a rising on the part of the people. In 1450 the Duke of Suffolk, who had negotiated the marriage with Margaret, and was the King's favorite Minister, was impeached by the Commons and condemned to banishment, but was murdered on his way to the Continent. Not content with the fall of Suffolk, the men of Kent, led by Jack Cade (q.v.), rose against his appointees, who still held the chief offices. They demanded a redress of grievances, and that the Duke of York should be made the head of the Government. The latter was a descendant of Lionel, the third son of Edward III., and consequently by hereditary right his title to the crown was superior to that of Henry VI., who was descended from Edward's fourth son. From this time York was supported by the discontented people and generally opposed by the nobles. During two periods while the King was temporarily insane York was made Protector, but each time the King recovered his reason York was in danger of destruction. In 1455 the battle of Saint Albans was fought between the King's favorite, Somerset, and the Duke of York, in which Henry was taken prisoner. This is generally called the first battle in the War of the Roses (q.v.). After some desultory strife Henry VI. was again captured by the Yorkists in the battle of Northampton, in 1460, and York asserted his claim to the throne. The lords arranged a compromise that Henry should keep the crown, but that York should be acknowledged as his successor. This arrangement only led to a long war, because Margaret was enraged that her son should be deprived of the succession to the crown. She sought aid in the north, raised an army of 18,000 wild warriors, and won the battle of Wakefield, in 1460, where York was slain. But the depredations and cruelties of her rough followers alarmed the people in the south, who rallied to Edward, Earl of March, the son of York. The latter, by his victory at Towton (March, 1461), gained the throne, and was crowned as Edward IV. on June 29, 1461. Margaret and Henry escaped, and there were several engagements before 1465, when Henry was taken prisoner. Margaret was implacable, and finally obtained the aid of the Earl of Warwick (see WARWICK, RICHARD NEVILLE, EARL OF), who in 1470

drove Edward out of England. Henry, although an imbecile, was reinstated as King; but Edward returned in the same year. Henry was captured and died in 1471. There is little doubt that he was murdered by order of Edward. Consult: Gairdner, *Paston Letters* (London, 1872-75); Stubbs, *Constitutional History of England* (Oxford, 1891); Pauli, *Geschichte von England* (Leipzig, 1864-75); Green, *History of the English People* (several editions).

HENRY VII. (1457-1509). King of England from 1485 to 1509. He was born January 28, 1457, at Pembroke Castle, the son of Edmund Tudor, Earl of Richmond, and Margaret, granddaughter of John of Gaunt, founder of the Lancastrian House, from whom Henry derived his title to the crown. His grandfather was Owen Tudor, a Welsh knight, who married Catharine, widow of Henry V. In 1471, on the death of Henry VI., and Edward, Prince of Wales, Henry became the head of the Lancastrian House. During the reigns of Edward IV. and Richard III., the last Yorkist kings, he took refuge in Brittany, until the crimes of Richard III., who murdered his own nephews, 'the Princes of the Tower' (q.v.), alienated the Yorkist nobility and drove them to accept Henry as Richard's only possible rival. Henry landed at Milford Haven in 1485, and in the battle of Bosworth, August 22d, Richard was defeated and slain. The marriage of Henry with Elizabeth, the Yorkist heiress, cemented the union of the two parties; but Henry was crowned before the marriage and claimed the title of his own right, the first of the Tudor kings.

The numerous disturbances of Henry's reign were due on the whole rather to the instigation of remnants of the Yorkist faction and its foreign supporters than to the disaffection of his subjects at home. The rising of Lovell (1486), the invasions of the impostors Simnel (1487) and Perkin (1495 and 1496-97), found little favor among the English people, and were easily suppressed, but they had important consequences. In order to prevent the Scottish King from taking further part in these intrigues, a marriage was arranged between Margaret, Henry's eldest daughter, and James IV. of Scotland, which led to the accession of a new ruling house in England one hundred years later. In order to guard himself from further invasions from Ireland, a stronghold of the Yorkist party, whence danger usually threatened, Henry was forced to resume the fateful policy of English control which had been abandoned during the Wars of the Roses. In 1494 it was provided that English laws then in force should apply to Ireland. The celebrated Poynings's Law (q.v.) of the same year provides for the supremacy of the English Council over Irish legislation. Foreign affairs occupied much of Henry's attention, since the enemies of France, especially Maximilian of Austria and Ferdinand the Catholic, were anxious for Henry's coöperation; but he was too wily to be led into wars from which they would profit more than he. The negotiations led, however, to the marriage, in 1501, of his eldest son, Arthur, to Catharine, the daughter of Ferdinand and Isabella, and after Arthur's death in 1502 to that prince's brother, Henry VIII., in 1509.

During Henry's reign the royal power rapidly increased. Livery and maintenance (q.v.) were

suppressed. The Star Chamber (q.v.) offered an effective means of curbing the turbulent nobles. Henry was avaricious and the wealthy groaned at the heavy taxes; but Parliament was compliant to his will. His power was not based entirely upon force, for he had no standing army, but on the support of the middle classes, to whom his reign brought security and prosperity after the disorders of the Wars of the Roses. He died at Richmond, April 21, 1509. Among the events of the reign of Henry VII. was the discovery of the North American continent by John Cabot.

The best biographical accounts are Gairdner, *Henry VII.* (London, 1889), in "Twelve English Statesmen Series," and two lectures by Bishop Stubbs in *Lectures* (Oxford, 1887). Five volumes of sources have been printed in the "Rolls Series," under various titles. The admirable French *Histoire générale*, by Lavisse and Rambaud, vol. iv. (Paris, 1894), has a chapter on Henry by M. Bémont, somewhat biographical in character, with a bibliography. Bacon's *Henry VII.* is still of interest. Consult: Lingard, *History of England*, vol. iv. (London, 1854); Green, *History of the English People*, vol. ii. (New York, 1879); Green, *Short History of the English People*, p. 300 (London and New York, 1894); Hallam, *Constitutional History of England*, vol. i. (London, 1855); Traill (editor), *Social England*, vol. ii. (London and New York, 1894), with bibliography.

HENRY VIII. (1491-1547). King of England from 1509 to 1547. He was the second son of Henry VII. and Elizabeth of York, and was born at Greenwich, June 28, 1491. He was intended for the Church until, at the age of eleven, he became heir apparent to the English crown on the death of his brother Arthur, in 1502. In the following year he was betrothed to Catharine of Aragon, Arthur's widow, a Papal dispensation having been obtained from Julius II. on account of their relationship. The marriage was to have taken place on the completion of Henry's fourteenth year; but Henry VII. was playing a wily game of diplomacy with Ferdinand, Catharine's father, and postponed the wedding on various pretexts in order to extort concessions. He even caused his son to protest that the whole arrangement was against his will. On April 21, 1509, Henry succeeded to the crown, at the age of eighteen. On June 11th he married Catharine, and they were crowned together on June 24th. Although she was six years his senior, their marriage was for many years a happy one. For some time after his accession Henry gave himself up to festivities and sports. He was described in 1519 by Giustiniani, the Venetian Ambassador, as the handsomest and best-dressed prince in Europe. "He is very accomplished, a good musician, composes well, is a most capital horseman, a fine joustier, speaks good French, Latin, and Spanish, is very religious, hears three masses daily when he hunts, and sometimes five on other days. . . . He is very fond of hunting, and never takes his diversion without tiring eight or ten horses, which he causes to be stationed beforehand along the line of country he means to take, and when one is tired he mounts another, and before he gets home they are all exhausted." On account of his handsome person, his hearty, generous manners, his fondness for the services of the Church, and his appreciation of the new learning, Henry

was a favorite with all classes of the English people. He chose his ministers with rare sagacity, and, in spite of his gayer, knew what was going on in his administration. He had a violent temper, and no monarch ever held his servants under firmer control. Until 1529 affairs were in the hands of Wolsey (q.v.), whom Henry had raised from a humble station to be Archbishop of York (1514) and Chancellor (1515), and caused to be appointed cardinal (1515) and legate *a latere* (1518). Wolsey had thus in his hands almost supreme power over Church and State, and he rivaled the King in outward splendor; yet no one was in doubt as to who was the real master. Wolsey's precarious tenure depended upon his ability to fulfill, and if possible to anticipate, his young master's wishes.

During approximately the first half of Henry's reign, before the matter of the King's divorce became urgent, his attention was occupied with foreign affairs. After 1519 Europe was divided into two hostile camps by the rivalry between Charles V. and Francis I. Henry could be depended upon in the long run to take the side of Charles, not only on account of his relationship, having married Charles's aunt, and the close commercial relations between England and Charles's possessions in the Low Countries, but because Henry dreamed of renewing the Hundred Years' War and rivaling the deeds of Edward III. and Henry V. For these reasons, Henry always opposed Francis when it came to actual warfare, though he frequently changed sides in the diplomatic struggle. Even before the accession of Charles V. and Francis I., the relations of their predecessors had been much the same, and in 1511 Henry had been drawn into the Holy League between the Papacy, Spain, Austria, and Venice against France. Early in 1512 Henry had sent an abortive expedition to regain Guienne. In the following year he took part in person in the triumphant campaign in Northern France. The French were defeated at Guinegate, August 16th, in what is known as 'the Battle of the Spurs,' from the rapidity of the French flight; Théroutanne surrendered August 24th, and Tournay September 25th. James IV. of Scotland, taking advantage of Henry's employment elsewhere, invaded England, and was defeated and slain at Flodden, September 9, 1513. Henry fully intended to renew the campaign the next year; but when he learned that both Ferdinand of Spain and Maximilian of Germany had deserted him, he secretly made peace, which was cemented by the marriage of his sister Mary with Louis XII. From this time until the outbreak of the first war between Francis and Charles (1521), Wolsey was free to carry out with tolerable success his favorite policy of mediation between the two rivals. There were many interviews, among others the famous 'Field of the Cloth of Gold' (1520), and much treachery on all sides; but in the end Wolsey's peace policy had to give way before Henry's warlike spirit. There were campaigns against France in 1522 and 1523; but they had no other result than an increased taxation at home, for which Wolsey was popularly held accountable. In 1525 Francis was not only defeated at Pavia, but taken prisoner, and Henry thought that the time had come to recover the crown of France. With this purpose in view, he demanded an immediate loan from his sub-

jects in proportion to their incomes, but at so extortionate a rate that riots broke out and the loan had to be recalled. Henry, as was his wont, meanly threw the odium upon Wolsey, who was in no wise responsible. The failure of the loan made peace with France necessary, which was signed in 1525. In the following year Francis regained his freedom upon agreeing to Charles's extortionate demands; but he held himself not bound by forced concessions, and war broke out anew (1527-29), in which he found an ally in Pope Clement VII. Henry took no direct part in this war, but he was anxious to join the French and Papal side, for the reason that he was meditating the divorce of Catharine of Aragon, to which the consent of the Pope was necessary.

For some years Henry had been growing tired of Catharine, and his indifference increased after the appearance at Court in 1522 of the young and sprightly Irish beauty, Anne Boleyn. In addition, Catharine's only surviving child was her daughter Mary, and since no queen had ever sat upon the throne of England, it might reasonably be doubted whether the succession was safe without a male heir. Henry's professed motive, however, was conscientious scruples concerning the validity of his marriage with his brother Arthur's wife, notwithstanding the Pope's dispensation, and in 1527 he asked Clement VII. not merely to grant him a divorce, but to declare that the dispensation of Julius II. was invalid, and that the marriage with Catharine had been void from the beginning. Apart from other considerations, Clement VII. could hardly be expected to impair his own authority by such a ruling; nor was the time propitious for such a request, for in the year in which it was made the Imperial troops had sacked Rome, and Clement VII. was at the mercy of Charles V. The most that Henry could obtain was a legatine court, composed of Wolsey and Campeggio; but the Pope's sole purpose in granting it was delay. Campeggio could neither induce Henry to change his mind nor Catharine to yield, and in 1529 Clement revoked the case to Rome, where Henry knew that it would be useless to press the matter further, especially as Charles and Clement were now in alliance. The result was the fall of Wolsey, and the beginning of momentous changes in the relations between the State and Church in England. Henry probably little realized the importance of the steps which he took in order to satisfy his lust. He certainly did not intend to introduce Protestantism, for which he had an aversion. He was no mean theologian, and in 1521 he had written a book against Luther entitled *Assertio Septem Sacramentorum*, which won for him, by the irony of fate, the Papal title 'defender of the faith,' which English sovereigns have borne to the present day. In 1530 Henry was occupied with Cranmer's suggestion that the favorable opinion of the learned doctors of the universities as to the nullity of the marriage would leave him free to marry again without the Pope's consent. Bribery and cajolery were freely used with considerable success; but in 1531 Henry proceeded to more vigorous measures. Upon the suggestion of Thomas Cromwell, an adventurer, who rose to influence soon after Wolsey's fall, he conceived the plan of seizing the Papal authority and revenue in England, thereby not only securing the divorce, but vastly increasing the

resources and power of the Crown. Henry accused the clergy of having violated the Statute of *Pramunire* (q.v.) in accepting Wolsey's legate authority, although they would have met with swift punishment if they had presumed to act otherwise, and although Henry himself had called in the legate *Campeggio* a short time before. Large numbers of the laity were also equally involved; but this was merely a violent and unscrupulous method of securing the clergy at home before proceeding against the authority of the Pope. Henry's complete success and the very moderate resistance of the clergy show how times had changed since the days of Henry II. and Thomas of Canterbury. The Pope had never fully regained his authority after the movement of *Wicliff*; and the English clergy were not only wealthy and therefore timid, but since Wolsey as Royal Chancellor and Papal legate had practically united supreme power in State and Church, they had grown compliant to the royal will. The Convocation of Canterbury offered a gift of £100,000 (equal to at least £2,000,000 at the present day) to be freed from the penalties of *præmunire*, which involved the confiscation of all their property. Henry demanded in addition that he be recognized as the supreme head of the Church of England, which after some resistance they accepted with the vague qualification, "so far as is permitted by the law of Christ." The Convocation of York soon after bought its pardon on the same condition and the payment of £18,000. Henry found support in these measures in Parliament, whose elections he practically controlled, and whose members were either lawyers or country squires, with little affection for the Church. In 1532 the clergy submitted its entire body of canons to the King's examination, and renounced the right to make new canons without royal permission, thus putting an end forever to the freedom of the English Church. In 1533 Henry made retreat impossible by secretly marrying Anne Boleyn without a divorce. In the same year he made *Cranmer*, an able but compliant and vacillating churchman, Archbishop of Canterbury, who on May 23d decided that Henry's marriage with *Catharine* was void, and on May 28th that his secret marriage with Anne was lawful. About a year after, *Clement* decided in favor of *Catharine*, but not until Henry, foreseeing the result, had all but severed the connection between the English Church and Rome. In 1534 Parliament changed the provisional Act of *Annates* of 1532 into an unconditional one, giving the King the annates or first fruits which were formerly paid to the Pope. It also provided for the appointment of bishops without reference to Papal authority, and abolished appeals to Rome. Henceforth the Pope was merely 'the Bishop of Rome,' with no more authority in England than any other foreign bishop.

The new royal supremacy found its first expression in three acts which, taken together, assumed an intolerably tyrannical character. The first act of succession of 1533 not only fixed the inheritance to the crown in the issue of Anne Boleyn, and declared that the marriage with *Catharine* was invalid from the beginning, but required all subjects to take oath affirming their full acceptance of the contents of the act, which no Catholic could conscientiously do; and it further declared that any one who refused

should be guilty of high treason. The act of supremacy and the treason act of the following year confirmed the royal title 'supreme head of the Church of England,' and declared that any one who should deprive the King of his title should be guilty of high treason. The King thus tried not only to rule over men's actions, but over their consciences. Numerous victims met a traitor's death for refusing to swear that *Catharine's* marriage was unlawful, though otherwise they were willing to accept the new succession. With incredible callousness, Henry sent to the block *Sir Thomas More*, his former friend and boon companion, one of the ornaments of the age, and *Fisher*, whom the Pope shortly before had made cardinal. Many friars were burned merely for refusing to take the oath on conscientious grounds. Some of them had spoken against the King's second marriage, but others had not. In 1536 Anne was executed, on charges of which we have no proof. Ten days later Henry married *Jane Seymour*, and a new act of succession made it treasonable to affirm what it was formerly treasonable to deny.

The resistance of the friars no doubt helped to call the attention of *Cromwell*, who had been made vicar-general in ecclesiastical matters in 1535, to the rich booty to be acquired through the dissolution of the monasteries, whose laxness of discipline made them vulnerable to attack. He ventured at first to despoil only the lesser houses. A royal visitation of the year 1535 made the convenient discovery that monasteries "where the congregation of such religious persons is under the number of twelve persons" were the seats of "manifest sin, vicious, carnal, and abominable living," while those with more than twelve persons were not. Parliament thereupon (1536) dissolved the smaller houses and gave their property to the King. The Catholic rising in the northern and more conservative districts in 1536, known as the 'Pilgrimage of Grace,' involved some of the remaining abbots of that region, and this was a signal for the dissolution of the greater monasteries. Those who were implicated in the revolt were executed for treason, and the others were gradually frightened into surrendering their authority and property into the hands of the King, "of their own free and voluntary minds, good wills and assents, without constraint, coercion, or compulsion of any manner of person or persons," as the Parliamentary act of 1539 puts it. Henry used the enormous spoils of the monasteries partly for religious objects, partly for military purposes; but much was granted to royal favorites, and many prominent families in England at the present day derive their fortunes from this source. One of the unexpected consequences of the dissolution was the formation of a considerable party keenly interested in maintaining the religious innovations.

It was not, however, Henry's first intention to introduce religious innovations, other than the royal supremacy. If *More* and *Fisher* were beheaded for denying the royal supremacy, *John Frith* was burned for denying the doctrine of transubstantiation. Yet preachers with Protestant tendencies were appearing and criticising the old order of things with great asperity. To prevent these disturbances, the Ten Articles were promulgated in 1536 by royal order, containing a creed which in the main held to the old order, yet

passed over in silence or tried to explain some of the controverted points. In the same year the Bible was translated with royal sanction, though Henry apparently took no great interest in it. The new movement was sure to grow. Its intellectual leader was Crammer, who was himself under the influence of Ridley. Crammer and Ridley were slowly changing their views in the direction of Protestantism. Cromwell also favored Protestantism, for political reasons. In 1538 there was much smashing of images and spoliation of tombs, until Henry took alarm. In 1539 he issued, with the consent of Parliament, the reactionary Six Articles, affirming the principal controverted Catholic dogmas. Englishmen found it as dangerous to be too Protestant as too Catholic, and the discreet conformed to Henry's somewhat shifting views. In 1544 Crammer wrote his celebrated Litany, and ordered certain parts of the service to be said in English; but further changes were cut short by Henry's death.

In the meantime Cromwell had come to grief through his arrangement of the marriage of Henry to Anne of Cleves, in order to form a connection with the Protestant princes of Germany. When Anne reached England she was found to be far from handsome, and Henry's resentment was great. This is supposed to be the real reason for Cromwell's disgrace and execution, July 28, 1540, though Henry may have grown tired of Cromwell as he grew tired of every one else. On the day of Cromwell's execution Henry married Catharine Howard, Anne having been divorced shortly before; but she was soon found to have been unfaithful both before and after her marriage, and was beheaded. In 1543 Henry married his sixth wife, Catharine Parr, who survived him.

In Henry's last years his attention was again occupied with foreign enterprises. He tried to establish his authority in Ireland by winning over the native chiefs, stripping the Irish monasteries for their benefit. From 1542 to 1546 he was at war with Scotland and France. The Scots were defeated at Solway Moss in 1542, and James V. died soon after. Henry took Boulogne in 1544, and made peace two years later. He died January 28, 1547. By act of Parliament, in 1544, the succession had been given to his three children, Edward, Mary, and Elizabeth, the offspring respectively of Jane Seymour, Catharine of Aragon, and Anne Boleyn, who succeeded in this order and died without issue.

HENRY I. (c.1008-60). King of France from 1031 to 1060. He was the son of Robert I., and a grandson of Hugh Capet. The first years of his reign were disturbed by a rebellion headed by his mother, Constance of Toulouse, who, however, submitted in 1033. In the disorders which followed the death of Robert the Devil, Duke of Normandy, in 1035, Henry assisted William the Bastard, the illegitimate son and successor of Robert, in establishing his authority over the rebellious Norman nobles, participating in the battle of Val-ès-dunes in 1047. Subsequently Henry grew jealous of the power of the Norman Duke. Leaguering himself with the Count of Anjou, and calling his brother Eudes into the field, he invaded Normandy from Evreux in 1054. When, however, Eudes had been defeated at Mortemer, Henry drew back in haste and left the Normans to themselves. In 1055 he caused his eldest son, Philip, to be crowned as joint King. Henry died in 1060. He was an active prince, who spent a large part of his time in the field, upholding the royal authority against the feudal nobles. His first wife, Mathilda, niece of Henry III. of Germany, died childless; his second wife, Anne, daughter of Jaroslaw, Prince of Novgorod and Kiev, bore him three sons—Philip, his successor; Robert, who died in childhood; and Hugh, Count of Vermandois. Consult Soehnle, *Etude sur la vie et le règne de Henri I.* (Paris, 1891).

HENRY II. (1519-59). King of France from 1547 to 1559. He was born March 31, 1519, being the second of three sons of Francis I. by his first wife, Claude. From 1526 to 1529 Prince Henry was a hostage in Spain, together with his brother, the Dauphin Francis. In 1533 he married Catharine de' Medici and in 1536 the death of the Dauphin Francis made him the heir apparent to the throne. The same year he became the lover of the celebrated Diane of Poitiers, a woman several years his senior, but of attractive mind and strong will. In 1547 Henry succeeded his father, Francis I., and at once submitted himself to the influence of his mistress and of Anne de Montmorency, Constable of France, though the Guises also enjoyed a large share of the royal favor. A revolt in Guienne, where the people had risen against the *gabelleurs*, or collectors of the salt duty, was speedily put down by Montmorency. In 1550 Boulogne, which had been taken by the English during the wars of Henry VIII., was recovered by the French, and in a second war, which began in 1557, the English lost Calais and Guines, their last possessions in France (1558). Though a strong Catholic

and a persecutor of the Huguenots, Henry made treaties of alliance with the German Protestants, led an army of 38,000 men to aid Maurice of Saxony against the Emperor, and made himself master of the bishoprics of Toul and Verdun, while Montmorency seized Metz by treachery (1552). After the abdication of Charles V. (1555-56) Henry embraced the opportunity of attacking the Netherlands and Italy before Philip II. could consolidate his newly acquired possessions; but the results of this step were disastrous to France at every point. In Italy, the attack on Naples, made by Guise at the head of 20,000 men, utterly failed; while in the Low Countries the French under Montmorency sustained a total defeat, August 10, 1557, at Saint Quentin, and were forced to abandon the town to the Spaniards. This was followed by the defeat of De Thermes at Gravelines in 1558, which with other causes led to the Treaty of Cateau-Cambrésis, April 2-3, 1559. On June 29th Henry II. was mortally wounded in a tournament by Count Montgomery, the captain of his Scottish Guards, and died July 10, 1559. He is represented by historians as a bold and handsome man, but cold and indolent. His Queen, Catharine de' Medici, bore him ten children, of whom three lived to be kings of France. He was succeeded by his eldest son, who became Francis II. Consult: The contemporary memoirs of Monthieu, Tavannes, Vieilleville, Villars, and Brantôme; also, Barre-Duparcq, *Histoire de Henri II.* (Paris, 1887); Ranke, *Civil Wars and Monarchy in France in the Sixteenth and Seventeenth Centuries* (trans. London, 1852-61). See, also, FRANCE; and consult the authorities referred to there.

HENRY III. (1551-89). King of France from 1574 to 1589. He was the third son of Henry II. and Catharine de' Medici, and was the last of the House of Valois. He was born at Fontainebleau, September 19, 1551, and in his youth bore the title of Duke of Anjou. At the age of sixteen he was made a lieutenant-general, and placed in nominal command of the armies of France, though the real direction of operations was in the hands of Marshal de Tavannes. Henry had a part in the victories over the Huguenots at Jarnac and Moncontour in 1569, and was active in abetting the massacre of Saint Bartholomew. He was elected King of Poland in 1573, but upon receiving news of the death of his brother, Charles IX., in the following year, he fled from Cracow to make certain his succession in France. As King he continued the war against the Huguenots; but the union of the party of his brother, the Duke of Alençon, with the Huguenots wrung from the alarmed King the Peace of Beaulieu (or of Monsieur) in 1576, confirmed by the Edict of Poitiers or Bergerac in 1577. This peace granted so many privileges to the Huguenots that it exasperated the Catholic Party and led to the formation of the Holy League, the avowed object of which was to maintain the supremacy of Catholicism, and the secret purpose to secure the reversion of the throne to the Guises. Meanwhile the King forfeited all respect by the indulgence of his vicious propensities. His life was marked by alternate outbursts of licentiousness and moods of gloomy fanaticism. The affection he lavished upon his effeminate favorites, or *mignons*, as they were called, aroused the disgust of the nation. A renewed war with the Huguenots

(1579-80) was concluded by the Peace of Fleix, a renewal of the terms of that of Bergerac. The strength of the League grew rapidly, aided by the popularity of the Duke of Guise with the Catholic masses. By the death of the Duke of Anjou (formerly of Alençon), Henry of Navarre became heir to the throne (1584); but the Catholics would not accept him, and Henry III., after an attempt to come to an understanding with his cousin of Navarre, issued the Edict of Nemours (1585), repealing all privileges granted the Huguenots. The so-called 'War of the Three Henrys' then broke out. In 1587 the Huguenots under Henry of Navarre triumphed at Coutras. King Henry found that Henry of Guise, through his commanding position, was becoming master of the kingdom. On May 12, 1588, the so-called Day of the Barricades, the inhabitants of Paris rose against the royal forces, and were quelled only by the interposition of Guise. The King fled to Blois, convoked the Estates, and summoned Guise to a private audience. Guise was assassinated in the King's cabinet by the guards known as the 'Forty-five' (December 23, 1588); and his brother, the Cardinal of Lorraine, was put to death on the following day. This double assassination aroused the hatred of Catholic France. The doctors of the Sorbonne declared the people to be relieved of the duty of obedience to the King, and the heads of the League dissolved the Parliament. Henry was distracted by the difficulties of his position, and threw himself under the protection of Henry of Navarre. The two kings advanced at the head of an army of 40,000 Huguenots on Paris, which would probably have had to capitulate had not Henry III. been assassinated, August 1, 1589, by a fanatical young Dominican, named Jacques Clément. The murderer was slain on the spot by the royal guard, and the King died on the following day, after having declared Henry of Navarre his successor.

Armstrong, *The French Wars of Religion, 1559-98* (London, 1892); De Noailles, *Henri de Valois et la Pologne* (3 vols., Paris, 1867); De la Barre-Duparcq, *Histoire de Henri III.* (Paris, 1882); Robiquet, *Paris et la Ligue sous Henri III.* (Paris, 1886); Nolhae and Salerti, *Il viaggio in Italia di Enrico III., re di Francia* (Turin, 1890). See FRANCE; HUGUENOTS.

HENRY IV. (1553-1610). King of France from 1589 to 1610, sometimes called the Great. He was born in the Castle of Pau, Béarn, December 14, 1553, being the third son of Antoine de Bourbon and Jeanne d'Albret, daughter and heiress of Henry II., King of Navarre and Béarn, and allied through his father with the French royal family. In 1555 his mother became Queen of Navarre, and gave her husband the title of King. Henry himself was known as Prince of Viane. His father's death, in 1562, placed him under the sole control of his mother who was a zealous Calvinist, and was careful to select learned men holding her own tenets for his instructors. Upon the outbreak of the third Civil War in France

the young prince and his intrepid mother joined the Huguenots at La Rochelle, and after the death of the Prince of Condé at Jarnac (March 13, 1569), Henry was proclaimed by the voice of the army chief of the Protestant cause. On account of his extreme youth, however, the actual command was vested in Coligny (q.v.). Notwithstanding the defeats which the Huguenots had experienced in this campaign, the Peace of Saint Germain-en-Laye (August 8, 1570) was apparently of great advantage to them, and was speedily followed by a contract of marriage between Henry of Navarre and Margaret of Valois, the sister of Charles IX. Jeanne d'Albret died suddenly a few months later (June 9, 1572), and the prospective bridegroom became King of Navarre, under the title of Henry III. After much opposition on the part of both Catholics and Protestants, the marriage with Margaret of Valois was celebrated with great pomp, August 18, 1572, followed within a week by the massacre of Saint Bartholomew. It had been originally intended that Henry should share the fate of his friends and co-religionists, but his life was spared on condition of his professing himself a Catholic. For more than three years he remained at the French Court, virtually a prisoner, and continually plotting and seeking to escape; but at length, in February, 1576, he contrived to elude the vigilance of his guardians, and made his way to the camp of the Huguenots in Gascony, where he repudiated his enforced conversion and resumed the command of the army. In the Peace of Beaulieu, concluded May 6, 1576, the Huguenots obtained several distinct advantages.

The death of the Duke of Anjou (late Alençon) in 1584 made Henry presumptive heir to the crown. Some years previous to this the Catholic League had been formed, the secret purpose of which was the support of the Guise pretensions to the throne. The War of the Three Henrys (Henry III. of France, Henry of Navarre, and Henry of Guise) was terminated by the Protestant victory of Coutras, October 20, 1587. In 1588 Henry III. of France, hating and fearing the powerful Guises, who had virtually made themselves his masters, caused the Duke of Guise and the Cardinal de Lorraine to be murdered, and in the following year came to an understanding with Henry of Navarre. The two now proceeded to lay siege to Paris, August, 1589. The assassination of Henry III. by Clément made Henry of Navarre, as the nearest lineal male descendant of the royal house of France, rightful King of France, the House of Bourbon succeeding to that of Valois. As a Protestant, he had been excommunicated by Sixtus V. in 1585, and declared incapable of succeeding to the French crown. His religion, moreover, made him obnoxious to the greater part of the nation, and he found in addition that the dukes of Lorraine and Savoy, and Philip II. of Spain, were prepared, each on his own account, to dispute his claims. He withdrew, therefore, to Normandy until he could collect more troops and obtain reinforcements from England and Germany. His nearly hopeless cause, however, gradually gained strength through the weakness and internal dissensions of the Leaguers, who proclaimed the aged Cardinal de Bourbon King, with the Duke of Mayenne Lieutenant-General of the Kingdom, and thus complicated the interests of their party. After a success at Arques (September, 1589),

Henry reappeared before Paris. He won a splendid victory over Mayenne at Ivry (March 14, 1590), but Spanish intervention defeated his plans, and it is probable that he would never have been generally acknowledged had he not, by the advice of his friend and Minister, De Rosny, afterwards Duke of Sully (q.v.), formally professed himself a member of the Church of Rome, in 1593. "Paris," the light-hearted but astute monarch is reported to have said, "is well worth a mass." His public recantation of Protestantism, before the Archbishop of Bourges, July 25, 1593, filled the Catholics with joy, and was followed by the speedy surrender of the most important cities of the kingdom, including Paris, which opened its gates to him in March, 1594. The war with the League was not, however, terminated till 1596. In 1598 peace was concluded between Spain and France by the Treaty of Verbins, which restored to the latter many important places in Picardy and was otherwise favorable to the French King. On April, 13, 1598, Henry signed the Edict of Nantes, which secured the Protestants perfect liberty of conscience and the administration of impartial justice.

Henry was now left at liberty to direct his attention to the internal improvement of the kingdom, which had been thoroughly disorganized through the long continuance of civil war. The narrow-minded policy of the preceding reigns had left the provinces greatly at the mercy of the civil governors and large landed proprietors, who arrogated almost sovereign power to themselves in raising taxes and exacting compulsory services. Such abuses Henry completely stopped. By building canals and roads, and opening all parts of his kingdom to commerce, he established new sources of wealth and prosperity for his subjects. The mainspring of these improvements was, however, the reorganization of the finances under Sully, who, in the course of ten years, reduced the national debt from 330,000,000 to 50,000,000 livres. In 1601 the districts of Bresse, Bugey, and Valromey were acquired from Savoy and added to France. For ten years France enjoyed prosperity previously unheard of. In foreign politics Henry devoted his entire energy to the formation of a powerful coalition against the House of Austria, the ancient enemy of France, against whom, since the Treaty of Cateau-Cambrésis in 1559, the distracted country had been too weak to contend. The disputed succession to the duchies of Jülich and Cleves (qq.v.) afforded an opportunity for the opening of hostilities, and the King, who had entered into an alliance with the Protestant Union of Germany, was about to take personal command of the French army, when he was struck down by the dagger of Ravallac, a religious fanatic, at Paris, May 14, 1610. Nineteen times before attempts had been made on his life, most of which it was thought could be traced to the agency of the Papal and Imperial courts, and hence the people in their grief and consternation laid Ravallac's crime to the charge of the same influences. The most horrible vengeance was wreaked on the murderer. Henry was succeeded on the throne by Louis XIII., his son by his second wife, Maria de' Medici (q.v.). Time has strengthened the high estimate which the people of France formed of their favorite King, for although his faults were numerous, they were eclipsed by his surpassing qualities. An inordinate passion for women was

his greatest failing. He was without doubt the most imposing figure in France of his day, and has taken his place in history as the greatest of Bourbon kings.

BIBLIOGRAPHY. For the history of Henry IV., consult the memoirs of the time, particularly those of the Duke de Sully (Amsterdam, 1725); also Poirson, *Histoire de Henri IV.* (3d ed., Paris, 1865); Jung, *Henri IV. écrivain* (ib., 1885); Guadet, *Henri IV., sa vie, son œuvre et ses écrits* (ib., 1879); Leseure, *Vie de Henri IV.* (ib., 1876); Barre-Duparcq, *Histoire de Henri IV.* (ib., 1884); Rambault, *Henri IV. et son œuvre* (ib., 1884); Zeller, *Henri IV. et Marie de Médici* (ib., 1877); Lacombe, *Henri IV. et sa politique* (ib., 1878). In English the following works may be consulted: Gurney, "Henry IV.," in *Chapters from French History* (London, 1870); Baird, *The Huguenots and Henry of Navarre* (New York, 1886); Jackson, *The First of the Bourbons* (London, 1890); Willert, *Henry of Navarre and the Huguenots in France* (New York, 1893).

HENRY V. OF FRANCE. See CHAMBORD, DUKE OF.

HENRY IV. An historical play by William Shakespeare, in two parts, produced in 1597 and 1598, printed in 1598 and 1600. The sources are Holinshed's *Chronicles* and a popular old play (produced in 1588), *The Famous Victories of Henry V.* In it the royal hero, who had appeared as a spirited youth in *Richard II.*, is represented as a care-worn monarch, who has passed down his boyish fire to his son, Prince Hal. The plot deals with Hotspur's rebellion and the sobering of the Prince's character through the tempering process of his nation's trial. See HOTSPUR; and also FALSTAFF.

HENRY V. An historical drama by William Shakespeare, a continuation of Henry IV., and derived from the same sources. It deals with the adventures of Prince Hal after he ascended the throne, especially with his invasion of France, and tells of the death of Henry's former boon companion, Falstaff. It was performed in 1599, and was printed in 1600, imperfectly, by Thomas Creede.

HENRY VI. An historical drama in three parts, produced in 1592-94, and printed in 1594-95, in which Shakespeare's genius can be traced, working over the cruder stuff of possibly Marlowe, Peele, Lodge, Kyd, and Greene or some unknown dramatists. It deals with the early years of Henry VI.'s reign, his misfortunes during the Wars of the Roses, and his tragic death. The first part was produced in 1592, and called forth Greene's charge of plagiarism in his *Groat's Worth of Wit*. The second part, founded on an old play, *The First Part of the Contention Between the Two Famous Houses of Yorke and Lancaster*, and the third part, founded on *The True Tragedie of Richard, Duke of Yorke*, were evidently elaborated and adapted by Shakespeare from works by unknown writers.

HENRY VIII. An historical drama, produced in 1613, begun by William Shakespeare and completed by Fletcher and Massinger. It is founded on Holinshed's *Chronicles* and Fox's *Christian Martyrs*, and was first printed in the folio of 1623. Only Act I., Scene 1; Act II., Scenes 3 and 4; Act III., Scene 2; Act IV., Scene 1, can be ascribed to Shakespeare; the rest was

written by Fletcher, with possibly some help from Massinger.

HENRY, ALEXANDER (1739-1824). An American fur-trader, born in New Brunswick, N. J. He was with General Amherst in the expedition against the French in Canada (1760). After the peace he went to Michillimackinac to engage in the fur trade, and was one of the few survivors when the English garrison of the fort was massacred by the Indians at the time of Pontiac's uprising (1763). Henry remained for a year a captive among the Ojibways at Sault Ste. Marie, whence he came with an Indian contingent to join General Bradstreet's army on the lakes and by the desertion of his battalion regained his liberty. He resumed the fur trade, voyaging between Montreal and the Rocky Mountains, and from 1770 to 1774 made an unsuccessful attempt to float a company for working the copper-mines on Lake Superior. His book, *Travels and Adventures in Canada and the Indian Territory Between the Years 1760 and 1776* (1809), is quoted at length in Parkman, *Conspiracy of Pontiac* (London, 1868).

HENRY, CALEB SPRAGUE (1804-84). An American Protestant Episcopal clergyman and author. He was born in Rutland, Mass., graduated at Dartmouth in 1825, and studied theology at Andover and New Haven. In 1828 he became a Congregational minister at Greenfield, Mass., and in 1833 removed to Hartford, Conn. In 1834 he started the *American Advocate of Peace*, the organ of the American Peace Society. He then entered the ministry of the Protestant Episcopal Church, and was professor of moral and intellectual philosophy in Bristol College, Pennsylvania (1835-38). In 1837, with the aid of Rev. Francis L. Hawks, he established the *New York Review*. He was professor of history and philosophy in the New York University from 1839 to 1852. Later he held other pastorates, but was chiefly engaged in literary work. He translated Guizot's *History of Civilization*, and other works from the French, and was the author of several works, including *Compendium of Christian Antiquities* (1837), and *Satan as a Moral Philosopher* (1877).

HENRY, CAPE. See CAPE HENRY.

HENRY, ä'n'rê', CHARLES (1859—). A French librarian and editor. He was born at Bollwiller, Haut-Rhin, and was educated in Paris, where, in 1881, he became assistant and afterwards librarian in the Sorbonne. As a specialist in the history of mathematics he was sent to Italy to seek some manuscripts of that nature which the Government wished to publish. He edited several works upon kindred subjects, as well as memoirs, letters, and other volumes, and wrote critiques upon the musical theories of Rameau and Wronski. C. Huet's correspondence he published under the title *Un érudit, homme du monde, homme d'église, homme de cour* (1880), and he issued also *Problèmes de géométrie pratique* (1884); and *Lettres inédites de Mlle. de Lespinasse à Condorcet et à D'Alembert* (1887).

HENRY, EDWARD LAMSON (1841—). An American historical and genre painter. He was born in Charleston, S. C., January 12, 1841, and studied at the Philadelphia Academy with Peter Weber, and from 1860 to 1863 with Suisse and Courbet in Paris. He returned to the United States during the Civil War, and sketched on

the James River. In 1869 he was elected a member of the National Academy, and established a studio in New York. He is also a member of the American Water-Color Society. In 1871, 1875, and 1882 he revisited Europe, sketching in France and England. He received a medal at the New Orleans Exposition in 1884 and at the World's Fair, Chicago, in 1893, and honorable mention at the Paris Exhibition, 1889. His speciality is genre figures, quaintly depicted. The composition is usually well balanced, with elaborate details; the outlines are often hard, and the color crude. One of his largest paintings is the "Initial Excursion of the First Railway Ever Constructed in New York State," Coreoran Gallery, Washington, containing fifty figures. His principal works are: "Old Clock on the Stairs" (1868); "City Point—Grant's Headquarters" (1869), Union League Club, New York; "Battle of Germantown," owned by William Astor; "Declaration of Independence," owned by J. W. Drexel; "Reception to Lafayette," "In Sight of Home," "Waiting for an Answer."

HENRY, ä'n'ré', ETIENNE OSSIAN (1798-1873). A French chemist, son of Noël Etienne Henry (1769-1832), born in Paris, and trained by his father, who was director of the Central Pharmacy of the Parisian hospitals and professor in the School of Pharmacy. In 1824 he became director of the chemical laboratory of the Academy of Medicine. He discovered sinapin and studied mineral waters, milk of various animals, nicotine, and tannin. His works include: *Traité pratique d'analyse chimique des eaux minérales*, with his father (2d ed. 1858); *Mémoire sur l'analyse organique*, with Plisson (1830); *Analyse chimique des eaux de Paris*, with Boutron-Charland (1848); and, with Ratier, a translation of the *Codex Medicamentarius* (1827).

HENRY, JOSEPH (1799-1878). An American physicist, born at Albany, N. Y. He was educated at the Albany Academy, where in 1826 he became professor of mathematics. Henry enjoyed the reputation of being one of the greatest of experimenters, and did more toward the development of the science of electricity than any other American since the time of Franklin. At the Albany Academy he developed the electromagnet, which had been invented a few years previously by Sturgeon of England. By insulating the wire with silk and constructing the apparatus according to certain original ideas, he obtained electromagnets of far greater power and efficiency than those of other experimenters, and also transmitted the current from the battery through a considerable length of wire to the magnet. In 1831 Henry sent a current through a mile of fine copper wire, and caused the armature of the electromagnet to be attracted and strike a bell, thus producing an audible signal. This is the first electromagnet telegraph, and Henry is to be regarded as the inventor of the principle now universally applied in modern practice. In further experiments at Princeton where Henry was appointed professor in 1832 he devised an arrangement of electromagnets and batteries, where the current transmitted to a considerable distance energized a magnet and attracted an armature which opened a 'local' circuit with its battery and caused a powerful electromagnet to perform work by allowing a weight to fall. This experiment contains the principle of the tele-

graph relay which made possible telegraphy over considerable distances. The apparatus was set up between Henry's residence and laboratory at Princeton, and the earth was used as a return conductor for the first time. Henry was also the first to employ magnetic attraction and repulsion to produce motion, and constructed a simple magnetic engine which had the first automatic pole-changer or commutator ever applied to the galvanic battery.

In the discovery of magnetic induction Henry was anticipated by Faraday (q.v.), but he was the first to notice the similar phenomenon of self-induction. He also investigated the oscillations of electric discharges and other electrical phenomena. In 1846 he was chosen secretary of the Smithsonian Institution at Washington, a position that he held until his death. In 1849 he was elected president of the American Association for the Advancement of Science, and in 1858 he was chosen president of the National Academy of Sciences, of which body he was an original member. Upon the establishment of the Lighthouse Board in 1852 Professor Henry was appointed a member, and in 1871 became its head. He carried on in this capacity a number of important tests for the Government which resulted in the improvement of fog-signals and the various lights and lighthouses. He was also interested in meteorology, and in his reports, as secretary, he urged the Government to collect and distribute meteorological information. He suggested the use of the telegraph for this purpose, and for a number of years this important work was under the direction of the Smithsonian Institution. Terrestrial magnetism was also a subject of interest to Henry, and he not only participated in investigations on his own account, but urged upon the Government the importance of having such observations made. In acoustics, Professor Henry also carried on important researches, his attention being directed to this subject largely through his experiments with fog-signals. Henry enjoyed no small amount of European reputation, and in his trips abroad was enthusiastically received by English and Continental scientists.

Henry was involved in a controversy with S. F. B. Morse (q.v.) as regards the invention of the telegraph, but it is safe to state that the former is to be regarded as the originator of the principle, while Morse invented the instrument first used for this purpose. Henry's collected writings are to be found in the *Smithsonian Miscellaneous Collection*, vol. xxx. (Washington, 1887). In volumes xx. and xxi. of the same series are to be found excellent biographical and memorial notices. Consult also Dickerson, *Joseph Henry and the Magnetic Telegraph* (New York, 1885).

HENRY, MATTHEW (1662-1714). An English Nonconformist divine and Bible commentator. He was born in Flintshire, near Chester, October 18, 1662. Having qualified himself for the ministry, in 1687 he was settled as pastor of a congregation of Dissenters at Chester, where he continued for twenty-five years. In May, 1712, he removed to a charge at Hackney, near London. He died June 22, 1714. His principal work is an *Exposition of the Old and New Testament*, which was commenced in November, 1704, and five volumes appeared in London prior to 1710. He lived to finish it only to the Acts of the Apostles, and the remainder was finished by thirteen Nonconformist ministers, whose names are given

in some of the editions. For many years this was the standard commentary on the Bible. It has been often reprinted; e.g. by Burder and Hughes, with additional matter from Henry's manuscripts (6 vols., London, 1811). Besides his commentary, Henry published numerous volumes, as well as sermons and tracts. His miscellaneous works were republished in London in 1830. For his life, consult: Williams (London, 1865); *Diaries and Letters of Philip Henry* (his father), edited by Lee (ib., 1883).

HENRY, PATRICK (1736-99). An American orator and statesman, born in Hanover County, Va., May 29, 1736. His father was a native of Scotland, and a cousin of Robertson, the celebrated historian. Patrick was unpromising as a scholar, and when he was fifteen years old he was placed to work with a country tradesman. After a year's apprenticeship he was set up in business with his brother William, but before the end of a year the undertaking had to be abandoned. He was slovenly in dress, and showed no aptitude for business of any kind. At the time that he married the daughter of a farmer, a Miss Shelton, his business had collapsed, and he was wretchedly poor. He next tried farming for two years, but had neither perseverance nor knowledge, and after one more of many failures he opened a store and failed within the next three years. When no customers appeared he would close his store and go fishing. But at intervals he read such books as he could find, and managed to gain a fair idea of Latin and Greek. Having utterly failed in farming and in trade, he made an attempt at the law, and after a period of reading said to have extended over only one month, had the boldness to ask for license to practice. This was granted in 1760, on the condition that he would extend his studies before undertaking to practice. In 1763 he leaped into immediate prominence in his profession. He was then engaged in the place of a more experienced advocate, who refused to continue the defense in a celebrated case known as the 'Parson's Cause,' and by an unexpectedly brilliant speech aroused such intense excitement that the audience seized him and bore him in triumph on their shoulders. (See PARSON'S CAUSE.) Thereafter his practice was enormous and his prosperity assured. But he was not satisfied with his legal profession. In 1765 he became a member of the House of Burgesses. At the critical period of the Stamp Act excitement he was comparatively unknown to the Assembly, and the rich planters were scandalized at his presumption in offering to the House the brief resolutions which set forth that the burgesses and the Governor had the exclusive right and power to lay taxes and imposts upon the people of the Colony, and that not alone the Stamp Act, but all acts of Parliament which encroached upon the rights of the Colonies, were unconstitutional and therefore void. A storm of opposition from the conservative members naturally followed, and the resolutions were denounced as extreme, impolitic, and dangerous. In the debate he startled even the radicals by his historic outburst: "Cesar had his Brutus, Charles the First his Cromwell, and George the Third—" [here he was interrupted by the presiding officer and members with cries of "Treason! treason!"]—"may profit by their example," calmly said the orator, completing the sentence, adding, "If this be treason, make

the most of it." The resolutions were adopted by a very small majority. He was now a power in the Colony, replaced the vacillating planters in the leadership, and became the authorized representative of the people against the aristocratic element. In opposition to Parliamentary imposts and in preparing the articles of association to discourage the use of British merchandise, Henry was one of the leaders. He continued his legal business, and, though deficient in legal education, was wonderfully successful before juries. At this time he took an active part in the movement for securing the rights of the Dissenters, which finally culminated in the Religious Freedom Act of 1785, by which the Church of England was disestablished in Virginia. Patrick Henry, with Jefferson and others, was ready to precipitate an open rupture with England. He was especially active in the House of Burgesses, and in May, 1774, took a leading part in those acts of the House with reference to the Boston Port Bill which led to its immediate dissolution by Lord Dunmore. Upon the following day (May 27th) was held the historic meeting of the former burgesses in the Raleigh Tavern, as a result of which came the first Revolutionary convention of Virginia (August, 1774), of which Henry was a member, and by which he was chosen a delegate to the first Continental Congress. In that famous assembly he was hailed as the champion of constitutional liberty, and his wonderful eloquence was at once recognized. He served on the Committee on Trade and Manufactures, on the committee to prepare an address to the King, and on that appointed to draft a statement of the rights of the colonists. Returning thence to Virginia, his prominence was still further enhanced by his work in the Provincial Convention of March, 1775, where he introduced resolutions to organize the militia and put the Colony in an attitude of defense, which met with great opposition. He replied by a speech in which, according to one version, occur the words: "There is no retreat but in submission and slavery. Our chains are already forged. Their clanking may be heard on the plains of Boston. The next gale that sweeps from the north will bring the clash of resounding arms. Our brethren are already in the field. Why stand we here idle? What is it that gentlemen wish? What would they have? Is life so dear or peace so sweet as to be purchased at the price of chains and slavery? Forbid it, Almighty God! I know not what course others may take, but as for me, give me liberty or give me death!" Without an opposing voice the resolutions were adopted, and a committee, with Henry as chairman, was appointed to prepare a plan for the defense of the province. Soon thereafter the royal Governor, Dunmore, caused to be removed on shipboard much of the province's supply of powder. The people took up arms, and being told that the powder would be returned, they at once disbanded. Henry, however, seized the favorable moment, gathered a force of militia, and marched upon Williamsburg to demand the powder or compensation. An agent of Dunmore's met him and paid him £300 for the powder. Henry was denounced for stirring up sedition; but it was too late to talk of loyalty; the province was aroused, and in June Dunmore took refuge on a man-of-war. A convention assembled at Richmond and appointed a committee of public safety with most

extensive powers. Two regiments were enlisted, and Henry was appointed commander of all the forces to be raised. The first collision was at Great Bridge, where the Virginia militia gained a triumph over trained British troops, and drove Dunmore back to his ship. Henry should naturally have been the leader of the troops, but the active command was given to Col. William Woodford. Henry was disappointed and resigned. In the convention of May, 1776, when the delegates to the Continental Congress were instructed to demand the independence of the Colonies, he took an active part and was chosen by that convention one of the committee which prepared the first Constitution of the Commonwealth of Virginia. In that year he was chosen by the convention, which then exercised the power of election later exercised by the Assembly, to be Governor of Virginia, and was reëlected until 1779, when he became ineligible; and more than once during his occupancy of the office the Legislature conferred upon him, in times of crisis, practically dictatorial powers. He returned to the Legislature, in which he served until 1784, and was then once more chosen Governor, serving until 1786, when he finally resigned. In 1788 he was a member of the convention which ratified for Virginia the Federal Constitution, which instrument he vigorously opposed, chiefly on the ground that it failed properly to protect the rights of States and individuals against the extreme centralization of power in the Federal Government. In 1794 he declined a seat in the United States Senate, and in 1795 Washington offered him the position of Secretary of State, but he declined. He also declined the office of Chief Justice of the United States Supreme Court, and Adams's offer of a special mission to France, as well as an election as Governor in 1796. He was elected to the House of Delegates in 1799, but did not live to take his seat, dying on June 6th of that year. Consult: Tyler, *Patrick Henry* (Boston, 1887), in the "American Statesmen Series;" Wirt, *Sketches of the Life and Character of Patrick Henry* (2d ed., Philadelphia, 1818); and William Wirt Henry, *Patrick Henry, Life, Correspondence, and Speeches* (3 vols., New York, 1891).

HENRY, ANRÉ, PAUL PIERRE (1848—). A French astronomer, born at Nancy. He was an assistant at the Paris Observatory (1864) and adjunct astronomer (1876). With his brother, **PROSPER MATHIEU HENRY** (1849—), who was made titular astronomer in 1893, he did much for the perfection of astronomical photography, in their labor of completing the *Atlas éclipique* of Chacornac. The older brother discovered the Comet III. and the planetoids 126, 141, 152, 159, 164, 177, and 227, and Prosper discovered the planetoids 125, 127, 148, 154, 162, 169, and 186.

HENRY, PHILIP (1631-96). An English Nonconformist clergyman, born in London. He graduated at Oxford in 1652 and was ordained in 1657. His career as a preacher was repeatedly interrupted by the religious persecutions of his time, and it was not until the Act of Toleration was passed in 1687 that he was allowed to pursue his calling unmolested. The remaining years of his life were spent in unceasing labor. His *Diaries and Letters*, published in 1882, gives a detailed account of the Nonconformist life of his period.

HENRY, ROBERT (1718-90). A Scottish historian, minister of the Established Church. He was born in Saint Ninian's Parish, Stirlingshire; was educated at Edinburgh University, and after a term of school-teaching entered the Church, his first charge being at Carlisle. For the last twenty-two years of his life he was in Edinburgh churches—New and Old Grey Friars—and found opportunity to compile his *History of England on a New Plan* (6 vols., 1771-93), of which the last volume was published after his death. Henry's 'new plan' of grouping social progress in periods is no longer new, and has been followed out with greater accuracy since his time.

HENRY, ANRÉ VICTOR (1850—). A French philologist, born at Colmar. He studied both law and philology, but finally devoted himself exclusively to the latter, and was appointed professor of grammar and comparative linguistics at the University of Lille. In 1889 he was transferred to a similar position in the faculty of letters at Paris. His writings, which are numerous, cover a wide range of linguistics. Among them special mention may be made of his *Esquisse d'une grammaire de la langue innok* (1878); *Esquisse d'une grammaire raisonnée de la langue aléoute* (1879); *La distribution géographique des langues* (1880); *Etudes afghanes* (1882); *Esquisses morphologiques* (1882-90); *Précis de grammaire comparée du grec et du latin* (Paris, 1888, translated into English by R. T. Elliot, 1890); *Précis de grammaire comparée de l'anglais et de l'allemand* (1893); *Manuel pour étudier le sanscrit védique* (1890); and *Le livre septième de l'Atharva-Véda* (1892).

HENRY, WILLIAM (1774-1836). An English chemist. He studied chemistry and medicine at the University of Edinburgh, and received the degree of doctor of medicine from that university in 1807. Henry devoted himself mainly to investigations in chemistry and medicine. He was the author of several papers in the *Philosophical Transactions* (chiefly on the chemistry of gases); and his *Elements of Experimental Chemistry*, originally published (1801) under the title of *An Epitome of Chemistry*, passed through numerous editions. He is remembered chiefly as the discoverer of the important general law, according to which the amount of any gas absorbed by any liquid is proportional to the pressure exercised upon the gas, provided no chemical combination takes place between the gas and the liquid.

HENRY, WILLIAM WIRT (1831-1900). An American lawyer and historical writer. He was born at Red Hill, Charlotte Co., Va.; was educated at the University of Virginia, and was elected to the State Legislature, where he attended four sessions. In addition to the practice of his profession, he was deeply interested in historical studies, and became president of the American Historical Association and of the Virginia Historical Society. He is the author of the *Life, Correspondence, and Speeches of Patrick Henry* (3 vols., 1890-91), besides historical addresses and essays.

HENRY AND EMMA. A poem in dialogue, published in the collected edition of Prior's works in 1709. It is founded on the old English ballad *The Nut-Brown Maid*, and is among the three more ambitious but less read of his attempts. It contains the line: "Fine by degrees, and beautifully less."

HENRY ESMOND. A novel by Thackeray, published in 1852, and one of the finest historical romances in English. The scene is laid in England in the reign of Queen Anne. The hero is a young colonel in the army, at first deeply in love with the beautiful daughter of his guardian, but finally married to her mother, the widowed Lady Castlewood. See ESMOND, BEATRICE; and CASTLEWOOD, LORD and LADY.

HENRY OF BLOIS, blwä (c.1102-71). An English prelate, son of Stephen, Count of Blois, and brother of Theobald, Count of Blois and Champagne, and of King Stephen. He was brought up at Clugny; came to England in 1126, and, three years later, received the see of Winchester. After the death of Henry I. he did all in his power to gain the crown for Stephen, and at the coronation pledged his word that the liberty of the Church would be kept intact. Henry failed in his candidacy for the see of Canterbury (1136-38), but in 1139 he was appointed Papal legate. As such he opposed the imprisonment of the Bishops of Salisbury and Ely, and, at the Council of Winchester, charged Stephen with sacrilege. In the quarrel between the King and Matilda, he gradually went over to the side of the latter and swore allegiance to her in 1141. But he quarreled with her soon after, and was rescued from her besieging army by the forces of Stephen. In 1143, Pope Innocent II. having died, the commission of Henry expired, Theobald was appointed as his successor, and Henry's power at Rome was over. Five years later he was suspended because of his advice to Stephen that Theobald should not be allowed to attend a Papal council at Rheims. Toward the close of the civil war all Henry's energies were bent on the hastening of peace. He assisted at the coronation of Henry II., but was afterwards under the King's displeasure because of his leaving England without the royal consent (1155). Henry did not fall in with Thomas Becket's policy, and defended the King in 1166 and 1167. He died soon after the death of the Archbishop, for which he bitterly condemned the King.

HENRY OF LAUSANNE, ló'zán'. See HENRICIANS.

HENRY OF HUNTINGDON (c.1084-1155). An English historian, the son of Nicholas, a churchman, and, possibly, archdeacon of Huntingdon. He spent his early years at Lincoln in the home of Bishop Robert Bloet, where Albinus of Angers was his teacher. In 1109 or 1110 he was made Archdeacon of Huntingdon. In 1139 he went to Rome and met Robert de Monte, who made him acquainted with the *Historia Britonum* by Geoffrey of Monmouth. This and a request of Alexander, Bishop of Lincoln, prompted him to write his *Historia Anglorum*, which, in the last edition, came down to 1154. This work is a mere compilation, with occasional touches of pure imagination, for the period to 1127, where the author's personal knowledge begins. The following works are also ascribed to Henry: *Epigrammata Libri VIII.*, of which two books are extant, and one is printed in Wright's *Anglo-Latin Satirical Poets and Epigrammatists of the Twelfth Century* (in the *Rolls Series*, 1872); *De Amore*; *De Herbis*; *De Aromatibus*; and *De Lege Domini*. The history is reprinted from Savile, *Scriptores post Bedam* (1596); in Migne, *Patrologia*, vol. xciv. (1854), and translated by

Forester (1853). For his biography, consult Liebermann (*Göttingen*, 1878).

HENRY II. OF TRASTAMARE, trá'stá-mä'rä (?-1379). King of Castile, 1366-67 and 1369-79. He was the oldest son of King Alfonso XI. of Castile by his mistress, Leonora de Guzman. Alfonso gave him the County of Trastamare; but when, in 1350, Peter the Cruel, Henry's half-brother, ascended the throne, Doña Leonora was imprisoned and soon after murdered, while her sons had to flee for their lives. Peter the Cruel continued in his career of assassination until, in 1356, the nobles began a revolt under the leadership of Don Juan de Albuquerque and the illegitimate children of Alfonso. The rebellion was soon suppressed; Henry escaped, while most of the others were executed. In 1360 the Peace of Bretigny between England and France set free bands of marauders who united under the name of Free Companies. Charles V., King of France, in order to rid his country of them, sent them, in 1363, under the leadership of the great general Du Bertrand Guesclin against Peter the Cruel, who was aided by the English under the Black Prince. In 1366 Henry of Trastamare entered Castile, and was crowned as Henry II., and Peter fled to the Black Prince at Bordeaux. By the Treaty of Libourne (April 3, 1366) the English agreed to use their utmost efforts to restore Peter in return for the Lordship of Biscay. They fulfilled their promise, and the Black Prince won the decisive battle of Najera on April 3, 1367, and Henry again became a fugitive. But the departure of the English left Peter defenseless, and in 1369 Henry returned, and was welcomed by Madrid and other cities as far south as Cordova. Peter tried to bribe Du Guesclin to help him to escape, but the latter betrayed him to Henry, who put him to death. The crown was now claimed by Ferdinand of Portugal, and somewhat later by John of Gaunt, who, in 1371, had married Constance, a daughter of Peter the Cruel. But Henry was able to overcome, with French assistance, all attacks, and developed into a good and liberal ruler. Consult Burke, *History of Spain*, vol. i. (London, 1895).

HENRYSON, ROBERT (c.1430-c.1500). A Scottish poet. He seems to have been educated abroad, as his name does not appear in the registers of the University of Saint Andrews, the only one existing in Scotland in his youth. When he was admitted, in 1462, to the newly founded University of Glasgow, he was called 'the venerable Master Robert Henryson, Licentiate in Arts and Bachelor in Decrees.' He probably took orders, and was schoolmaster and notary public at Dunfermline. Henryson, who had the finest poetic talents of all the followers of Chaucer, wrote a sequel to *Troilus and Cressida* entitled the *Testament of Cressida*. He resumes the story where Chaucer leaves off, and completes it by inflicting a suitable punishment on the false Cressida. This continuation displays so much skill that it was included in the earlier editions of Chaucer, as if it had been the work of that poet himself. Another poem, "Robene and Makyne," though short, is remarkable as the first known specimen of pastoral poetry in the Scottish language. Henryson wrote several beautiful lyrics, and made a metrical translation of Æsop, adding morals of his own suitable to his time. In these fables he displays admirable sense

and humor. Consult: the selections in Ward, *English Poets* (London, 1880-83), and *Poems and Fables of Henryson*, edited by Laing (Edinburgh, 1865).

HENRY THE DEACON. See HENRICIANS.

HENRY THE LION (1129-95). Duke of Saxony and Bavaria. He was the son of Duke Henry the Proud. When only ten years of age he lost his father, who had engaged in a war with the Emperor Conrad III. of the House of Hohenstaufen, and who had been stripped of his Bavarian possessions. For seven years the young prince's mother, Gertrude, and his grandmother, Richenza, ruled his paternal dominions in Saxony. In 1146 Henry assumed the reins of government, and at the Diet of Frankfort, in the following year, he demanded of the Emperor Conrad the restoration of the Duchy of Bavaria, which had been wrested from his father. This was refused, and Henry, in concert with his uncle Welf (Guelph), had recourse to arms; but his efforts were crushed by the energetic measures of Conrad. After the death of this Emperor, however, Bavaria was given up to him by his cousin, the Emperor Frederick Barbarossa, who formed with him a close friendship (1156). Henry's possessions now extended (not continuously, however) from the North Sea and the Baltic to the shores of the Adriatic (including some territories in Italy), and he was by far the most powerful prince in the Empire, rivaling in influence the Emperor himself. In 1166 a league comprising the Archbishops of Bremen and Magdeburg, the Bishops of Halberstadt and Hildesheim, the Margrave of Brandenburg, and the Landgrave of Thuringia, was formed against him. He triumphed only after two years of hard fighting. About this time he separated from his first wife, and married Matilda, daughter of Henry II. of England, soon after which event he undertook an expedition to Palestine (1172). Henry broke his alliance with the Emperor by refusing to join in the Italian expedition of 1176, causing Frederick's defeat at Legnano. (See ITALY.) The wrath of the Emperor was kindled, and the numerous enemies of Henry the Lion again combined against him; he was summoned to appear at three different diets, and, refusing, was put under the ban of the Empire in 1180. By 1181 his fortunes were at so low an ebb that he was forced to ask mercy of the Emperor at Erfurt; but all that he could get was permission to retain his hereditary territories of Brunswick and Lüneberg, and even this was on the condition of his going into exile for three years. Henry, in consequence, went with his family to England; but returned to Brunswick in 1185, where he lived quietly. On the departure of Frederick for Palestine in 1189 Henry again was obliged to withdraw to England, but he soon returned, and engaged once more in wars with the petty princes of the North, achieving little, however. A little later he took up arms against the Emperor Henry VI., but was finally reconciled with the Hohenstaufen. He died at Brunswick, August 6, 1195. Consult: Prutz, *Heinrich der Löwe* (Leipzig, 1865); Philippson, *Geschichte Heinrichs des Löwen* (ib., 1867-68).

HENRY THE MINSTREL, or BLIND HARRY. A Scottish poet, who flourished about 1490. Scarcely anything is known of him beyond what

is told by John Major in his Latin *History of Scotland* (1521). "When I was a child," he says, "Henry, a man blind from his birth, who lived by telling tales before princes and peers, wrote a book of William Wallace, weaving the common stories (which I, for one, only partly believe) into vernacular poetry, in which he was skilled." In 1490-92 Blind Harry is found at the Court of King James IV., receiving occasional gratuities of 5, 9, and 18 shillings. The poem attributed to him, *The Life of that Noble Champion of Scotland, Sir William Wallace, Knight*, was completed before the end of 1488, when it was copied by John Ramsay. This copy, the oldest manuscript of the work now known to exist, does not ascribe it to Blind Harry, nor is his name given to it in the earlier printed editions. The poem, which contains 11,861 lines, composed in the heroic couplet, is altogether a wonderful performance, for the blind minstrel must have carried it all in his memory. The style is simple and vigorous, and at times eloquent. The author makes repeated appeals to two Latin lives of Wallace, one by his schoolfellow, John Blair, another by Sir Thomas Gray, parson of Liberton. While the poem undoubtedly has a basis in fact, it is to be regarded mainly as a fiction woven out of popular traditions and written in the spirit of the metrical romances, with which the author was well acquainted. The poem was probably printed earlier, but the first extant edition is dated 1570. Immensely popular in Scotland for two hundred years, the poem fell into neglect, owing to the fact that its language naturally ceased to be understood. Its place was supplied in 1722 by the poor modernized version of William Hamilton, of Gilbertfield. Consult: Moir, *A Critical Study of Blind Harry* (Aberdeen, 1888), and a critical edition of the original poem, edited by Moir for the Scottish Text Society (Edinburgh, 1885-87).

HENRY THE NAVIGATOR (1394-1460). A Portuguese prince, celebrated as a munificent patron of voyagers and explorers. He was the fourth son of John I., King of Portugal, and was born at Oporto, March 4, 1394. He first distinguished himself at the conquest of Ceuta, in 1415. As early as 1420 he took up his residence at the town of Sagres, not far from Cape Saint Vincent, and while prosecuting the war against the Moors of Africa exerted himself in every way to decipher the mystery of the great continent upon which the Portuguese had but recently set foot. Under his inspiration Portuguese sailors reached parts of the ocean which the navigators of the time had long supposed to be inaccessible. The grand ambition of Henry was the discovery of unknown regions of the world. At Sagres he founded an observatory, to which he attached a school for the instruction of youthful scions of the nobility in the sciences necessary to navigation. Subsequently he dispatched some of his pupils on voyages of discovery along the western coast of Africa. Creeping down the coast by short and steady stages, these expeditions during Prince Henry's lifetime succeeded in unraveling the unknown shore line of Africa to within fifteen degrees of the equator. The Madeira Islands had been reached in 1419; in 1434 Cape Bojador was discovered; in 1441 Cape Blanco was reached; in 1445 Cape Verde, in Senegambia, was doubled; and in 1455 Cadamosto reached the mouth of the Gambia. Prince Henry died

at Sagres, November 13, 1460; but the impulse which he had imparted to the maritime enterprise of the Portuguese continued for more than fifty years after his death, and resulted in the circumnavigation of Africa, and in the upbuilding of a Portuguese empire in India and in Brazil. The science of navigation, which before his time can hardly be said to have constituted a science at all, is indebted to Prince Henry for many important improvements. Consult: Major, *Life of Prince Henry of Portugal* (London, 1868); id., *Discoveries of Prince Henry the Navigator* (ib., 1877). See AFRICA, section on History and Exploration.

HENSCHEL, hën'shel, GEORG (1850—). A German-English composer and vocalist, born at Breslau. He was of Polish descent on his father's side, and both his father and mother were noted for their knowledge of music. His first teacher was Schaeffer, and he subsequently studied under Moscheles and Wenzel for the pianoforte, Götze for singing, and Reinecke for theory and composition. He was enrolled as a student in the Liepzig Conservatory from 1867 to 1870, after which he studied in Berlin—composition under Kiel, singing under Schulze, and the violin under Schiever. For the next few years he steadily made a reputation for himself as a vocalist of high rank, singing in the *Messiah* (in French) at Brussels in 1873. Other important engagements followed rapidly, notably in Gluck's *Iphigénie en Tauride*, succeeded in 1874 by an engagement as a soloist at the Lower Rhine Musical Festival held at Cologne. His first concert in England was early in 1877, and his success was so complete that London became his permanent home, and in 1890 he was legally naturalized. He was speedily in request as a teacher of singing, his first English pupil being a daughter of Queen Victoria, the Princess Louise. About this time he first met Miss Lillian Bailey (1860-1901), a young American soprano who made her English début at a Philharmonic Society concert in London in 1879. She became a pupil of his, and two years later (1881) they were married at Boston, Mass. From 1881 to 1884 he was conductor of the Boston Symphony Orchestra, returning to London in 1885. From 1886 to 1888 he was professor of singing at the Royal College of Singing, London. After his marriage his appearances in the principal cities of America were in company with his wife. Both artists became famous for their work in *Lieder*, although they were equally at home in opera and oratorio. His compositions are many, consisting mainly of vocal works and studies, together with a serious opera, *Nubia* (1899), a comic opera, *A Sea Change* (1899), and several works for string and full orchestra. His most important work is the *Stabat Mater* (1899). He had a very high reputation as a teacher of singing, three-fourths of his pupils generally being Americans. His wife died in London.

HENSEL, hën'sel, LUISE (1798-1876). A German devotional poet, sister of Wilhelm Hensel the painter. She was born at Linum, and after the death of her father moved with her mother to Berlin (1810), where, seven years afterwards she met Clemens Brentano, who influenced her greatly. Though she had been a Protestant, she became a Catholic (1818), as Brentano was of that Church. In 1819 she was

companion to Princess Salm, and in 1821 became teacher in the family of the Countess Dowager of Stolberg. From 1833 to 1837 she lived in Berlin again; then at Neuberg, Cologne, and Paderborn. In her first book, *Gedichte* (edited by Kletke, 1858), she collaborated with her sister Wilhelmine. Her evening hymn, "Müde bin ich, geh' zur Ruh," is one of the finest of German devotional lyrics. Her completed works were edited by Schlüter (last ed. 1892). Consult Binder, *Luise Hensel* (Freiburg, 1885).—**WILHELMINE HENSEL** (1802-93), sister of Luise, besides the poems published with Luise, wrote another volume, *Gedichte* (1882).

HENSELT, WILHELM (1794-1861). A German historical and portrait painter, born at Trebbin, Brandenburg. He studied at first architecture in Berlin, then became a pupil of Director Frisch at the Academy, and in 1813-15 took part in the War of Liberation, during which he visited Paris twice and became deeply interested in its art treasures. Although successful afterwards in Berlin as a poet, he yielded to his greater inclination for art, and in 1825 went to Rome, where he copied Raphael's "Transfiguration" and other masterpieces. After his return in 1828 he was made Court painter, and in 1831 professor at, and a member of, the Berlin Academy. He painted mostly biblical subjects, such as "Christ Before Pilate" (1834, Garnisonskirche, Berlin), "Christ and the Woman of Samaria" (Royal Palace, Berlin), "Miriam Leading the Procession of Virgins After Crossing the Red Sea" (1836), etc.; but also historical genre scenes, such as "Vittoria Caldoni Bidding Farewell to Her Friends" (1830), and a great number of portraits—he is credited with more than four hundred—among them those of historical personages ("Emperor Wenceslas," Römersaal, Frankfort) and many contemporaneous celebrities, notably Felix Mendelssohn, whose sister Hensel had married in Rome. He is said to have left also about a thousand portraits in silver point, and did creditable work as an illustrator and etcher, his best-known drawings being those for Tieck's *Genoveva* and *Phantasmus*.

HENSELT, hën'selt, ADOLF VON (1814-89). A distinguished German pianist, born at Schwabach, Bavaria. The progress he had made in his art, together with the evidences he had given of his genius, led King Ludwig I. to grant him an annuity, which made it possible for him to take up study with Hummel at Weimar and Sechter at Vienna. In 1837 he made his formal début as a concert virtuoso, and scored a remarkable triumph in the several large cities of Germany in which he appeared. The following year he went to Saint Petersburg, where his fame had already preceded him, and where he ultimately reaped his richest rewards. Soon after his arrival there he was appointed Court pianist to the Empress and music-teacher to the Imperial family, an appointment which was followed by that of inspector of musical instruction at the Imperial Educational Institution for Girls. He was not a prolific composer, but all his compositions are marked with his individuality, and depend largely for their interpretation on the style of playing in which Henselt excelled. As a performer he was remarkable for his sympathetic and poetical interpretation, as well as his mastership of legato execution, and what has

since come to be known as singing-touch. His compositions include the well-known F minor pianoforte concerto; *Poème d'Amour*, op. 3; *Ballade*, op. 31; and several other successful pieces, as well as some extremely difficult extension studies for the practice of a legato execution of extended chords and arpeggios. He died at Warmbrunn, Silesia.

HENSEN, hën'sen, VICTOR (1835—). A German physiologist, born in Schleswig. He studied medicine at Würzburg, at Berlin, and at Kiel, where he became docent and later professor of physiology. His earlier studies, under the influence of Bernard, were in embryology, and in the physiology and anatomy of the organs of sense; but afterwards he devoted himself to marine biology, became a member of the Commission for Scientific Research in German Waters, and contributed largely to the development of German fisheries. His works include: *Physiologie des Gehörs* and *Physiologie der Zeugung*, both in Hermann's *Handbuch der Physiologie* (1880-81); *Reisebeschreibung der Planktonexpedition* (1892); and *Die Planktonexpedition und Haeckels Darwinismus* (1891).

HEN'SHAW, HENRY WETHERBEE (1850—). An American ornithologist and ethnologist, born at Cambridgeport, Mass. His delicate health drove him from Harvard to bird-collecting in the Southern States. In 1872 he went to Utah, officially employed in the same quest, and he afterwards accepted a Government position at Washington, to write reports upon naturalists' observations, but was transferred in 1879 to the ethnological department. His publications include *Animal Carvings from Mounds of the Mississippi Valley* (1886), and other papers on similar subjects.

HENSLOWE, hënz'lô, PHILIP (?-1616). An English theatrical manager. In the neighborhood of Southwark, where he lived, he owned much property, including the Boar's Head and other inns, and managed and partly or entirely owned several playhouses. He rebuilt the new Rose Theatre, managed Newington Butts, the Swan, and, in company with Edward Alleyn, the actor, built the largest London theatre, the Fortune, in Cripplegate (1600). He also carried on a general brokerage business. He bought plays of the authors and sold them to various acting companies. A diary which he kept of these transactions is a most important document. This and other valuable papers are preserved in the library of Dulwich College. The *Diary*, with some forged entries, was published in 1845 by J. P. Collier for the Shakespeare Society. Consult *Catalogue of MSS. of Dulwich College*, edited by G. F. Warner (London, 1881).

HEN'SON, JOSIAH (1787-1883). An American clergyman and lecturer, born a slave in Port Tobacco, Md. His early career is remarkable for the hardships he was forced to endure. He escaped into Canada in 1828, and became a Methodist preacher at Dresden. Mrs. Harriet Beecher Stowe met him, and drew from the story of his life her character of Uncle Tom. Henson lectured throughout the United States, and made three trips to England during the last years of his life. While upon his final tour in 1876 he was entertained at Windsor Castle by Queen Victoria.

HENSTEIN, hën'stîn, JOHANNES VON (1822-80). A German botanist, born at Potsdam. He studied horticulture in Potsdam and Berlin, and was made a lecturer in the University of Berlin in 1855. In 1861 he was appointed custodian of the Royal Herbarium, Berlin, and from 1865 was professor of botany and director of the botanical garden at the University of Bonn. His botanical studies were varied, but have to do chiefly with plant physiology and morphology. His publications include: *Untersuchungen über den Bau und die Entwicklung der Baumrinde* (1853); *Versuche über die Leitung des Saftes durch die Rinde* (1860); *Uebersicht des natürlichen Pflanzensystems* (1867); and *Einige Züge aus der Biologie des Protoplasmas* (1880).

HENSZLMANN, hën's'l-män, EMERICH (1813-88). An Hungarian art critic and archaeologist, born at Kasehau, and educated at Pest and Vienna. After studying medicine, he devoted himself to archaeology and aesthetics, and traveled extensively. He took part in the Revolution of 1848, serving in a department of the Ministry of Foreign Affairs. He was imprisoned for eight months; then left Hungary and lived in London and Paris until 1862, when he returned to his home. He was a member of the Lower House of the Hungarian Diet (1869-72), and professor of the history of art at Budapest (1873-88). A member of the Hungarian Academy and of the National Kiszfaludy Society, he wrote: *Théorie des proportions appliquées dans l'architecture* (1860); *Die nordfranzösische Abtei und Kathedralekirche* (1865); *Die Grabungen des Erzbischofs von Kaloasa* (1873); and, in Hungarian, on the relation between Greek tragedy and Christian drama (1846), on mediaeval architecture (1866), and on the remains of Gothic architecture in Hungary (1880).

HEN'TY, GEORGE ALFRED (1832-1902). An English author. He was born at Trumpington, Cambridgeshire, and was educated at the Westminster School and at Caius College, Cambridge. He served in the purveyor's department of the British Army during the early part of the Crimean War, and after returning home invalided was promoted to be purveyor and given service in the Italian Legion. After the close of the war he commanded for a time the Belfast and Portsmouth districts, and in 1866 became war correspondent of the *London Standard*. In the service of his paper he accompanied the contestants of the Austro-Italian, Turco-Servian, and Franco-Prussian wars; took part in the Abyssinian expedition of 1868 and the Ashanti expedition of 1873; participated in Garibaldi's Tyrolean campaigns; was present at the opening of the Suez Canal in 1869; attended the Prince of Wales during his travels through India; and made an extended tour of the mining regions of the United States. He is known as the most prolific and popular of contemporary writers for boys, his books being chiefly historical novels. The best known of his novels are: *All But Lost* (1869); *Gabriel Allen* (1888); *Dorothy's Double*; *A Woman of the Commune*; and *Colonel Thorndyke's Secret* (1898). Among the most recent of his books for boys are: *In the Irish Brigade* (1900); *Out with Garibaldi* (1900); *With Buller in Natal* (1900); *At the Point of the Bayonet* (1901); *Malcolm the Water-Boy* (1901); *To Herat and Cabul* (1901); *With Roberts to Pretoria* (1901); *The Treasure of the*

Incas (1902); *With the British Legion* (1902); *With Kitchener in the Soudan* (1902).

HENTZ, NICOLAS (1750-1820). A French politician, born at Sierck, where he became justice. Elected to the Convention in 1792, he voted for the death of the King, and became a trusted agent of the Revolution. In 1794, when he returned to Paris from a long series of important missions, in which he had had unlimited powers, he was accused of cruelty in La Vendée, and was found guilty; but, benefiting by the amnesty of October, he left public life. The law against the regicides passed in 1816 forced him to leave the country. He escaped to the United States, and died on an island in Lake Erie.

HENZÉ, ä'n'zá', GUSTAV (1815—). A French agriculturist, born in Paris. He was educated at the Agricultural Institute of Grignon, and was appointed director of the Grand-Jouan Institute in 1840. Six years afterwards he was administrator of the school at Nozay, then professor of agriculture at Grignon, and was appointed to the same chair at the opening of the Institute in Paris, and in 1880 was made also inspector-general of agriculture. Between 1843 and 1849 he wrote voluminously upon professional subjects, such as fodder, fertilizers, milk, pastures, and the *Influence of the Crusades upon the Agriculture of the Middle Ages* (1855).

HENZEN, hën'tsen, JOHANN HEINRICH WILHELM (1816-87). A German philologist and authority on Latin inscriptions. He was born at Bremen, studied at Bonn, Berlin, and, after travels through France, England, Italy, and Greece, at Rome, where from 1842 to the end of his life he was closely associated with the German Archæological Institute. With Mommsen and De Rossi he edited for the Berlin Academy that great work *Corpus Inscriptionum Latinarum*, in which he personally edited the *Fasti Consulares* to 766 A. U. C. and the inscriptions of the city of Rome after Cæsar. His other works, besides many contributions to philological journals, to the *Bulletino* and the *Annali* of the archæological institutes and *Epheméris Epigraphica*, were a supplementary volume to Orelli's *Inscriptionum Latinarum Collectio* (1856), and *Acta Fratrum Arvalium que Supersunt* (1874).

HENZEN, WILHELM (1850—). A German dramatist, born in Bremen, and educated at Leipzig, where, save for two years (1874-75) at Munich, he lived after the success of his first play, *Die Kypseliden* (1874). Henzen was connected with the Stadttheater as dramaturgist from 1882 to 1885, and in 1893 became director of the National Association of Dramatic Authors and Composers. Besides the dramas: *Lügen des Herzens* (1876); *Ossian* (1877); *Zweideutigkeiten* (1878); *Studiosus Lessing* (1880); *Bettina de Monk* (1881); *Luther* (1883); *Ulrich von Hutten* (1884); *Schiller und Lotte* (1891); *Tod des Tiberius* (1895); and *Kaiser, König und Bürger* (1890), and others, he wrote the valuable study, *Ueber die Träume in der altnordischen Sagalitteratur* (1885-89).

HENZI, or HENTZI, hën'tsé, SAMUEL (1701-49). A Swiss patriot, born at Bümplitz (Canton of Bern). After a very comprehensive training he held subordinate posts under the Government of the Canton of Bern; in 1741 was appointed a captain in the military service of the Duke of Modena; and in 1744 with others addressed to

the Council of Bern a petition for a revision of the Constitution. For this he was sentenced to ten years' banishment, commuted by pardon in 1743. While an assistant librarian at Bern he entered into a conspiracy which had for its object the subversion of the Constitution, but which he supposed intended merely a second petition to the cantonal authorities. The undertaking was, however, discovered, and Henzi was executed on July 17, 1749, with two associates. Lessing planned a tragedy based on the fate of Henzi. Consult Bähler, *Samuel Henzi's Leben und Schriften* (Aarau, 1880).

HEPAR (Lat., from Gk. ἥπαρ, liver). A name given by the older chemists to brown or liver-colored compounds of sulphur. *Hepar antimonii*, called also 'liver of antimony,' is a mixture of antimony trioxide, potassium sulphide, potassium carbonate, and antimony trisulphide, which has been used in veterinary medicine. *Hepar sulphuris*, called also 'liver of sulphur,' is a mixture of potassium hyposulphite, potassium sulphide, and potassium pentasulphide, with some potassium carbonate, which has also been used in medicine.

HEPATICÆ, LIVERLEAF (Neo-Lat., from Lat. *hepaticus*, Gk. ἥπατικός, *hēpatikos*, relating to the liver, from ἥπαρ, *hēpar*, liver). A plant of the genus *Anemone*, which belongs to the natural order Ranunculacæ. The best-known species, *Anemone Hepatica*, has showy white, pink, or blue flowers that in earliest spring emerge from a hairy bud which is surrounded by the sombre-

HEPATICÆ.

tinted leaves of the previous year. It is the most beautiful of the early spring flowers of Eastern America, and one which by reason of its habitat and mode of blooming furnishes many texts for nature-study in elementary schools. The same species is found throughout Northern Europe, where it is cultivated and often produces double flowers. The root has powerful astringent properties. Another species, *Anemone angulosa*, native in Transylvania, is cultivated for the sake of its beautiful pale-blue flowers.

HEPATICÆ (Neo-Lat. nom. pl., from Lat. *hepaticus*, pertaining to the liver). The technical name of the group of plants popularly known as liverworts. The Hepaticæ form one of the two primary subdivisions of bryophytes; the other one includes the mosses. Liverworts grow in a variety of conditions; some float on the water; many live in damp places, and many on the bark of trees, but in general they are moisture-loving plants. The prostrate body consists of what is

called a 'thallus' (q.v.). By virtue of this position the body is 'dorsiventral,' since the two surfaces are unlike. The upper (dorsal) surface, exposed to the light, develops structures accordingly; while the under (ventral) surface

surface, but develops reproductive structures from its upper surface. In many cases there is a budding form of reproduction; little cups (cupules) appear often in great numbers in which small disk-like bodies (gemmae) are formed. When these gemmae are scattered they again produce new plants. Upon the upper surface also the sex organs are carried, and in *Marchantia* itself they are borne upon the summit of a conspicuous erect branch. As a rule the two sex organs (antheridia and archegonia) are borne upon different plants.

The *Jungermanniales* include many more species than either of the others. These forms often

is against the substratum and develops root-like processes as hold-fasts and absorbing organs.

There are three well-defined groups of liver-

grow in very dry situations, as on rocks, tree-trunks, etc., and are often mistaken for delicate mosses. Their resemblance to mosses suggests one of the chief features. The prostrate thallus body remains simple in structure, but becomes very much modified in form, being organized into a central stem-like axis which bears two rows of small foliage leaves. As a consequence the *Jungermanniales* are usually spoken of as the 'leafy liverworts.'

The *Anthocerotales* comprise comparatively few forms, but these are of great interest since they are supposed to represent forms which have given rise to the mosses and perhaps to the ferns

works, each of which represents a special line of development. In the *Marchantiales*, the thallus body remains simple in form, like a flat green

disk, but becomes thick and rather complex in structure. This thickish body not only produces root-like processes (rhizoids) from its under

also. The thallus body is very simple, both in structure and in form, but the chief interest is in connection with the spore-case, which is clon-

gated like a slender pea-pod, grows continuously in length, is green, and splits into two valves.

The liverworts are thought to have been derived from certain green algæ, and among them there is the first clear example of alternation of generations (q.v.). The thallus body is the sexual generation (gametophyte, q.v.), since it bears the sex organs. The fertilized egg produced by these sex organs develops a very different body, namely the spore-case, which is the sexless generation (sporophyte, q.v.). The spores upon germination produce the thallus body or gametophyte again, and so the alternation continues. The structure of the sex organs is also of interest, since they are very different from those of the algæ from which the group has come. The male organ (antheridium, q.v.), a many-celled body, consists of a wall of sterile cells within which very numerous sperm-producing cells occur. These sperms, which are of definite structure, have just two motile cilia.

VERTICAL SECTION OF SPOROGONIUM OF PORELLA, still within the calyptra, and showing the globular spore region.

The female organ (archegonium, q.v.), which is very characteristic, is a flask-shaped body, within the bulbous base of which a single large egg is formed. How this archegonium of the liverworts has been derived from the far simpler female organs of algæ is one of the important botanical problems. In any event, it continues to be the characteristic female organ through mosses, ferns, and gymnosperms. (See CHLOROPHYCEÆ.) Fossil liverworts, allied to the modern genus *Marchantia*, are found rarely in the Eocene shales and in the Oligocene amber of Europe. See LIVERWORTS.

HEP'ATITIS (Neo-Lat., from Gk. *ἥπαρ*, *hēpar*, liver). Inflammation of the liver. See LIVER, DISEASES OF.
